1077. There is a discrepancy of £16,000 estimated, between the revenue and the expenditure on this line;—do you think it is likely that that amount could be made up? I am sure it will be made up. It is very much like any other enterprise. It is very much like Sydney was in its early days. Sydney has developed until it is now one of the most prosperous cities in the world. At its inception it was a poor place, because there was no trade. The trade has developed, and now it is one of the finest towns in the world, and it will be finer still when the improvement scheme is carried out. So it is with a railway. It is the trade on a railway which makes the railway, and unless you get the railway you cannot say what trade you will have. The electric trams, for instance, created a trade for themselves. There are hundreds of people—thousands of people—tens of thousands of people—riding in the electric trams who either walked or who used some other means of conveyance. So it is with a railway; give people facilities and they will not go on to assume that only the same volume of trade will be carried on between two points with all the difficulties which surround the trade at the present time. To say that only will be continued when there is a railway is rather putting a damper on the progress of the Colony.

1078. The two extreme points on this line are already well served, and the question is, will the country to be served by the railway be likely to make up this great deficiency which is estimated;—there is only a very small income estimated from the line, viz., £4,844, while the estimated annual cost is £21,429; it does seem an immense amount to make up? I will tell you honestly what I think. I think if you wait for railway construction until it can be proved that each line will pay you will not have any railways made for a great many years to come.

1079. This country has been described to us as being not by any means rich country, and it is a country where cheap railways would hardly come in, because there are a good many steep gradients in the line, and that sort of thing? By comparison with the best alluvial land on the Clarence, it is not what we would call rich; but, by comparison with what you call forest land in many other parts of the Colony, it is very rich. That is my opinion about it.

1080. I think the estimated capacity of the country is about one beast to 7 acres? That is in its natural condition; but when you have proper paddocks formed, and when the best of the land is put under crop for the growth of green fodder, and a variety of things which can be produced by the thrifty husbandman, the production would be largely increased. To make a bald calculation, as the grass is now, with all its disabilities and difficulties, of what we may believe will be the result, is not, I think, a fair way of putting it, because nothing is left to development or incentive. I think there is going to be an enormous increase in both respects. What we call forest lands on the Clarence, before the introduction of the dairying system, were looked upon as worthless. The people tried cattle-raising, but when they got the cattle raised they could get scarcely anything for them. A poddie they would sell for 2s. or 3s., and in some cases they could not sell them at all. These forest lands are now all valuable, and the cattle which they could hardly sell before—the yearlings and others—are worth from 30s. to 40s., and in some cases more than that, according to their breed. It would be very difficult to estimate the increase, but I should certainly think there has been quite an increase of £2 a head all round on the cattle in the district. There is an increase in value of £500,000. I showed that the cattle had increased from 219,708 in 1891 to 238,516 in 1900. What I particularly had these statistics prepared for was to show the enormous developments which have taken place in each decade from 1871 to 1900, which is only a fair testimony as to what might be expected to take place in the years that are to come. The increase in the decade succeeding this one I take it will be very much greater than the increase in the decade preceding it, and you, gentlemen, who are called upon to decide this question would reasonably take this return into account when I vouch for its authenticity. I have not prepared the return myself. It was prepared, under my instructions, by the Government Statistician, who really did not know what I wanted it for. I look upon that return as most interesting from the progressive point of view, apart altogether from its bearing on this question, as showing the enormous progress which the country, in that particular district, has made.

1081. Is it your opinion then that, within a reasonable time, this line would become self-supporting? I honestly think it will pay the interest on the capital cost before the line between Murwillumbah and Lismore will, but I do not think that it can possibly stop at Grafton. I think there must be a North Coast line.

1082. *Mr. Levien.*] Supposing there was a light line made, which, Mr. Deane says would cost £500,000, then there would be only half the loss and more chance of its paying;—I suppose you think it is better land between Grafton and Casino than between Newcastle and Sydney when that line was constructed? The land between Newcastle and Sydney, I suppose, you will put down as poor land so far as the surface is concerned. What it contains underneath I do not know—coal, I suppose. You could not find country as bad up there.

1083. The surface would not be much good for anything? No; except for residences.

1084. *Mr. Watson.*] Do you think a tramway would be sufficient to open up this country between Grafton and Casino? Unless they could utilise the present rolling-stock they have on the Tweed—no.

1085. A very much lighter line than that on the Tweed would carry all the rolling-stock other than the engines now used on that line? Yes.

1086. Do you think a line that would carry the rolling-stock that is on the Tweed line now, at a slow rate of speed, would be sufficient for the opening up of this land? I am not in a position to give an opinion in a practical way; but if the rolling-stock which they have on the Tweed line can be used in conjunction with the projected line between Casino and Grafton—if they can get a light line and cannot get the other—I should say it is better to have a light line than no line at all, which would really mean, I suppose, largely a question of this description—whether the light line could be ultimately converted into a heavy line without any very serious loss in doing so, or whether a light line would mean a loss if it were proved that a permanent line would have to be constructed. That is really a question for the practical men

men—the engineers—to deal with. They have a Railway depôt at Lismore with sheds, and all the appliances for cleaning, repairing, and so on. That would not be necessary to the same extent at Grafton. That expense has already been incurred which forms a very considerable portion of the expense of working a line. If you have ever such a short distance of line, you must have certain appliances for working that line, and the isolation adds to the expenditure per mile. The extension would reduce, according to its length, the *pro rata* expenditure on a mileage system. In other words, if it cost £10,000 to maintain the engines, &c., in connection with 50 miles of line, you reduce the expenditure proportionately by extending the line.

1087. The trouble is, that we are confronted with a very heavy expenditure—nearly £8,000 per mile;—taking the present price of rails—and the prospect of a through traffic does not seem to be very great—I take it from your evidence that you are convinced that what pays best is the through traffic? Partly.

1088. No railway gets a great amount of return from the traffic along its route; it is nearly all through traffic? The combination of the traffic is the best.

1089. In this case there does not seem any very large prospect of a through traffic, and whatever justification there is for the line seems to rest on the probable opening up of a large area of Crown land? I will give you this case. Suppose there are 20,000 persons on the Clarence, and they want to come to Sydney by rail, if they have to go to Glen Innes it is a journey of 100 miles or so, whereas if the railway went to Grafton, they could simply step into the train and go right over to the Tweed, and they have not very far to go then to catch the Brisbane train. It seems to me that before very long there will be a connection between the two systems.

1090. I do not think there would be many people who would care to go by that way when they can come down in your boat for £2? I know some people who would rather forfeit £20 than come down by boat. There is bound to be a tremendous change of trade, which is necessary between all these rivers—between the Macleay and the Clarence there is the exchange of cattle. Men go to the different districts and buy cattle, and they trade. The things they consume they get direct; but still there is that necessary trade, and the development of it does add more or less to the earnings of the railway.

1091. *Mr. Hyam.*] When the Clarence and the Richmond districts are very nearly fully developed, what population do you think they will carry? The Clarence is more developed than the Richmond, although there is a great deal to be done yet. On the Clarence there is an enormous area of land which is not taken up or utilised in the way it ought to be. I do not exaggerate when I say that it will carry three or four times its present population.

1092. I go a little further than that? Of course, in years to come it will be a great deal more than that. To occupy the lands which are now unoccupied would absorb three times the population we have on these rivers.

1093. I have had an opportunity of seeing more of this country than you have had? I would be very sorry to exaggerate, because I have seen a great deal of it. I do not want to mislead the Committee. I am only stating what I believe to be the case.

1094. *Chairman.*] This very gratifying increase in settlement and production in the northern district has mainly taken place along the lines of the rivers? Mostly.

1095. And the intermediate spaces between the rivers have not, as a rule, been very thickly settled? Only on the Richmond. There has been a great deal more of internal development on the Richmond; that is between the two rivers. There is no doubt that the railway has done that.

1096. *Mr. Harper,* speaking of the section between Casino and Grafton, made this statement when he was giving his evidence before the Committee:—

This section of the line is a complete blank, so far as intermediate traffic is concerned, and, as there is no exchange of products between the Richmond and Clarence Rivers, there can be no through goods or stock traffic from Casino on the Richmond, or to Grafton on the Clarence, or *vice versa*."

From your previous remarks, I think you are inclined to challenge that statement? Absolutely. I say, with all due respect to Mr. Harper, that he does not know what he is talking about in that respect. The present method of communication is primarily between Chatsworth on the Clarence, and Woodburn on the Richmond, a distance of 26 miles. It is only a narrow strip. That is how the passenger trade has developed. The people who want to go from the Clarence to the Richmond to catch the steamer, and do their trade, go by that way, or *vice versa*. As regards the mail route, the original trade from Sydney to Tenterfield was through Lawrence. There is a main road from Lawrence to Tenterfield, that is *via* Drake and Tabulam. There was a road between Casino and Tenterfield also. Then the main road between the table-land and Grafton was along the Glen Innes route. There was one also from South Grafton to Armidale. It is not reasonable to suppose that people who want to go to the Richmond would undertake a 60 miles odd journey when they could get along the other way. The river steamers are very handy. The people can get into a river steamer at Grafton in the morning, and go to Chatsworth, whence they go by coach to Woodburn, and there get the river steamer to take them up to Lismore. The cattle which come down by that road, come across the country from the Richmond to the Clarence. If there were a railway, instead of wasting the cattle as they do now, the probability is that they would be trucked.

1097. Have you considered this proposal in view of any future connection with Glen Innes or Tenterfield? Necessarily.

1098. What would be the general effect on the development of the country between Grafton and Murwillumbah, of a further connection between Grafton and Glen Innes? As the products on the coast are so different from what they are on the table-land, there would be an enormous exchange of products. For instance, they cannot grow wheat on the coast, and they can grow it on the table-land. They cannot grow sugar on the table-land, and they can grow it on the coast; it is semi-tropical. Then, I am sure that, in the summer time, there will be an enormous number of persons living on the coast who will be glad to go to the cooler climate on the table-land, just as people go from Sydney to the Mountains. I may say that in the future, we are going to have the same development of mountain ranges between the coast and the table-land as has taken place between Sydney and the Blue Mountains, or Bowral. Of course the population will have to increase in proportion before it is done, but the quality of the mountain country is on all fours with that of the country I have mentioned, and it is adapted for fruit growing. It is unimproved country between the coast and the table-land, containing minerals and timber, and in addition it is a sanatorium.

1099. Do you know of any report on the mineral character of the land between Grafton and Casino? No. There is a good deal of gold-mining going on at a place called Yulgilbar, which is some distance from

Hon.
J. See, M.P.
16 July, 1900.

from the line of road. There has been a considerable quantity of gold found, from time to time, between the rivers, at a place called Limesville.

1100. Could you indicate, either in a general or in a particular way, how the construction of this railway would still further stimulate the progress of either the Grafton end or the Casino end—would it make the progress of either of these districts more rapid than it has been? By inducing the occupation of the land between the two districts, which cannot be used now for dairying even. I am satisfied that, if there were a railway made, and a reasonable chance of reaching a factory, or factories, that land if thrown open for selection, would all be taken up.

1101. How do you view the line in general—as a developmental line, or as one for giving facilities for interchange between the two rivers? As both. I look upon the North Coast line as a national line, and I look upon this section as a line which will largely facilitate the development of the intermediate country, and give facilities for communication between the two great districts.

1102. Is there anything further which you can add? No, thank you, unless you desire to ask further questions.

FRIDAY, 13 JULY, 1900.

Present:—

THE HON. ANDREW GARRAN, LL.D. (VICE-CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

JOHN CHRISTIAN WATSON, Esq.

THE HON. SOLOMON HERBERT HYAM.

ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Edwin Joseph Statham, late Supervising Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

E. J.
Statham.
13 July, 1900.

1103. *Vice-Chairman.*] Are you a resident in the Clarence district? Not at present. I resided there for nineteen years. It is nearly ten years since I left the district.

1104. Do you know the whole country between Grafton and Casino? Yes.

1105. *Mr. McFarlane.*] What position did you hold in the district? I was Supervising Engineer in the Roads and Bridges Department.

1106. I suppose you have a good general knowledge of the Clarence district? I know the district thoroughly.

1107. Have you a knowledge of the Richmond River end of the proposed railway? Yes.

1108. How would you class the country along the route of the line from Grafton to Casino? I should say it would be second-class grazing land, with agricultural land along the course of the creeks.

1109. Would there be any considerable extent of agricultural land? I should say there would be a considerable extent along the different creeks—Saltwater Creek, Sportsman's Creek, Myall Creek, Myrtle Creek, Sandy Creek, and Deep Creek.

1110. What class of land is it on Camira Station? There is some fair grazing land and some agricultural land on Camira—that is, along the course of Myall Creek there would be some very good land.

1111. Would it be along the banks of the creeks you mentioned that the agricultural area would be found? Yes; and right away up to the heads of them.

1112. Would there be any depth of this agricultural land? You might get 40 and 60 acre patches.

1113. When I asked you about your knowledge of the country on the route from Grafton to Casino, I did not mean the country along the road, but the belt of country which the railway would influence? There is very little good land to be seen along the road. To go along the road would give a rather unfavourable impression of the country. You would see the worst of the land from the road.

1114. What class of country is it generally—timbered country? It is lightly timbered, as a rule; but on the ridges it carries good iron-bark timber and box—some very good iron-bark.

1115. When you speak of the country as being second-class grazing land, do you mean in its present condition? In its present unimproved condition.

1116. Can you improve its quality for grazing purposes? Yes, very considerably, by clearing and ring-barking.

1117. Has that been tried in many places along the route of the proposed railway? Yes; in small patches, and there has been a good deal of ringbarking done about Camira.

1118. And that had a beneficial effect on the country? Yes; it improves the grass.

1119. Is it what you call fattening country? I would not call it fattening country. It is not equal to Dyrabba or the Upper Richmond.

1120. Could you give any information respecting the marketable timber within reach of the railway, if constructed? There is a considerable quantity of timber all over those ridges.

1121. Is there an export trade in iron-bark? There is a great deal of iron-bark taken out of it.

1122. Is there much traffic between Grafton and Casino by road? Very little.

1123. Is there much settlement at present? Not a great deal.

1124. Can you account for the land not being settled? It is mostly held as grazing country by squatters.

1125. I understand that there is a considerable area of Crown land available for settlement between Grafton and Casino;—is that within your knowledge? Yes; there are settlers up these creeks, and at the head of Whiteman Creek.

1126. As regards the settlement you speak of, is the land taken up for grazing purposes, for dairying, or for agriculture? For mixed agriculture and stock-rearing.

1127. In your opinion, if this railway be constructed, would the Crown land be taken up for settlement purposes along the route? I think it would all be taken up.

1128. In what sized holdings do you think the land should be cut up? Along the line I do not think it should be cut up in blocks larger than 200 acres, certainly not larger than 320 acres.

1129. Would that be sufficient to enable a man to keep himself and family, and make a fair living out of it?

- it? That would be sufficient for a homestead—for headquarters. Anybody that would take up one of these blocks would go in more land in the back country.
1130. Where would the back country be? Extending right back to the Clarence.
1131. Would the back country be at some considerable distance from the railway? From 15 to 20 and up to 25 miles.
1132. Would the railway influence or assist the settlement of the country for a distance of 25 miles on each side? On the west side of the line it would—that is, towards the table-land.
1133. Towards the Clarence River? Towards the head of the Clarence.
1134. No; the Clarence runs parallel with the line? For a short distance it runs parallel.
1135. Do you think that those on the Upper Clarence, high up the river, would be sufficiently near the proposed railway, and that it would be a benefit to the settlers to convey produce in that way? It would be necessary to make one or more branch lines. You see it runs a long way back—30 or 40 miles. Starting from Myall Creek (the road to Tenterfield comes in at Myall Creek) the road goes through Wyon and Tabulam, and on to Tenterfield.
1136. Can you state the approximate distance from this proposed railway and the different parts of the Clarence which you state are parallel to the river, and to which, in your opinion, a branch line should be run? From Myall Creek to Wyon and Deep Creek at Jordan's, possibly on to Tabulam. I should think the distance would be 35 miles.
1137. Would that branch line open up good country? There is very good country about Wyon, and excellent country at Deep Creek, at Jordan's; it is basaltic country.
1138. Is there a large area of this country? A considerable area.
1139. Sufficient to justify the construction of branch lines? Yes; cheap light lines.
1140. Would that materially increase the traffic on the railway from Grafton to Casino? It would make a considerable addition to the traffic; they would be actual feeders.
1141. From what direction would the traffic come by these branch lines? The traffic at present goes to Lawrence.
1142. Would the traffic on these branch lines, if constructed, go towards Grafton or towards Lismore? It is a matter of balance as to which would be the shorter. I should say it would be the shorter to the Clarence, especially if you tapped it at Broadwater. You see a short branch line from Casino main line leading down to Broadwater would take you at once to navigable water in the Clarence.
1143. Are the shipping facilities on the Richmond equal to those on the Clarence? Not by any means.
1144. Where is timber exported to from there? To all the colonies; a great deal has gone from the Clarence to the harbour works in Melbourne, and some has gone direct to New Zealand.
1145. Would the Richmond admit of the shipping of timber to other colonies? You could not get as large boats in there as you can get into the Clarence.
1146. Is there any timber being shipped within your knowledge direct to the other colonies? I cannot speak for the present time, because it is four years, at least, since I visited the district.
1147. What class of country is it between Grafton and Casino for railway construction? It is very easy country.
1148. You have had some large experience in superintending the maintenance of different roads? Yes.
1149. Would you consider this a difficult country from an engineering standpoint? There are no engineering difficulties at all. The creeks are not large, and there would be no heavy cuttings and no heavy gradients. I do not think you need have any gradient over 1 in 60.
1150. Is the iron-bark timber you speak of suitable for railway construction and for the bridges that would be required on the line? Yes, you would get a large quantity of sleepers there; I think enough for all the lines to the Tweed and the Clarence, and even for other lines.
1151. Would there be much carriage in bringing sleepers or girders to the railway? A great deal of the timber would be very close to the line—say, 10 miles.
1152. Would the different creeks which the line crosses be expensive ones to bridge? No; none of them are very large.
1153. Is much of the country flooded, or subject to flood? Yes; the creeks are all liable to be flooded.
1154. Of course the creeks are, but is much of the country for any length along this railway subject to flood? No. After you leave the Clarence it is flooded up to the junction; that is 3 miles out from Grafton.
1155. From Casino towards Grafton, is there any flooded country? There is flooded country between Deep Creek and Casino; that is, for a distance of 6 miles.
1156. Would it be deeply flooded? No; I have seen it covered with 12 or 13 inches of water.
1157. Would there be any run of water in flood-time which would interfere with any viaduct or embankment on the railway? No; it is still water.
1158. *Mr. Shepherd.*] I think you said that you consider the country between Grafton and Casino second-class grazing land? As second-class grazing land I should class it.
1159. The distance from point to point is only 64 miles; there are already two ports, one at each end, and from the central point on the route it would be only 32 miles to either Grafton or Casino;—do you consider that an excessive distance to take stock? It is a great consideration for fat stock to be trained.
1160. Do you think that a very long distance to drive fat stock? It is not a long distance, but it may do them a great deal of harm in hot weather, for it is very hot there at times.
1161. You see that 32 miles would be the extreme distance, and each station would be shortening the distance between that point and the port? The cattle which would be shipped by that line would be very fat cattle from the rich land on Dyrabba, Kyogle, Sanderlands, and Wyangarie.
1162. What distance would those stations be from Grafton or Casino? Kyogle would be about 15 miles from the line at Casino; Dyrabba probably 12 miles, and Sanderlands about 25 miles.
1163. Would you not consider anything within 21 miles of a port or a railway as fairly well served already? Yes.
1164. As the total length of the line is 64 miles, if you deduct 20 miles from each end, it only leaves 24 miles of country in the centre to be served by the railway? But then you have the rich lands where they fatten fat stock, at right angles to the line. For instance, Yulgilbar and Gordonbrook would come in on to this line. Approximately, Yulgilbar would be about 30 miles from the line, and Gordonbrook, I suppose, would be about 40 miles.

E. J. Statham.
13 July, 1900

- E. J. Statham, 1165. Where do you consider the branch lines ought to start from? I have already spoken of one branch line from Myall Creek. I think a second branch line would go from somewhere about Deep Creek.
- 13 July, 1900. 1166. How far is each of these places from either Casino or Grafton? From 20 to 25 miles.
1167. Do you suggest that one should start on one side of the line and one on the other? No; both on the west side of the line.
1168. That would make three lines within a distance of 64 miles? They would be two feeders to this line, and would be opening up agricultural country.
1169. Do you think the country is sufficiently rich to support two branch lines? It is very rich land along Dyrabba and Sanderlands and the head of Deep Creek. It is very superior land there to the land along the proposed line.
1170. Is there any cultivation going on at either of the places you have mentioned? Yes, to a small extent. They mostly grow maize.
1171. At what port do they deliver their maize now? I think it is mostly used locally. There is not much more grown than can be disposed of locally.
1172. I suppose it is too far to carry it for commercial purposes? Yes; the carriage is a heavy item.
1173. I think you say that the country is not first-class fattening country? Along the line, no.
1174. How do you propose to feed the railway, for if it is not a good fattening country there would be no fat stock to take from there, I should think? Fat stock would come from the heads of the Clarence and the heads of the Richmond.
1175. You would consider, then, that the probable feeding of that railway would be from the branch lines, and not from the country along its route? I think, mile for mile, the line is justifiable.
1176. You think that the line would be payable within a reasonable time? Yes.
1177. Are you aware of the estimated difference between the income and the expenditure on this railway? No.
1178. It is estimated to be £16,000? I would not pay much attention to that.
1179. *Mr. Hyam.*] There are a great many cattle sent from Dyrabba, Sanderlands, and Wyangarie to the Ramornie Meat Works? Yes.
1180. These cattle would have to be trucked at Casino, which, I think, would be the nearest port? No. I think they would truck the cattle at about Deep Creek, which is 6 or 7 miles from Casino.
1181. Suppose the length of this railway were 64 miles, do you think the owners of these stations would truck their cattle to Grafton or Ramornie in preference to driving them along the road? As they would have to tranship the cattle at Grafton, it would be almost as well to drive them from the stations. They drive them across to the Clarence.
1182. Not from Dyrabba and Sanderlands, and the other stations? They do.
1183. Over by Tabulam? No, by Yulgilbar.
1184. That would be a very long route from Dyrabba to Yulgilbar? No; you cross at Copmanhurst.
1185. You do not think the stations I have mentioned would avail themselves of this railway to send their cattle to Ramornie? Not unless they were very fat.
1186. I am only speaking of fat cattle? It would pay them to truck fat cattle.
1187. I suppose the Ramornie Meat Works will only deal with fat cattle—butchers' cattle? Yes. You see the graziers ship cattle, and if this line were made they would ship their cattle at the Broadwater.
1188. How long would it take to drive—not to overdrive, mind—fat cattle from these stations, which are pretty well about the same distance from Ramornie to the Meat Works, or to the big steamers? From Kyogle or Dyrabba, or Sanderlands, I should say about six days.
1189. You think it would be to their advantage to send the cattle by train rather than by road? Decidedly. In hot weather, if they are very fat, they may die on the road.
1190. *Vice-Chairman.*] Is Casino a shipping-place at present? No.
1191. You cannot ship produce there? They have to take the produce down the river in small steamers.
1192. Then you do ship it there? Yes; but it has to be handled twice. Coraki is the shipping-place.
1193. From what distance all round does Casino drain produce into itself for shipment? I should think 40 miles, along the course of the river.
1194. How far along the course of this railway would the influence of Casino be felt as a port? Perhaps 10 miles.
1195. And how far from Grafton along the railway would the influence of the shipping place at Grafton be felt? I think that if there were facilities, they would prefer to ship on the Clarence district into ocean steamers.
1196. Are there settlers—I mean taking 15 and 20 miles back from Grafton—who now ship at Grafton? All as far as Tabulam I think, which is about 60 miles north-west from Lawrence.
1197. What sort of produce is it which comes down to Lawrence? Hides, tallow, and all that sort of thing.
1198. All pastoral produce? Yes.
1199. How far does agricultural produce come from Grafton to Lawrence? I do not think there is very much coming that way.
1200. Taking Casino as a centre and the circle round it which drains into Casino, would the drift of that trade be altered in any way if the line were made from Grafton to Casino—that is, would the trade which is now shipped at Casino go down the line and ship at Grafton? At Grafton or Broadwater.
1201. You think that there would be no occasion to go right into Grafton? For fat cattle, it would be better to ship them at Broadwater.
1202. Taking the agricultural produce and the dairy produce, would any of that trade which now goes to Casino take the railway and go to Grafton by preference? Yes.
1203. Because it is a better shipping-place? Yes; and because there is no transhipping.
1204. Suppose the line were extended from Casino to Lismore, as it certainly would be if this railway were made, would the dairy produce in Casino go to Grafton or Lismore? I think the dairy produce would, most likely, go to Lismore. That would be affected by the trainage.
1205. That would be the nearest good shipping-place? Yes.
1206. You do not think that the making of a line from Grafton would draw any portion of the dairy traffic from the Richmond down to the Grafton for shipment? It is more certain on the Clarence; the steamers trade more regularly.
- 1207.

1207. That is true;—but would the produce bear the handicap of a railway freight? It would depend upon what the difference in the freight would be. E. J. Statham.
13 July, 1900.
1208. Assuming that the freight from Lismore to Sydney is the same as the freight from Grafton to Sydney, do you think it would be? They would ship at Grafton in preference if there was no very great difference, because they would be more certain of getting it away.
1209. We are told that the steamers are not detained now at the head of the Richmond since the improvements have been made, and that freights have fallen since those improvements were made;—would there be such a preference, do you think, to Grafton as to bear the handicap of the railway freight? The two things being equal, there would be nothing to choose between them; they would take whichever route was the cheaper.
1210. It is just a question of cheapness? Yes.
1211. If going from Casino to Lismore would be cheaper than going from Casino to Grafton, or as cheap, Lismore would get the advantage? Yes.
1212. You know where the line crosses the Richmond Range? Yes.
1213. It is nearer to Grafton than Casino? Yes.
1214. How does the produce from the Richmond Range farms get to the Clarence River now? I am afraid that there is very little produce to go.
1215. Would the people settled there make the nearest track to the river, or would they take the railway to Grafton? I think all south of the Richmond River would be likely to go to Grafton.
1216. North of it would go, where? To Lismore they would be likely to go.
1217. We are told that there is not enough settlement on this route at present to pay for a railway, and that it must rely upon the settlement it would create, and that the industry they would establish would probably be the dairying industry;—throwing out of the account the trading centres of Casino and Grafton, which is already served, do you think that the dairy traffic on the intermediate portion of that line would pay a fair interest on the cost of construction? If it were thoroughly developed. It might not, perhaps, for eight or ten years.
1218. How far back, on each side of the railway, do you think the railway influence would go in stimulating settlement and production? There are sixty-two parishes, I think, which it would affect.
1219. How far back from the line is the furthest parish? Forty miles.
1220. You think the influence of the railway would be felt 40 miles for dairy produce? Not for dairy produce.
1221. For agricultural produce? You see there would be stock rearing, and rearing dairy cattle.
1222. That would be more pastoral than agricultural? Yes.
1223. *Mr. Levien.*] Did you see a letter written by Mr. G. N. Griffiths in to-day's *Sydney Morning Herald*? No.
1224. Did you read Mr. See's evidence on this proposal? No.
1225. Mr. Griffiths says in his letter: "Mr. See's vivid imagination carries him a long way when he speaks of the Casino-Grafton railway carrying live stock from the Richmond and Tweed for Ramornie Meat Works." In your opinion would they carry fat stock there for killing at the Meat Works? I hardly think they would, under present circumstances.
1226. Do you think they would carry any fat stock along there? The Ramornie Meat Works are about 10 miles from Grafton, and as the line is to terminate at Grafton, they would have to tranship the stock at Grafton, and take them across the river. I do not see very well how they could do it unless the railway crossed the river.
1227. Mr. Griffiths also says in his letter, "I can assert that not a fat beast ever has gone, or is likely to go, from the Tweed to Ramornie, and from the Richmond River districts all stock for Ramornie are likely to continue to travel over on the hoof." If they wanted to send fat stock very quickly to Ramornie, would not they use the train? You see the train will stop on the north side of the river, and Ramornie is on the south side.
1228. But Mr. See gave his evidence on the assumption that this line would be a section of a North Coast line, and would cross the river? If it would cross the river it would be quite close to Ramornie.
1229. On the assumption, as Mr. See implied in his evidence, that it would cross the river, you think they certainly would use the railway for that purpose? Yes.
1230. Then you do not agree with these observations by Mr. Neville Griffiths? No.
1231. Mr. Griffiths also says, in his letter, "Mr. See forgets that the water communications of the Richmond and Tweed Rivers are as good as those of the Clarence, and that there is not the remotest possibility of a payable goods traffic between Casino and Grafton. As to a passenger traffic (except it were on through lines from Sydney, *via* Glen Innes and Grafton), I guarantee it would not require one car a week to carry";—what do you say to that statement? The line is necessary for the opening up of the country. There are sixty-two parishes almost undeveloped.
1232. Then you do not agree with that observation of Mr. Neville Griffiths? Certainly not.
1233. Mr. Griffiths also says,—“Mr. See forgets that what he says of the probable timber traffic is about the worst card in his pack, for there can be no comparison drawn between his Clarence River trade and the enormous timber traffic which must come from the great pine and cedar scrubs on the Upper Richmond as soon as the Casino-Tenterfield railway opens them to cheap carriage”;—what do you think of that statement? The timber traffic of the Richmond is an entirely different traffic. This would be a traffic in hardwood.
1234. You mean a different timber from what Mr. Griffiths refers to? Yes.
1235. So that you absolutely differ from his opinion there, too? Yes; they cannot be compared at all.
1236. From what you know of Mr. See's evidence, as indicated in that statement by Mr. Griffiths, you agree with Mr. See? Yes. Mr. See knows the country as well as I do. There is a lot of pine country in the Upper Clarence, and that would be tapped by this branch line by Deep Creek. That would all come down to Broadwater to be shipped. You see there is a big shipment of timber from Broadwater sprung up quite lately.
1237. After hearing the statements which I have just read from this letter, you absolutely disagree with Mr. Griffiths, and you support Mr. See's theory? Yes.
1238. You know Mr. Griffiths? Yes.
1239. He lives at Casino? He has a station there called Woorooloolgan.

- E. J. Statham. 1240. *Mr. McFarlane.*] In answer to Mr. Shepherd, I understood you to say that you consider grazing country to be well served if within 20 miles of a railway;—did you mean country used for stock-raising—that is, for pastoral purposes? For pastoral purposes.
 1241. There is a large amount of dairying carried on on the Clarence and Richmond Rivers? I believe so.
 1242. With regard to the grazing land which you say will be taken up in the event of a railway being constructed, would that land be used for pastoral purposes, or dairying purposes and agricultural purposes, within easy reach of the line? I should think that would be taken up for headquarters—of dairying and mixed farming.
 1243. Do you consider 20 miles too far for a dairy farmer to send his milk-cans to a factory? Yes; it would not pay to send more than 5 miles.
 1244. So that a railway 20 miles away would be of no use whatever to a farmer? No.
 1245. Would 10 miles be too far away? I should think 5 miles would be the limit.
 1246. So that when you said that 20 miles would be near enough to fairly serve the country, you meant for pastoral purposes? Simply for pastoral purposes.
 1247. And it did not apply to dairy purposes, for which you would consider this district would be used in the event of the railway being made? Immediately along the line the land would be used for dairying.
 1248. Is there anything else you would care to say? Only as regards the road material. The whole of the Clarence River is very badly supplied with road material. There is no basalt. The nearest basalt would be at Jordan's, Deep Creek. There is a large formation of basalt there, and that would supply a very large item of traffic to the railway.
 1249. How far would it be from the line? It would be 25 miles—it would be on the course of the first branch line I mentioned.
 1250. That would be taken to the proposed railway by a branch line? Yes.
 1251. You think that would be a considerable traffic? A very considerable traffic.
 1252. Is that the nearest point from the Clarence district where that superior stone could be got? Yes.
 1253. *Mr. Hyam.*] That basalt country you speak of is west of the Richmond Range? Yes, at what is known as Jordan's, Deep Creek.

William Albert Braylesford Greaves, grazier, sworn, and examined:—

- W. A. B. Greaves.
 13 July, 1900.
1254. *Vice-Chairman.*] Are you a resident in the Clarence River district? Not now. I have been a resident there. I have been connected with the Clarence since 1856.
 1255. In connection with the pastoral industry? And otherwise.
 1256. Sugar-growing? No. My first occupation was as a Government surveyor for about ten years in charge of the district. I lived in Armidale afterwards, but I never ceased to have an interest on the Clarence, and I have visited it every year, and I have the same interest now.
 1257. *Mr. Levien.*] Do you know the country on this line from Casino to Grafton? Yes; very well.
 1258. I suppose you have known it since 1856? I have.
 1259. What is your opinion about constructing a line of railway from Grafton to Casino? I think it is very desirable that a line of railway should be constructed. It will open up a piece of country that has been locked up for fifteen years, in which there is no settlement, nor any likelihood of any settlement so long as it is locked up—that is to say, reserved from sale. The only lands which have been sold of late years have been at some considerable distance away from the proposed railway. Grafton was located first, and then the Richmond began to take a start. So soon as the Richmond began to take a start, the lands on the Clarence being all locked up, pending the construction of three lines of railway—one to the north, another to the south, and one to the west—the country of the Richmond River had the full benefit of the population desirous of settling. Hence the large amount of settlement which has taken place on the Richmond within the last few years.
 1260. What is the quality of the land between Grafton and Casino, taking it all through? It is a varied piece of country, highly productive so far as producing grass. It is arable in most places; a great deal of it is arable. It is a light, loamy, sandy soil—grey and red. It is capable of being converted into dairy farms and used for mixed farming, I think, very successfully. I have known the country for many years, and I have noticed the improvement which has taken place in the grasses. Stocking has worked quite a wonder. Some years ago it would not carry a beast on 8 or 10 acres, and now it will carry a beast on about half that area. Stocking has made that improvement. When the country is ringbarked it becomes as good as any land in the Clarence or Richmond district of a grazing character. It is land which is very much benefited by showers; where land in other localities, on ridges of a different kind, and perhaps richer soil—does not receive the same benefit. It is so well grassed, and it lies so nicely undulating, that it is about the very best piece of dairying country I know. Grass is always green, and in abundance, and it is a most excellent piece of country. On flats where you would be quite starved out in winter time, there is excellent feed on this country, and I consider it most excellent dairying country in winter; you may dairy all the year round.
 1261. Do you think dairying would pay at so great a distance between point and point? Dairying has paid, dairying does pay, and the reason why there is no settlement on this land, or at the back of the land we are speaking of, or within a reasonable distance of Grafton, and the same distance of Casino—say 10 to 12 miles—although as rich as the land in the Big Scrub, is, because it is too far to convey produce to market. I can instance thousands of acres that the Government measured many years ago in the parishes of Hanging Rock, Tunstall, Jiggi, Vautin, and others. The Government thought the land was so valuable that they put it up at a high price per acre; I think it was £3. They reduced it to 30s.; afterwards bringing it down to £1, but could not sell it. It is only at the back of Casino, at the outside from 15 to 20 miles. It is red soil, quite as good as the land in the Big Scrub, and is heavily timbered, and the only persons who have ventured into it have been two or three timber-getters, and they are the only persons who occupy it at present.
 1262. What kind of produce would it grow along there? I have a memorandum of the produce which can be grown on this country. It will produce lucerne and oaten hay, maize in localities, potatoes—it is splendid country for potatoes—millet broom, all fruits, citrus fruits and mangoes, which grow admirably. It produces cattle, pigs, poultry, ducks and geese, and bacon. Every farmer has a large number of pigs. It also produces the early tomatoes that come to Sydney in the month of September, coffee, and a very large amount of timber. The country is most wonderfully timbered

W. A. B.
Greaves.
13 July, 1906.

1263. What is the particular timber growing there? Iron-bark, bloodwood, white-mahogany, red-mahogany, stringy-bark, two kinds of box, tallow-wood, mountain-ash, grey-gum, pine, and cedar; a great variety of brush trees—what are called soft woods (they are very valuable), spotted-gum, brush-box, turpentine, and swamp-oak.

1264. Is there any great quantity of these timbers there? There is any amount; it is a most wonderful piece of country for timber.

1265. How far would these timbers be from this railway line? Along the line and extending back 10 to 15 miles, and to 20 miles, all along the main Richmond Range. The range has been reserved for its magnificent timber.

1266. Do you think the proposed line would be any good for the travelling of fat stock from Ramornie? You must understand that Ramornie is 12 miles up from Grafton by water, and on a branch river called the Orara.

1267. Supposing the line was to cross to Ramornie, do you think there would be many fat stock taken by train to the meat-works? I listened to what was said when the previous witness was being examined. I have not seen Mr. See's evidence; I have seen an epitome of it in the *Herald*, but I did not notice what he said about travelling stock.

1268. Fat stock he spoke of? I am of opinion that all the fat stock from the Tweed and the Richmond for the meat-works, if the line were made, would go by rail? I am a producer of fat stock myself, and I know what I should do under the circumstances.

1269. Have you any properties down there? Yes, all over the district.

1270. Along the route of this line? Only in Grafton, along the line.

1271. You have station properties down there—where are they situated? Five or six miles above Ramornie meat-works.

1272. Do you think there would be a large passenger traffic along this line? I am quite sure there would. I will give you an instance of what I think there will be. I was on the railway between Lismore and Byron Bay the other day, and I saw almost what I may call a suburban traffic—local farmers and their wives and their children. The traffic seemed to me to be most wonderful at the present time, and within the last twelve months, I am assured, that 1,000 families—that is, 4,000 persons—have settled themselves along that line. I believe the very same thing would occur along this line, from Grafton to Casino, if constructed. It would be largely populated; every acre of land would be taken up within twelve months of the time it was notified that it was open for sale. I am quite sure that the whole of it would be rushed.

1273. How many acres do you think it will take to support a family on this land? It should be subdivided into portions of from 400 to 640 acres, and those areas would support a family of five or six. Mr. Coghlan's estimate is five to a family. I have a memorandum about that matter. On the west side of the road there are unalienated 45½ miles of frontage, and on the east side 44 miles of frontage, making a total of 89½ miles of unsold frontage to the railway line. On the west side of the road there are 17½ miles of frontage sold, and on the east side of the road 19½ miles of frontage sold. On the route of this railway line there are 140,000 acres of land reserved for timber, 200,000 acres alienated, 24,000 acres reserved for railways, 36,000 acres for water, village and other reserves; and outside these reserves there are 320,000 acres of Crown lands. If this area of 320,000 acres were sub-divided into 400-acre blocks, it would accommodate 800 families; and in 800 families, at Mr. Coghlan's estimate, there would be 4,000 persons. Four thousand persons would be settled on this line within a very reasonable time if constructed.

1274. Suppose you were starting now in life, apart from your own personal interest in the district, would you think of starting there with a small capital? I can tell you candidly that I have recommended people to wait on purpose to go out on this land. I know a person who went there the other day and took up 1,280 acres outside the limit of the railway, and at the back of everybody. And I know four young men in a family now who are waiting to go on that land if a railway be constructed. I may call it a virgin country. It is too far away from any settlement yet to be beneficially occupied, on account of the distance from market.

1275. I suppose you are frequently over this part of the country? I am not frequently over it, but I have been over it lately.

1276. Do you think it has improved much since you had been there? It has improved very much. I may tell you that for the last two years the Clarence and Richmond, and part of New England, have almost supplied Sydney with beef. I believe that as many as from 8,000 to 10,000 head of cattle have been sent to the district within the last two years for sustenance from drought-stricken districts. I know instances of poor sheep and cattle being unloaded on the railway line in New England, many being dead in the trucks, and a great number unable to travel after being unloaded, and to drive them 100 miles down to the Clarence was utterly impossible. While the Government are making railways into drought-stricken country to take poor stock away, I think it might make a railway to that country which is capable of maintaining them.

1277. In drought times in the west, would you call this good country to take starving stock to? It is the very best country you could take them to, because in winter it is warm, and in summer warmer.

1278. How is it watered? It is the best watered country anywhere; you cannot go wrong. The Clarence and Richmond are both splendidly watered. There is water in all directions.

1279. So that in drought times you think it would pay to take poverty-stricken stock to this part of the country? They are doing it now, and they have done it before. I will give you an instance of what a man named Small did with 1,000 acres of land on Myrtle Creek. He took from Goulburn 500 starving heifers and cows last year. He fed on his 1,000 acres of land 580 head of starving stock, and at the end of six months he sold some of them fat, and sent back to Goulburn the 500 head that came from there. He gave me this information when I was at Myrtle Creek lately.

1280. Then, even although they have got New England, they send starving stock down to this part for sustenance? It has been the means of saving thousands of stock, and it has been the means of making beef so cheap in Sydney that you have been permitted to buy it, otherwise it would have been so dear that you could not have bought it, and at the present time the Clarence and Richmond, and parts of New England, are again supplying Sydney with beef.

1281. Would you say that it is a more certain climate than New England, so far as starving stock goes? Starving stock will not live in New England in the winter, it is too severe a climate.

1282. It is warm on the Clarence, and there is plenty of food there all through the winter? Always.

1283. And almost as good in the summer, and well watered? Very well watered; you cannot go wrong for water. Stock were never known to be short of water on the Clarence. Again, the whole of this country

W. A. B.
Greaves.
13 July, 1900.

country is magnificently timbered. On some of the flats there is not so much timber. There are some swampy areas near Casino, but near what is known as the Travellers' Rest and the junction of the roads to Lawrence, and nearer Grafton, there are gentle undulating ridges. They extend for miles and on to the main ranges, and the higher you get the better the land is, and the heavier the timber the richer the soil. That timber would pay admirably to cut before the land is sold. A royalty should be imposed, and the Government should give some of the money towards building the railway. The timber on the land is really worth more than the land, but if you turn settlers on to it they immediately begin to ringbark and destroy some of the best timber in the country. It pays them better to ringbark and leave it, and cut it down afterwards and taken away, because dairying is their object, and dairying is thriving with great strides at present. At Myrtle Creek, five suppliers of milk made £735 during last year, and another one, with 400 acres, made £325 out of his dairy farming. Another person on Myall Creek, named Buckland, on a quarter of an acre, grew a quarter of a ton of millet used for brooms. Millet is worth £6 5s. per quarter ton—that is, £25 a ton—and he can grow a ton to the acre. Where millet is grown largely on the Hunter, from 12 to 16 cwt. is considered a good crop per acre, and this country is particularly adapted for growing broom millet, and there would be a large industry in that way.

1284. Where are you living now? At Strathfield.

1285. You have lived in Armidale a number of years? For many years.

1286. Would you compare that New England country with this country in a drought-stricken season? You cannot compare it. This is far superior in a drought. New England is good sheep country—a very large portion of it. You cannot produce sheep on the Clarence or on the Richmond, because the grass is too long.

1287. You have been a large stockowner for a number of years? I always have been a stockowner.

1288. *Mr. Shepherd.*] Mr. Statham, the previous witness, described this country as second-class grazing country? It is second-class grazing country, because the very best grazing country is that which you have in the west, and that is first-class grazing country. The whole of the Clarence and the Richmond, the very best of it, is only second-class grazing country.

1289. At that rate, it is not good fattening country? When it is ringbarked it is; but it never produces fat cattle so well as the western country. On the coast you never can get the same good fat cattle, or cattle of the same size, as you can get from the west.

1290. Would this country not be suitable, then, for sending fat stock away from? It is only suitable for bringing store stock to fatten on ringbarked country, and the other area of the unimproved Crown estate is admirably suited for breeding purposes.

1291. But the country is of good quality without the ringbarking, although it requires to be ringbarked to produce the extra quantity of grass? It not only produces the extra quantity of grass, but it sweetens the grass to ringbark. Many years ago a gentleman said to me, "What are you doing—are you ringbarking?" I replied, "Yes." "Well," he said, "I have ringbarked a piece of my paddock, and there has never been any grass on it since." I said, "I cannot understand that. Have you got any stock in it?" "Yes," he said, "I have got stock there, and I never can get them off it." It improved it in that way—that this wiry coarse grass that stock will not eat, the very moment the land is ringbarked they eat it bare.

1292. I am aware of that; but when you are speaking of the quality of country you generally classify it irrespective of the timber that is growing on it;—of course, the grass-producing quality is improved by the ringbarking, while the country remains the same? Yes; it is very good grazing country, but only second-class.

1293. I think you described it as a light sandy loam? I do. It is very friable, and will receive all the benefit that climatic influence can give it, and very quickly, and in that way it is so sustaining.

1294. A light sandy loam as a rule does not produce heavy crops? It depends on what the crop is.

1295. Well, any kind of crop? It will not grow so heavy a crop as the rich maize land on the Clarence—land that is improved by the detritus from the hills.

1296. Sandy loam as a rule requires a great deal of manure to make it produce a heavy crop of anything? Yes, it does; but stocking and removing the timber improve it very largely. You know, for instance, the sandy and bad nature of the country all about Bondi; I have a 5-acre paddock there, and I believe it will keep a beast to the acre.

1297. From Casino to Grafton the distance is 64 miles;—what distance do you consider the available distance for pastoral country to a station or a port? The whole of the land within 10 miles on either side would be benefited by the railway, and a considerable distance beyond in another and indirect way. It is chiefly adapted for dairying and mixed farming. A dairy farmer has a number of dry cows always. He will keep his milking herd within 10 miles of the railway, and he will have a paddock outside that limit for his dry cows, and he will work them backwards and forwards. That is the way the land would be benefited by the line, and the whole of it would be brought within a marketable distance.

1298. What would you call a marketable distance? Ten miles off the railway.

1299. Not more than 10 miles? Hardy, for dairying; but the country behind that would be very much benefited by it, because it would be utilised in the way in which I have expressed myself.

1300. Do you consider the country now is only served within 10 miles of Grafton and 10 miles of Casino? That is what it is.

1301. Not more? No, and 10 miles off the river bank anywhere. It will not pay to grow maize and carry it more than 10 miles, although I believe it is done. It is done below Grafton, where it is proposed, I think, that this line will be ultimately extended south as a North Coast railway. Farmers have taken up that land years ago. The Government first of all asked £6 an acre, and farmers actually took it up at £6, and they have undergone several revisions of their purchases, and it has been very much reduced. I think some of it has been reduced to £1 and 30s. an acre, and all that land has been or is being abandoned pending the construction of a railway. It would be the most lively spot in New South Wales if this railway could be made, and this coast line, and to-day New South Wales is so much the poorer on account of this grand piece of country known as the Clarence and the Richmond not being connected with the railway system of the Colony. It is a magnificent piece of country, as large as all England and Wales, and every 40 acres of the good land is suitable for maintaining a family with sugar and maize, and all the coast country is suitable for sugar. At Coff's Harbour, the head of the Orara River, and all down to the Bellingen and to the Macleay Rivers, the whole of that country is capable of growing sugar, and maintaining a large population.

1302. The roads, I think, are very good? No; they are very bad in the district. For short title, I think the district ought to be called the "Neglected District."

1303.

W. A. B.
Greaves.

13 July, 1900.

1303. What distance would it be from Lawrence to the proposed line? Ten miles.

1304. I suppose up to that point you would consider the country as fairly well served, because Lawrence is a shipping port? Exactly, and it would all have been sold, had it not been locked up as I have described, and it has been so locked up for the last fifteen years. There have been several inquiries into constructing this railway—and this is, I think, the third—only to repeat over and over again that there is no population, and not likely to be any; and if in another 100 years another inquiry should be held, under the same circumstances, there will be the same old story to tell.

1305. Do you know the estimated annual loss on this line? I do not know it, but I have heard it stated.

1306. It is estimated at about £16,000? I do not believe it will be anything like that. I will tell you what I think should be done. The railway would improve the value of this land which has been locked up. It has been waiting for an enhanced value on account of this railway. The Government should hand over a certain portion of the revenue derived from its sale to pay the interest on the cost of construction, and when the working expenses are taken off the profits, the Government should contribute so as to make the net revenue up to 3 or 3½ per cent. from the enhanced value of this land. The railway should be constructed on these principles. In Melbourne they have a system of that kind, and I believe there is in the hands of the Railway Commissioners an enormous sum of money which has been derived in that way from Crown lands through which railways have been carried. The same system should be inaugurated in this Colony, and it would be for the benefit of this railway, and there is enough timber on this part of the country to make this railway three times over.

1307. Would that timber be easily accessible to the proposed line? Very; because the country is very pleasant and undulating. There is no trouble whatever in drawing.

1308. So that it can be readily got? Yes. They are taking it now along the road some 15 miles to Lawrence. As you go along the road you can see where it has been taken from, but it is almost a flea-bite. You cannot miss it because there is so much of it.

1309. You think, within a reasonable time, the line will become self-supporting, even with this estimated discrepancy of £16,000 a year? First of all, I think the cost of construction is enormous. It is set down at £7,000 per mile. Does any man think it would be reasonable to build a bridge over that little babbling brook at Casino, called the Richmond River, at a cost of £40,000 with steel girders, a steel bridge over Myrtle Creek at a cost of £10,000, and another bridge over Sandy Creek at a cost of about £6,000, and wharfage at Grafton at a cost of £70,000? And does this estimate include the cost of resumptions? No.

1310. It does not include the cost of resumptions? I think it is outrageous. I get a little irritable when I think of it.

1311. *Mr. McFarlane.*] There has been an estimate made for a light line of railway, to cost about £3,000 per mile? That is too much for a light line of railway where there is all this magnificent timber which I have described. I think that, with a little stone or brickwork, and this magnificent timber, bridges could be built which would last a century for a small sum.

1312. *Mr. Hyam.*] Have you any definite knowledge of the rainfall in this locality? No; I know the red soil on the Big Scrub, unless it gets a shower every day, does no good at all.

1313. Have you any idea of the annual rainfall on the route of this proposed railway? I do not know what it is, but I know it is very copious.

1314. It is equal to the rainfall on the Big Scrub, I think? Hardly so, but it is very copious on the whole of the Clarence and the Richmond.

1315. I suppose it is in consequence of that very large rainfall the grass is so sour? Yes; and timber.

1316. Sandy loam is a country which requires a great deal of rain, and naturally it gets it? Yes. It is very good country for ploughing; it is country that would grow magnificent crops of turnips, and it is very good for early potatoes. There would be a very large trade, I believe, from the Clarence in early potatoes grown on this very country. I know other localities where potatoes are grown on exactly the same kind of soil. It is well known in the Clarence district, and the Richmond district also, that the higher you are dairying on the ridges, the richer is your cream. It is very much better than it is on the low lands—on the flats.

1317. You stated that, in your opinion, 10 miles from a railway is about the limit to serve dairy farmers;—are you aware that 16, 18, and 20 miles from the Lismore railway, and from Lismore itself, dairying is carried on very successfully? Is it near water carriage, then.

1318. No? I am not aware of it, and I did not think it was so; but I know that there are nineteen or twenty creameries between Lismore and Byron Bay, and that they are 10 miles apart.

1319. I suppose when the dairying industry is well established between Grafton and Casino it will be carried on under the same conditions as it is being carried on at present in the Big Scrub district? I think it would.

1320. If people went there and established dairy farms, there would be no difficulty in getting these companies to extend their operations to that particular district? Not the slightest; I know they are only waiting to do it.

1321. *Vice-Chairman.*] I suppose, in common with others, you look upon this line as part of the Coast line? As part of the North Coast line.

1322. Looking at the policy of that line, would it be better to begin at the north end or south end? I think myself the present isolated apology for a railway up in the north, and its position there and maintenance, can only be justified by its being extended further south; and the further south it is extended the better it will pay.

1323. Which do you think would be more to the advantage of this Clarence district—to make a line from Armidale or Guyra, down the Don Dorrego country, to Grafton, or to make a Coast line? The line, when it shall have been made to the tableland, will go from Grafton to Glen Innes, I am quite sure. I know the country so well. I have advocated that line for many years, and it is the only line which will serve the largest number and be the best for the State. The Clarence River is capable of accommodating over-sea vessels of large tonnage. The harbour is very good, and it is being improved. It has been somewhat neglected; but as improvements are now going on, and as Sir John Coode's scheme is being carried out, it will be a port not second to Newcastle, but quite equal to it; and I think it is by nature designed for a large commercial system.

1324. And a line going from Glen Innes to Grafton would be better than a line going from Guyra to Grafton? That is going all round the moon. I do not think that could be made less than 150 miles,

W. A. B.
Greaves.
13 July, 1900.

and a line from Grafton to Glen Innes would be about 96 miles; and when that railway to Glen Innes shall have been made, we shall send from the Clarence up to New England fish, bacon, cheese, sugar, early potatoes, beef, maize—a short time ago maize was 5s. 6d. a bushel at Inverell—tomatoes, millet broom, early fruits, pumpkins, melons, &c. We shall send soft-wood timbers, such as cedar, and all merchandise from over-sea, and farming implements which will be made at Grafton; and in return we shall receive from New England and the west, sheep in the form of mutton, wheat, wool, hides, tallow, flour, all English fruits which we cannot grow on the Clarence, tin ores and other minerals, ores, bark for tanning, lime, and hardwood in very large quantities; for the whole of the slope of the tableland falling towards the Clarence is one enormous forest extending from Camden Haven, on the south, to Mount Lindsay, on the north; and it is the most magnificent forest that any man can look upon.

1325. All that awaits a North Coast railway? That awaits a railway.

James Burt, Inspector, Survey Branch, Department of Lands, sworn, and examined:—

J. Burt.
13 July, 1900.

1326. *Vice-Chairman.*] Have you any statement ready to make? No; I was up in that district a month or so ago, and when I met a member of the Chamber of Commerce, he said he would send my name down as a witness.

1327. *Mr. McFarlane.*] What part of the district were you in? I was in the Grafton Survey Office for eight years. I was draftsman in charge, and during that time I had relations who were settled on the route of this line. I used to go over there occasionally, and within the last month I was up there spending a holiday, and went all through that country to a great extent.

1328. Is that right through from Grafton to Casino? Yes; and I went off the road at Myrtle Creek down to the east about 5 miles.

1329. That would be off the main road and the route of the proposed line? Yes.

1330. Have you had much experience in other districts in regard to land and its character? I was in the Goulburn district for a time. I have seen what can be done to country there in the way of improvement. I have seen the country in its natural state, and what it can be brought to after ring-barking, and stocking, and making other improvements, and I have also seen the same up in the Grafton-Casino district.

1331. What is the character of the country through which this line will pass? From what I have seen about Myrtle Creek, and what has been done by my brother-in-law there within the last ten years, I am certain that the country is capable of great improvement. My brother-in-law went there, I think, in 1888, and shortly afterwards he had a severe illness, and he had to neglect the place entirely. He was in Sydney nearly twelve months under doctors, and when he got back he was pecuniarily embarrassed. At that time he had only 1,200 or 1,300 acres. Since then, simply by fattening cattle, he has managed to get together a property of about 4,000 acres, and last year alone I believe his profits were about £1,000.

1332. Is that owing to the dairying industry? No; simply to fattening cattle. When I was there last month, I saw 100 fat cattle taken away in prime condition which had been sold to the butchers, and I dare say he has 100 head of cattle fat now, although it is winter, and is not the best time for fattening. He has highly improved the country by ringbarking. The ringbarking has sweetened the country, and it is able to carry a beast to 6 or 7 acres easily. His place is down Myrtle Creek, about 5 miles on the east side of the proposed line.

1333. *Mr. Watson.*] A local witness told the Committee that he had to throw up his holding in that locality—to his brother, as it turned out? My brother-in-law, within the last twelve months, bought two selections which had practically been abandoned, and he has done remarkably well with them.

1334. *Mr. McFarlane.*] Is there much settlement on Myrtle Creek? There is a fair amount of settlement, but most of it is on the western side of the road, up near Small's place, and Buckland's place. Of course, there is not a great deal at present.

1335. Are there any attempts made at cultivation? No; there is very little in the way of cultivation. I noticed some land on Myrtle Creek, just near the main road—at the Accommodation House—where very good crops of hay, vegetables, and potatoes, are grown. The soil looks very good indeed. My brother-in-law had just fenced in a paddock for the purpose of cultivation, but he had only got as far as ploughing it up, and it all turned out pretty much as Mr. Greaves said—a nice loamy soil, which I believe would readily grow fair crops of hay and potatoes.

1336. Is dairying carried on to any great extent? No; but I believe it would be. Ringbarking sweetens the grass so much that I am sure if the land were devoted to dairying it would be a success.

1337. Do you think the country between Myrtle Creek and Grafton would be suitable for dairying purposes? I think so. There was a selection about 10 miles out from Grafton—Duggan's—and judging by what he has done there, I should say that the whole of the country is equally capable of improvement. That selection has been improved, I understand.

1338. Would that, in its unimproved condition, be similar to the bush lands which are there now unoccupied? I certainly think so.

1339. You think the same results would follow from the improvement of the Crown lands now available for settlement? I think so.

1340. Is there much of it which you would consider fattening country for stock? I believe nearly all of it can be made fattening country, but it must be ringbarked and improved. That is what my brother-in-law does solely. He buys stores and fattens them. A piece of country alongside his holding which was vacant has been taken up by his brother a couple of weeks ago, and his intention is to ringbark and improve it, and go in for fattening. He says he is confident that he will do well, judging by what he has seen on the adjoining land. The improvement in the country is most marked. On one side of a fence you will see the ringbarked country, and on the other side the unringbarked country. In some cases the unringbarked country scarcely shows grass at all, whereas on the ringbarked country the grass is plentiful.

1341. The land on the banks of the different creeks, I suppose, would be of superior quality to that of the intervening country? Yes. There are always nice little patches of cultivation on the flats—that is, on the creek banks.

1342. Do you know Camira Station—at the homestead? No. I have been past by road, and while we were going through I had my attention called to the fact that the country thereabouts was considered sour, but even then there was a splendid growth of kangaroo grass which could be sweetened by ringbarking. That is just on the road going through from Casino to Grafton.

1343.

1343. Do you think the available Crown land within easy reach of this railway, if constructed, would be taken up by selectors? I am almost sure it would.

1344. In your opinion, what holding would be of sufficient size to maintain a family? I think if it were for dairying, they would want 600 or 700 acres at least, because you want a run for dry cattle as well as for milkers. If that suggestion of Mr. Greaves were adopted, I think it would very materially assist the railway, because he estimated that the country would carry 800 families with 640 acres each. The present rentals we get for conditional leases, even away from the line, is about 5d. an acre. The Government land is worth, we will say, £1 an acre. If this railway were constructed, we could readily ask £2 10s. per acre.

1345. Do you think it would increase in value to that extent? I believe it would. The present rentals are as high as 5d. an acre. For a homestead selection at £1 an acre the rental would be 3d. an acre, and at £2 10s. an acre the rental would be 7½d. an acre. If a man can pay 5d. an acre now for fattening cattle, surely he would not object to pay 7½d. an acre for dairying, when he would have the convenience of the railway right at his door. You could readily expect that, I think.

1346. Do you think there would be much passenger traffic between Grafton and Casino and Lismore? I do not suppose there would be a great deal to start with, but it would develop, I think. At the present time commercial travellers and others, travelling from Grafton down the river, cross at Harwood, and go over to Woodburn and thence up the Richmond River, and a great many of them coming to Sydney from the Richmond travel *via* the Clarence.

1347. Would they do that if this railway were made? I do not think so; I believe they would go to Grafton and do their business, and then on by rail to Casino and Lismore.

1348. Is there anything else which you would like to mention? Only that when I was in the Grafton office, Wooroolgan and Camira runs along the route of this railway were abandoned. We subdivided them, and I think nearly every one of these occupation licenses has now been taken up. There is very little of what we call unoccupied country now, although ten years ago, when I was in Grafton, I suppose nearly all that country was actually abandoned. I know it is nearly all taken up by occupation licenses since. The holdings were made smaller. There used to be one or two very large runs like Wooroolgan, and the lessees abandoned them, and we subsequently cut them up into occupation licenses in area ranging from 5,000 to 30,000-acre, and I believe nearly all of them have been let.

1349. Has there been many inquiries for land by free selectors with the view of taking up any of the country between the two rivers? I cannot say that there has been. I think the reservation blocks that you see a mile on each side of the line has been reserved for fifteen years; that would debar men from going there. If they knew that they could build their houses alongside the road and start straight away it might be an inducement to them to select; but when they have to go at least a mile back from the road, and to a place where there are no roads constructed, I think that is a drawback, and prevents people from taking up land.

1350. How would you compare the country between Grafton and Casino with the country at Goulburn that you were referring to? Of course, the country in Goulburn is mostly devoted to sheep, and the country between Casino and Grafton is devoted to cattle growing. Both my brothers-in-law come from Goulburn, and they think it is far superior to much of the land which has been taken up in the Goulburn district. You can get a return more rapidly out of it.

1351. There has been a considerable amount of evidence given as to the importance of the forests of timber in the district;—do you think that would develop into a large trade, given railway facilities? I think it would, for there is some magnificent timber there. I know that some of the mill-owners at Lawrence have offered as much as 10s. a tree at Myrtle Creek for iron-barks, and they have to cut it down and cart it 3 miles to Lawrence.

1352. Would this timber be sent by the railway if made? I certainly think it would.

1353. Is the timber mostly used locally, or is it exported? It is exported mostly to New Zealand. It is shipped direct.

MONDAY, 16 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Patrick Riddle Donaldson, late District Surveyor, Grafton, sworn, and examined:—

1354. *Chairman.*] You are a surveyor by profession? I am. I was employed by the Government for thirty-five years in the Grafton and Casino districts—I might say for the Clarence and Richmond districts—for the first three years as a licensed surveyor, and for the other thirty-three years as a staff surveyor in the same districts, and for the last twenty years as district surveyor. My district embraced the whole of the Grafton Land Board district, including the Tweed, Lismore, Casino, Grafton, Bellingen, Kempsey, and Port Macquarie districts.

1355. In your professional capacity, I suppose, you have had ample opportunity of examining all the country between Grafton and Casino? I have. I selected the necessary reserves, and all that sort of thing years ago for timber, water supply, and everything which was necessary for the future welfare of the district and its beneficial occupation.

1356. You know the proposal before the Committee? I do.

1357. It is to construct, at a cost of £501,375, a railway connecting Grafton and Casino. The annual expenditure

J. Burt.

13 July, 1900.

P. R.
Donaldson.

16 July, 1900.

P. R.
Donaldson,
16 July, 1900.

expenditure is estimated at £21,429, and the annual income at only £1,844, giving a net annual deficiency of £16,000;—will you kindly give us some information, based on your personal acquaintance with the district, as to the probability of this line getting sufficient traffic to put the estimated revenue closer to the estimated expenditure? For some years to come it is not likely to pay anything like an equivalent to the amount you mentioned, but year by year, as the settlement which it would induce takes place, the deficiency would be gradually lessened, and I think eventually it would be overcome, or, if not overcome, the margin would be so small that the revenue from the land which was taken up, caused by the making of the railway, would amply compensate for the deficiency.

1358. What do you think the land along the route is best suited for? It is best suited for dairying, generally speaking. On the banks of the creeks there are patches suitable for cultivation, and a number of the ridges themselves are suitable for the growth of cereal crops such as oats, but not for maize, which is the product on the banks of the rivers Clarence, Tweed, and Richmond; it is quite suitable for the growth of such crops as oats, but, of course, compared to the land on the banks of the river, it is poor, and it has been looked upon as so poor by comparison that no one would look at it. That and the want of the facility to get anything they grow to a market, have entirely prevented this land from being taken up. In view of the construction of a railway, years ago I had reserved a mile on each side of what was supposed to be the best route for the railway, and that has also locked up a great quantity of land. I think about 45,000 acres were locked up by the railway reserve, about 60,000 acres also for timber reserves within 10 miles on each side of the route, and 10,000 acres were reserved for water supply and other public purposes within 10 miles of each side of the route. Of course, beyond the 10-mile limit there is more good land, but I give you the estimate of about the quantity which is not available within 10 miles of the line. There are also very large timber reserves beyond the 10-mile limit.

1359. Even making allowance for these reserves, is there not still a good deal of country not far distant from either Grafton at one end or Casino at the other which has been open for settlement, and which has not yet been taken up? There was not within 15 or 20 miles of Casino on the one hand, and probably about the same distance from Grafton there was scarcely any left in 1896, when I resigned my position as district surveyor.

1360. In 1896, within 15 miles from Grafton, and within from 15 to 20 miles from Casino, all the available land had been taken up? Quite so.

1361. Had it been put to its best use or was it simply held for the purpose of speculation? I think it has all been put to a use of some kind or the other, especially latterly, for the dairying industry at each end.

1362. *Mr. Watson.*] You stated just now that the land which was open within 10 or 12 miles of Grafton had all been taken up before you left the district? Practically.

1363. On this map here you will notice a piece of land known locally as Clifden—part of the old Clifden station, I suppose—about 11 miles out of Grafton, on the west side of the proposed railway, which is not reserved, and which, being open for a considerable time, has not been taken up;—can you give a reason for its not being taken up? That is rather broken country—sandstone; but still there are patches of good land in that piece, and I do not think it will be long before it is taken up if it be opened under homestead selection. I do not know whether it is so; but it was not open when I left the district.

1364. A few miles from Lawrence there is another piece of land, which would lie about east of the proposed railway, at a point about 16 miles from Grafton;—how would you describe that land which, also, has been open for some time? That land is not as good as the major part of the land on the route; but still, I believe, that would be taken up readily for homestead selection if available. I do not know whether it is so or not; but there is much worse land being taken up.

1365. Did you say that these two blocks which are now vacant are not as good as the general run of land through which this railway will pass? Not as good.

1366. *Chairman.*] Taking the land through which the proposed railway runs generally, how many acres do you think will be sufficient to provide a family with a decent living by dairying? Assuming that they had a railway, I think from 500 to 600 acres, according to the quality of the country. In some cases it would require not nearly so much, and in other cases more, according to the character of the country.

1367. Have you considered what the nature of the traffic will be along this line, apart from dairy products? I do not think there will be very much traffic except from the settlement of the country itself. I look upon it that as it is now, there are 300,000 or 400,000 acres there which are almost valueless to the State; and I believe that with a railway there it would carry a population of 400 or 500 people. That would give probably about 500 or 600 acres to each family. It would carry 400 or 500 homes, and I suppose each home would average four persons at least. I look upon it that this country would be of no more use, without a railway, than it is at present. It is turning in very little to the State now.

1368. Settlement in these districts has usually followed the course of the rivers? Quite so; but within a reasonable distance it is all taken up on all the rivers.

1369. And has that land, within what you call a reasonable distance of the rivers, been put to its highest use? I think so. The Fresh Food and Ice Company have spent about £20,000, I think, on their works at Grafton and on creameries in the district. They have over a dozen creameries in different parts of the river, and their return of butter for last June on the Clarence alone was 48,000 lb. weight, according to the reports in the Press. Of course, on the Richmond pretty well the same sort of thing is being carried on. June is a winter month too. There is this to be considered in that country, that the frosts are very mild. You can graze all the year round. Not far from Grafton, on 16 acres, I had seven or eight head of cattle and ten horses all the year round. Some of the horses would get a feed of oats or maize, now and then, but the cattle certainly never got anything. Of course, that was on the alluvial flats near Grafton. The average return is over 40 bushels of corn to the acre right through the Grafton district.

1370. The nature of the soil, and the character of the operations carried on on each of these rivers are pretty well the same? Almost exactly the same.

1371. A railway joining the two rivers is not likely to create any interchange of traffic from one district to the other? It will a little, because the Clarence River is a better river, and the passengers not so liable to be stopped at times, because the company employ a better class of vessels. Travellers, and those who have business with the Richmond, make use of the Clarence River as far as Harwood, and cross over to the Richmond, and of course a lot of that traffic would go to this railway.

1372. Grafton would be the centre to which the greater amount of the passenger traffic would be attracted? Quite so.

P. R.
Donaldson.

16 July, 1900.

1373. I suppose you do not regard that as sufficient justification for the expenditure of £500,000? Not interchange of passenger traffic.

1374. Then, in your opinion, this line must depend mainly on the local traffic, which its own construction will develop? That is my opinion.

1375. You think the land is better suited for dairying than for anything else? It is.

1376. I suppose you also admit that dairying as dairying, although the value of the product is high, produced very little railway revenue? Very little compared to other products. Of course there would be other products, because a lot of the land would grow oats, as I have said, and that could be got to a market. It is utterly impossible now to do that sort of thing. The distance to the water is too far to enable a man to grow crops of that kind.

1377. Do you consider the development of the timber areas along that district as being of some importance, from a railway point of view? I do. I think daily the carriage is getting too far for the timber-getters to profitably get out the timber. There was an immense traffic done before I left with New Zealand. They supplied piles and girders of enormous length for the public works of New Zealand, and even for the Lismore-Tweed line a great lot of the sleepers were got in the Clarence district and shipped to Byron Bay. I do not say that they were all got from that quarter, but I have seen steamers loaded with them for Byron Bay.

1378. Would you say that the district between the two rivers is now languishing for the want of some railway or road facility? It is utterly stopped.

1379. And is all the available land along the course of the river and the course of the tributaries being taken up and developed? Yes.

1380. And is the expansion of that district restricted by reason of the want of some communication of this kind? It is.

1381. *Mr. McFarlane.*] How many years did you live in the district? Thirty-five years. When I went up the banks of the Clarence were lined with dense brush, and up to within a few miles of Grafton. I personally surveyed the first two years all along the banks of the Clarence, and for some distance back, the land that was likely to be taken up.

1382. You were district surveyor for a number of years? I was licensed surveyor for three years, and I was put on the staff and given charge of the district. I was promoted gradually from second class to first-class surveyor, and still in charge of the district, acted as a district surveyor, and then when a district surveyor was appointed for that particular district I was appointed. When the Land Act of 1884 was passed, and the decentralisation took place, I was appointed district surveyor for the Grafton Land Board district, which embraced the Macleay as well as other northern rivers, and at a later stage the Port Macquarie district was added to me, so that I had all the districts from Port Macquarie up to the Queensland border.

1383. Have you an intimate general knowledge of the country—not along the road itself, but along the route of this proposed railway from Grafton to Casino? I have; I have been in and out, backwards and forwards, through the greater part of it.

1384. How would you class the country generally? Fair grazing country.

1385. Is much of the land occupied? It is nearly all occupied in leasehold areas, annual licenses, or occupation licenses for pastoral purposes.

1386. Are there many settlers, farming and dairying, within a reasonable distance, say, 10 miles, from the river at Grafton, and the same distance from the river at Casino—that is, in the intervening country between the two 10-mile points? About Myrtle Creek, which is 20 miles from Casino, there is a great number of settlers.

1387. Between that and, say, 10 miles from the Clarence at Grafton? There is very little settlement between those parts.

1388. What is the reason of that? The reason, I presume, is partly on account of the land not being A1, being only fair, and, of course, the distance to cart produce. The principal factor against that back land being taken up is, and always has been, the very rich land on the bank of the river. Now, after they have been working that land for thirty-five or forty years without manure of any kind, a few years ago the average on the Clarence was 40 bushels of maize to the acre.

1389. It is exceptionally rich land in the valley of the river and its tributaries? It is; that being the case the people would not look at anything outside such rich land, and yet all this land I am speaking of is quite as good as you would see out in the southward, or out in any of the other directions. I have been in all the other directions, and what I see from the railway the land is not to be compared, on the whole, to the land we are speaking about.

1390. In the Richmond River district itself, how would you describe the land? It is very good, but a great portion of it is heavily timbered, and requires a great deal of money to clear it.

1391. How would the land between Myrtle Creek and 10 miles from Grafton compare with the valley of the Clarence and the valley of the Richmond for dairying or agricultural purposes? Not so good.

1392. But if you were comparing the land I am now referring to with the average districts throughout the Colony, how would you describe it? It would compare very favourably.

1393. Is it heavily timbered country? It is lightly timbered generally. There are patches, of course, heavily timbered with good timber—iron-bark, grey-gum, and all the good hardwood timbers. But it is astonishing to see the grass that grows on the gum ridges when ringbarked by the settlers.

1394. Do you know any of the settled parts between Grafton and Casino, which have been free-selected and improved? There are some which are directly on the line of route. For instance at the cross roads, where the Grafton Road joins the Lawrence Road, there is a place which shows what the grass is after the trees have been felled. It is on an old place, and it is certainly thirty-five years since it was first taken up. Beyond the Flying Horse some of the paddocks—at Riley's, two miles away—which have been run show signs of what improvement has been made.

1395. Do you know Duggan's selection, some few miles from Grafton? Yes; I think I personally surveyed it.

1396. What class of land was it in its original condition? It was a fair sample of the land between the 10 miles we were speaking about, say, between a little beyond the Flying Horse and Myrtle Creek.

1397. Have you seen it since it has been improved? Yes; I have passed it scores and scores of times. It has doubled its carrying capacity in my opinion.

1398. Is it land suitable for dairying purposes? It is quite suitable in every respect, and parts of that land would grow oats and light crops of that kind.

1399.

P. R.
Donaldson.
16 July, 1900.

1399. Do you put that forward as a fair sample of the whole of the country between Grafton and Casino? It would be a fair sample of the land between Myrtle Creek, and not quite so near this way as the Flying Horse.

1400. The railway would cross a number of creeks;—is any of the land on these creeks superior to the flat country between the different watercourses? There are little patches of alluvial land on all the creeks, and the same in the valleys running back from the creek into the ridges, and all those flats are suitable for cultivation. For instance, at Myall Creek and at Camira Station the crops of maize which have been raised were surprising, yielding far above the average of 40 bushels to the acre.

1401. Would the extent of agricultural land be considerable, putting the whole of these watercourses together, within the influence of the railways? Not really good agricultural land—not like the flats I have just been speaking of.

1402. That land is of extra quality? Yes; but, as I say, there are a great number of ridges which are fit for lighter crops than maize. What I spoke of before as showing such results were good crops, particularly maize.

1403. Has any cultivation taken place up to the present time in these places you refer to? I do not think there has been much done. They depend more on the cattle.

1404. What agricultural produce is grown or would be grown for home requirements? They only grow just sufficient for their own wants.

1405. Do you think the construction of a railway would tend to develop the agricultural resources of the different areas along the watercourses? I think so. It would give them a market for any patch of good land they had. They would make the best possible use of it; if it was more advantageous to them to put into a crop, they would do that with it rather than keep it for dairying, although, even on the banks of the river, they are not growing so much maize as they used to. They are using the land for dairying, which seems to have become a favourite industry. The fact of the matter is, that a cheque every month is a very desirable thing, very much more so than having to chance getting a very low price for their maize, and getting it spoilt, as I have seen it spoilt, on the wharfs many a time. I have seen it lying there rotting with tarpaulins partly over it, and the wet spoiling it.

1406. Do you think the dairying is more likely to increase on the upper portions of the river—that is, above navigation, where it is not so convenient to ship agricultural produce? On the Clarence they have about 35 miles of water-carriage above Grafton, and there are creameries all up that way. They put the cream on to the steamer, and it comes down to the principal factory. But where there is no watercourse they cannot go any great distance. The land-carriage in a vehicle would debar them from doing anything of that kind with the cream.

1407. How far do you think it would pay a dairy farmer to send his milk to a factory? I think it would pay to send 6 or 7 miles—some of them, I have been told, even bring it from a greater distance. Of course, a great deal would depend on the road. If they have anything like reasonable access they could bring it probably 10 miles more easily from some places than they could bring it 5 miles from others.

1408. Speaking of the land along the banks of the navigable portion of the river, would it pay them to send their milk for conveyance by drogher some considerable distance to the factory? Yes, either the milk or the cream. A number of them separate the cream now with their own separators.

1409. Where they have separators, I understand that it pays them to send cream a far greater distance than it could possibly pay them to send milk? Just so; but I see by recent reports they will have to improve their method, else they will bring discredit on the butter market.

1410. Do you think this railway, if made, would have the effect of settling dairy farmers and agricultural farmers along the route between Grafton and Casino? I have not the slightest doubt about it.

1411. How far on each side do you think the railway would serve the country? I think from 6 to 7 miles easily.

1412. That would be for dairying and agricultural farms? Yes. I am putting a very inside limit to them, because I think they could go more than 6 or 7 miles, perhaps you might say 10 miles. I estimate that it will improve the value of the land to a distance of 10 miles from the railway. I think the land within the immediate vicinity of the railway would be doubled in price. It has a nominal value at present; I do not believe that it is worth more than 12s. or 15s. an acre. I think the whole of that land would be doubled in value by making a railway through it.

1413. You have a good knowledge of land values in the district? Yes. I fixed the upset prices of all Government lands throughout the district, from Port Macquarie up to the Tweed. I used to make that my business. Of course, I had to keep myself *au fait* of the prices that land realised.

1414. During your long residence in the district have you observed that there is much through traffic between the Richmond and the Clarence? Not a great deal. The through traffic is confined to coaches—I think two a week—from Casino to Lawrence, and two coaches, sometimes two or three a day, from Harwood, on the Clarence, to Woodburn, on the Richmond.

1415. Do you think that if this railway were constructed the traffic that now goes by Harwood and Chatsworth, and to the Lower Richmond, would go by train? Not the whole of it. I think that those who had business on the lower parts of the Richmond, going down the Richmond from Woodburn towards Ballina, would go that way still, but anyone having business on the upper part of the Richmond would take the train.

1416. Do you think that that passenger traffic would be large if given railway facilities? I do not think it would be very large. I do not anticipate any great amount of through traffic.

1417. Do you think there will be much produce sent to the Clarence for shipment to some other port, not only from the Richmond River district, but from the Richmond River end of the proposed railway, if made? I think there would be some from above Casino, but not from many miles below, and if the Casino-Lismore railway, which I see is being pushed through the House, is constructed, I do not know that there would be any sent from Casino towards Grafton. I think it would go down towards Lismore, and be shipped at that point.

1418. Do you think it would induce traffic to the Clarence by reason of the fact that the freights from Lismore are higher than the freights from Grafton to Sydney? Yes; I overlooked that part of the business. I find that I would have to put on a railway freight from Casino in addition to a higher freight from the Richmond than from the Clarence, in consequence of the fact that they cannot get the same class of steamers there to use. I think there would be some. It would depend, of course, on the tariff a great deal.

1419. Do you think this railway, if made, would have the effect of inducing a considerable amount of traffic, not only an interchange of traffic between the two districts, but an intermediate traffic? I think there would be a great deal of intermediate traffic. I think the settlement along and within a reasonable distance of the route would be one of the principal factors in that respect. Another reason why it should be built is that it forms part of a North Coast railway, which will probably be constructed some day.

P. R.
Donaldson.
16 July, 1900.

James Inglis, merchant, Sydney, sworn, and examined.—

1420. *Mr. Watson.*] Have you been through the district between Grafton and Casino? I know it pretty well. Within the last twenty years I have been all over it a good many times.

J. Inglis.
16 July, 1900.

1421. How do you regard the proposal to run a railway from Grafton to Casino from the standpoint of the general public? My main idea is dependent entirely upon whether it would be a piecemeal thing or part of a great plan. To my mind it should be part of a comprehensive plan of a North Coast railway. I have always been in favour of that idea, and now that the proposition is to bring the railway over from Nerang or Southport, on the Brisbane side, and that part of the intermediate stage has already been made, I look upon it as part of the broad, comprehensive plan of linking the whole of the river districts together, with Brisbane, Newcastle, and the metropolis. As a mere piecemeal line, I think it might be a little premature; but if the Government intend to carry out this comprehensive scheme of a coast railway, then, of course, the sooner we set about it the better.

1422. Are there any reasons which might be advanced for the present construction of a plan such as you speak of, having in view the steamer competition which exists to-day? Without saying anything derogatory to the steamer competition, it must always, to a certain extent, be dependent on somewhat adverse natural conditions. To some extent, what generally presents itself to any reasoning man's view is, that you are opening up new country; you are inducing settlement; you are giving further facilities for travelling and the transit of produce. In this particular district there is a point which it does not seem to me has been sufficiently urged, and which, perhaps, has not been present to your minds. It possesses a very equable temperature—no great excess of heat or cold. It has a very abundant rainfall. The soil is just suitable for the class of sub-tropical crops which are grown by planters in India. I think the whole of this tract between the two rivers would be very useful for quite a new class of cultivation altogether. And, as our Government are very liberally and very wisely advancing the cause of agriculture by means of model farms and efforts of that sort—I was one of the first to suggest them in one of my published books—here is an opportunity, I think, such as is scarcely enjoyed by any other part of the Colony with which I am acquainted—and I have been all over it—for the production of oil crops, such as rape, mustard, sesamum, and castor. On all these various oils, as it is evident to you, there will be some sort of federal tariff required, and that I think may give our farmers a better opportunity to supply our own immediate wants. I feel perfectly certain that rape, mustard, sesamum, turmeric, ginger, indigo, coffee, and tea can be grown on all the slopes within this tract of country. I feel sure that with sub-tropical cultivation quite a new era of prosperity would attend on this district if you give them ready means of access to market. I think also the value of the timber industry has not been sufficiently recognised. When I was at Home—I went Home as President of the Chamber of Commerce—I had the honor of addressing no less than thirty-three different chambers in different parts of the United Kingdom. I think I was the first public man in Australia who pointed out that in our forests alone, unalienated, we had an asset which would more than pay off our national debt three times. I am still of that opinion. We have an enormous asset in our unexploited timbers. I am at present engaged in trying to get £150,000 capital to exploit the district, south of Grafton, on the Bobo and Nymboida Rivers. I went up with Mr. Kethel and spent more than a week in going over this country. We took it acre by acre, made a very exhaustive survey, and, upon my word, it astonished me. I do not know any other part of the surface of this globe where you have richer natural resources than in the forests up there. You only want to employ different methods. The old day of the lumbering bullock-dray is done with. You have to get steam capstans that can work for 2 miles on each side of the line with a wire rope, and skid roads, and you can bring your logs in over hill and dale, through slush and quagmire, and everything else. The weather does not stop you, and you do not want any feed, for you have the food on the ground for your machinery. One such modern mill as we project would employ from 300 to 500 workmen. You would have villages springing up. Our proposal also is to have a scheme of reforestation. For every tree we cut down we plant two or three. On some such scientific scale as that, I think you could start industries there which would astonish you. My idea would be not to have a very expensive line at the first. If you made your permanent way, which, after all, is the most expensive thing, I would say the lightest plant suitable to a rather sparse passenger traffic at first would be the best to have. By that means I think you could bring it well within practical scope. If you are going to spend £12,000 or £15,000 per mile as we have done before, I do not think the thing at present is altogether practical, although, as part of a great comprehensive scheme, it to my mind suggests infinite possibilities. Of course, I am a sanguine man; I am simply giving you my own opinions. I have thought out the subject pretty well. I have travelled over the district, and comparing it with other districts, with the Central Cumberland district, and with the districts round about Bathurst and Goulburn, although this is a light sandy soil—it is not like the rich alluvial bottoms you get along the main rivers—still, with its climate and rainfall it has splendid capabilities. The thing you get your money returned more quickly from, is a dairying country—a grazing country. But then, as settlement increased, you would have these little patches of sub-tropical cultivation which, I think, would pay remarkably well. Take capsicums. There is an immense demand for capsicums. All these little industries are neglected here. We all go in for a big thing—butter, beef, wool, mutton—and we neglect thousands of these little subsidiary industries on which a selector's family could always find a pleasant and profitable occupation. I am perfectly certain that a whole lot of these things can be cultivated here easily and remuneratively. I am not speaking without the book, because I have made exhaustive experiments. I have grown all these things in this country. At the first Sydney Exhibition I had a very large exhibit of thirty-eight kinds of sub-tropical products, from the seed right up to the finished article. I showed the products, and I have been preaching that sermon ever since. But I have been like one of those "crying in the wilderness."

1423. Would you say that the land between Casino and Grafton, which is admitted to be intrinsically rather poor, is suitable for the cultivation of these products you mention? It is the very thing for oil crops.

1424.

- J. Inglis.
16 July, 1900.
1424. Do you know where New Italy is, between Woodburn and Chatsworth? Yes; I have shot quail over that country.
1425. Do you know whether the people at New Italy have gone in for growing any of these sub-tropical crops? No: I think they have gone in principally for the ordinary crops. They cannot get very well to a market either, for they are a good distance from either river.
1426. It is timbered and very poor country? It is poorish country. Mulberries grow very well there. I think coffee, too, would grow remarkably well. It is not as good land as this land we are speaking about. Then you have—what is a very important thing in all cultivation—you have a good under-tillth; in other words, the subsoil is good, and it is retentive of moisture, which is a most important thing for Australian cultivation. I know that, as an old practical planter, I make it my business whenever I am travelling to get a good grip of the country and see what the capabilities are likely to be. I have fourteen travellers always employed, and I have one traveller who does that trip six times a year. I have been with him over all the country, and I have gone down from Guyra, from Hillgrove, from Glen Innes, and from Tenterfield. I think you are simply mixing up two propositions when you begin to talk about the probable route to connect with the table-land. That has nothing to do with the merits of this case. I look at it as a broad general comprehensive scheme, and whatever parochial or local difference of opinion may be, I do not think that should be present to the mind of a practical politician. He has to look at it from the point of view of the whole country.
1427. We have not gone into that aspect? I am speaking now about some letters I saw in the newspapers. I give you credit for having a bigger view of your functions and duties than that. But that is where a lot of this opposition comes from—purely from local and parochial suppositions as to whether it will take a little trade from this town or from that town. The way I have to look at it is, whether it will be good for the whole Colony or not.
1428. The point which seems to be most vital to the present inquiry is, whether the all-round advantages from railway construction will be beneficial to the State;—within a reasonable time, do you think there will be a fairly large population settled along the route of this railway? I certainly think so. From what I have seen of the land, I think it would be the quickest and best means of promoting settlement and of giving a value to the land for settling purposes which it does not now possess.
1429. You would not say that the timber along the route would be either as valuable or as plentiful as that in the region you are speaking of—a little south of Grafton? Certainly not. The timber on both sides here, for miles and right away up to the flanks of the ridges, is timber of a rather valueless character and not much use for mercantile purposes, but as soon as you begin to tap the ridges and get away into the valleys there, you have magnificent timber—pine and hardwood of all kinds, and a great many sorts suitable for cabinet-making.
1430. But down south of Grafton the country you spoke of a few minutes ago is more basalt than sandstone? Yes; and it is very much better timber there.
1431. Would you think the timber along the Richmond Range, and within a reasonable distance of the suggested line, would be worth something from a mercantile standpoint? Undoubtedly, if you could get it readily away. It is of no use just now, because you have so far to carry and cart it. Although not nearly so good as the timber in the Don Dorriggo country and round about there, still there is a very large amount of good timber there, and I think it would be a very favourable place for the trial of reforestation. I think you could grow a great many kinds of valuable timbers there. There should be a little timber reserve here and there all up and down that coast country, which should not be allowed to be touched unless under a proper contract to reforestate—as you cut to replant—because a lot of it, however good the soil, would take a long time—perhaps a couple of generations—before it would become fit for the plough. I am quite sure that every valuable tree we know, from teak upwards, could be planted on these slopes. I believe it would be a splendid place for a teak forest. I have lived among the teak. I have been through all northern India, where forestry is regularly practised. I had charge of very large estates up there, belonging to the Agra Bank, and a very large part of our revenue came from forestry operations. In fact, if people knew the value of bamboo as a crop here they would start plantations. It is the very place for bamboos. Right round the foot of the ranges you could have bamboo plantations. It would grow like grass with no trouble, and for scaffold operations there is nothing finer on the face of the earth. You could always get from 15s. to 20s. a hundred for bamboos in any large town from builders for scaffolding purposes. They are tough and pliable; they have only to be bound together and the whole fabric gives like a basket. You cannot break it. It is better than squared timber, it is better than hardwood for scaffold purposes. Bamboo-planting should be carried out on a proper scientific scale. Always cutting from the inside, letting the air into the inside, and letting your bamboos grow from the outside, they grow like grass. That is the whole secret of bamboo-planting. It would be as good as many of the crops which farmers grow there. Bundles of bamboos could be floated down the river or sent down to large centres, and builders would give a very high price for them. It is a very valuable plant. The people do not half know the use of it here. Even when the bamboos get a little worn they can be cut up and made into dunnage. Shipmasters will buy them to put between the shell of the ship and the cargo they are putting in. From wool ships you would get any demand for bamboo batons. That is only one of the indications, and a very slight one, I give you of how many sub-tropical products are neglected here by farmers from the want of knowledge.
1432. You indicated a little while ago that you would not be an enthusiastic supporter of this railway unless it was to be considered as part of a through line along the coast? That, to my mind, is its main justification at present.
1433. Do you know sufficient of the land south of Grafton and right down to Newcastle to be able to say whether it is good land? I have been all over the land, and I consider that it is even better than this.
1434. Do you think we would be justified, from the point of view of settlement, and probably of returns, either direct or indirect, within a reasonable time, in going on with a line right along the coast? I do; I would advocate it strongly, from a broad point of view—of good to the State. I do not take a district view of it at all. I look upon it as part of a great comprehensive scheme—a network of railways. You would save money on your roads; you would give access to little valleys and patches of ground which are now absolutely worthless; you would be settling happy families upon the soil, who would all make a reasonable living; you would be introducing fresh industries, and that naturally gives a stimulus to trade. I being a trader, naturally take the commercial view; I think there would be half a dozen industries
very

very soon started, and my traveller would not have such a large distance to go from one town to another without getting some orders; and whatever benefits the commercial traveller means a benefit to the State, for these are all dutiable articles that we deal with.

J. Inglis.
16 July, 1900.

1435. Our South Coast line has not been very encouraging in that respect? I do not think it has had such broad hinterland; it is closer to the sea, and there is not so much room for settlement. In the north the hinterland is broader, with a great many little valleys, where families could settle and make a very good livelihood indeed. You can keep cattle and sheep even on the ridges here, because, although there is that worthless blady grass, it can be very easily eradicated. If it were rough-harrowed, and couch put in, it would eradicate the blady grass. Wherever you can grow blady grass, you can grow couch. The way we got quit of the thatch grass in India was to dig out a clump, make a compost of fresh cowdung and clay, and put in some couch chopped up. In less than two weeks the couch begins to grow, and in one year you will have couch all over the place. In New Zealand, thirty years ago, I saw the couch grass beat the bracken. Couch is one of the most valuable grasses we have for fodder, because it will stand through the winter and the summer.

1436. Taking this line, in conjunction with the Casino-Lismore-Tweed line, and a possible connection north, to what extent would you expect through traffic? At first that would be rather inconsiderable, I think. As you give opportunities to travel, so travelling develops, but I would not like to give a very glowing account. I think the passenger traffic at first might be inconsiderable, but it would be bound to grow.

1437. What class of goods do you think would be carried other than those which are carried to the rivers at either end of the suggested line? If this system of cultivation I spoke of were gone in for, there would be oils, oil seeds, and oil-cake.

1438. Suppose you had your through line to Sydney, or suppose you only had a line to Grafton, would you expect the people sending these products to use the railway, or to ship at the nearest river port? I think it would be from river port to river port. I think they would be really feeders. Unless where the bar forms a supreme barrier, I have no doubt that river carriage is cheaper than rail.

1439. It has been pointed out in this inquiry that at the Clarence Heads very considerable improvements at large expenditure have been undertaken by the Government, and, so far as the evidence of the engineers goes, it would seem that very good results in keeping the bars open have followed; the point is whether, in the present stage of the Colony's development, the people are not fairly well served by having free water communication kept open? It is just a case of larding the fat sow. Those who have the best lands and live on the easiest conditions have access to natural means of traffic, whereas the hurrying crowds who have stepped on their heels find that they have to go further back. But they are a very valuable class of settlers to encourage, and you are forcing them into conditions which are almost heart-breaking. They can see no good out of all the labours they do under the sun, and a hot sun too. I really think, if at a slight loss, it would be a statesmanlike thing to encourage the settlement of the very class of men we want to take up the land, make it valuable, and settle happy homes.

1440. It is for the latter class you think the railway is required? Yes.

1441. As a man whose business and ideas take him all over New South Wales, you must recognise that we have only a certain amount of interest-paying ability in the community each year. Unless public works are reproductive—that is, if losses are to be extensive on many lines or works—a limit must be reached, so far as the community are concerned for a time. Looking at this question all round, and comparing this district with other districts, would you say that this is one of those cases in which you would first undertake the construction of a railway, seeing that we have only a few millions each year that we can spend in this way? I would sooner have the main Northern Coast line gone on with, with a considerable amount of vigour, than some of the other projected lines, which it would be very invidious for me to mention. I really think that where you have great main-reaching lines through pastoral districts, you have done all that the State, considering its present capacity for paying interest, might possibly be expected to do. But where you have land fit for this class of settlement, where you can get 300 or 400 acres to a family, I really think it will be a very statesmanlike thing to make a railway. Of course I would put the burden on posterity as far as I could, and I would make the lines themselves earn their interest as far as possible; but what loss there was on them I think might fairly be borne, to a certain extent, by those who have to come after us, and who will reap the benefits. I quite agree with you that there is a limit beyond which no wise man would commit himself. All the same, I think this is one of the most deserving of the propositions which have been put before your Committee—that is, always taking it as a whole comprehensive scheme.

1442. *Mr. Shepherd.*] You have mentioned that some portions of the country between Grafton and Casino are suitable for growing coffee and tea? I think so, in some of the sheltered valleys and on the higher slopes. I am quite sure that indigo would grow well.

1443. How far do you think it would pay a farmer to carry such products to a port or to a railway? All these products are grown and made on the farms. If you grow coffee you pulp it on the farm, and the pulp is useful for food. With indigo you have a couple of little vats, and you make your indigo, and you put the product of 2 or 3 acres of indigo into one 80 or 100 lb. chest. With your oil-seeds, you would have more scope for profitable carriage.

1444. But at what distance from railway or port would it pay a man to grow many of these products? Thirty or 40 miles.

1445. As this line is only 6½ miles long, it would absorb nearly the whole, either one or the other port? No; your middle distance would be about 30 miles from water-carriage, so that you could give access to a steamer by the railway to any farmer almost on your line.

1446. But taking the whole distance, if it would pay to manufacture these products, say, 30 miles from a port, you see 30 miles from Casino on the one hand and 30 miles from Grafton on the other would absorb nearly the whole line? But then you have 30 miles back from the railway to think of.

1447. This line is running north and south, and you would have east and west to a distance of 20 or 30 miles as well? I am not thinking of those who are only 30 miles from a port, I am thinking of those who would be 30 miles from a railway, and then 36 miles from a port. I would like to give these men an equal show with those closer to a port.

1448. Do you think the nooks and valleys in this country are sufficiently extensive to justify the construction of the railway? There are a great many of them. There is a lot of fine land in there.

- J. Inglis.
16 July, 1900.
1440. You have described this land as a light sandy soil? It is a very open sandy loam; there is good loam underneath, and with plenty of moisture.
1450. Considering that this railway is estimated to cost a little over £500,000, and that the annual deficiency is estimated at £16,000, do you think it is likely that that piece of country would produce sufficient to justify the construction of the line under these circumstances? Well, consider how long that loss of £16,000 would be likely to last. Would it not be diminishing year by year.
1451. Undoubtedly? Well, then it comes to be a practical question as to when you may expect the line to be self-supporting. I quite agree with those who say that at first this line would not be self-supporting. It would take some time for settlement to advance. It would take some time even for the introduction of such products as I have mentioned. I think for the first few years you might expect a loss on the line; but then again, if it were part of a main northern line, I believe the line as a whole would pay—parts of it would pay better than others. Therefore, I think, we should look at the problem as one comprehensive scheme, not as a piecemeal thing. If you are going to make that bit of line, and stop there, then I certainly would be against it.
1452. You see both Casino and Grafton are already fairly well served? The towns are, and the immediate vicinities.
1453. We should look at this line as necessarily feeding itself between those two points? Yes.
1454. If you deduct 20 miles from each end, it only leaves 24 miles in the middle to feed the whole railway? And the back country which it would tap on both sides, that increases your area a good bit.
1455. You think that, under the circumstances, the country would be justified in constructing the line? I do. I would be in favour of it, although I would not for a moment be so sanguine as to think it would pay its way from the jump. I think it would very soon be made remunerative. Of course, at present maize is considered the principal product in that district. They would not grow much maize on that sandy loam. You know that rape and sesamum, which is very largely cultivated in Europe and Upper India, and which, as you know is very largely used as an adulterant for olive—in fact you can scarcely tell the difference between them—fetch a very high price. The beauty about all this produce is that there is no waste. Your refuse is the finest food you can have for cattle, especially dairy cows. I would like to see every small farm in these districts have its own little oil mill, and its own little tobacco drying plant. You could grow tobacco there beautifully. It does not want that rich chocolate soil some people think it does. If you have a good subsoil it will grow quite well. The best tobacco is not grown on the richest soil. The golden tobacco is grown on light soil.
1456. What area do you think would be a fair thing for an ordinary farmer to make a living off, taking into consideration the cultivation of many of these products you have mentioned? I think he ought to do very well on 300 acres. If he had 100 acres in good cultivation, he could have 200 acres under couch and other grasses, and he could supplement his income by dairy products.
1457. A sort of mixed farming? Yes. We have been so accustomed to have huge slices of land here exclusively for beef, mutton, or wool, that people turn up their noses, and do not see the possibilities contained in 200 or 300 acres. If they would go to where the population is more dense, where land is harder to get, and see what farmers in Scotland can do out of 60, 80, or 160 acres—if they would go down to Sussex or any of the English counties and see the size of the farms there, they would alter their views.
1458. Is it your opinion that sugar can be grown satisfactorily there? I should not think so, as it requires a richer soil. You might grow the light Nepauli or Upper India sugar there as fodder and get a great many tons per acre, but I do not think it would be much good for sugar.
1459. One or two witnesses have stated that sugar can be grown there? I doubt it.
1460. It requires a soil more suitable for grass? Yes.
1461. *Mr. Hyam.*] Do you think these Indian products could be grown successfully without cheap labour? I am sure of it. You see, ginger, coffee, and a great many other things would grow there—what I call family industries—where the children would come in very handily; and rape, sesamum, mustard, and flax, it is splendid country for flax, could be just as well grown there as in the north of Ireland.
1462. You have had considerable experience in regard to these products? I have been a practical planter nearly all my life.
1463. Suppose this railway was only done in a piecemeal way, still you would be an advocate of its being done in that way? So long as the main finish of the thing is kept in view.
1464. You would advocate the construction of this line, even if it were only a piece of a North Coast line? Well! “If ye bid for a silk goon, ye’ll mebbe get a sleeve o’t.” I think a Great Northern Coast railway would shorten the route to the Tweed by nearly 200 miles. It would be a very important link, I think.
1465. Do you not think this coast line would divert nearly the whole of the traffic going to Queensland? I do not think so. The through traffic between the two capitals now is very inconsiderable. The main traffic is from town to town.
1466. You expect to see a great accession to that traffic in the near future? It is just like giving postal facilities or anything else. The traffic grows with the facilities you give it.
1467. You think that if this line is constructed between Grafton and Casino the traffic would come? It would go largely to make its own traffic. Give them easy facilities for travelling, and the traffic would come. I think it has become a matter of almost mathematical precision to say what amount of traffic a railway or road will bring. Those who are accustomed to statistics of that sort will be able to tell you in how many years you may expect to get so much traffic.
1468. You think this line would be the means of settling a large population between Grafton and Casino and to the east and west of the route? I do think so. I know lots of fathers with lads and lassies growing up, getting married, and going out, who are looking out for some such tract of country as this I am speaking of, where their children might go and settle. The old folks would start the young folks with a few cows and a little capital, and the young folks would go and start a homestead by themselves.
1469. *Mr. McFarlane.*] The annual deficiency of £16,000 a year on this railway is based on the calculation that it will cost £7,000 a mile to construct;—but an estimate has since been made for laying a light railway between the two points at a cost of £3,000 per mile? I should think that could be very easily done to satisfy all requirements for the next fifteen or twenty years. I do not speak as an engineer; but I feel sure that to put down a line at a cost of £7,000 or £5,000 a mile over country like that would be a waste of money.

1470. Even looking at it as a section of the North Coast railway? Even so.

1471. It must necessarily be a considerable number of years before a North Coast line could be built, supposing it were undertaken now? Yes.

1472. Do you think it would be wise to lay down a light line between Grafton and Casino pending the completion of the North Coast line? Just in the same way as it was considered a wise thing to put a line over the Blue Mountains, and now the time has come when they have spent a lot of money in taking out curves and making new tunnels; so your first object, I think, should be to promote settlement and to give access to your lands as cheaply as possible, always with the view to having it made into a great permanent-way hereafter. I should think £3,000 a mile would be ample. There are no engineering difficulties to overcome, except with regard to some of the creeks.

1473. Do you think a light line would answer the purposes of settlement equally well as an ordinary main line? I do.

1474. That would reduce the annual loss on the Departmental estimate from £16,000 to about £7,000? That is a very material difference. I think the country would get that, and more, in the increased value of lands, in a larger consumption of dutiable articles, in better settlement and more contentment, and in the introduction of new products.

1475. Are you not aware that both coffee and ginger are now grown in the Clarence district? I know they are grown both on the Clarence and on the Richmond.

1476. Have you seen the results? I have seen the things growing. I do not know what the mercantile results are yet. It is not so very long ago since they were started. Twenty years ago I sent out thousands of bags of all sorts of seeds, which I got down from the Government of India. My wife and I made them up at night; I had them all initialled and sent out, and all I asked them to do was to send me a written report of the results. Old Mr. Colley, of Kangaroo Valley, and two others, were the only three out of hundreds to take the trouble to send me a report.

1477. Do you think the products you mention could be profitably grown there, given railway facilities? I do. A little rough mill could work the whole of these oil products. You would only want barrels to send the oil to market, and the oilcake is reserved for the use of the farm. With mixed farming, without dairying, a family could be exceedingly happy and comfortable. They could have butter and eggs and all sorts of farm produce to send to market.

1478. How will the Don Dorrigo country compare with the country between Grafton and Casino, as regards timber? It is a superior timbered country, but it certainly is not so useful for agriculture. It would take far too much money to open it out for the plough. It would take a generation to do it.

1479. The departmental estimate of the value of the timber in the Don Dorrigo country is £14 per acre on the royalty now paid? That is better than even £1 an acre.

1480. What class of marketable timbers are there between Grafton and Casino? There are swamp gum, a lot of maiden's blush, and a very large quantity of first-class wattle. I believe wattle farming would pay on all these low spurs. Mr. Moses tried growing wattle in New England, and would have made a good thing of the business, only that he gave it up when it was just coming into form. On that light sandy soil at the foot of the ridges you could grow wattle splendidly. It is the perfectly ideal home of the wattle. There are a lot of other timbers for dye stuffs which could be grown there. The gum is rather stunted and gnarled—very few straight barrels—from what I saw. I have not been back into these ridges myself. I am going now by hearsay.

1481. You do not know the forest reserves of iron-bark there? No; but I should think that there would be good iron-bark there.

1482. Of course, where you get iron-bark you do not get much of anything else? No.

1483. *Dr. Garran.*] If these sub-tropical products were grown on the Richmond River, would they find their way to the markets of the world by the Richmond, or would they go down this line? That question was asked me before. I think the river traffic would always be preferred to the railway traffic.

1484. We must not look for a large terminal business on this line? No; unless you make it a straight line right through.

1485. This line would create its own business? Yes.

TUESDAY, 17 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Henry Paterson, Manager, Fresh Food and Ice Company, sworn, and examined:—

1486. *Mr. McFarlane.*] Have you any personal knowledge of the district between Grafton and Casino? I have been several times right through from Grafton to Casino, and from Lismore to Grafton, going from Casino.

1487. Would you care, first of all, to state what you know about the district? I should say that there is a good lot of Government land which might be turned to fair account. I do not say, by any means, that it is extraordinary land. It is not chocolate soil or black soil to any great extent; but still it is ground which might be made useful for many purposes, especially dairying. I do not make that statement, because I am connected with dairying. I think it is specially adapted for dairying. I think you would get a lot of creameries up there, which would naturally help the line to pay, and there are other things which, no doubt, could be grown. I think you see the worst part of that country when you see just the top of it, that is, the land along the road.

1488. Have you been off the road in different places? Very little.

1489. In its present condition, is it suitable for stock purposes and for dairying? It is suitable for them. Of course, you want a good lot of land for a fair-sized family to live upon. I should say you want 500 or 600 acres to a family.

J. Inglis.
16 July, 1900.

H. Paterson.
17 July, 1900.

- H. Pateson. 1490. Is that in its present condition or its improved condition? In its present condition, I should say. They could live upon that area. I do not think they could make an extraordinarily good living, but then a man would soon improve the land naturally.
- 17 July, 1900. 1491. Would it be suitable for producing artificial grasses? I should think so. I should think you would have to get beyond the top and go down to the subsoil, ploughing it well up.
1492. Is there much dairying between Grafton and Casino? Very little now.
1493. How does it extend out of each place along the proposed railway? At Casino it extends out from 8 or 10 miles, and from Grafton I do not think it extends at present more than 10 miles, and then there is not a great deal of it.
1494. How far would it pay a dairy farmer to send his milk to a factory or creamery? He should not send it over 8 miles, and it should be well cooled and aerated before he sends it so far. The idea would be, if you did run a railway from Grafton to Casino, to station creameries all over it; and the cream would be separated there, and pasteurised, and then it would travel 60 or 70 miles in real good order. Of course, it would not go to that distance, because it would naturally go to Lismore.
1495. How far would it pay to carry cream? You could not cart it more than 7 or 8 miles, and the same with milk, unless you pasteurised it. If you pasteurise it, you can carry it, perhaps, 15 miles; but still, land carriage does not pay for carrying cream.
1496. The reason why there is not more of the land used for dairying purposes between Grafton and Casino is through not having some means to convey the milk or cream? Without a doubt. They wanted to send cream from Myrtle Creek, which is 35 or 36 miles from Grafton.
1497. I think it is nearer 40 miles? It may be; for I am speaking without the book. They wanted to send their cream, but we would not take it. Under any circumstances, if you bring cream by road it would only make a rotten sort of stuff.
1498. Would it not be nearer for them to send it to Casino or Lismore? It would be nearer to send it to Casino.
1499. The line is 64 miles long? It would pay them better to send it to Casino; but, even then, they would not send it by road.
1500. You think that if this railway were constructed, the land would be taken up for dairying purposes? I can only answer that question by saying that since the dairying industry has got a good hold on the Clarence the land that is not saleable or usable is practically scarce now.
1501. Are there many inquiries for land for dairying purposes in the district? Many inquiries. When I went up there first, four or five years ago, you could get land almost at any price you wanted; but now all the dairying land is taken up. Of course, down the lower river, down at Copmanhurst, and on the other part of the river, you can find that land is being taken up. The best proof that it is being taken up is the fact that when I went there first I should say that they were not making more than 160 or 170 tons a year, whereas now, they are making about 800 tons.
1502. Is it likely to continue to increase if there is sufficient land available to be taken up for that purpose? Without a doubt. There is no district better adapted for dairying than the Clarence and the Richmond. They at present, I think, supply all Sydney wants—for nine months out of the year, anyhow.
1503. Is there any other industry that would be likely to be developed by the construction of this line other than dairying? Of course, there is a great deal connected with dairying—pigs, fowls, and poultry of all descriptions. What the subsoil is I could not say, but I should think you see the worst land at the top. In Grafton they can grow everything—tropical fruits of every kind, coffee, and all that sort of thing. I think I could enumerate the things they cannot grow better than the things they can grow.
1504. Do you think the majority along the railway would send their milk or cream—particularly cream—to Grafton rather than to Casino or Lismore? I take it that in any case they would have to send it by rail to either Grafton or Casino—it would not matter much.
1505. Would the same facilities be available at one place as at the other? It is simply a question of distance, as to whether it pays better to send to Casino than to Grafton.
1506. The reason why I asked that question was because it is stated that the dairy farmers of Myrtle Creek are making inquiries as to whether they could send their cream to Grafton, which is considerably further away than Casino? They applied to us time after time to put a factory or creamery up there. We would not do it, because we knew that it was too far.
1507. What depth of country do you think the railway would serve on either side? I am afraid I am not in a position to answer that question. There ought to be 800,000 or 900,000 acres there.
1508. Provided that the land was suitable for dairying purposes, what distance would it pay them to send their cream to a railway for conveyance to a factory? It would pay them to send it in 40 or 50 miles. We at present get cream from Queanbeyan and places like that; plenty of it comes down to our own place in Sydney. If you take care of your cream, and see that it is well looked after from the beginning, you can practically travel it any reasonable distance by train.
1509. Do you do much chilling in your establishment in Grafton? We did some meat for Mr. Greaves last year, but he is shipping down by the boats this year. We do a very large amount in bacon there.
1510. Is that increasing each year? It is with us. I will give the returns of our business for the last three years. The milk and butter business, £162,520; and the pig and bacon business, £17,588; making a total of £180,108 in that period. We spent on plant and buildings £17,400, and we pay an average wage of £65 per week. When we started up there we were doing about a fifth of that business.
1511. The first figures you read represent the moneys spent in purchasing these articles? Yes.
1512. Where do you mostly get the stock from for chilling; for instance, pigs? We buy them all over the river—down as far as Palmer's Island, and right down to Lower Copmanhurst.
1513. Do you get any from the direction of the Richmond River? We get some from there. We have been greater buyers of pigs, but the steamships do not treat us well. If we want pigs for Grafton, they do not put any facilities in our way for getting them; they will not let the droghers bring them down, because it pays the company better to carry a pig than to carry two sides of bacon.
1514. Do you think it will materially assist to develop that industry if this land were thrown open by means of this railway? I do, undoubtedly.
1515. And that the settlers would have communication with Grafton as a market for the stock they raised? Certainly.
1516. Do you think there would be much through traffic between Casino and Grafton, or between Lismore and

H. Pateson.
17 July, 1900.

and Grafton? I think there would be not only a great deal of traffic in the way of stock, but a good deal of passenger traffic. You see, people do not go to Grafton or the Richmond, because they have an unpleasant sea voyage to put up with, and if they have not that, they have a bad coach service to put up with.

1517. You think that if they got railway facilities there would be more inducement held out to them to travel? A great deal. I reckon the Clarence is one of the most beautiful spots in New South Wales. It is only the wretched way of getting to it, which keeps it back.

1518. Do you think the railway would be much used for conveying fat stock? I do, because, as a rule, they send them on foot to Glen Innes or Tenterfield. I always get mixed up, between the Richmond River and the Clarence River, as to whether they send their stock to Tenterfield or Glen Innes.

1519. Is there much fat stock coming from the Richmond River now to Grafton? There has been a good deal, and will be a good deal, because the Ramornie works take a lot of fat stock. I am satisfied that there would be a great deal more fat stock coming to Sydney. If you have a line from Lismore to Casino, and a line from Casino to Grafton, and you make a through line to the main line, then you will be able to truck your cattle at any part you choose.

1520. That is, provided that there was a connection with the table-land? There would be then a through connection from the water to the main line.

1521. Do you think that much of this land is suited for cultivation? I think a lot of it could be cultivated.

1522. Would that be to grow products for sale, or feeding stock? I should think it ought to pay to cultivate products for sale and feeding stock as well.

1523. Is the land sufficiently rich to grow maize? Only a portion of it from what I have seen.

1524. Do you know the country about Myrtle Creek? I have seen a good deal of that country.

1525. Do you think that is good dairying country? I think it could be made good dairying country. I reckon it would take a square mile to make a good homestead for a man and his wife and a good many children, and then, I think, he would have to cultivate from 100 to 150 acres, so that he could grow almost any produce he chose. I think if he went deep enough, he would get soil good enough to grow practically anything he wanted to grow. I do not think that much less than 640 acres would do for a man. Perhaps I am taking an exaggerated view of it, but that is my opinion.

1526. How does the land between Grafton and Casino compare with other dairying district;—I do not mean in the valleys of the rivers? It compares very well. It is not real loam, but there are many places where they dairy on land quite as bad. You must bear in mind that, in dairying, poor land turns out the better quality of butter—that is, better for keeping and better for exporting.

1527. Is there anything else which you would like to add? No; I believe that line would support a great many persons, particularly as it is Crown land. There must be 800,000 or 900,000 acres of Crown land.

1528. It all depends upon the distance you go back from the railway line? Yes; you can go back 7 or 8 miles on either side.

1529. I think that would mean about 400,000 acres in all? Well, I exaggerated the area, then; I thought you had from 700,000 to 800,000 acres.

1530. You would have to go a greater distance back to make up that area? I think it would be a good line. Of course, it would assist the main line, and if you want to assist the Murwillumbah line, if you want to do business with Queensland, you have a great assistance either way. You have the south, if you want to go there. Up to the present you have the Murwillumbah railway, which, I presume, would soon go into Queensland.

1531. Do you think there would be much traffic with Brisbane in the event of a railway connection right through? I am sorry to say I do think so.

1532. In farming products or dairy produce? Farm products, dairy products, and all kinds of things. They got a great deal of stuff from New South Wales; Of lucerne, they buy a tremendous quantity, and that can be grown on the upper part in any quantity. There is no doubt that it would assist greatly to make the Lismore-Murwillumbah railway pay. I should not think it pays at present. It always struck me as a line from nowhere to nowhere.

1533. Do you think it would be rendering that line a better paying line if the Queensland connection were made? I am sorry to say I think it will do New South Wales harm, because a lot of our exports would go into Queensland; but still I have not the slightest doubt but that Queensland will have to send a lot of her exports into New South Wales.

1534. That would make an interchange? Yes.

1535. That will also add to the traffic? Without a doubt.

1536. Do you think there is much maize exported from the northern rivers to Queensland? Sometimes a great lot; but then, as a rule, it comes by boat to Sydney. It is carted in from somewhere and brought to Sydney, whence it is sent to Brisbane.

1537. If there were a railway connection between Grafton and Brisbane the produce would go in that direction? Without a doubt, and a great deal of it. A great many firms which do their business now in Sydney would probably transfer themselves to Brisbane; at the same time, there would be an interchange, more especially of stock. Queensland has so many more cattle than we have, and Queensland, as we all know, is a good Colony.

1538. It has been stated that of the fat stock going to Ramornie meat-works, a large number come from the Richmond River;—do you think they would come by train? I feel sure they would.

1539. You notice from the map that the train would not go so far as Ramornie, but would stop at Grafton? You are such a little way from Ramornie, and you have such a good place to untruck at in Grafton, that there would not be very far to drive them. When they have to drive, they drive to Tenterfield and Glen Innes from the Richmond, and it does not want a man with any sense to know that the stock must lose a great deal on the trip. Mr. Greaves has been shipping all his cattle lately by the "City of Grafton." Once a drover gets his bullocks into a train he never takes them off if he can help it. There is no doubt that both the Clarence and the Richmond have plenty of fat stock; in fact, it is wonderful what the northern rivers, taking them right through, could supply. But I would not like to say that the railway is going to pay right off.

1540. You do not think it will pay at the start? I do not. It must take time to open up that country. You cannot open up that land in a day or a year. I should reckon that that railway would not pay under

- H. Pateson.
17 July, 1900.
- under six or seven years. Still you get a sort of national line. You get from the seaboard—that is, the river to the main line, and by that main line you can go either way.
1541. Do you think, in view of all the circumstances you have stated, it is a line which should be constructed? I do, indeed. At any rate we show our faith in it; we have spent plenty of money in the district. Everybody laughed at us when we went up there. In the first year we could make about 3 tons a week, whereas last year I think we made nearer 20 tons a week. Grafton butter has a good name on the market; in fact, all the northern rivers have a good name for butter.
1542. It is all of equal quality? It is of good quality. I do not know any district in the Colony, taking it as a district, which turns out a better article than the northern rivers.
1543. *Mr. Watson.*] Assuming the railway to be constructed, for how far on each side, east and west, do you think it would pay to go in for dairy settlement, assuming that the land were good enough—that is, that a man would then have to cart his milk to a creamery, and that the creamery would have to take the cream to the railway for shipment to Grafton or Casino? I should think about 8 miles; perhaps it might be 10 miles.
1544. Assuming that the creamery was located 10 miles from the railway line, how far would the influence of that creamery radiate beyond that 10-mile point? Six miles round it.
1545. The railway would influence the land for 16 miles on each side for dairying purposes if the soil were good enough? That is so.
1546. *Dr. Garran.*] You are doing an increasing business on the Richmond River? No, the Clarence.
1547. Is the land on the Richmond richer for dairying purposes than this land would be? Some of it is. There is some of the finest land in the world on the Richmond River.
1548. Is it twice as good? Not for dairying.
1549. You could not carry twice the cattle on the same number of acres on the Richmond as you could on this land? I do not think you could. You do not want extraordinarily good land for dairying; you want only a moderate sort of land, and you will get more butter off that moderate sort of land than you will off very rich pastures.
1550. You want a sweet grass, and plenty of it? Yes. Where you get all this very rich soil that will grow sugar-cane; if you happen to fatten your beast too much she does not give as much milk as she should.
1551. Are there several factories on the Richmond? There are any quantity of factories on the Richmond. There are about five central factories, and, I should say, seventy or eighty creameries there.
1552. Do they produce as good milk and cream as you do on the Clarence? Equally. You could not say that one was any better than the other. They fetch the same price in London, which is what I go by.
1553. You say that from Casino, for 10 miles out, the farmers are pretty well served? I should think so. Of course, in Casino itself, and for 2 or 3 miles round, I do not reckon there is any good land. I think it is all sand there.
1554. From Grafton they are served for about 10 miles out? Yes.
1555. This line is only 64 miles long; if you deduct 20 miles of country that is already well served, it leaves 44 miles of railway to yield you the traffic, but you must make the whole 64 miles to go from end to end? Yes; I should say a large amount of it would go to Casino.
1556. A great many of our railways go from a port of some great town towards the interior, and the interior terminus sweeps a considerable distance; but here we have a railway proposed between two river ports, each river port already sweeping a certain area round itself? Yes. Whether that goes to Casino or whether it comes to Grafton, you at present have no opportunity to get either place, but then you will have an opportunity of pleasing yourself as to whether you go to Casino or Grafton.
1557. At present all the men within 10 miles of Casino, unless they happen to be exactly on the line, will take their milk and cream in by cart to Casino by the road as they do now? I do not think so.
1558. Would they go 4 miles to a railway station to do the other 10 miles on the railway? I think so. You have only to take the Murwillumbah railway to see an example of that. They will go 3 or 4 miles by road to get in about 8 miles further by train to the factory at Byron Bay, and the same with the Richmond factories at Lismore.
1559. When they get 6 miles from a railway, will they go to the line itself? Yes. You must bear in mind that if you have to go very far by road it shakes the stuff up so that you cannot make as good an article as you can if you get it down by train.
1560. And when it is coming by road it is not as bad for the cream as it is for the milk? It is very bad for the cream.
1561. Is it liable to ferment? It is liable to ferment, and you cannot make a good article.
1562. We are told that this land is good second-class grazing country, and that it will take about 500 acres to support a family? I said a mile square, which is 640 acres.
1563. Suppose the land subdivided at that rate, and a family for every square mile, would that population be dense enough, do you think, to give a paying traffic to the line, for it will only take 2,000 families within 16 miles all along? I think so.
1564. Your commodity is rather a portable one; it is not a bulky one? It is very bulky in milk and cream.
1565. Cream is not very bulky? It will take 50 lb. of cream to make 20 lb. of butter, on an average.
1566. How much freight in cream do you think each square mile would give to the railway in the course of a year? If you have 2,000 families with a square mile of country each, and if it will take 4 acres to a cow, it leaves 160 acres to work on, you might say. Each cow ought to produce per annum 200 lb. of butter, which is a very low estimate; that would make 400,000 lb. of butter. But then I reckon that it would come in as cream to Casino or Grafton. If it was cream, it would mean about 1,000,000 lb. of cream, if you had 2,000 families on that country.
1567. *Chairman.*] That would be 500 tons? Of cream alone. I cannot state the passenger traffic. You would have just as good an idea of the passenger traffic as I would have, but I should say that it would be pretty heavy. Many people will not go from the Clarence to the Richmond, because they cannot go there in an easy manner. If I could jump into a train and go to Grafton, I would go every two months, whereas at present I do not go once a year.
1568. This line would not help you to go to Grafton much more easily than you can go now, unless you go right up to Brisbane and thence down to Grafton;—are you considering this line as part of a North coast scheme going all the way? I am afraid I was.
- 1569.

1569. There would not be much passenger traffic, then, between Grafton and Casino? If you carry this proposal out the railway will be running between Grafton and Lismore, and then you will have a lot of traffic. I take it that, in considering this scheme, you will consider the passenger traffic and the other traffic that would be between Grafton and Lismore, not between Grafton and Lismore as one part, and then from Casino to Lismore, as the other part. H. Pateson.
17 July, 1900.

1570. We have taken into consideration up to Lismore, and farther than that? The best way would be to go round by Brisbane, then.

1571. The estimated annual cost of this line is based on a tri-weekly train service;—would a tri-weekly train service be of much use to cream-producers? Yes; it could be made to do. You would have to use a little more scientific knowledge.

Francis Augustus Wright, Esq., M.P., sworn, and examined:—

1572. *Chairman.*] Will you be good enough to state your views concerning the construction of this proposed railway from Grafton to Casino? Some years ago I visited the northern districts, and went over, through what is called the Big Scrub, from Lismore to the Tweed. I have been over the country between Grafton and Casino three times. I have made three independent trips across the country. Once I went across and back, and the other time I went through. When I was Minister for Works, recognising what I thought was the correct thing then, and what I think is the correct thing still, namely, that Grafton should be the great port of the northern districts of this Colony, I proposed this railway from Grafton to the Tweed. Believing that no good port would ever be made at the Richmond, and that there was no possibility of making a good port at the Tweed, and recognising the value of the district, I thought it was desirable, in the interests of the country, that a railway should run from the northern boundary of the Colony to the Clarence. I have some knowledge of the country; I know the extreme richness of the Tweed, of the Big Scrub, and of the Richmond River. As regards the intervening country between Grafton and Casino, a large portion of that country I look upon as fair grazing land, and some of it as very indifferent country. There is a great deal of valuable timber growing on this ridge, which I think will be developed into a big trade eventually. When I did propose the railway I did so with the most perfect confidence, believing that that portion of the Colony deserved the expenditure of public money in it to facilitate the traffic of the people. I also proposed the line as a portion of what eventually I believe will be an accomplished fact—a North Coast railway from Sydney right through to the Tweed. I had no object to serve, I owned no ground in the north, and I own none now. But, as I said before, recognising the value of that fertile valley of the Richmond—I think the most valuable piece of Australian territory—and the great scrub, and the fact that the Tweed was a harbour which could never be frequented by vessels of any tonnage, that navigation would always be difficult, and freight consequently expensive, and believing then, as I do now, that it would be a most difficult matter to make the Richmond River anything like a decent port, and firmly believing that the Clarence will eventually be a good seaport, I felt fully justified in recommending the consideration of this line to my colleagues, and on my recommendation it was placed before Parliament. These are substantially the reasons which influenced me then, and I am still influenced by the same reasons. I think Grafton should be connected with the isolated portion of our railway system, running from Lismore to the Tweed. This Committee, I believe, recommended the extension of the line from Lismore to Casino. Casino cannot be in any sense of the word a port. The South Arm of the Richmond is a little peddling stream, some 4 or 5 miles from Casino, before they get to navigation, and even then it is difficult. Notwithstanding the recent improvements in the Richmond, notwithstanding the comparatively large expenditure of public money which has taken place in making the Richmond a good port, I believe it will never be anything but a very inferior port—will never be a port capable of accommodating vessels of any tonnage. The modern requirements of traffic, even for our coastal trade, require rather large vessels to enable them to carry freights at a low rate. Even the coastal vessels must be of considerable tonnage. I am quite satisfied that no vessel of any large tonnage will ever venture to enter the Richmond River. I am equally satisfied that the Clarence, which in itself is a magnificent river, barred by rather a bad entrance, will, eventually, be made a first-class port capable of accommodating large vessels. No doubt the bulk of the traffic from the northern districts of the Colony will always go by sea till the railway is constructed. But the people are very largely handicapped by the class of vessels they have to employ, being small vessels with a very light tonnage. Twenty years ago all the trade between Melbourne and Sydney was conducted by steamers of about the same size as those which now run to the north. The freights ran up to £3 a ton between Sydney and Melbourne, whereas now you can get freight taken for 5s. a ton either way, showing that vessels of large capacity are able very considerably to reduce the rate of freight, which is a very important feature to the northern people, who grow a great deal of weighty stuff. Maize and potatoes are not high-priced articles, and they can only pay a very small freight. I am quite sure that if the policy is carried out of making one great port in the north—that port being the most central one, with the best river—the freight both north and south of Grafton will largely gravitate towards Grafton, because they could employ larger vessels, charging a very much cheaper freight than it is possible for any other port to employ. I believe the possibilities of this railway are not bad. Of the intervening country, as I said, a portion is very inferior, and a great portion is really good grazing land. Of course, you cannot compare it with the rich flats on the Clarence or the Richmond. But from my observation, and my knowledge of that country, I believe it is country which will, eventually, be occupied, and utilised very considerably for dairying purposes. There is a portion of it suitable for agriculture, and, I think, nearly the whole of it will be then fairly suitable, and that a dairy farmer will find on 640 acres a sufficient area to cultivate what he wants for himself—sorghum, maize, and crops of that class. That is all I have to state. I shall be very pleased to answer any questions.

1573. *Dr. Garran.*] Has not the policy of the country now become sufficiently defined to make the Richmond a navigable river? Quite so; but not a navigable river capable of admitting large vessels.

1574. But vessels large enough for the trade of the river? I doubt it, because, as I have said, the vessels going to the north being so small in tonnage, necessitate a much higher freight than should be charged to those people if they had a good port.

1575. Is the freight to the Richmond very much higher now than the freight to the Clarence? I am not aware what it is. I am not in a position to give you information respecting the freights to the two ports.

F. A. Wright, Esq., M.P.
17 July, 1900.

1576. The evidence before the Committee is that there is very little delay now at the Richmond Heads, that vessels can get in and out almost always? With the class of vessels trading there, I have no doubt but that they can.

1577. And that the freight is reduced by 2s. 6d. a ton since the improvements were made? I am not familiar with any details of the freights; I am speaking of general principles only.

1578. Your theory was that we should abandon any attempt to make a good job of the Richmond, and make Grafton the centre of the northern commerce? That was my belief.

1579. I am merely asking you whether we have not gone too far now to proceed with the line? I think not. We have improved the Richmond considerably so as to enable vessels to get in and out. It is not like it was thirty or forty years ago, when a vessel was bar-bound for weeks and weeks. The class of vessels which frequent the Richmond can generally get in and out in all moderate weather; but still the fact remains that, to make the Richmond a good port, would cost six or seven times as much as to make Grafton a first-class port. I am strongly of opinion that one good port—one port capable of admitting large sea-going vessels—is quite sufficient in the north, and that a great deal of the trade which now goes to the Richmond, and that a great deal of the trade which now goes to the Macleay and the Nambucca, if there was a coast railway constructed, and a good port at Grafton, would gravitate both north, south, and east to that port.

1580. But it would cost considerably more to take produce from Lismore to Grafton, and then ship it to Sydney than to send it from Lismore by sea? It depends on two things—the difference of freight between the Richmond and the Clarence, and the cost of the railway transport.

1581. You would have to bring the railway transit down very low to compete with water? Our railway transport for many things is very low. For instance, milk and all those things are carried at a ridiculously low rate. They bring, I think, a 10-gallon can of milk 50 or 60 miles for 1s.

1582. *Mr. Shepherd.*] You are thoroughly acquainted, I think, with the country between Grafton and Casino? I do not know the country off the road further than my view extended. I have been across the road three distinct times, and I know nothing of the country beyond what I could observe as a traveller. I have been long used to travelling about the Colony. I generally go about with my eyes open, seeing all I can see, but I cannot say that I am familiar with this country, except along the road.

1583. What portion of it between the two points would you be able to give an opinion about? So far as the country along the road is concerned, I should think three-fourths of it is fairly good land for dairying. There is a portion of it which is very inferior country.

1584. The chief crop that is grown in that neighbourhood is maize, I believe? There were no crops at all grown when I went across that country. It was practically uninhabited.

1585. The country between Grafton and Casino, I believe, is not suitable for the cultivation of maize? I daresay you could find flats and spots where you could grow maize; but I should not think it would be a good maize-growing country taking it generally. No doubt there are flats which would grow good crops, but only to a limited extent.

1586. It is described generally as a light sandy soil, or as a light sandy loam, which is not at all suitable for the growth of maize? It is only little alluvial flats which you could grow maize upon.

1587. It would be used largely for grazing? Yes. I think it would be taken up for its timber first, and for its grazing capabilities afterwards. I think in most cases a man could find 10 or 20 acres where he could grow a little crop, and dairy farmers, as a rule, do not cultivate very much. It is a big dairy farmer who cultivates more than 30 acres.

1588. For dairy farming alone, do you think it would be likely to support a railway? No; I do not think the intervening country would support a railway itself, but I think a considerable traffic will be drawn over it from other sources.

1589. What additional support do you suppose it would get other than the effect of opening the land? I think there would be a considerable passenger traffic developed. Grafton and Lismore are two big towns in the north, and, judging from what we see of other places, I should think there would be a considerable interchange of traffic between the two places in passengers alone, and possibly in commodities. All the North Coast would, to a certain extent, I think, use this line.

1590. What do you think would be the inducement to create a large traffic there? The inducement that people have in all parts of the world to move about, interchange of friendships, interchange for business purposes, and so forth. There are said to be about 35,000 people on the Richmond, the Tweed, and the Brunswick; and there are about 25,000 people on the Clarence. Both these populations are continually growing populations, but you cannot imagine 35,000 people 60 miles from one place, and 25,000 people 60 miles from another without realising the fact that there will be a considerable passenger traffic. You may say what supports our main lines now. There is an immense traffic on the main line of mere casual visitors—people going from Sydney to Bathurst and different towns in the west, and *vice versa*, for holidays and amusement and business purposes.

1591. You are aware that there is a very large annual loss estimated at the start—about £16,000? I have not seen the report, and, therefore, I do not know what is the estimated loss. I have seen that estimate made in other cases where a marvellous result has been produced. I have known—and I suppose you all know—of cases in New South Wales where the Railway Commissioners have estimated a loss, but where there has eventually been a large profit, notably the railways constructed over a country not at all populated between Narrabri and Moree. In that case there was a profit of £1,000 a year estimated, but there is a profit of £7,000 or £8,000 a year realised.

1592. *Mr. Watson.*] There was a big through trade there? There was a trade there, otherwise the profit would not have been realised. I only mention that case to show you how uncertain and unreliable these estimates of profit and loss very often are.

1593. *Mr. Shepherd.*] The total estimated cost of this line is £501,375; the annual working expenses are put down at £21,429; and the estimated annual revenue is only £4,844—leaving a loss of £16,000 a year? If I am allowed to express an opinion, I should say that the estimated working expenses are simply an atrocious misrepresentation of facts. I remember a case not long ago, of 92 miles between Moree and Inverell, where the working expenses were estimated at £4,000 a year.

1594. I suppose they have very good means of ascertaining the probable cost? My opinion of the estimates of the Railway Commissioners is, that when they are favourable to a line they put the best leg forward; but that, when they are unfavourable to a line, they will put the worst possible complexion upon it they can, and I think that is the experience of every gentleman on this Committee also.

1595. You are of opinion, then, that the line would be a success ultimately? I believe it would be a success ultimately—not immediately, possibly—but I believe it is a line which will be built, and which must be built in the future history of this country. Whether it is premature to build it now, I am not prepared to say, but my own impression is that it is not premature. I look upon this question of the actual profit and actual loss on the railway as one which should not altogether guide this Committee, and as one which should not altogether guide the Parliament of this Colony. The country wants opening in every direction. We want railways. We have built lines of railway lately which the Commissioners think will not pay for some time to come.

F. A. Wright,
Esq., M.P.
17 July, 1900

1596. *Chairman.*] Is there anything further which you would like to add? No.

FRIDAY, 20 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

1597. *Mr. Watson.*] Since you were last examined on this proposal you have had an opportunity to look through the estimate of probable traffic which Mr. Varley placed before the Committee at Grafton? Yes; and I thought it was best to prepare a report on his estimate, so that it would be handed in.

J. Harper.
20 July, 1900.

1598. Will you kindly read the report? It reads as follows:—

PROPOSED RAILWAY, GRAFTON TO CASINO.

The total earnings of goods and coaching traffic over the Lismore-Tweed line (63 miles 57 chains) during the year ended 30th June, 1899, amounted to £11,398—£5,420 being for coaching and passengers, and £5,978 for all descriptions of goods and live stock.

The population served by this line for goods traffic is approximately 13,310, including Lismore; and for coaching traffic it would be fair to include a portion of Casino also.

The value in freight of the dairy produce traffic carried over the line during the last twelve months was £1,469. The quantity of butter, cheese, and bacon made in factories and on farms in the counties of Ross, Richmond, and Clarence, which include the area served by the Richmond and Tweed Rivers, for the year ended March last, was as follows:—

Butter	3,435 tons.
Cheese	6 "
Bacon	705 "
Total	4,146 "

In this area there is an estimated population of 47,000.

According to Mr. Varley's theory, the Grafton-Casino line will serve 437 families, or (say) 2,185 people (five for each family); and the revenue from all sources he estimates at £15,268. This is £3,870 more than received from the Lismore-Tweed line. He builds up his argument on cream traffic, which, according to his own showing, will only be carried an average distance of 21 miles per ton. He estimates that this small population will produce 26½ tons of cream alone per day, or 9,581 tons per annum. This is more than double the weight of the whole of the butter, cheese and bacon produced by an estimated population of 47,000 on the Clarence, Richmond, and Tweed Rivers.

In placing 437 families on the line, Mr. Varley admits that 280,000 acres of land would be absorbed, each family occupying 640 acres. According to the evidence of the District Surveyor at Grafton, the land available on both sides of the proposed line for a distance of 10 miles is held as follows:—

Classes.	Area.
Alienations	93,106
In course of alienation	100,263
Forest reserves	139,463
Railway reserves	23,885
Other reserves	36,404
Available Crown lands	320,132
Total	713,253

It would be most extraordinary development if 280,000 acres of this land were brought into profitable use in three years, as argued by Mr. Varley, especially in view of the large areas available on the Upper Richmond and in the Lismore district but privately owned. The most distant dairy farms 8 miles from Grafton towards Casino. Alienated land extends from Casino to Myrtle Creek, about 20 miles, yet only a few old settlers have gone in for dairying on Myrtle Creek.

For passenger and coaching traffic I allowed £1,276. This provides for 4,000 fares at 5s. each an average distance of 32 miles, which is half-way between Casino and Grafton. As Mr. Varley only estimates a population of 2,185 along the line, I think the credit I have allowed for passenger traffic is very fair.

Over the Lismore-Tweed line (63 miles 57 chains) we only earned £5,420 per annum for coaching and passenger traffic from a population of about 15,000 people, including the town of Casino. How Mr. Varley is able to show that the section, Grafton to Casino, with an intermediate population of 2,185, will yield £8,742 for passengers alone, I am at a loss to understand, especially as there is an alternative route to Sydney, *via* Chatsworth, by steamer, thence by road to Woodburn, and thence by steamer to Lismore, which might be availed of frequently. The present fare is 19s. return, but this would be reduced in competition with the railway.

I think in the report I have followed up the whole of the estimate.

1599. You say you do not think it is likely the land will be taken up;—is the land on the Upper Richmond, from Casino, Crown land or land privately owned? It is chiefly owned privately.

1600. As a rule, can you get privately-owned land on as reasonable terms as you can get Crown land if it is open to be taken up? Of course, I do not know what the terms would be. There is a lot of land there which is not turned to profitable use; but with the construction of the railway to Casino no doubt it would all be turned to dairying.

1601. Do you know whether all the land on the Lismore-Tweed railway has been brought into use? Not a fourth of it.

1602. The land on the Lismore-Tweed railway is privately owned? Yes; but that is simply owing to the fact of its not being cleared—to the expense of clearing it. There is no doubt that it will all be brought into cultivation.

- J. Harper. 1603. Assuming that a man could lease this land between Grafton and Casino on easy terms from the State, he would not require a great deal of capital to make a start, for the clearing would not cost much? I suppose not. The clearing and fencing would be the chief item.
- 20 July, 1800. 1604. Is it not forest land? Yes; it would not be expensive to clear. It is not like the heavy brush land.
1605. In attempting a comparison of the probable traffic on the Grafton-Casino line with that on the Casino-Tweed line, you count Casino as a factor in the passenger traffic on the Lismore-Tweed line? In creating the traffic which exists on the Lismore-Tweed line.
1606. Do you think there is any considerable portion of the people from the Casino district who use the line towards the Tweed? Yes; they use it in going to Byron Bay, to various shows in the district, and to business in the district.
1607. It would be a sort of holiday traffic more than otherwise? Holiday traffic, and there is also a regular traffic in the dairying district. People travel to acquire stock if they can. The indication on the road between Casino and Lismore shows that there is a considerable traffic passing between Casino and Lismore.
1608. I am curious to know what business they would have in a large way by the Tweed line? None; except what I have indicated. There is a population of 2,000 within 18 miles of the line.
1609. If that is so, surely you are justified, in considering the Grafton-Casino line, to take some note of the population at Lismore and of an interchange of traffic—assuming the connection to be made, of course? That is about the only traffic I can conceive of on the line. The existing population is 200, and the estimated population of Casino is about 2,500, and I have allowed for 4,000 fares.
1610. Mr. Paterson, manager of the Fresh Food and Ice Company, which has a branch factory at Grafton, thought that if the land within a reasonable distance of the suggested line were all settled, the probable produce in cream would amount to about 500 tons per annum, taking it to either one terminus or the other;—do you think that would be a larger item than you have calculated upon? No; I calculated upon a larger item than that.
1611. Will you tell us on what ground your estimate rests for the carriage of dairy produce? I think I explained the difficulties of arriving at any estimate at all. I took a section that we could pretty well estimate between Casino and Lismore, and applied it. Of course, it is all bush. You cannot assume that that is all going to be settled, and a lot of it is very inferior bush too.
1612. You really have allowed for half of the Lismore traffic? Yes. When you have an opportunity of going more carefully into my report on Mr. Varley's estimate, you will see how absolutely inconsistent it is, and also how little revenue comes from the carriage of cream and butter. £1,400 represents all the revenue from the carriage of cream, butter, bacon, eggs, and other dairy produce on the Lismore-Tweed line, and that from a district where every acre is better than any 4 acres between Grafton and Casino.
1613. And much more expensive land to clear, which means more capital invested? But still the capital is there, and I am showing how much revenue would be derived from the production of cream and butter from the railway point of view.
1614. *Mr. McFarlane.*] What did the Lismore-Tweed railway cost per mile? The total expenditure on the line up to the 30th June, as shown in the books of the Railway Construction Branch, has been £903,152, which is equal to £14,336 per mile.
1615. That would be by far the most expensive part of the original proposed line from Grafton to the Tweed? Yes.
1616. What were the difficulties in the construction of that line to make it so costly? It was very rough country indeed, compared to the country between Grafton and Casino.
1617. The section from Grafton to Casino could be constructed, according to the official estimate, for about one-half of that amount? I think that is the estimate.
1618. And a light line could be made at a cost of £4,000 a mile? I cannot conceive of a light line being built down there. Of course, the engineers may say that it can be built; but I cannot conceive that it can.
1619. Respecting the quantity of dairy produce which you say is produced in the Richmond and Tweed districts, is it not a fact that the bulk of the agricultural land is not used for dairying purposes? I do not know about that; but I can give you some information indicating how much land is used for dairying purposes. I know the bulk of the land in the Richmond district is not yet cleared. I will give the number of dairy cattle they are carrying in each district. In the Clarence district they have 19,400 head of dairy stock, in the Richmond district 39,885 dairy stock, and in the Tweed district 7,000 dairy stock. These, as I say, will only produce under 5,000 tons of butter, bacon, and other dairy produce.
1620. Can you give us the number of acres under cultivation in the Richmond River and Tweed districts which are not dairying at all? I do not for one moment mean to say that the whole of that land is employed for dairying purposes. But I want to point out that along the 63 miles of railway, between Lismore and the Tweed, the land is employed very largely for dairying purposes, carrying practically 40,000 dairy stock, and yet the total revenue from the carriage of dairy produce on that line is only £1,469. I do not know whether the district between Grafton and Casino will carry 40,000 dairy stock. Personally, I do not think it will.
1621. *Mr. Hyam.*] There is very little development between Byron Bay and Murwillumbah yet? None at all practically on the Tweed. I do not profess to be expert enough to say how many cows to the acre will be carried on the country between Grafton and Casino, but I think if it carries a cow to 5 acres it is as much as I expect of it.
1622. *Mr. McFarlane.*] Is it not a fact that one of the reasons why the Lismore-Tweed railway does not produce as much revenue as it otherwise would, is that a large amount of the produce is shipped at Byron Bay? The whole of that cream is all carried along the line.
1623. Is not the country immediately surrounding Byron Bay producing any cream? No. In the neighbourhood of Byron Bay itself, it is poor country.
1624. If there was not a shipping port at Byron Bay the traffic would have to go either to Lismore or to the Tweed? Yes. That would not add very much, considering that the whole of the dairy produce in that district only yields a revenue of £1,400 a year to the railway.
1625. There are other products besides dairy products carried on the railway? Decidedly; and that is what goes to make up the total. I wish to emphasise how little railway revenue is derived from the carriage of dairy produce. Of course, the chief argument in favour of this line from Grafton to Casino,

as far as I have been able to trace Mr. Varley, has been in the direction of dairy produce. I mentioned to the Committee what our absolute experience is in money paid per annum for the carriage of dairy produce on a similar line with a population of 13,000 to-day, and with 40,000 dairy stock. It will show the Committee how little revenue is derived by the railway from the carriage of cream or butter. J. Harper.
20 July, 1900

1626. Would not the settlement of a population of 4,000 or 5,000 mean a considerable amount of traffic other than dairy produce, which they would have to send to market? Decidedly it would; but even Mr. Varley does not claim a settlement of that extent. He only claims a settlement of 2,500, including men, women, and children. I think his estimate is based on the occupation of 280,000 acres, with 640 acres to each holding.

1627. But in settling that number of families over, comparatively speaking, a small stretch of country, would it not mean an increase of other population as well? That, of course, I must leave to the Committee to draw their own conclusions upon.

1628. Is it not usually the case that in country which carries a somewhat dense population business people settle, and small townships spring up? It has not had that effect so far on the Richmond-Tweed line. As a matter of fact, with the exception of a very small settlement indeed at Mullimbimbi, and a little settlement at Bangalow, there is no close settlement springing up. Dairy farmers, as a matter of fact, do not, as a rule, create townships amongst them.

1629. Between Lismore and Byron Bay there are some townships? No.

1630. Have you made any allowance for the carriage of timber? Yes; there is a large forest of timber, and it is all allowed for.

1631. On what do you base your calculation;—on the present export trade? On our experience of the timber industry in the Richmond and Tweed districts. The railway has been built for five or six years, so that we have had some experience of the timber business in that district.

1632. The timber industry along the proposed railway from Grafton to Casino would be vastly different from the timber industry in the Richmond and Tweed districts? It would be different in character; but still there is plenty of good timber in the Richmond and Tweed districts. In any case, as far as timber is concerned, what is there after it is cut out. That represents even less than cream does from a railway point of view.

1633. It will be taken up for dairy purposes afterwards? I am speaking of the value of the timber to the railway revenue.

1634. *Dr. Garran.*] Is it not true that a very large part of the Richmond district that will be accessible from the railway is not yet brought under cultivation? Quite so.

1635. Therefore, your present traffic is no fair criterion of what the traffic on that railway is going to be? No.

1636. Is it quite fair to infer the traffic on this Grafton-Casino line from that, seeing that the country here is so much more open, and so much more readily brought into use? Yes; but it is very different in quality.

1637. That, I admit;—as soon as ever this line is opened, do you think that the land within 10 or 15 miles will be brought into dairy cultivation? It probably might be; I would not like to say it would; but I have shown what the revenue to a railway is from the production of 40,000 head of dairy stock.

1638. But have you thought what the dairy produce will be if the whole district within 15 miles of either side of this line is fairly occupied and utilised? I have given it a thought; but it is far too remote to conceive such a thing. I would not pledge any little reputation I have by giving an estimate on that.

1639. Because ultimately, I suppose, that will be what will happen? That is as it may be if people cannot get any better land. It is rather singular that in the best part of that district—at the Richmond end—with the exception of one small dairy there is nothing within 8 miles of Casino, where there is a factory. It does not appear to indicate that there is very much desire on the part of any one to take up land within 8 miles of an existing factory.

1640. You mean to say that there is hardly any dairying round the Casino district? Oh, yes; but it is all on the Upper Richmond—it is not on that line.

1641. It is not close to Casino? Not generally.

1642. Whatever there is round Casino, and that centres there at present would, I suppose, continue to centre there even if this line were made? That is my impression.

1643. And the same at the Grafton end? Yes.

1644. So that we should not get the traffic over the whole length of line;—taking off 10 or 15 miles at each end, the traffic did not come along that line at all, but went to the nearest port? Yes.

1645. We should have to take 20 miles off the 64 miles, and the traffic on the balance would have to pay the interest on the whole line? That is so.

1646. Of course, this line is a peculiar one, in connecting what we may call two shipping places together? Yes.

1647. Many of our extensions go from a township or a shipping place out into the interior, and the terminal point serves as a centre for a radius of country all round, but that is not so with either end here? No.

1648. We get no terminal traffic on this line at all? No; except at Lismore and Byron Bay.

1649. We will have to trust to the line itself to make its own traffic? It will simply be a question of rivalry in the intermediate districts, as between Grafton on one side and Lismore on the other.

1650. Two parts will give us no terminal traffic for the railway? No.

1651. It is the intermediate section of the district which will have to provide the profit? Yes.

1652. Is it your opinion that the line running through a dairying district would not give a freight traffic that would pay interest on the cost of construction? It would have to be a very cheaply constructed line, and it would have to be a very good dairying district.

1653. Do you think that, in that wet country, a cheap line would stand the heavy rains? That is rather an engineering question; but I should not think it would. All our pioneering light lines have been built in districts where the rainfall is very small.

1654. We have only experimented in the dry country? Yes.

1655. As far as we have seen those heavy rains have not hurt the line? We have occasional damage done, but nothing of any serious consequence.

1656. During the last two months we have been having heavy rains—for instance, in Riverina? We have had occasional washaways, but we have been able to repair them pretty quickly.

1657.

- J. Harper. 1657. The general ballasting of the line has not shown a weakness, and you have been able to carry the traffic? Yes.
- 20 July, 1900. 1658. We cannot speak positively yet as to how a cheap line of that style would answer in the Grafton climate? It is rather an engineering question, but from my experience of these lines I should not think so.
1659. The lightest of light lines will be more than enough to carry all the traffic you think there is likely to be on it? I should think so.
1660. And the heaviest test of that traffic will be the weight of the engine itself? Yes.
1661. In carrying loads of fat cattle down, would a very light line be equal to that traffic? Yes; we use light lines to-day. Of course, we limit the class of engine; but the lightest class of engine we can put on the road is heavier than a truck-load of cattle.
1662. Do you think it is heavier than two truck-loads? Yes.
1663. You might get the weight of two truck-loads on the same rail at the same time? Yes; you get the whole of the engine on one rail, practically.
1664. Looking at this line as a possible section of a North Coast railway, do you think there is an advantage in beginning at the north end, as we have done, or should we begin at the south end? I should think, if there is any advantage at all, it is in beginning at the south end.
1665. Do you think the construction of this line would help to make that non-paying line more productive? I think it would simply add to the burden of it.
1666. *Mr. Watson.*] If the Lismore-Tweed line had been constructed at the revised rate at which Mr. Deane says the line from Grafton to Casino could be constructed, the annual interest, instead of amounting to £32,000, would amount to only £9,000? Yes; but I think he would tell you, if you ask him, that he could not have built that line very much more cheaply than he did. I think there are five or six long tunnels on the line.
1667. *Mr. McFarlane.*] You stated, in reply to a question, that the proposed railway, for a distance of 10 to 12 miles from Grafton, would be non-productive? Practically on the eastern side.
1668. And also that for a similar distance from Casino it would be non-productive? Yes; that is as far as timber is concerned, and largely as far as dairy produce is concerned; but that, of course, is east of the line.
1669. What is the length of the railway from Lismore to the Tweed? About 64 miles.
1670. Would not the first 10 or 12 miles of that line from Lismore be non-productive for the same reason? No; it runs practically at right angles. Between Casino and Grafton it is not at right angles to the rivers.
1671. How far from Lismore, along the Lismore-Tweed line, would producers draw produce to Lismore instead of using the railway? About 6 or 8 miles.
1672. How far from the Tweed end? We do not get any cream traffic there; there is no dairying in that district yet.
1673. It is settled? Yes.
1674. Say, for agricultural farmers, how far out from the Tweed towards Lismore? We get more of the sugar-cane right alongside it; but that is for carriage to the Quondong mill. The bulk of the traffic from Murwillumbah goes by river. We get very little passenger business there at all.
1675. How far from Byron Bay would produce be carried other than by rail? As I pointed out before, practically from nowhere, because the neighbourhood of Byron Bay is not productive in any sense. It is all swamp.
1676. There must be a considerable part of the line to Byron Bay which is non-productive? Absolutely none.
1677. For what distance from Byron Bay would it be non-productive? Five or 6 miles, speaking from recollection.
1678. That, together with 8 miles at the Lismore end and a considerable distance at the Tweed end, would mean that a very considerable part of that line is non-productive also? I would not call it that, because we get more from the sugar-cane than we get from dairy produce in that district—that is, at the Tweed end.
1679. Is it not carried at a very low rate? It is carried at a very low rate; but we get plenty of it.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM GRAFTON TO CASINO.

REPORT.

THE Sectional Committee, consisting of Mr. W. J. Trickett, M.L.C., and Messrs. Watson and MacFarlane, M's.P., appointed on Thursday, 22nd February, 1900, to inspect, take evidence, and report with reference to the proposed railway from Grafton to Casino, left Sydney on Saturday, 24th February, by the s.s. "Kallatina," and arrived at Clarence Heads on Monday, 26th February. They were met by Mr. H. A. Blomfield, District Engineer, Harbours and Rivers Department, and proceeded by Government launch to Yamba, where an inspection was made of the works for the improvement of the entrance to the Clarence River. Proceeding up the river, the Sectional Committee called at Palmer's Island, Maclean, and Ulmarra; they also visited the Government dock and the quarry from which stone was being obtained for the harbour works, arriving in Grafton at 6 p.m. On Tuesday, the 27th February, the Committee commenced its sittings in the Municipal Council Chamber at Grafton, and sat daily until Thursday, examining in all twenty-six witnesses. The evidence included statistical and other information as to the capabilities, progress, and prospects of the district; also testimony with regard to traffic, and the character of the country that would be affected by the proposed railway. On the latter point, the evidence of official and private surveyors, confirmed by that of practical farmers and others acquainted with the country, was to the effect that for about 10 miles on each side of the route of the proposed railway the country, comprising fairly good grazing land capable of carrying in its natural state one beast to 10 or 12 acres, and, when improved, one beast to 5 or 6 acres, would be suitable for dairy settlement in farms of about 500 or 600 acres. During the inquiry at Grafton much stress was laid upon the recent development of the dairying industry on the Clarence River, and those who were examined on the subject were of opinion that, if a railway were constructed, that industry would be successfully established on the lands along the line between Grafton and Casino. On Friday, 2nd March, the Sectional Committee left Grafton by special coach at 8 a.m., and proceeded along the Grafton-Casino road. They were accompanied by Mr. District Surveyor Ebsworth, who rendered valuable assistance to the Committee in their investigations. For the first few miles, level country was passed through with cultivations adjacent to the road, after which the land was partly cleared and well grassed, but with less cultivation. Approaching Duggan's farm, nearly 10 miles from Grafton, the soil was somewhat sandy in character, and, as indicated by the road-cuttings, not of great depth, though a good growth of grass prevailed. At Duggan's, the Sectional Committee were shown a paddock, consisting of grey sandy loam, which had just grown a hay crop of 2 tons to the acre, the land having been thoroughly cleared, ploughed, and treated with green manure. The beneficial result of clearing was evident on Mr. Duggan's holding, where there was ample grass. Ringbarked land, highly improved, was carrying a beast to about 5 acres, and where the land was entirely cleared of timber its carrying capacity was, of course, much greater. From Duggan's to Sportsman's Creek, a distance of about 7 miles, the country was of a more sandy nature, carrying thick scrub and some good timber. On the south side of the creek, at Zuill's station, a large paddock

paddock had been ringbarked and cleared, with the result that there was a considerable extent of fine grazing land. At Sportsman's Creek one of the Committee, Mr. Watson, under the guidance of Mr. District Surveyor Ebsworth, in a light vehicle, inspected the country for a considerable distance off the road, and found it to be excellent grazing land, with good waterholes on the flats. Resuming the journey, it was noticed that the country began to be hilly and thickly timbered, with somewhat sandy soil. After passing Traveller's Rest Creek, 25 miles from Grafton, the road traversed a number of spurs of the Richmond Range until reaching the highest point on the line, at 440 feet above sea-level. A little further on, at a point 27 miles from Grafton, the abandoned Tenterfield road, leading through Camira station, was followed, the character of the country being undulating forest land, thickly timbered, showing a good growth of grass. At Camira was seen some cultivation land on the flats which it was stated had given a yield of 80 bushels of maize to the acre. Descending to Camira Creek, the party followed the creek in an easterly direction, and struck the main road again near Myall Creek. By a gradual descent the Committee reached a long stretch of flat country, thickly timbered, which they traversed until arrival at the "Myrtle Creek Hotel" at 7.15 p.m. Parts of this last stretch of country are subject to flood. The same evening the Sectional Committee sat until 10.30 p.m., taking the evidence of several practical dairymen, who gave favourable testimony as to their dairying operations on holdings about Myrtle Creek. With one exception—a witness who said that in winter the country was too cold for working a milking herd—the evidence was favourable to the country between Myrtle Creek and Grafton being largely occupied by dairymen if a ready means of access to creameries and factories were provided. In this connection the evidence seemed unanimous, that about 5 miles was a sufficient distance for a farmer to cart his milk to a creamery, any greater distance than that involving rather heavy expense for road carriage, as well as the risk of the milk being spoilt. The Committee left Myrtle Creek at 9 a.m. on Saturday, 3rd March, crossing some ridgy country, until they arrived within about 7 miles of Casino, whence into that town a stretch of level country was passed. They arrived at Casino about a quarter past 12 p.m. In the afternoon the evidence of Captain P. G. Fanning, who had a good general knowledge of the country, was taken, and proved of value, as showing that the western deviation of the proposed line near Casino was higher and less liable to flood influence than the original route, or a more easterly one suggested by some of the Myrtle Creek witnesses. This evidence was confirmed later on by Mr. Wm. Kennedy, Railway Construction Branch, Department of Public Works, who accompanied the Committee throughout their inspection. On Sunday, the 4th instant, the country in the direction of Kyogle was inspected and found to consist of very rich agricultural flats with occasional ridges, the soil being chiefly volcanic, and excellent for dairy purposes, this industry being evidently on the increase in the locality. A sitting was held at the Casino Town Hall on the 5th instant, when seven witnesses were examined. While not opposing the proposed line, the local residents who gave evidence did not advocate its construction, and appeared generally indifferent with regard to it. They admitted that, though the land along the route of the proposed railway would not bear comparison with that immediately surrounding Casino and northwards towards Kyogle, if a railway were constructed, it would probably be taken up in blocks of 600 or 700 acres, but would have to be ringbarked and sown with artificial grasses. The Committee concluded its inquiry at Casino and left that place by special coach at 3.30 p.m. on Monday, 5th instant, arriving at Lismore at 6 p.m. on the same day. On Tuesday, the 6th instant, eight witnesses were examined in the Lismore Council Chamber. The evidence, in its general purport, was adverse to the proposed railway, both as regards probable traffic and the prospect of settlement along the line. Two more witnesses were examined on the following day, which concluded the taking of evidence.

In view of the fact that the local evidence is very conflicting, and that further evidence, including that of the Chief Traffic Manager, Department of Railways, is to be adduced, the Sectional Committee refrain from making any direct recommendation as to the desirableness or otherwise of constructing a railway, but beg to report as follows:—

- (1) The importance, fertility, and productiveness of the large tracts of country, of which both the Clarence and the Richmond Rivers are the arteries, are too well known to need any detailed description in this report.

(2)

- (2) The improvement of the entrances to those rivers, caused by the construction of training-walls and the commencement of breakwaters, is manifest, and has tended largely to increase the trade of both the Clarence and Richmond River districts.
- (3) Dredging and other works must continue for some time longer on both rivers, seeing that they are waterways which will always form the chief means of collecting and transporting the products of the large and fertile areas surrounding them.
- (4) In considering the question of the proposed railway from Grafton to Casino many side issues present themselves, such as the claims to superiority of the rival entrances to the Clarence and the Richmond Rivers; the conflicting claims as to suggested connection by rail between the north coastal districts and the tableland; the extension of the existing line of railway between Murwillumbah and Lismore from the latter town to Casino; the national view of the present proposed line as forming portion of the long-talked-of North Coast railway; whether such a railway should, or should not, be commenced at this particular part of the route, &c. To have inquired into these matters in all their various bearings, and made necessary inspections, would have occupied a very long time, and the evidence taken by the Committee was, therefore, confined chiefly to the question referred to them, namely, the proposed line between Grafton and Casino.
- (5) Regarding the country on the proposed route, it must be admitted that the land along and on either side of it is not nearly as good as that on and near the river-banks and surrounding both Grafton and Casino.
- (6) Only a small amount of settlement, and that of a scattered nature, exists along the proposed line.
- (7) There is very little passenger or goods traffic between Grafton and Casino.
- (8) While some of the witnesses at Grafton predicted an interchange of products between that town and Casino, other evidence was of a totally different character, and it is difficult to see how such could take place to any considerable extent.
- (9) There is no doubt that the construction of the line could only be justified on the basis of future settlement, as, at present, there is apparently no settlement between Duggan's, 10 miles from Grafton, and Myrtle Creek, 30 miles from Casino.
- (10) In the event of the railway being constructed, most of the witnesses agree that its revenue would largely depend upon the existence of a dairying population.
- (11) Large quantities of the land inspected by the Committee, along and near the route, carried thick grass, but the opinion prevailed that, in order to improve and make the grass sweet, the country would have to be ring-barked, and some witnesses stated that artificial grasses would have to be introduced,—a practice now generally followed in respect of the richer lands on both rivers. Most of those who were examined, including opponents of the railway, admitted, however, that the land in its natural state would carry about one beast to 10 or 12 acres, and, when improved, probably a beast to 5 or 6 acres, and that about 640 acres would be sufficient to support a family.
- (12) Considerable revenue, it was stated by some witnesses, would be obtained from the carriage of timber, of which there is a very large quantity of a marketable character within a reasonable distance of the proposed line, and in this connection special attention is drawn to the evidence of Mr. Ebsworth, District Surveyor.
- (13) The best route seems to have been selected, including the western deviation at the Casino end of the line.

In conclusion, after inspecting the route and some of the adjoining country, as before described, the Sectional Committee are of opinion that a railway between Grafton and Casino would in all probability induce considerable settlement on the large areas of Crown lands available.

W. J. TRICKETT,
Chairman.

19th March, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM GRAFTON TO CASINO.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

TUESDAY, 27 FEBRUARY, 1900.

[The Sectional Committee met at the Municipal Council Chambers, Grafton, at 10 30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Grafton to Casino.

Alexander Lobban, District Inspector of Schools, Grafton, sworn, and examined:—

1. *Mr. McFarlane.*] How long have you occupied your present position in this district? Twelve years. A. Lobban.
2. Have you a good knowledge of the district? Yes. 27 Feb., 1900.
3. And more particularly with regard to the country between Casino and Grafton? I have been over it.
4. What is your opinion of the character of the country? From here to Myrtle Creek it is chiefly open forest country with grassy flats, and gullies, and creeks. Altogether I look upon it as fair grazing country—that is, from here to Myrtle Creek.
5. And are you acquainted with the country between Myrtle Creek and Casino? Yes; that is rich grazing land.
6. At Myrtle Creek are there any areas of cultivation land? There are some; but the land is chiefly used for grazing.
7. Is most of the land occupied? Yes; a large quantity is occupied.
8. What is the occupation of the people along the proposed line? There are some timber-getters, some graziers, and some farmers.
9. Is it hilly country;—in your opinion, would it be difficult for railway construction? On the contrary, it is comparatively level country.
10. Have you a general knowledge of the country between Grafton and Casino, say, for 10 or 12 miles on either side of the proposed railway route? I have not been much off the roads, except where there are settlement and schools.
11. Where you have been off the roads, is the country similar to that near the roads? Yes; and it is often better country than that close to the roads.
12. Country that would carry a fair population? Yes; I should think so.
13. Has there been any increase in population? In order to be absolutely accurate, I had a list of the schools on the Clarence and its tributaries prepared from my own records. I have left out the upper part of the Clarence above Yulgilbar, as that is included in the Richmond River district. In 1889 there were 60 schools in operation on the Clarence and its tributaries. At the end of 1899 the number of schools had increased to 81. In 1899 there were 3,487 pupils on the rolls, and in 1899 the number of pupils was 3,941. These figures show an increase, during the ten years, of 21 schools and 454 pupils. I have the same information with regard to the whole of the North Coast, including the Manning, and from Cape Hawke to Point Danger. There is a general increase throughout the district.
14. Speaking generally of the coastal rivers, is there a similar increase? Every quarter there is an increase, every year there is an increase. In the last ten years that I have been in this district the number of schools has risen from 256 in 1889 to 335 in 1899. In the year 1889 myself and two other inspectors examined 8,960 pupils, and in 1899 we examined 12,479. That gives a fair indication of the increase throughout the whole district. I can tell you the number of school children actually inspected by myself and the other two inspectors in each section of the district. I may say there are three sections of the district. The Port Macquarie section includes the Woollamba River, the Manning River, the Hastings River, and the southern side of the Nambucca River. The Grafton section—which I have specially under my own oversight—includes the northern side of the Nambucca River, the Bellinger River, and the Clarence River, up to Yulgilbar, and its tributaries. The Lismore section includes the Clarence River above Yulgilbar, the Richmond River, Byron Bay, the Brunswick River, and the Tweed River. In the Port Macquarie section, in 1899, there were 120 schools, and 3,939 children were examined. In the Grafton section there were 110 schools inspected and 4,209 children examined. In the Lismore section there were 105 schools and 4,331 children examined. That gives a total of 335 schools and 12,479 children examined. In the ten years there was an increase in schools for the whole district of 38 per cent. That is the whole of the North Coast. The increase in the attendance at public schools during the same period was 39 per cent.
15. The nature of your office necessitates a considerable amount of travelling in the district, does it not? Yes.
16. Have you any knowledge of the traffic between the Clarence and the Richmond? When I have been staying at Chatsworth I have noticed a constant run of traffic. A considerable number of people travel from Chatsworth to the Richmond River.

- A. Lobban. 17. And in the opposite direction? Yes; there is traffic also from Lawrence to Casino, but at present it is not nearly so great as that on the shorter route.
- 27 Feb., 1900. 18. Have you noticed whether, between Grafton and Casino, there is a considerable amount of traffic? There is a fair amount of traffic from Grafton to Casino. It is really only a day's journey from here.
19. In the event of a railway being constructed as proposed, how do you think that volume of traffic would go? I have always thought that the great river Clarence, with its free access to the ocean and to the metropolis, would always attract a large portion of the travelling public. It is always a safe outlet, and during the twelve years I have been here I do not think there has been half a dozen delays at the Heads. I have noticed that when all harbours have been stopped, and vessels could not enter, vessels have been able to come into the Clarence. I have been much struck by that.
20. Then, in your opinion, the passenger traffic between this district and the Richmond, including the routes you have referred to, would, in the event of railway construction, go by railway? That is my opinion—that there would be considerable increase of traffic if the railway were constructed.
21. That is generally the outcome of railway communication—increased traffic? Yes. I have noticed further, that since the railway has been opened from the Richmond to the Tweed the population has almost doubled itself along the railway-line. Our schools have been almost doubled in number. Where we could, formerly, hardly get an average attendance the schools have grown up rapidly.
22. That you would take to be a reliable indication of increased settlement? Yes. I also think that if this railway were constructed there would be excellent dairying land all along the line.
23. And an increase of population? Yes, increased settlement, the settlement of families on the land.
24. That, of course, would mean additional traffic for any railway that might be constructed? Yes.
25. *Mr. Watson.*] Do you know how far towards Casino settlement goes at the present time? There is settlement all along the road.
26. Of what class? There are two or three stations on the road, important stations, grazing properties.
27. Is there any other settlement? There are houses along the road where people are engaged on small farms, and grazing on a small scale, also timber-getting and work of that kind.
28. Are there any engaged in agriculture in that direction? Not largely, after you get some miles out of the town.
29. How far out does the agriculture go towards Casino? Not more than 10 or 12 miles from here. After that there is not much agricultural settlement along the road.
30. How do you account for that;—do you think the land between 10 and 20 miles from here is unsuitable for agriculture? You must consider the excellent land along the river. It is only of late years that dairying has had any show here. While sugar-cane was the sole product, all the rich land was taken up. Now that dairying has taken root in the place, I notice that this second-class land, as you might call it, is becoming very valuable. As I am travelling I notice fences being put up all round where they had formerly been pulled down. My impression, travelling through the country, is that everything is reviving, and the district at present shows great prosperity.
31. Has that revival you speak of led to any of this land, say, between 10 and 20 miles out, being taken up for agricultural purposes? I can hardly say how it is taken up.
32. *Chairman.*] How far does your district extend in the direction of Casino? I am District Inspector. I have general supervision of the whole of the Northern district.
33. And your observation extends to Casino? From Point Danger to Cape Hawke.
34. How do you travel generally? I drive my own horses.

Samuel See, Mayor of Grafton, sworn, and examined:—

- S. See. 35. *Chairman.*] How long have you been here? I have been a resident of Grafton for twenty years, and have been on the river for nearly thirty years. I came here in 1870.
- 27 Feb., 1900. 36. Would you like to make a general statement to the Committee? I might first supplement the evidence of Mr. Lobban as regards the increase in population and schools by saying that his evidence related to the public schools during a period of ten years. During that period of ten years there have been established in this district, embracing the area mentioned, a considerable number of Convent schools and some private schools. I am not in a position to give the number of pupils attending these establishments, but I know they form a large edition to those on the roll of the public schools, and that during the ten years mentioned a large number of them were taken from the public schools. There are some hundreds of pupils attending Convent schools to-day who, within the period to which Mr. Lobban's figures apply, were attending public schools. There is one of these schools at Yamba, one at Maclean, one at Grafton, one at South Grafton, one at Palmer Island, and one at Ulmarra. As regards school attendance, the establishment of these denominational schools has materially affected the public schools, and this fact has to be taken into consideration in any figures given with regard to the increase of scholars in the public schools. My knowledge goes back to 1870, and from that time there has been such an increase of population as necessarily follows the opening up of a new district. In 1870 there were not nearly so many settlements on the river as now exist, owing to the land not having been cleared. Going back for, say, a period of fifteen years, there has been a considerable increase in the population on the Clarence River. The population seemed to remain stationary for some years in consequence of the financial crisis that overtook the Colony, and which reached the Clarence River as well as other parts of the Colony, and previous to that we had serious floods, and blight in our cane and maize. But, during the last four or five years, there has been a marked improvement. As one who knows something about the commercial position of the district, having dealt very largely with the people, and from my position as manager of the North Coast Steam Navigation Company, and as a townsman of Grafton, I am in a position to say that the prosperity of the Clarence district has been most pronounced—more so than in any former period of five years during my recollection. I attribute the increased prosperity very largely to the advent of the dairying industry. Previous to the introduction of the dairying industry on the Clarence River there was a large quantity of land along the river which was not considered suitable for cultivation, and was only used for raising crops that might be useful for local purposes. This land was not worked up to its full capability, as it has been during the last five years. Having been a farmer for a number of years, and having had large commercial experience, I think I am safe in saying that, so far as the Clarence River proper is concerned, it is only
- on

on the eve of its prosperity. Though the farmers have gained a great deal of information, and, in consequence, a great deal of wealth, we are now only on the eve of the possibilities of this district. Lands that are outside what is known as the Clarence River valley are being sought after very freely by persons who are entering into the dairying industry. Until the advent here of the Fresh Food and Ice Company the manufacture of butter was an unknown thing. I know of hundreds of instances where land which had been abandoned has been re-fenced and stocked, and has become of considerable value. I am speaking now of land fairly near the river. Having a knowledge of the country between here and Casino, I am of opinion that if communication were opened up between Grafton and Casino, the unoccupied and unalienated land along the line, of which there must be some hundreds of thousands of acres, would be taken up for the purposes of dairying. Besides the grass, a great deal of that land would grow maize, and other grain suitable for fowl food, poultry farming being an important factor on the Clarence River, though up to the present it has not been carried on as a special industry. Regarding the production and growth of poultry in this district, I may mention incidentally that the value of this export alone last year amounted to £52,000. If better means of access to a market were provided this amount would be considerably increased, and the industry would become a source of wealth to those settled on the land I am speaking of. They might, in addition, grow oats and oaten hay. Oaten hay can be grown very much better, and quite as profitably, upon land of that kind, as it can upon rich land like that in the valley of the Clarence, for the reason that, though you get a smaller result, as far as tonnage is concerned, you get an article that is valuable and saleable anywhere. On the banks of the Clarence this particular class of hay grows too strongly. The reason this land is not cultivated now is that growing oaten hay would not be a profitable industry. To put any quantity of land under cultivation for the growth of hay or wheat in a district like ours, with the absence of communication, would not be profitable, and a man could not possibly make a living. In regard to the production of butter, if a man has to extend his operations for 10 or 12 miles in any direction from a creamery, that distance makes the industry almost impossible, because too long a time would be occupied in delivering the cream or milk. With knowledge and observation of what has taken place in this district, and with a general knowledge of the Hunter River district, where I resided as a boy, and which I visited again during the last couple of years, I may say that the transformation caused by the dairying industry has been most marked. Lands that were considered absolutely useless in the early days are now being taken up and fenced, though there, of course, the area of country being limited, they are very much nearer a railway system than we here are near to water carriage. With regard to the capabilities of the dairy land in this district, we call it inferior land, but in doing so we have in our mind's eye the very best land on the Clarence River, which is better than that of any other district. In comparison with these rich lands, the outlying lands have been considered by the farmers of the Clarence River as inferior, but their value is now becoming realised through the establishment of the butter industry. In the event of communication being opened up by railway, I believe the whole of the land along the route would be taken up for pasturage purposes, and with ringbarking and grubbing out the undergrowth, which means the ultimate clearing of the land, the dairy-farms which would be established would carry on an average one beast to 5 or 6 acres.

37. Has all the available land, all the very rich land, the river flat land—has all that been taken up? All land that was possible to be taken up. There is a tremendous quantity of rich land on the upper river which, though it might not be immediately affected by this railway, would, if a railway were constructed, be brought so many miles nearer communication than it is now, because the head of navigation is only 30 miles beyond Grafton. Then, again, besides the utilising of the land along the proposed line for dairying and poultry-raising, we must consider the value of the timber on the land. Between here and Casino there is an immense quantity of hardwood which is every day becoming more valuable. Within a certain number of miles of the Clarence River proper the timber has all been felled and used for girders and sleepers, and cut up into spokes for the export trade. It is becoming a matter for the consideration of those engaged in the timber trade as to how far they are going to continue their operations. I am not aware what would be the scale of charges on the railway, but if they were not prohibitive there would be a large quantity of timber carried along the line. Even if we increased the output by 100 per cent. yearly there would still be sufficient timber to meet the requirements of the export trade of the Clarence River for many years to come. There is abundance of the best hardwood timber, including kinds not used for the ordinary purpose of fencing and splitting. There are tallow-wood, black-butt, ironbark, and spotted-gum. These timbers are of considerable commercial value, but at present are not worth anything, as it is not possible to get them to a market. Settlement would, of course, soon follow the construction of a railway, because the occupation of a block of 500 acres of land would mean probably 100 cows, and that would entail a considerable amount of work. It would mean that between here and Casino there would be an enormous population which could not be brought about except by the construction of a railway. There is another argument: We have in our midst hundreds of young men growing up, and their desire is naturally to remain at home. They will have in the near future to seek homes elsewhere if an opportunity is not given to them to settle upon this land by the opening up of communication. There is not, generally speaking, in this district an absence of labour for what are known as the working classes; but I feel confident that the labour of the community would be absorbed, and with profit to the state if a line of this kind were constructed. I may add that the rainfall of this district is abundant and fairly regular. I do not apprehend any danger of a drought as regards the dairying industry, or the growth of wheat or barley, or anything of the kind required for fowl food. There will also be a marked increase in the horses and other stock in the district. With the advent of dairying the raising of horses has again become a valuable industry. Though we had numbers of horses here, they were always sold out to a great extent, and the establishment of the dairying industry has led to a great demand. You cannot raise horses as profitably on a large station as you can upon a small holding where the animals have daily attention. In regard to the passenger trade between here and the Richmond River, it has greatly increased. At present the route taken is from Chatsworth, on the Clarence, to Woodburn, and thence up the Richmond River by steamer. This involves a considerable distance—perhaps nearly 200 miles—at a cost of more than double that which would be charged by rail from here to Casino or Lismore. There is a good deal of trade between here and the Richmond River, and I am satisfied there would be a great increase in that trade in the event of railway communication, by reason of the cheapening of carriage. It would cost about 12s. 6d. per passenger to go by rail from Grafton to Casino, and 13s. 6d. from Grafton to Lismore—that is first class—and it would cost £1 13s. 6d. to go from

S. Sec.

S. Sec.
27 Feb., 1900.

from Grafton to Lismore by coach and steamer. Then again there is the saving that would be effected in point of time, the railway journey only occupying six hours as compared with one and a half day at the present time. Another advantage would be that the people of Grafton would be placed in comparatively easy communication with Brisbane, which, at present, is not the case.

38. Speaking about the passenger traffic between Grafton and Lismore, what do you think of this paragraph in the report of the Railway Commissioners, dated 19th December, 1899: "Excepting passenger traffic, which is on the decrease, there is practically no interchange of traffic between the Clarence and the Richmond"? That is not correct. The people of the Clarence and the Richmond are associated by relationship, and every day people of this district are visiting their friends on the Richmond River, and people on the Richmond are visiting their friends here. Then, again, if the people of this district were afforded an opportunity of reaching Brisbane, they would very often travel to that place. A few months ago I was approached by a number of residents of the Clarence River asking if steam communication could not be established between here and Brisbane, so that they might visit that city during their holidays. That is a frequent occurrence, so far as the people of Grafton are concerned. In the event of a railway being constructed, the whole of the Casino passenger traffic would come this way, and a large proportion of the Richmond River trade would come this way to be carried to Sydney. My reason for the latter statement is that, at any rate for some years to come, the steamers running between the Clarence and Sydney must of necessity be of a higher class than those trading between the Richmond River and Sydney. I do not wish to detract from the Richmond River, and the company I represent are as much interested in the one river as in the other, but I am only stating facts. A steamer can be brought to Grafton if necessary with a draught of 14 or 15 feet, while a steamer cannot be taken to Lismore with a draught of more than 10 feet 6 inches, and nothing but a little flat-bottomed steamer can be taken to Casino. Facility of transport to market is, of course, very important in the case of perishable goods, and there would be a large trade of that kind. Around Casino the manufacture of butter is only in its infancy. I believe that traffic would come to Grafton. I believe it could be carried from Casino by the railway to Grafton, and thence to Sydney, as cheaply as it could be conveyed from Casino to Coraki or Lismore, and carried thence to Sydney.

39. *Mr. Watson.*] Is butter now carried on the steamers in freezing chambers? Yes; from the Clarence and also from the Richmond.

40. Then you would want cool trucks to carry on the railway? That would not be very difficult; the company could easily make arrangements to have cooling appliances. I feel certain that the whole of the trade from Casino would come to the Clarence River by means of the railway.

41. *Chairman.*] We may take it, then, that, apart from the passenger traffic, the dairy produce would be the chief factor in the railway revenue? A great deal of it. Then there would be timber, and the wood supplied to Grafton and to the mills. That is in itself only a small item; but, added to the other traffic, it would be a great feeder to the railway.

42. There is no coal in the district? I think there is a deposit of coal along the line. There is a seam of coal at Coaldale, which place the proposed railway would cross.

43. Is wool-growing carried on in this part of the country? No. Sheep will fatten here, and wool will grow, but there are other things more profitable. Cattle, for instance, are much more profitable than sheep, for the reason that the grass is so dense that the sheep get foot-rot, and all sorts of things.

44. What would be the rate per ton between Casino and Grafton for dairy produce? I think in my last evidence I gave it at 5s. 2d.

45. There must be some portion of this country between Grafton and Casino—that nearest to Grafton, for instance—from which it would pay a farmer to cart his produce to Grafton;—is there any indication of settlement of that kind. If a railway were constructed, a man 5 or 6 miles out of Grafton would hardly put his stuff on to the railway, but would cart it in;—is there any indication of settlement of the character you indicate actually taking place within such a distance as that? Yes, there is now, in consequence of the dairying industry. As I have said, beyond a certain radius dairying operations must cease owing to the cost of carriage.

46. But take an area of about 10 miles? All the land within a reasonable distance is under dairy occupation at the present moment. That is, between Grafton and Casino, along the Casino road.

47. Is that a recent development? Since the dairying industry came, within the last five or six years, a number of the bolder spirits started, while others hesitated. So that we might say that we are now only starting the dairying industry in the Clarence. There is always the man who prefers to wait and watch developments, and then again companies have to get experience as to what is the right thing to do; but we may say now that the dairying industry is fairly launched, and has proved successful.

48. You said, "Within the area that would be profitable";—how far would that be? About 10 miles I think. I do not think you could go much beyond that. If you have to cart milk further than that, it becomes expensive.

49. When you were examined before, you seemed to think there would be a limitation to the distance on either side of the railway, within which this industry could be carried on—say 10 or 12 miles;—do you still believe that? I should say it would not extend much beyond that distance. If you have a good road, you do not measure your distance by miles, but by time. The same distance, which on a good road could be done in only a few minutes, might with a bad road take two hours.

50. What areas do these people occupy? 300 or 400 acres. I should consider 500 acres on the land in question a good holding.

51. What would it pay a farmer to give an acre for that land? If land were available now at the State price, £1 an acre; but I do not consider that would be the value of it to the farmer, with the improvements. If the land would carry a beast to 5 or 6 acres, it would give a return of much greater value than £5 or £6 an acre. The land would be worth £1 an acre undoubtedly.

52. Would that land be suitable for the growth of crops as well? Some portions of the land all along the route would grow maize, but that would only be cultivated for home consumption, for the production of eggs and fowls, and not for the purpose of export. I omitted to mention the pig industry, which is a very important one. In this district there is a daily increasing demand for this class of product. The supply is not nearly equal to the demand, though the export is very large indeed. You can fatten a pig on this land with milk and ordinary grain, just as well as you can on much better land. On this land you would be able to give a pig 10 or 12 acres, which you could not afford to do on more valuable land.

S. Sec.
27 Feb., 1900.

land. This is an industry worth many hundreds of pounds to the people on this river, and the extent of its future growth it is almost impossible to forecast. Its progress would keep pace with that of the butter industry. Up to a certain stage, pigs can be reared on milk alone, and all along the route there are patches of ground which will grow good maize.

53. But we cannot look to maize as a big item of freight for the railway? I do not say that the maize grown would be brought along the railway to Grafton; but if the line were constructed considerable quantities of maize would go from the Clarence to the Richmond River.

54. Does not maize grow well on the Richmond? It does not grow so well there as it does here. They import maize to the Richmond River from Sydney. There is one part of the Richmond district—the south arm of the Richmond River—where attention is directed chiefly to maize-growing. On the lower and other portions of the river attention is directed to the cultivation of sugar-cane, while on the higher, or what are known as the "Big Scrub" portions, the land is chiefly devoted to dairying. It is unprofitable to attempt to grow maize on the high land of the Richmond. In the event of communication being established between the Clarence and the Richmond, a great deal of maize would go from here to the Richmond; and at some portions of the year we should send maize to Brisbane. I do not say we should send much, because the price might be prohibitive; but there would be times in the history of the two colonies when we would send maize from here to Brisbane. Then, again, there would be times when we would send potatoes from here to Brisbane. That is a product we can raise very extensively on the Clarence River. There is scarcely a limit to its cultivation.

55. If a railway were constructed between Grafton and Casino, where should you expect to get the population from—from the sons of the people locally, or from outside? From outside. I think you will get evidence from gentlemen competent to speak on that subject that numbers of inquiries are made here daily from persons in various parts of the colonies for land suitable for dairying purposes. I know as a fact that people have come from the Richmond River and have taken up land at Grafton. Almost daily people are looking for land suitable for dairying purposes. Apart from the young men of the district, whose claims I think should have first consideration, there are hundreds of people coming to the Northern rivers who would go upon the land if they could get it; but they will not do so in the absence of communication.

56. Do you think the tendency nowadays is for the farmer to go in for dairying in preference to cropping? It depends entirely upon the character of the land. The best farmers on the Clarence River, with few exceptions, are doing some dairying, and they are also growing some maize. Mixed farming is coming into operation more freely every day, as men get enlightened and understand the thing. In regard to labour, the butter industry is one in which the small boy can be employed before and after school, while in the case of cane-growing, that is an occupation in which the boy cannot be engaged.

57. Do you regard this proposed railway as a line to be constructed on its own account, or as part of what is known as the North Coast railway scheme? I regard it from a twofold aspect. First I consider it necessary as a connection between Grafton and Lismore, for the trade I have spoken of, and as such it will be a good investment for the State, because it will provide a livelihood for a number of families, and afford employment for the labouring classes. But I feel it has a greater destiny as portion of the North Coast line, which must ultimately reach the metropolis. The latter reason alone should justify its construction. I know the coast from the Tweed to Maitland, and I can say without hesitation that the opening of a coastal line would be beneficial to the State, and would also benefit the localities. There is land lying between these rivers that cannot be opened except by railway communication.

58. Suppose a railway were extended from here right away to Newcastle, and further south, the main produce of the district would still go by steamer? Heavy produce would, but the butter would not, and the passengers would not.

59. I suppose the old axiom that land carriage cannot compete with water carriage, from a money point of view, still obtains? Yes, that holds good. But with the increase of population you would get considerable passenger traffic, and also traffic in perishable goods, including vegetables and fruits such as grow in a semi-tropical climate. Fruits grown in a climate like this, though more luscious, do not last as long as those grown in colder climates. In this semi-tropical climate a class of fruits would be produced that would be very acceptable to people in the metropolis. At present they cannot be sent to Sydney because of the twenty-eight hours' passage by sea. Evidence can be given by gentlemen who grow these fruits that want of access to a market prevents anything being done in that respect. If the North Coast railway were constructed all this trade would reach Sydney by rail. A large passenger traffic would go to Sydney by rail, and all the butter and all the eggs would go by the same means. At present there is a difference of 1d. between the price of southern eggs and northern eggs, owing to the long sea voyage. This 1d. a dozen means a great deal of money in twelve months. It means a twelfth part of the total production amounting to £50,000. Then, again, a very large trade could be done between here and Sydney in fish. Fish, in my opinion, would go by rail and not by steamer. The value of fish exported from the Clarence River at the present time is very considerable.

60. In the estimate of cost, a sum of £70,000 is put down for station and wharfage accommodation at Grafton,—do you think such a large amount would be necessary at the present time? Certainly not. I should think £15,000 would cover everything necessary, and provide most elaborate buildings. The height from the top of the wall to the top of the bank of the river would not be more than 12 feet.

61. *Mr. Watson.*] Can you say how far the land which you think is suitable for dairying extends along the proposed line towards Casino;—would it be similar land a little distance out of Grafton right up to the Richmond Range? Yes.

62. How much of a break would there be in the suitable land, or would it all be good? I consider that the whole of the land is suitable for grazing.

63. Inclusive of the Richmond Range? Well, there is a portion of the Richmond Range which is a little bit gravelly, but it will grow grass. The Richmond Range is not a very formidable matter at all. I do not think its altitude is above 50 feet at the most.

64. Beyond that again, towards Casino, does the land alter at all? The land improves; it is better land there. From Myrtle Creek to Casino the land is better.

65. Then, practically, the whole of that land for 10 miles on either side would be taken up if the line were constructed? Yes, I think so.

66. *Mr. McFarlane.*] With regard to the paragraph in the report of the Railway Commissioners, about an

- S. Sec.
27 Feb., 1900.
- an alleged decrease in the passenger traffic between the Richmond and the Clarence, do you consider that to be correct? No.
67. Has the population of the Clarence increased steadily during the past few years? It has.
68. And that of the Richmond also? Yes, very considerably.
69. What would you imagine to be the natural outcome of this increase of population—would it tend to a decrease in the traffic between the two places? Certainly not.
70. In your opinion, is a railway from Casino to Grafton desirable, in view of its being a portion of the North Coast line? Most desirable.
71. Have you any particular reason for that opinion? I have already, in answer to the Chairman, referred to the opening up of the intermediate lands, which would certainly be profitable. This portion of the railway would be profitable, like the other portions. I believe that the lands intervening between the other rivers are even of a better character than the lands between Grafton and Casino; so that, as a portion of the North Coast line which would connect those other lands, the railway would be highly profitable. Another thing that would have to be considered in connection with the North Coast railway is the facility that would be afforded for military organisation. The line would be a great factor in our national defence.
72. Some consideration would have to be given later on to the necessity of crossing the river—that is, in the event of a further extension south? Yes.
73. That could not be easily done lower down the river? No. In the North Coast railway system the bridges would of necessity have to be constructed beyond the point of navigation by large steamers. In the case of this river the railway crossing would have to be above navigation, and that would be at some point beyond the town of Grafton.
74. If it were merely a question of connecting the Clarence and the Richmond by rail a cheaper line could be made? Yes; very much cheaper. You could have a railway with a narrower gauge, which would suit as far as the trade between the two rivers is concerned. You could have a lighter line.
75. Then you favour this proposal as being a section of the North Coast scheme? Yes.
76. Similar to the Lismore-Tweed line? Yes.
77. You think that connecting it with that line would be the means of securing increased traffic? I think that, in consequence of its being connected with that line, there would be an increased traffic.
78. On the larger section, connecting Grafton with the Tweed? Yes.
79. And with regard to the settlement that would take place between Grafton and Casino, there would naturally be a considerable increase in traffic? Yes, a very large increase.
80. Have you a fair knowledge of the district between Grafton and Casino? I have.
81. I do not mean along the proposed railway route only, but for some distance on either side? Yes, I know the country off the road.
82. Is it similar country to that along the road? The country off the road is better.
83. With regard to the timber industry, would that mean a considerable increase in traffic? Very considerable.
84. In your opinion, most of the timber would come by rail in the event of a railway being constructed? I think large quantities of it would come by rail. I expressed that opinion before, but I have become even more convinced since the construction of the railway to Lismore; because on that line rates have been charged which enable the farmers to bring their cane to the mills. A great deal of the cane grown on the Richmond, along the line of railway—in fact, the whole of it—is placed upon trucks and brought to the mill. Well, if cane can be brought profitably to the mill by rail certainly timber can be brought profitably by rail to the place of consumption or export.
85. Is the timber industry in this district an important one? It is a very important one, and is growing daily.
86. Is that increase of supply for local requirements or for export? For both. Some figures will be given to the Committee on this point by another witness, but I may mention that it is estimated that during last year 4,000,000 feet of timber were sawn for export and home purposes.
87. The timber most conveniently situated would be taken first? Yes, owing to the cost of haulage.
88. And every year as the timber gets, so to speak, further away, timber-getters will have to go further inland? Yes; in fact it is daily getting further away.
89. At present mill-owners haul their timber by teams? Yes. One firm have improvised a steam tramway with wooden rails; but even in that case much of the timber has to be hauled by team.
90. You are of opinion that large quantities of timber would come by rail from the country referred to? Yes.
91. You stated that in view of the long water carriage a considerable quantity of produce would go by rail from the Clarence River to Sydney, if a line were constructed? Yes.
92. Going a little further south, say to the Bellinger and Nambucca rivers, where the entrances are not good, the freights by steamer are considerably higher than from the Clarence? Yes; they are as much again on the Bellinger.
93. Do you not think, in view of the high freights by steamer, that those districts would use the railway? I think that, in regard to the Bellinger and the Nambucca, the whole of the produce from those rivers would go by rail.
94. *Mr. Watson.*] What is the freight at present paid by steamer? One shilling and sixpence a bag down there, and 8d. here.
95. *Mr. McFarlane.*] Have you any idea how much per bag the freight would be by train at the ruling rates? A trifle over 1s. a bag.
96. In view of that, do you not think the growers of maize and other products would be induced to send their goods by train? I believe they would. Not only would it be cheaper as regards freights; but they would be able to take advantage of a favourable market. On the other rivers referred to, the people are at a great disadvantage as compared with the Clarence. Here, the producer can reach the market at a few days' notice.
97. Going further south, to the Macleay, the Hastings, and the Manning Rivers, where the cost of freight to Sydney would be greater, in your opinion would not the people use the train instead of the steamer, and would not the bulk of the produce go by train? I am certain it would.
98. That would be a strong argument in favour of the North Coast line? Yes.
99. What is your opinion with regard to the North Coast line;—do you think favourably of the scheme? I do, in the interests of the country.
100. Would it also have the effect of opening up land for settlement between the different rivers? There

is a considerable quantity of land between each of these rivers that can never be settled and worked up to its capabilities until railway communication is established.

101. And for the same reason you favour the present proposal—the section under consideration? I do; and the fact just mentioned is a great argument in its favour.

102. You stated that a considerable quantity of produce from the Casino district would come this way in the event of a railway being constructed? Yes.

103. Have you any particular argument in support of that assertion? Casino is situated on what is known as the south branch of the Richmond River. The only method of getting goods from Coraki to Casino is by small steamer, which necessarily involves considerable delay. Whether you take goods from Sydney to Casino, *via* Coraki, or produce from Casino to Sydney by the same way, there must be considerable delay. There is either delay at Casino before taking the produce away, or delay at Coraki before putting it on the steamer. Then, as regards the inward goods, there is delay at Coraki before taking them to Casino. The only way of overcoming this difficulty, so far as the Casino people are concerned, would be by the construction of a tram line from Coraki to Casino. That is the only way by which that route could be made to compete at all with a line of railway from Casino to Grafton.

104. Is the river navigable up to Casino? Only by small boats, and then there is a good deal of cartage to be done—about 2 miles.

105. How many steamers have the North Coast Steam Navigation Company trading to the Richmond River? Three.

106. Regularly? Yes.

107. And to the Clarence? Three.

108. I understand that those trading to the Clarence are the larger steamers? Yes; they are larger in tonnage. We can load the largest of our steamers at Grafton, but on the Richmond River, nowhere above Broadwater can we load the steamers to their fullest capacity.

109. How do you find the Clarence entrance with regard to your trade? We consider the Clarence entrance very much improved.

110. Do you meet with much delay? Not very much.

111. Do you meet with any delay on the Richmond River? Yes; considerable.

112. In the event of the breakwater at the Clarence Heads being carried out as proposed by Sir John Coode, would that, in your opinion, give better facilities for shipping at this port? Yes.

113. It would admit larger steamers? Yes.

114. What depth of water do you think it would give? We have had over 22 feet of water on the bar. Some patches of it were 30 feet at high tide. It is the opinion of our captains trading to the port that when the proposed works are completed—that is, when the southern breakwater is extended, and the reef removed, and the training-wall completed—we shall have from 20 to 22 feet of water on the bar.

115. Assuming that improvement to take place, you would then probably have larger steamers trading here? Yes. As a matter of fact the company have now under consideration the construction of a very much larger steamer. The plans are all ready now. Everything is in readiness for the construction of a faster and larger steamer for the trade.

116. Is it not a natural result from an improved entrance, and larger and better steamers, that there will be a reduction in fares and freights? Yes; that is the natural result. With larger bottoms you can do the trade 25 per cent. cheaper, and with a greater hope of profit than you can with smaller ships.

117. With a better entrance and better shipping facilities, would there not be a strong probability of the Casino produce coming to the Clarence? I believe so.

118. That is to say, with better shipping facilities than now exist, there would be a greater probability of getting trade than is the case under present circumstances? Yes, undoubtedly.

119. If the bar were improved to a depth of from 20 to 22 feet, would there be any difficulty in getting the steamers up the river? No. You would not require to load a boat up to 22 feet at Grafton, because you load her along the river. But to-day we can load a boat at Grafton up to 14 feet 6 inches, and that means 600 or 700 tons.

120. You do not anticipate any difficulty whatever in regard to boats coming up the river? None. As a matter of fact, we loaded a 400-ton ship 14 miles above Grafton a few years ago.

121. Do you remember that some years ago what is known as the crossing at the Clarence Heads was more trouble even than the bar? Yes.

122. After negotiating the bar, vessels could not always get over the crossing? Yes.

123. Since the training walls have been carried out, have you noticed any marked improvement in this respect? Yes; the obstacle at the crossing has been entirely removed.

124. What is the depth of water there now? It is reported that there are from 30 to 35 feet of water.

125. Where the original crossing was? Yes; there is one point there where there is a depth of 50 feet. There is abundance of water—about 30 feet on the average—all down the training-wall.

126. Previous to the training-walls being carried out, particularly the south training-wall, what depth of water was there on the crossing? Where the training-wall is now was a sand-bank, and there has been as low a depth as 5 feet of water on the crossing, and for many months there was never more than 8 feet 6 inches. I remember that very well, because before the construction of the training-walls, and at the time I am speaking of, produce had to be conveyed to the steamer by droghers.

127. That trouble has been done away with by the partial construction of the training-wall? Yes; the whole of that difficulty has gone.

128. In view of that improvement to the crossing, is it your opinion that the extension of the south breakwater will have a similar effect with regard to the bar? I feel satisfied it will.

129. And will allow of the removal of the reef, as proposed by Sir John Coode? Yes.

130. Do you think there will be any difficulty in the shape of a rocky bottom that will prevent the scour? No. I am satisfied there is no rocky bottom at the Clarence Heads, because in 1887, the time of the flood, a dredge broke away and was driven out to sea, and it is supposed that this had some influence in scouring out the channel, for after that flood there was a depth of 22 feet, and in some places 30 feet. I take that as a fair indication that there is no rock at the bottom.

131. *Chairman.*] Do you know the line between Lismore and Murwillumbah? I do.

132. How does the country between those two places compare with the country between Grafton and Casino? That is better land than this.

S. Sec.
27 Feb., 1900.

S. Sec.
27 Feb., 1900.

133. That railway has not been exactly a success from a traffic point of view? No; but it is bettering its position every day. There is a loss every year, I know; but until it was constructed there was a very much more serious loss to the man who invested in the land. The land was absolutely useless. I know of instances where men spent hundreds of pounds on the land, and not only lost that money, but became bankrupt. That land has since become valuable;—in fact within a radius of a great number of miles of the line you cannot obtain land except at £7 or £8 an acre. I know land there that has been sold at £8 an acre uncleared, and before it was not worth 8d. an acre. I attribute that increase in value solely to the construction of the railway.

134. *Mr. McFarlane.*] Did it lead to increased settlement along the line? Yes, to a considerable extent.

135. *Chairman.*] Do you look upon the position of Lismore and Murwillumbah as analogous to that of Grafton and Casino;—having regard to the two rivers and the two ports, admitting that there is a better tract of country between Lismore and Murwillumbah, do you think that the superior condition of the river at Grafton would improve the position, and attract a big traffic from the direction of Casino, if a railway ran there? Yes, I think so, though I am ready to admit that the land between Lismore and the Tweed is better.

136. Seeing that there is better land between those two places, I want you to explain why you think there would be better results from railway construction between Casino and Grafton? The land between Lismore and The Tweed is better land, and in consequence of that fact was selected; but it was comparatively useless until the construction of the railway. Practically everything excepting pine was exhausted, and there was nothing else left to the owners of the land. Though the land could not be cultivated for maize, it could be utilised for cane; but that was of no use, because you could not get the cane to a mill. The land has gone up considerably in value owing to the starting of the dairying industry; but assuming that 1 acre of land there is worth 3 or 4 acres of land between Grafton and Casino, the country between the latter places carries a large quantity of hardwood timber, which experts have estimated to be worth from £3 to £4 an acre as it stands. That is an asset which the other land did not possess. Then, again, you have a larger number of acres with easier facilities for getting to it, because it is level land, while the other is rough. I consider that the land between Grafton and Casino stands in a better position, as regards the man who wants to take it up, than the land between Lismore and the Tweed, in view of the roughness of the latter and the absence of valuable timber. If it were open for selection to-morrow, the land here would be as readily taken up as that between Lismore and the Tweed.

137. And the Lismore to the Tweed line was a much more expensive one to construct? Infinitely more. The cuttings were very heavy indeed. That section cost within a few pounds of £1,000,000—a most expensive line. Between Grafton and Casino there is a good deal of Crown land.

138. *Mr. McFarlane.*] In the event of railway communication between the tableland and the coast, which, in your opinion, would be the best terminal point? I think Grafton would be.

139. I suppose you have good reason for assuming Grafton to be the best and most central point? Yes; it would be the best terminal point in consequence of the navigable condition of the river. On account of the better entrance to the Heads it is a better port. As a matter of fact, it is a port extending for 48 miles.

140. And in the event of connection with the tableland, would Grafton be a central locality—that is, in view of the other districts along the coast, such as the Bellinger and the Nambucca on the one hand and the Richmond and the Tweed on the other? Yes; it would be a central point.

141. The coast produces articles that cannot be grown on the tableland, and there are many products on the tableland that cannot be produced on the coast? Yes; a great number.

142. In view of that there would be a large interchange of products? Yes.

143. In the event of maize or potatoes being sent to the tableland, could districts other than the Clarence participate in sending these products by means of the railway from Grafton? Yes.

144. It would give the people in the districts on both sides of Grafton an opportunity of sending their produce to the tableland? All the coastal rivers would be in touch with the tableland if Grafton were made the terminal point.

145. And in your opinion Grafton would be the best centre for connection with the tableland, in view of the better facilities for shipping on the Clarence? Yes; that is the main reason. I consider that Grafton is a central position, but it is in consequence of the river affording such safety that it would be a better terminal point than any other place.

146. In the event of a railway being constructed from the tableland to Grafton, would that give additional traffic to the proposed line from Grafton to Casino, if it were constructed? Yes.

147. Take, for instance, the passenger traffic,—if the tableland were connected with Grafton by railway, would not that give additional passenger traffic between Grafton and Casino and Lismore and the Tweed River? Yes.

148. So that one line would help the other considerably? Yes.

149. And in view of the products that could be sent to the tableland greater traffic would on that account come to the proposed railway? Yes; that would be the case quite independently of the route to the tableland.

149½. Have you any evidence with regard to the outward tonnage from Grafton? The figures for 1899 are as follows:—"Kallatina," 650 tons gross, 52 trips; "City of Grafton," 800 tons gross, 52 trips; "Australian," 450 tons gross, 27 trips; "Oakland," 500 tons gross, 16 trips; "Wyoming," 250 tons gross, 2 trips; total, 2,650 tons gross, 149 trips. These figures represent an outward tonnage of 80,360 tons. They do not include sailing vessels, which have taken timber to the extent of fully 3,000,000 feet. Of that quantity 2,000,000 feet were exported to intercolonial ports, and the balance shipped to Sydney for consumption in New South Wales. With regard to the passenger trade, the number of passengers carried to and from Sydney in 1899 was as follows:—Saloon, 6,249; steerage, 2,015; total, 8,264.

Joseph Spencer, storekeeper, Grafton, sworn, and examined:—

J. Spencer. 150. *Chairman.*] How long have you been in business? I have been in business on my own account in Grafton for a couple of years; but I was a traveller for one of the Sydney houses for about fifteen years.

151. I believe you have some figures with regard to traffic? I can give you an approximate idea of the traffic between here and the Richmond. I was on that particular line for the period mentioned.

152. Would you give us the character of the traffic and its fluctuations? I will first take the inter-relationship between the two rivers, so far as passenger traffic is concerned. When I heard it stated this morning before the Committee that there was no considerable volume of traffic I was rather surprised, because as a matter of fact there is a constant stream of traffic between the two rivers, as anyone constantly travelling about this district, as I have done, must recognise. I represented a large soft-goods house—Gardiner & Co.—for a number of years, and my cheque alone on the Chatsworth to Woodburn line was £60 a year for freight and carriage. I believe there are about sixty travellers on this road. Say there are ten handling as a great quantity of freight as I had, and you have at once traffic representing £600 a year. I do not know that they all paid the same as I did; but there are ten big houses, and they would pay at least an approximate amount to what I paid myself.

J. Spencer.
27 Feb., 1900.

153. Did you travel by coach? Yes. I hired special coaches, as we all do. Taking the ten just mentioned from the total number of sixty travellers, that would leave a balance of fifty, and putting their freight down at a minimum of £2 each, six times a year, that would be £12 per man, or a total of £600. This will give £1,200 a year paid for freight and carriage by one body of men.

154. But do not commercial travellers get an all-round ticket on the railways, and would not that apply to this kind of district? As far as the railways are concerned it does not apply to the Lismore-Tweed line. There the northern system of passes does not take effect. The Commissioners allowed that privilege on the Tweed line for some time, but they have now withdrawn it. An all-lines ticket would apply; but that would not affect the samples.

155. In the case of a commercial traveller doing business on these rivers, would it be worth his while to pay the £100? Certainly not, because there would only be a small proportion of his journey that would be covered by rail ticket. I have pointed out that there is an amount of £1,200 a year from one body of men alone, and, quite apart from that, there is the ordinary coach traffic. We will take the ordinary coach traffic between Chatsworth and Woodburn at three each way—that is, six per day—three going and three coming back. I do not know what the fare is now—it used to be 12s. 6d.; but say that 26 miles of coaching is worth 10s., that would be forty-two passengers, at 10s., equal to £1,000 a year. Then there are a number of people, of whom there is no record, who prefer to travel in their own vehicles. I suppose the greater number of persons who go over there from this immediate district drive themselves.

156. With railway facilities, I suppose the same character of business would still be kept up—with the supply of goods there would have to be travellers just the same? Yes; in fact, railway construction would very largely increase this class of travellers.

157. How do you get your goods from Sydney—by steamer? Yes.

158. It seems to be the opinion of one of the witnesses that a great number of the passengers would prefer to come from Casino to the Clarence, and take the steamer to Sydney, owing to the better class of steamers running from this river;—do you think that would be so? There is no doubt we are the safety-valve for the Richmond with our facilities for getting away. For instance, it used to be quite a common thing not to trust the Richmond if we wanted to go to Sydney by an early date, but to come to the Clarence, because we would be sure of getting out. In fact, as was remarked this morning, a tremendous lot of perishable cargo would come to the Clarence in preference to going out of the Richmond Heads. Besides, if a man wished to catch a favourable market, he would certainly take advantage of the Clarence, which would give him quick communication. I was in Lismore at the time the evidence was being given in regard to the Lismore-Tweed railway, and the traffic between the two rivers at that particular time was given at two persons per week. It was either one or two. I know only one coach used to run per week. It left Lismore on Monday, and returned on Friday. There was practically no traffic at all; in fact, it was quite an undertaking to go over there.

159. The traffic has, of course, considerably improved since they have had the railway? Undoubtedly.

160. Do you see any signs of improvement with regard to settlement and population between Grafton and Casino, on the proposed line of railway? Unquestionably. As was pointed out this morning, it is impossible for these men to embark on any sort of industry in the shape of dairying when they are 30 or 40 miles from a market, besides which a man could not think of going in for dairying at that distance.

George Henry Varley, newspaper proprietor, Grafton, sworn, and examined:—

161. *Chairman.*] What are you? Chairman of the Clarence Dairymen's Association, also President of G. H. Varley, the local Chamber of Commerce, and proprietor of the *Clarence Examiner*.

162. *Mr. Watson.*] Have you been long in the district? About nineteen years.

27 Feb., 1900.

163. You have therefore a pretty good knowledge of it? Fairly good, I think.

164. I understand you have some statistics which you desire to place before the Committee with reference to the output of products from the district? I have a number of figures taken from official sources. Commencing with maize, the oldest and the chief agricultural product, the export for the year 1899 was 540,720 bushels. Adding the local consumption, the total production for the year would be fully 700,000 bushels. This quantity, at an average price of 2s. 9d. per bushel, gives a return of £96,250. For the area under crop the yield was an average one, while the price was higher, taking the season right through, than has been usual of late seasons. About 24,300 bags of potatoes were exported, or 2,100 tons. The local consumption would bring the yield, probably, to 3,000 tons, and this, at an average price of £2 10s. per ton, would give a return of £7,500. This is far below the proceeds of 1898 year, when there was a high price and better crop. That year's income from potatoes was estimated at fully £25,000. Sugar-cane is an important item, the C.S.R. Co. having paid away during 1899 for cane and wages, £42,500. The smaller mills would swell this total to about £50,000. In 1898 the company paid £70,000, and during the coming season they expect to pay about £60,000. This, of course, does not represent the value of manufactured sugar, which is considerably greater than the amount stated. Allowing 10 tons of cane for a ton of sugar, and an average selling price of £15 per ton, the sugar product for 1899 would be worth approximately £68,600. The stock is another important item. Last year there were slaughtered in the district by those who held licenses, 12,151 fat cattle, and, in addition, about 900 were shipped to Sydney, while a number were sent overland. These three methods of disposal would represent 13,051 head, and these, at an all-round average of £5 per head, would yield £65,255. In this connection it may be stated that the average output from Ramornie Meat-works is £36,000 for tinned meat and extract, and £35,500 for tallow, hides, &c. The company also pays about £14,000 per annum in wages. It should, however, be mentioned that the whole of the cattle treated at Ramornie are not raised in the district; some are purchased

G. H. Varley, purchased from the northern part of the Colony and Queensland. On the other hand, however, there are a large number of milch cows bred in the district that represent a considerable sum. The returns sent to the Stock Inspector's office at Grafton, up to date, show that there were in the district 91,011 head of cattle (an increase of 4,094 on the previous year's returns); 17,432 horses (an increase of 952); 11,836 pigs (increase of 298); and 2,116 sheep (increase of 917). There were 8,209 pigs exported, and 4,219 returned as slaughtered in the district. The pig industry is worth about £15,000 to the farmers and others. The exports of eggs were 17,489 cases, and of fowls, 1,972 coops, estimated at the value of nearly £38,000. The local requirements would augment this to about £45,000. The butter industry has shown considerable expansion during four years. In 1896 there were 152½ tons manufactured; in 1897, about 476 tons; in 1898, 649 tons; and last year the output was 755½ tons, which, at £93 4s. per ton, gives a value of £70,536. It is estimated that fully 6½ million feet of timber were cut on the Clarence last year, representing a money value, at hardwood rates, of £37,682. Then there were exported 144,000 spikes, railway sleepers, girders, wattle-bark, &c, which would increase the year's revenue from our forests to at least £40,000. The total value of our products may be thus summarised:—Maize, £82,500; dairy produce, £70,536; potatoes, £7,500; sugar, £68,600; cattle, £66,755; timber, £40,000; pigs, £15,000; poultry and eggs, £45,000; hides (15,761), £12,500; vegetables, £5,100; fish, £5,200; horses (324 exported), £2,000; bark, £400. This gives a grand total of about £421,100. There are, in addition, some smaller industries, which would materially increase this amount. These figures will show the resources of the district and their rapid development.

165. That sum of £421,100 represents, I presume, the larger items of production—not so much of export, not solely of export? The exports could be easily separated; but that represents the total production.

166. The greater part would be exports? Yes. I have some information with reference to the proposed railway, as to which, as chairman of the Clarence River Dairymen's Association, I am, perhaps, competent to give an opinion on the probable output of dairy produce, &c. I do not know whether I am presuming too much in making an estimate of the cost of construction; but as one holding a public position, and knowing what has taken place in this district, I have prepared what I consider to be a fairly accurate estimate. In the first place I put the cost of construction down at £5,000 per mile, or a total for 64 miles of £321,000. The annual cost I put down at £16,018, of which £9,630 is interest on capital cost at 3 per cent., and £6,388, estimated cost of maintenance, and traffic and locomotive expenses. The probable income I estimate at £15,268 12s. 6d., made up as follows:—

<i>Revenue Estimate.</i>		£	s.	d.
525 cans of cream per day at tonnage rates, average £5 7s.		1,952	15	0
Pigs, calves, poultry, eggs, and general merchandise.		2,824	0	0
Sawn timber, spikes, firewood (say)		1,250	0	0
Mails, parcels (say)		500	0	0
9,470 adult fares—return—at 13s.		6,155	10	0
Excursion fares, 3,000 per annum		1,050	0	0
Passengers along the route, 1,000, estimated to make two trips per annum, an average of 32 miles (half the length of line), at 6s. 6d. return		650	0	0
1,500 estimated to make three trips per annum, an average of 16 miles (one-fourth length of line), at 3s. 3d. return		731	5	0
Through fares to Lismore and Tweed, one passenger per day, at 8s. 6d.		155	2	6
		£15,268	12	6

These figures leave an estimated shortage in revenue of £749 7s. 6d. Perhaps I may give the following explanation of my estimate just given:—

The estimate of cost is based on the evidence of Mr. Surveyor Lloyd, on the result of Mr. Surveyor Kennedy's explorations of more difficult country in the Clarence district, and the statement recently made by Mr. Chief Secretary John See.

Estimate of Revenue.

Believing that 437 families would settle within three years from the time a contract was accepted for constructing the line, on 279,680 acres (*e.g.* 640 acres for each family) and assuming the estimates of practical men to be correct (*i.e.*, 5 acres of improved land would keep a cow in full milk), there would be 525 cans of cream for daily freight, of which 285 might reasonably be credited to Grafton (from 35, 25, and 13 miles), and 240 to Casino (from distances of 19 and 9 miles). The freight charges are calculated on the "Special Class B." mileage rates for goods per ton.

For live stock, merchandise, &c., the estimate of the Railway Commissioners has been quoted.

With such large areas of splendid timber growing short distances on either side of the proposed line, it is generally believed that saw-mills will be established along the route, and considerable quantities of sawn timber freighted to the nearest port of shipment. The Fresh Food and Ice Company and the residents of Grafton use large quantities of firewood, which is mostly carted from the south side of the river. If the proposed line were constructed, no doubt firewood could be supplied at cheaper rates than are now paid.

With regard to the item of £6,155 10s. (fares), it is estimated that two-fifths of the population resident within an area of (say) 20 miles of the line, in the Grafton, Clarence, and Casino districts, and a like proportion of the increased population in these districts, would make one trip per annum.

In support of the estimate for excursion fares, it is claimed that the shows (two days at each town) at Grafton, Casino, and Maclean, races at Grafton (a number of days), Caledonian gatherings at Grafton, Casino, and Maclean, and other public sports, would attract at least 3,000 fares during the year.

The estimated revenue from passengers along the route will in all probability be realised, as dairying would admit of each occupant of 640 acres earning about £598 per annum, an average of 3d. per gallon for the milk of eighty cows, and returns for store pigs, baconers, poultry, and eggs.

The estimate of the passenger traffic between Grafton and the Lismore district could reasonably be increased, especially if the present mail contracts between these districts were abolished.

There is a greater probability of this line paying than the Tweed-Lismore line, owing to the fact that while the latter does not draw all the possible freight and traffic, this line, on the contrary, will go through the centre of a productive district. I have prepared an estimate of the probable revenue from the carriage of dairy produce, assuming that creameries would be established at intervals along the line. The first creamery I locate at a point on the line 13 miles from Grafton and beyond the area from which the Grafton factory is drawing milk. The following are the details of my estimate in regard to the transit of cream by the proposed railway:—

		£	s.	d.
13 miles.	45 cans per day, equal to 2½ tons, at 2s. 8d.	0	6	0
25 "	6 " " " 4s. 8d.	1	8	0
35 "	6 " " " 6s. 4d.	1	18	0
19 "	6 " " " 3s. 8d.	1	2	0
9 "	6 " " " 2s. 2d.	0	13	0
	525	£5	7	0

Estimate 525 cans daily at tonnage rates. £5 7s., yielding £1,952 15s. per annum.

Starting

- Starting from Grafton, I have estimated that a creamery would be established at a point 13 miles away. Then, at a point 25 miles from Grafton I have estimated that two creameries would be established on the eastern side of the line and two on the western side, the area in either case extending 10 miles from the line. Freight of the cream from these creameries to Grafton I have estimated at 4s. 8d. per ton. Then at a point 35 miles from Grafton there would be two creameries on the western side of the line and two on the eastern side. These I estimate would send in 6 tons of cream to Grafton per day, and I put down the freight at 6s. 4d. Next I take a point 19 miles from Casino, and there would be two creameries on the east side of the line and two on the west side delivering their cream to the railway. The quantity I put down at 6 tons, and the freight to Casino at 2s. 8d. The next point would be 9 miles from Casino, and there would be the same number of creameries and the same quantity of cream, the freight being 2s. 2d. per ton. As shown by the return quoted just now, I estimate that there would be 525 cans of cream carried daily by the railway, yielding a freight of £5 7s., or a total of £1,952 15s. per annum. In making my estimate I have assumed that from beyond 40 miles from Grafton the cream would go towards Casino, if a connection were made between Casino and Lismore. I have taken as a basis for each creamery twenty-five families, each on a holding of 640 acres.
167. How many cows would they run? Eighty in full milk.
168. Do you think they could keep up that average for any length of time on that area? I think on that area they could milk eighty cows right through the year.
169. How many cows would that leave in reserve? That would allow about forty dry cows.
170. Do you think you could run 120 cows on 640 acres? That is a less number than has been mentioned to-day. On that point I cannot speak from practical knowledge. The evidence of dairymen of large experience, is that this land when improved would carry a beast to 4 or 5 acres.
171. As chairman of the Dairymen's Association, and from what you glean from those now settled in the district, you think that 640 acres of this land would carry 120 cows, eighty in milk and forty dry? Yes, all the year round; that is, in three years time after the country had been improved.
172. Do you, in your estimate, provide for the growth of fodder for the stock during the winter, or do you consider the natural grasses sufficient? I have allowed for 40 acres of cultivation on each of these 640 acres. If there were a greater extent of cultivation more cattle would be carried.
173. Would it be necessary to grow fodder for the winter here? Not when they get the grasses which it has been proved will grow on that land—*Paspalum dilatatum* and other artificial grasses that have been introduced here.
174. Is it found that these grasses are a success in feeding cattle? Yes.
175. Your estimate of receipts and expenditure in connection with the proposed line is not put forward as what is likely to occur at once? I have assumed that in three years from the time a contract was started, you would have those results. Judging from experience on the northern line when it was built, the construction of the railway as it progressed would create population, so that by the time the line was finished to Casino it would be found that a large number of families would be settled on the land. A family could settle down on this land and get a dairy into working order very soon.
176. Is it heavily timbered? Not very heavily.
177. How do they proceed with regard to clearing here—do they ring the timber first? There is plenty of country along the line on which you could start dairying straight away.
178. Is it land that has been rung for some time, or is it mostly in reserves, with green timber growing? The portion coloured green on the map shows a railway reserve 1 mile wide right through to Casino.
179. On each side of that reserve how is the land generally held—is it Crown land or partly alienated? It is nearly all Crown land. I believe there are 721,000 acres available between Casino and Grafton.
180. Of the land not reserved a portion, I believe, is alienated in squatters' holdings? Not much. There is one station, Cumira, and another at Woorooloolgan.
181. Has the first named been ringbarked? I have never been over it.
182. You would not expect the line to bring all that land under profitable occupation within two or three years;—would it not take several years? I have estimated that only 279,000 acres would be occupied within three years.
183. And you have not gone beyond 10 miles on either side of the railway? No. The advantage of a line going through country like that is that by putting a creamery about 5 miles from the line, say on the western side, you not only drain the country between the creamery and the railway, but also the country 5 miles beyond the creamery.
184. Then you would have the creameries, not at the railway station, but 5 miles away from it? That would depend on the country. If a creamery were placed (say) 5 miles on the western side of the line, by putting another creamery 5 miles further to the west, you would drain another 5 miles still further to the west, so that the railway would drain 15 miles of country. What would be done would be this: the cream from the outer creamery would be brought into the central one, and from there the whole of the cream would be taken 5 miles to the railway. I know that the Fresh Food and Ice Company, who have largely developed the butter industry on this river, would be quite prepared to build any number of creameries if there were a demand for them.
185. How far directly north, or slightly east or west of north, is the furthest dairy-farm from Grafton, at the present time, that is in the direction of Casino? About 8 miles.
186. That would not be far from the river flats? No; dairying is being carried on at Stockyard Creek and at Copmanhurst, about 20 and 27 miles away.
187. Some distance from the river? Yes.
188. Are there any indications, so far, of men being willing to take up grazing land, which is not held to be suitable for agriculture and for dairy purposes? I think so.
189. Are there any specific instances you could point to as evidence of that inclination, and as showing the anxiety of people to get hold of land such as this railway would go through? I have had numbers of inquiries, and I know the banks have had inquiries. The banks and the auctioneers have frequent inquiries from persons wanting to know if they could get farms anywhere about. They are not obtainable in this district to rent—not a good dairy-farm within a reasonable distance from a creamery. There is no doubt there is a demand for this character of land.
190. But just now you told us that if you erected two creameries, say, westerly from any point on the line, one beyond the other, they could serve an area of 15 miles? Yes, in some parts.

G. H. Varley. 191. Could not that be done now with your facilities in the way of factories at Grafton; could not you reasonably expect that there would be an extension northerly to the second-class land for 15 miles from Grafton? I do not think so, under present conditions.

27 Feb., 1900.

192. Why? Because you would have to bring the milk in 12 miles by cart to Grafton factory.

193. I mean with the creameries, say 5 miles apart; would they not influence an area 15 miles out from Grafton as you indicated might be done if the creameries were properly placed in respect of the railway? In answer to that I may mention that I know a case here where cream is being brought over 30 miles to Grafton from Nana Glen, but it is done at a cost of about 2s. a can for the carriage of the cream. That is right enough while the price is up, but that cannot last always.

194. I suppose that is rich land? Very good land, no doubt.

195. Or else it could not stand that big freight? No.

196. You estimated the cost of constructing this line at £5,000 per mile on the authority of Mr. Lloyd, surveyor. Mr. Deane, in Sydney, was asked whether he had any conversation with Mr. Lloyd with respect to the estimate he had given in 1892, and he said:

I had considerable conversations with Mr. Lloyd about that. If he had been engineer-in-chief he would not have made that estimate, because he did not know all the circumstances. You see, a field officer judges things partially only; he does not see all the items that have to be included. It is very probable that he would under-estimate a line, and a very intelligent man—a man who might know something of the matter—might say: "that line ought to be made for £5,000." You may make a good deal for £5,000. You may make a good portion for £5,000, excluding bridges, stations, and a number of other things, but we have to include bridges and stations. I have to include all office and survey expense; you must not forget those things.

Further on he was asked:

Notwithstanding your conversations with Mr. Lloyd on the subject, and any information which he may have been able to afford you, you have no reason to think that it could be done for anything like what he said? No.

If you turn to the evidence of Mr. Lloyd before the Sectional Committee in the 1892 inquiry you will find that he admitted that, in the first instance, he had not included construction plant, station buildings, and resumption of land, nor had he included the cost of the bridge across the Richmond, which he himself estimated at from £30,000 to £40,000. You see, the bridge alone would add about £750 per mile. He was asked:

Are you of opinion that this line can be constructed from Grafton to Lismore at a price not exceeding £7,000 per mile? Yes; excluding the cost of the bridge.

Are you aware that the Engineer-in-Chief for Railways has included in his estimate the cost of the bridge? I was not aware of that.

Would that not make his estimate pretty much the same as yours? I daresay it would.

Then he goes on to compare the cost with the Cootamundra to Gundagai line? I think you will find that Mr. Lloyd gave supplementary evidence at Casino after he had been over the line. It will be found on page 69 of the Committee's report, question 1781. He said he was still of opinion that the line could be constructed for £6,000 per mile; that the country, from an engineering point of view, was extremely easy, being nearly absolutely level.

197. It is not clear from that whether he still excludes the cost of the bridge and the terminal works at Grafton? I do not know whether I am justified in repeating a conversation I had with him when he stated that, in his opinion, the line could be made for £5,000 per mile right through.

198. In this case we have inquired very carefully into Mr. Deane's estimate, so far as we could get information from his own department, and Mr. Deane adheres to his statement that the line cannot be constructed for less than £7,803 10s. per mile, irrespective of any reduction that may be made in the item of station buildings and wharfs at Grafton; in answer to Mr. McFarlane, Mr. Deane admitted the other day that a sum of £55,000 included in the item of £70,000 for Grafton might be cut out, as a number of things included in the estimate would not perhaps be wanted for a considerable time;—assuming that that £55,000 were cut out, it would still leave a total of £6,600 per mile? I remember that Mr. Eddy, when discussing the matter, said it was nonsense to put up expensive buildings and sidings, and that an earth-work siding would be ample, with galvanised iron buildings right along the line. Look what occurred in this district: At one time we had a line estimated to cost £20,000, and it was brought down to £12,000 per mile, afterwards down to £8,000, and now it is estimated at £5,000; and in part of the country between here and Rumormie, which is quite as difficult a country as that on the Casino line, Mr. Kennedy, the surveyor, estimated that the cost would be something like £3,600 per mile. Mr. See, the Chief Secretary, when this line was before the House last December, said he had consulted an engineer, and believed it could be made for £5,000 per mile, or considerably less. When the line was being surveyed one surveyor insisted upon taking it through an important part of the town, and also through flooded country, and this was not remedied until there was a good deal of agitation. The route was subsequently improved. It was taken round through agricultural land, and, for most of the distance, out of flood reach. The cost of the resumption will be very much less than the original estimate.

199. *Chairman.*] Is that a long while ago? About twelve or thirteen years ago.

200. *Mr. Watson.*] Mr. Deane was also asked in Sydney whether it would not be possible to reduce the cost of construction by making this line more in the nature of a light line, such as has been made in the back country; but he said it would be impossible to do without ballasting and heavy sleepers owing to the heavy rainfall in the district;—do you think that would be so? I do not feel competent to give an opinion about that.

201. But there is a heavy rainfall, I believe? Yes, an average of about 32 inches. There is plenty of timber along the line to make the railway. That is where railway sleepers are coming from now.

202. Turning to the general question, as a pressman no doubt you have taken considerable interest in the working of our railway system, and you are, perhaps, aware that coastal lines, so far as experiments have been made up to the present, have not been a success? Yes.

203. What reason have you for thinking that there is a greater probability of success in this instance than in the case of the South Coast line or the Lismore to the Tweed line? In the first place, the South Coast line runs close to the coast, and, therefore, can only drain the country for so many miles on the landward side. It gets nothing from the seaward side. The proposed Grafton-Casino line would drain the traffic for 10 miles on either side.

204. But when the South Coast line gets below Wollongong it drains a greater area, does it not? Yes; but the earnings on that line have to be very large in order to pay the interest on the enormous cost of construction.

construction. There is a very great difference in the cost of construction of the South Coast line, and that now being inquired into. The same may be said with regard to the line from Lismore to the Tweed, which I believe cost about £13,000 or £14,000 a mile.

G. H. Varley.
27 Feb., 1900.

205. The estimate in that case was Mr. Lloyd's estimate;—his estimate of £9,000 per mile was largely exceeded? There were misrepresentations about that proposal when it was before Parliament. When that estimate was given it was given as the cost from Grafton to the Tweed, and the line was spoken of in that general way. I remember Mr. Lloyd mentioning the contract price for the Tweed portion of the railway. This bears on his reliability in regard to making estimates. In the 1892 inquiry before the Sectional Committee he was asked, page 11, question 319:—

Does your estimate of £6,000 a mile for the proposed railway include a bridge over the Richmond? No; that estimate is exclusive of the bridge. I stated before the Public Works Committee with reference to the Tweed line, that I thought the first and second sections could be let for £9,000 a mile, and that this one could be let for £6,000 a mile. The contracts have been let for about £8,500 per mile, so that I was not far out.

206. The contract was let for £8,500 per mile, but the other cost brought the amount up to £14,000; so that Mr. Lloyd's estimate did not include the whole expense respecting the capital sum on which interest had to be earned? Quite so. When that estimate was made in the House, they were speaking of the whole line right through, and the House was, in my opinion, under the impression that it was sanctioning a line that was to cost £9,000, and not £14,000.

207. They were really sanctioning the expensive part of the line? Yes.

208. Would any resumptions be necessary on this line between Grafton and Casino—I mean outside of town allotments? The total amount for resumptions would be small, compared with the resumptions on the other lines mentioned.

209. *Mr. McFarlane.*] In your statement concerning the revenue likely to come from the proposed railway, did you make any allowance for the increased value that would be given to the Crown lands? No; there is not the slightest doubt that the value of the Crown lands would be increased. In my opinion, it would be safe to put the increase down at 10s. per acre. The then district surveyor, Mr. Donaldson, who had nearly thirty years' experience in the district, estimated (in the year 1892) the value of the land at £2 per acre, or an increase of £1.

210. Does that increase apply to the whole of the unalienated lands? No. With the view of settling some part of the land first, I think the pioneers of the district should get it at some advantage. I think, the increase right along would average 10s. over an area of unalienated land, estimated to be about 721,000 acres.

211. How did you arrive at that area? I know it to be correct; I think you will get it officially.

212. How far from the present line does that embrace? Ten miles on each side of the line. All my calculations are based on that area.

213. Is it your opinion that 10 miles on either side of the line would be affected? Yes; I have not the slightest doubt about it.

214. And the line would open up settlement for 10 miles on each side? Yes. In some cases the distance would exceed that. At Busby's Flat, and places like that, settlement would extend beyond that.

215. Have you any knowledge of the passenger traffic which now exists between this district and the Richmond? Except this, that I remember some years ago it was very difficult to get from Chatsworth to Woodburn, because the coaches were not often running, but now there are three or four vehicles running from Chatsworth and Woodburn every day.

216. Does that include Sunday? I believe you can go on Sundays. There are coaches and other vehicles.

217. There is also a road from Lawrence to Casino—are there any coaches running on that line? There is a mail coach twice a week.

218. Do many passengers travel by that route? I could not say; I should not think there were many.

219. I do not mean so much by the coach, but by that road? There is a fairly good traffic, I think, by private vehicles. Most people who go from here prefer to drive their own traps, because they go by a different route, and save 7 or 8 miles.

220. Between Grafton and Casino, is there any considerable traffic? I would not say there was considerable traffic.

221. I mean from all sources? The cheaper journey, and probably the better one, and one which most people take now, is to go Chatsworth, then by road to Woodburn, and from there by steamer to Lismore.

222. Taking these routes together, would there not be a large amount of passenger traffic between here and the Richmond? I believe there would. I believe the estimate I have made to be fairly accurate. It has not been flippantly made, but I have given the matter a lot of thought.

223. If a railway were constructed would nearly the whole of these passengers go by rail rather than take the coach? Certainly. I think the fare is considerably more by coach than it would be by rail, and, of course, the time occupied in the journey would be shorter. The coach travelling along that road is not by any means too fast; the pace is not equal to that of Cobb & Co.

224. With regard to the traffic now existing between Chatsworth and Woodburn, does that go in the direction of Lismore and Casino, or down the river? The bulk of it no doubt goes to Lismore, but a good deal of it goes to Casino. I cannot speak on this point with any degree of accuracy.

225. If the railway were constructed, in view of the growing importance of both districts and the increase of population, is it not likely, when better facilities for travelling were given, that there would be a large increase of traffic between the two districts? Yes; I have no hesitation in saying it would be so.

226. That is generally the effect? Yes; I should say that a dairying community doing well would perhaps travel more than many other sections of the community, because of the monthly cheques paid for milk. The regular monthly payments have a tendency to increase travelling.

227. If residents on the Richmond River—say at Casino or Lismore—wanted to go to Sydney, would they be likely to use this line and come by Grafton? Some little time ago, when the entrance to the Richmond River was not quite as good as it is now, and the boats were perhaps not so large, the people used to travel rather largely over to Harwood to go to Sydney. They would go down the river by boat at night and travel until 1 or 2 o'clock in the morning to catch the boat leaving the Clarence on Saturday morning. If a resident of Lismore wanted to get to Sydney with any degree of certainty as to time he would come by way of the Clarence, where there are better steamers. Getting on to the steamer at Lismore, which is 75 miles from Ballina, means considerable delay to a passenger—the loss of nearly a day.

G. H. Varley. day. This, of course, can be avoided by going by coach to Ballina and catching the steamer there; but I think Lismore passengers would prefer to get into the train at Grafton—that is, if the steamers here were better, as I think they would be if a railway was constructed.

27 Feb., 1900.

228. Taking the ordinary railway fare, would it be less expensive or otherwise to come from Lismore or Casino to Grafton than to go by coach and river? Yes; the return railway fare would be about 13s., and I think it would cost at least 19s. to go the other way.

229. That is taking the river steamer and the coach? Yes.

230. *Chairman.*] In your position as proprietor of a local paper, and holding, as you do, an official position, I suppose you come in contact with a great many people? Yes.

231. Various railway routes have been proposed from time to time;—it has been suggested, for instance, that the line should go from Casino to Lawrence, which, I think it is conceded, would be a much cheaper line than the one now proposed;—would that be a suitable line? It certainly would not be a suitable line as a section of the North Coast railway, because at Lawrence you would have to cross the widest part of the river, and if the river were not crossed there it would be a most expensive thing to bring the line along the river bank up to Grafton.

232. So that, provided Grafton has to be touched, the route *via* Lawrence is out of the question? I consider that the Grafton-Casino proposal is a long way superior to any of the others.

233. With regard to the deviation to the west, at Myrtle Creek, in lieu of the line as originally surveyed from Myrtle Creek straight to Casino, which do you think is the better of those two lines? I am not sufficiently acquainted with the country to give an opinion; but unless there is some good engineering reason for making the deviation, I should say the line ought to go as originally proposed. Very likely, however, the latter route goes over flooded country.

234. You know the country pretty well between here and Casino? I do, from an ordinary layman's point of view; I have been over it frequently.

235. This statement has been put before us in evidence in Sydney: "The country between Grafton and Casino is generally of such a poor character that it will not carry a large population, and does not, in our opinion, justify the construction of the railway";—what do you think of that? I believe that is not correct. An occupier of land at Myrtle Creek will give evidence before this Committee to the effect that he is making a good living fattening cattle in country where he is running a beast to 5 or 7 acres. I refer to Mr. C. Henderson.

236. Is his an exceptionally good bit of land, or is it a fair specimen of the country along the proposed line of railway? It is fairly good country I should say.

237. From Grafton out about 15 miles there is some scattered population, but between there and Myrtle Creek there is very little population, as that country is out of the radius of settlement at the present time. This line of railway has been advocated from time to time mainly as forming portion of the Great North Coast line, but you seem to take the view that, apart from that altogether, it would be a paying concern? I do, for the reason, as I say, that the dairying industry here cannot expand much beyond its present limit, unless there are facilities for bringing the produce to these centres, and I believe the proposed line would do that better than any other means I know of, and there is a demand for dairy country. In illustration of what a railway will do, I might point out that along the Richmond, at Hanging Rock and Jiggi, there is some splendid rich country which I understand has been open for settlement for about six years, but it is just outside the influence of the dairy industry, and on that account, I do not think there is one selection on the whole of that land. This will explain to a certain extent why the country along the proposed line has not been taken up.

238. *Mr. Watson.*] Is the land to which you refer too far from the main river? It is too far away from the influence of a creamery.

239. Is it on the main river—the Richmond? No.

240. *Chairman.*] Both your evidence and that of Mr. See seem to point largely to the fact that the stretch of country between Grafton and Casino would be largely devoted to dairy-farming;—has the experience of people in the district who have gone in for dairy-farming for any length of time proved that it is a profitable and lasting industry? Yes.

241. Not a case of here to-day and gone to-morrow? No; I think if a practical farmer were here giving evidence—a man who has had experience in maize-growing, and who is now dairy-farming—he would say beyond all doubt that dairying was more certain and more profitable than maize-growing. That I believe to be the opinion of those who have had a good deal of experience in both kinds of farming. I do not rely upon the line only as a local line, but I consider it as a part of the North Coast railway, which should be built in sections.

David Baillie, grazier and dairyman, Stockyard Creek, near Grafton, sworn, and examined:—

D. Baillie.

27 Feb., 1900.

242. *Chairman.*] What are you? A grazier and dairyman, residing at Stockyard Creek, in the parish of Copmanhurst. That is about 15 miles north-west of Grafton by the road.

243. What extent of land do you occupy? 640 acres.

244. How long have you had it? Very nearly twenty years.

245. Will you describe the character of the land? I took it up at first principally for the few small flats around the creek, the grass land being very poor indeed, and of sandstone formation.

246. When you went there first what did you do;—did you plant the flat portion? Yes, for corn. I used it for maize-growing.

247. How long did you continue that? Until the dairying industry started, about four years ago.

248. And then, from the experience of others, did you go into dairying? Yes.

249. How many cows did you start with? That I could not say; we had a good many cattle. In October, two years and a half ago, we separated 26 gallons of milk a day, and last October we were putting through 80 gallons.

250. Then you have considerably increased your herd since you started? Yes.

251. How many cows have you at the present time? We are milking ninety. All told, there are about 150 head, including calves.

252. On the 640 acres? Yes.

D. Baillie.

27 Feb., 1900.

253. Have you given up the corn-growing? Yes, completely, except for the use of the house.
254. Do you know the country between Grafton and Casino, along and near the proposed line of railway? Yes, I know it fairly well. I travelled it thirty-two years ago, and I have travelled it frequently since.
255. How does that land compare with the land on which you are now living? It is superior land to the land I am living on, as grass land. The formation is different. It is basaltic, while mine is sandstone formation.
256. What is the formation of the land on the railway line? The soil is more of a clayey description—red soil. It is better grass land by far.
257. The grass will grow stronger and last longer? Yes; and it is much quicker in the spring. I have come from the Richmond in September, and there was a beautiful spring there, and on arriving on the uplands of the Clarence there was no spring whatever in the grass.
258. In regard to the land you last mentioned along the railway line, would it require much clearing to prepare it for cattle? No; a good portion of it is already prepared by Nature, though some of it is thickly timbered. It could be greatly improved.
259. The first expense of a settler taking up that land would be in fencing and paddocking? Yes; he would have to have small paddocks if he wanted to get the full benefit from the land. For instance, if you put thirty-three head of cattle on to 100 acres, you would divide that area into ten paddocks, and put the cattle in each of the paddocks for two days at a time. The cattle would then have fresh eating, and the grass would have the twenty days' growth before the cows would come back. In that way you would almost double the carrying capacity without any expense in improving the grass.
260. Where a settler took up a 640-acre block of that land what do you think he could afford to pay for it per acre so as to make his holding profitable? It is not so much the taking up of the land. When a man takes up land he must have a certain amount of capital. It is not the taking up of the land that is the difficulty; it is getting the capital required to go upon it.
261. What would the land be worth per acre to a man with enough money to fence and do a little paddocking? In some places it would be worth 30s., and in other places not so much. There is a difference along the line according to the character of the country. There are some beautiful black-soil flats on the creeks.
262. The great industry that seems likely to rise in this part of the country is dairying; would land for that purpose be worth from £1 to £1 10s. an acre? Yes; some of it is worth 30s.
263. Is any of it of less value than £1? Yes, there are portions that would not be worth £1; that is, for grazing; but then the timber would make up for that. Where it was heavily timbered it would take a man a long time before he would get grass.
264. Is it marketable timber? Yes; a good deal of it—iron-bark and spotted-gum.
265. As an old resident of the district, and one who is engaged in dairy-farming, do you think that with better communication this tract of country would be likely to be occupied by a dairy population? I do.
266. And you speak disinterestedly because your property is not situated on the line? Exactly; I have no interest whatever in the line.
267. Is the country fairly well watered? Yes.
268. By creeks, I suppose? Yes.
269. In regard to your experience of dairying, have you found it to be satisfactory? Very. I consider that by introducing proper grasses a family can make a living on almost any section of land in New South Wales unless it is barren rock.
270. Do you employ labour? No; my own family milk and separate, and we separate also for our neighbours who have since taken up land.
271. How far have you to cart your cream to a factory? Five miles, and then there is transit by water for 30 miles to the factory.
272. Is that an expensive item? I pay 6d. per can for the 30 miles.
273. What is the greatest distance that you think a dairy-farmer could cart his milk to a creamery, and his cream to a factory? Farmers do cart their milk 5 miles to a creamery; but to do that a man must have a good road, and not a bush track. The milk will carry right enough, but it is very hard upon the man who has to cart it.
274. With a good road you could go 5 miles? Yes.
275. And then to the factory? You could cart cream safely to a factory for 15 miles. I say that, from my experience on the Richmond. At Alstonville a large van lifts all the cream, and takes it into the central factory at Lismore, travelling a distance, I suppose, of nearly 20 miles. In reference to grasses, a new grass called *Paspalum dilatatum*, has been introduced on the Richmond, and I think it would succeed on the class of country between here and the Richmond. I have seen it growing on the model farm at Wollongbar. It does well on clay soil. It is a frost-resisting grass, being very rarely killed by the frost, and is a good winter grass. I have heard that the Government are now asking those who take up special areas of Crown lands to sow *Paspalum* seed. It is very much thought of by the Government. It is a good hardy grass, and will grow in any soil; but it does not do so well with us on sandy soil. On the low clayey flats, where I have sown it, it grows splendidly.
276. *Mr. Watson.*] Much better than the original grasses? Yes.
277. It grows more luxuriantly? Yes; it is splendid grass, and it should do well on the clay soil between here and the Richmond River. It will grow also on low lying-lands. I have seen it growing within a few feet of the bank of the river. There is another new grass called guinea grass. It is eminently suitable for our class of soil. It is the principal grass grown in the eastern portion of Jamaica, where there are 116,000 acres under it. We got some of it from the model farm at Wollongbar, and we have had it now for two years. It is a drought-resisting grass, and will grow on the poorest and the lightest soil. It will grow on the sea beach. I have it growing at my place as tall as myself. If a cow went into it for any distance you could not find it. I have only a small patch, and I am trying to save the seed in order to propagate the grass, and sow it largely on my holding. It grows 4 inches a day in favourable weather. The *Agricultural Gazette* says it grows 6 inches a day; but in my experience it grows 4 inches.
278. *Mr. McErlane.*] You said that the value of the land between Grafton and Casino was from £1 to 30s. per acre;—is that its present value? No; not as it now stands.
279. You are assuming that the railway would be constructed? Exactly. Without communication it is of no value to a settler.

- D. Baillie. 280. *Mr. Watson.*] On your showing we might expect to see dairy farms 20 miles from Grafton in the direction of Casino, even with the present facilities as regards transit. You say you can take the milk 5 miles to a creamery, and a maximum distance of 15 miles from the creamery to the factory. There being factories at Grafton, should we not see some evidence of the taking up of that second-class land within 20 miles of Grafton. Well, it amounts to this: I, as one man, might go and do that, but where am I to get my neighbours. If I were to settle down 20 miles away, my neighbours would only laugh at me. How am I to erect a creamery. The population is not there. There are no means of transit.
281. No one cares to chance it "on his own;" but if the railway were constructed there would, you think, be a gradual spread of population, which would result in the settlement of the country? Yes, for miles and miles. The cream is carted here now for 20 miles by enterprising men, who have their own separators.
282. That is on the richer land? They took the land up for cattle, and there may be a portion of good land on it.
283. Only a portion of good land? That is all.

WEDNESDAY, 28 FEBRUARY, 1900.

[The Sectional Committee met at the Municipal Council Chambers at Grafton, at 10'30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).
JOHN CHRISTIAN WATSON, Esq. | JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Edward Ebsworth, District Surveyor, Grafton, sworn, and examined:—

- E. Ebsworth. 284. *Mr. McFarlane.*] What are you? District Surveyor for the Land Board District of Grafton.
285. How long have you occupied that position? Since October, 1895.
286. How far does your district extend? From Camden Haven, on the south, to the Queensland border, including the Tweed River. I hand in a map showing the Land Board District and the position of the proposed railway.
287. In what other parts of the Colony were you before coming to this district? I was Acting District Surveyor at Dubbo and at Forbes, and I have been engaged in a somewhat similar capacity in the Wagga district, besides which I had fifteen years' experience as a surveyor in the Metropolitan area.
288. From your long service and experience as a surveyor, I suppose you have a good knowledge of land values? I think so.
289. And are a competent judge of agricultural land and grazing land? Yes; my Department always look to me as an authority on land values in the district. I may mention I am also District Commissioner for Land Taxation, and, of course, have to deal with values right through the district.
290. You have done work in connection with the Land Taxation Department in regard to land values? Yes.
291. In your district? Yes; in the Land Board District, over the same area as I have to deal with for the Lands Department.
292. You are also connected with the Land Board? No, except that I furnish reports as required by the Land Act.
293. The Land Board are no doubt guided to a large extent by the nature of your report? A report is always furnished, and no doubt they are guided by the opinion of the District Surveyor, who is an expert officer.
294. If, for instance, they wished to know the value of land applied for under lease, they would take whatever valuation you should determine? They always look to me for a value in part evidence; but the Board fix the appraisement.
295. They would send to you for a valuation? Yes.
296. The proposed railway would for its whole length run through your district? Yes.
297. Have you a good knowledge of the country along the line? Yes. I have a very fair knowledge of it. My business has taken me over and about the whole of the land which would be affected by the proposed railway.
298. That, of course, means that you have a knowledge of it beyond merely travelling along the road? Yes, over the whole area that I expect will be affected. I propose to hand in a map showing the area which I consider will be affected. It shows by different colours the various classes of land with regard to tenure. The area coloured green is a reserve for the trial survey. The proposed route of the railway is shown by a broken red line from Casino to Grafton. The blueish-green colour all over the map represents reserves.
299. What class of reserve—reserves from sale owing to the railway? Yes, and for all other purposes. The lands coloured by a purple tint are alienated as freehold.
300. Free selections mostly, I suppose? No, freehold—principally, I think, auction sales in former times. The pink tint represents conditional purchases and conditional leases in process of alienation.
301. Is there any distinction between the conditional purchases and conditional leases? No; a distinction has not been made in that way, because we regard both as in process of alienation. A distinction has been made by a border of red, which represents homestead selection areas. The uncoloured parts of the map are Crown lands at present available for conditional purchase.
302. I see that some of these are along the route? There are a few; they were in existence before the reserve was proclaimed. For instance, the land at Camira station was alienated before the reserve was made. In connection with this map I will hand in a schedule giving the actual areas of these lands.
303. What distance from the line on either side? The distance varies from about 15 miles down to practically nothing at the Grafton end; and also at South Casino it tails off.
304. Does that apply to both sides? Yes; it embraces a distance of about 15 miles on both sides, except where approaching the terminal points.

305. Is that 15 miles continuous from a certain position at each end? It would be 15 miles back from Myrtle Creek on either side.

306. Between Myrtle Creek and Casino, what would be the average distance on each side of the line that would include these portions? I have made an estimate that it would apply right through the line to an average of about 10 miles on both sides. The figures are as follows:—

E. Ebsworth.
28 Feb., 1900.

SCHEDULE showing areas of different classes of country along proposed railway route, Casino to Grafton.

Classes.	Area	Remarks.
	acres.	
Alienations	93,106	Sold by auction, principally under the 1861 repealed Land Act; also by conversion of conditional purchases into freeholds.
In course of alienation	100,263	Consists of conditional purchases, conditional leases, and homestead selections.
Forest reserves	139,463	The forest reserves will be cancelled as they are cut out of marketable timber, and others be permanently substituted along the Richmond Range, where the finest growth of timber exists.
Railway reserves	23,885	Will be cancelled if railway is carried out, except area required for line and stations.
Other reserves	36,404	Will be largely reduced in the course of settlement, sufficient being retained for ultimate public requirements.
Available Crown lands ..	320,132	Not hitherto in demand except as pastoral holdings, owing to remoteness and want of market. A market has recently become available in the establishment of export butter and bacon factories in the towns.
Total	713,253	

307. With regard to the alienations referred to, of what class of country do they consist? The country alienated is undulating forest land generally, with water frontage and well grassed flats along the frontages.

308. Are most of these alienations at the Casino or Grafton end of the proposed line? At the Casino end.

309. Do they extend right across, in patches—I do not mean continuously? No; they only come out as far as Myrtle Creek from the Casino end—about 20 miles from Casino.

310. There is very little alienation between Myrtle Creek and Grafton? There is very little alienation and very little settlement until you get within 10 miles of Grafton.

311. Is there much settlement between that 10-mile point and, say, the boundary of the town? No, there is not much until you get within 5 miles of the river itself.

312. Have you noticed what these lands have been taken up for—whether for agricultural or for dairy purposes? The land in nearly all cases has been taken up for grazing purposes.

313. That means, of course, principally for dairying? No, not for dairying; they were taken up before any dairying came into the district.

314. I do not mean what they were taken up for in the first instance; but what is the present occupation of those on the holdings? They are now in the act of becoming dairymen; they are changing from cattle-raisers to dairy farmers.

315. Is there any cultivation land on the alienated portion? Yes; there is cultivation land all along the watercourses; but hitherto little of it has been used, because the holders have simply relied upon rearing cattle for sale. They do not at the present time grow much agricultural produce.

316. Not for the market? No, very little.

317. Though, in your opinion, the land in many cases is suitable for agriculture? It is eminently suitable along all the watercourses, and in many other parts, too.

318. Does that apply to the land you describe as in course of alienation? Yes, to both.

319. What class of country is comprised in the forest reserves? The forest reserves comprise generally pretty thickly-timbered country—iron-bark and spotted-gum, mainly.

320. Is it good timber country? Within the forest reserves it is.

321. Is the timber there in large quantities;—is there much iron-bark? Fairly large quantities. Of course, these reserves have been drawn upon for market purposes for very many years.

322. The Government getting no royalties, I suppose? Yes, royalties are paid. The timber is now getting thinned out nearest to access by water, and so forth; but with regard to the timber more remotely situated, the cost of carriage is too great to enable the timber to be profitably removed.

323. That saves the timber;—there is more timber, consequently, in those parts? Yes.

324. Is that land heavily timbered;—would there be any large quantity of marketable timber if there were proper facilities to convey it to the nearest port? Perhaps I might answer your question by pointing out the different main forest reserves. There is a large forest reserve in the parish of Richmond, south of the Richmond Range, and east of the line—reserve 1,101. That contains a large quantity of fine timber, including iron-bark and spotted-gum.

325. Is there much iron-bark? Yes, there is still a considerable quantity of iron-bark there suitable for market, for mill purposes, and for piles and girders.

326. That is the most valuable hardwood timber we have? It is in this particular district.

327. And the other principal variety is spotted gum? Yes. That is a marketable timber, and is largely used. There are a number of forest reserves partly included within the railway reserve about the parishes of Myrtle, Powerpa, and Dark. The forest reserves included within the railway reserve contain marketable timber, but not in any great quantity.

328. What is the reason of that;—has the timber been cut? No; but it grows more open and thinner. The best timber grows on the ridgy land, and it is flat where these reserves are. They have been reserved principally to afford the State royalty, and to prevent the timber from being exploited indiscriminately. These forest reserves within the railway reserve will be cut out and abolished.

329. After the removal of the timber, would the land in these reserves be of a character fit for settlement—fit for grazing? Yes; it would be fit for dairy settlement.

330. Do you know anything about the timber trade of the district? There is a considerable trade in timber done with the Clarence River, and much of the timber is gone from the timber reserves nearest to the river, within the area shown on the map.

- E. Ebsworth. 331. Was that timber cut for export? Yes; and also for local consumption. There are several mills constantly engaged on the river.
- 28 Feb., 1900. 332. In the event of railway construction, do you think the line will be utilised to any large extent for the purpose of conveying this timber to port, either at the Richmond River end or at Grafton? Yes; it would be the means of opening up a very large area of timber that we cannot now get at.
333. *Mr. Watson.*] Would that be mostly about the Richmond Range? Yes.
334. *Mr. McFarlane.*] You have referred to the character of the timber on the forest reserves;—I should like information about the timber on the unalienated land other than forest reserves? The unalienated land is generally what is called open forest land. The trees are not growing so thick that you would call it good forest land, as forest land. It is generally open forest land.
335. The timber is more scattered? Yes; and the grass, of course, is more plentiful. In dense forest country, such as that in these large timber reserves, you see no grass, because the timber is too dense, and there is not enough light.
336. Do the timber reserves include the best forests along the line? Yes.
337. Speaking generally of the unalienated land, could a large quantity of timber be taken for export purposes and local requirements? Yes; the timber, though scattered in open forest on the unalienated land, is frequently of excellent quality.
338. What description? Iron-bark and spotted-gum.
339. Would the unalienated land, speaking generally, be suitable for dairying purposes or agricultural purposes? In my opinion it would be well suited for dairy purposes. Except near Grafton and Casino, and a little at Myrtle Creek, it has not been tried for dairy purposes since the factories started.
340. What is the reason of that;—is it because there are no facilities for conveying the produce? It is partly on that account, because you must have creameries close at hand for dairy purposes—within 3 or 4, or, at the outside, about 5 miles. But hitherto there has been no demand for the land, because there has been no dairying here until quite recently, and there is no other purpose for which it was considered the land could be profitably used.
341. If facilities were given, in the shape of railway construction, is it your opinion that this land would be taken up for settlement? Yes; I am of opinion that it would then be taken up right through, and it would be all taken up.
342. What is the present value of the unalienated land? The present value of the land, in bulk right through, and apart from dairying, taking only the present use of rearing cattle, I should reckon, in its raw unimproved state, at about 15s. per acre over the whole area.
343. What do you think would be its value in the event of railway construction? I estimate an average value right through of about 22s. 6d. per acre.
344. That is an increased value of 7s. 6d. an acre. Yes. I may explain that in that average there will, of course, be portions near the railway, if constructed, that would go considerably higher.
345. You mean that, taking the unalienated land as a whole, there would be an increase of value to the extent of 7s. 6d. per acre? Yes.
346. Could you give us some indication of the quality of the land along different parts of the line? Hitherto there has been no demand, because dairying has only just got a hold here. The starting of the factory at Grafton, by supplying a permanent market, has altered the whole face of the industry, and it has been the same at Lismore and right down the coast to Port Macquarie. Factories are now established at all the main towns—Murwillumbah, Byron Bay, Lismore, Casino, Grafton, Kempsey, Port Macquarie, and Bellingen. It is only within the last four years that we have had these markets. At Lismore they were rather before the others, and have had a factory, I suppose, for six years. They are just getting into it here. The first use made of the factories on this river was by stocking-up the lands already occupied for cane-growing and maize-growing—that is, the portions of the farms lying fallow and not in use. It has taken about four years to fill up the river flats with dairy cattle, and the time has now arrived when, for the extension of the industry, resort must be made to other classes of land.
347. There is no more rich agricultural land available—that is, possessing any convenience? No. I would refer the Committee to a map of the county of Clarence, which shows the rich alienated land along the Clarence River, and, generally, where settlement along the Clarence River at present exists. The alienations, as a general rule, cover fertile alluvial lands. Since the establishment of the central factories on the Clarence it has taken up to the present time about four years to stock-up the river. People at first did not seem to care about dairying. They knew it was paying well at Lismore; but they had been cane-growing all their lives, and did not seem to care about going in for dairying.
348. They have changed their opinion now? They have. It has made an immense increase to the wealth of the district.
349. There is a strong tendency now to increase dairy properties? Yes; in fact it is a certainty that the whole of the coast districts, from the Manning right north to the border, will be dairy country.
350. You consider it suitable country? Yes, though different characters of soil are included.
351. Coming back more particularly to the route of the proposed railway, what area of land would there be, if any, unfit for grazing purposes? None whatever.
352. You think it would all be alienated shortly after the construction of the railway? It is all fit for alienation; but it would not be all alienated immediately, because we should have to deal with those forest reserves rather tenderly. The timber is too valuable to be sacrificed by being allowed to be merely cut down and ringbarked.
353. You think that timber is worth more than the 22s. 6d. per acre which you put down as the value of the land? Certainly.
354. So that some time would have to be allowed for the removal of the timber cut under royalty, and at the expiration of that time the land would be thrown open for settlement? Yes. The forest lands on the coast are so valuable to the whole Colony that they have to be treated with the greatest care. As these reserves become cut out, and parts of them are given up for settlement, we shall certainly substitute an equal, or, perhaps, a greater area of forest reserve elsewhere, and what we substitute will be a permanent forest reserve for all time. Where they will be substituted will be along the Richmond Range and in parts unfit for settlement.
355. How far would these proposed forest reserves be situated from the railway? From 15 miles to about 8 miles, following the range along. It will pay to cart hardwood timber up to a distance of about 15 miles, but it will not pay to take it 30 or 40 miles, except for special orders. 356.

356. These permanent reserves no doubt will be fully timbered? They are fully timbered, carrying some of the finest timber on the coast. E. Ebsworth.
357. And when the timber is removed from the existing forest reserves it will be, in your opinion, not too far to draw timber from the permanent reserves to some point on the proposed railway line? No; the proposed reserves would have been tapped now on account of the excellence of the timber were they not at present too far to haul from. 28 Feb., 1900.
358. That would add materially to the traffic on the railway in conveying this timber to market? Yes; it would be a permanent item of carriage to the railway. I presume the same thing would take effect here that has occurred on the Lismore-Tweed line. There mills have been established at various points along the line, and teams draw the timber in for the sawmills at the railway stations.
359. Does it seem to pay those engaged in the timber trade to use the railway for conveying the timber in that way? Yes, it appears to do so. The railway carries the logs, and also the planks and sawn timber, to the local market at Lismore and other places along the line, as well as to Byron Bay for shipment.
360. Taking the country between Grafton and Casino, embracing the area you have mentioned on each side of the line, how would it compare, in regard to timber, with a similar area on each side of the line between Lismore and the Tweed? On the Grafton to Casino line the timber is all hardwood, of an excellent quality, including spotted-gum and iron-bark. Some of the finest ironbark produced in New South Wales comes from the part of the Richmond Range at present accessible. On the Lismore-Tweed line, the country produces principally softwood timber, special trees that are picked out individually from the scrub, such as beech and teak.
361. Ironbark is principally used for railway sleepers? The ironbark from this district is used for a better purpose than that; it is used for the long bridge girders that are required all over the Colony, and also for export to New Zealand and other places.
362. But I wish particularly to know if the ironbark you speak of is not of the best quality, and if that timber is not principally used for railway sleepers? Yes; it is preferred for railway sleepers.
363. In connection with the construction of the proposed line, ironbark would be largely used for girders in any ordinary bridge work that might take place? I should think so, because there are no very large water-courses to cross. The streams are of small span, and it is a common practice to use iron-bark in bridge construction instead of iron for short spans.
364. In constructing the line, would it not be a consideration to have so much timber so close to the line? I should think so.
365. Would it not mean that the railway could be constructed at a cheaper rate compared with other districts where they have to carry the timber 300 miles? Certainly. There should be enough iron-bark within the railway reserve itself to make all the sleepers, and to provide all the girders—certainly as to quantity; but whether the quality of the timber within the actual reserves would be good enough for girders I would not like to say. The timber, however, could certainly be cut off the main forest reserves, quite handy and adjacent.
366. With regard to the railway reserves, comprising 23,885 acres, mentioned in the return you put in, could you give us some information concerning the character of that land? From Grafton to Myrtle Creek the land is generally of a sandy character, undulating forest ridges, partly openly timbered and partly thickly timbered with spotted-gum, iron-bark, and oak.
367. Is this land specially suitable for settlement? It is, for dairy-farming.
368. Were these reserves made for any special reason? They were made to protect the original survey of the railway line. Beyond the Myrtle Creek, on towards Casino, the land is more of a clayey nature, forest ridges; also partly open forest country, and partly dense forest. The country is well watered by flowing streams, chains of waterholes, and swamps. The water is of good quality. As you pass along the railway route you do not see the best land within the area that would be influenced by a railway.
369. Can you point out where the best land is? I can state pretty safely that the surveyed line passes through about the worst of the whole of the land.
370. How far would the best land be from the line? The best of the land lies on either side, and includes the alienated land, also the unalienated land on either side outside of the reserve; and near Grafton the same remark applies.
371. Can you give any reason for that;—would it be on account of the road taking the cap of the ridge? Partly that. When I say it is about the worst land, of course the worst is close to the actual main road or the railway line, which follow one another closely. I attribute it partly to the traffic along the road—to the soil being worn off the top, and so forth. Still there is a difference. You get a distinctly better class of country a mile or two away from the road on either side than you do along the main road.
372. Will you tell us the reason for making these railway reserves? It was in accordance with the 1884 Land Act, which provided that in trial surveys 1 mile on each side of the line was to be reserved with a view to giving the country the increment in value likely to arise from the construction of the railway.
373. Would you place the same value on this land as the value you placed on the land before, in regard to its present worth, and what it would be worth in the event of the railway being constructed? Along the railway line, my estimate of 22s. 6d. as the additional value would be largely increased, because we might expect that there would be several villages or townships along the road. As some suburban land would come in, I could not exactly say what the increased value would be. We sell no land in suburban areas under £2 10s. an acre, and anywhere near a railway station we might expect a smaller class of settlement. For instance, the men who have employment in the forests like to have small holdings within a convenient distance, and so forth. For such lands along the railways we can generally get from £3 to £4 an acre—that is, for picked pieces.
374. You think that putting all these reserves together the increased value would far exceed 7s. 6d. per acre? Yes; along the railway reserve itself. You can safely put the value of that land down at from 30s. to £2, though that is a rough estimate, because it is all prospective.
375. You told us just now that you had been in different districts of the Colony—Dubbo, Forbes, Wagga, and the Metropolitan area? Yes.
376. I suppose you have a fair knowledge of the country along the Western line? Yes; I have a fair knowledge of the country from Dubbo to Nyngan, and across from Warren to Coonamble. It is all pastoral country there.
377. How does the country along this proposed line compare with the country in the district you have just mentioned? As regards Crown lands there is no comparison. For instance, the land along the Castlereagh River and about Coonamble is very superior land. 378.

E. Ebsworth. 378. I am speaking generally with regard to the different districts along the Western line? It is a little difficult to make a close comparison, because you cannot grow wheat here, for instance, and that is the one thing they can grow there; the climate suits it. The soil along the proposed route, I should say, is equal to a great part of the land between Dubbo and Nyngan. Here we have no alluvial land; it is all undulating and hilly land.

28 Feb., 1900.

379. How would it do for fruit-growing? It would do very well indeed, but there is no market. The hilly lands, except the lower swampy parts, are suitable for fruit-growing.

380. At present you do not think it would be profitable to enter into the fruit industry to a very large extent, although the land is capable of fruit production? Yes, the land is eminently suited for fruit production. Wherever fruit-trees and vines have been grown around the homesteads they have done splendidly. But I put that out of the question, because we have no local market for anything of the kind. Under Federation it would be different, because we should have the two big markets of Sydney and Melbourne. I may say that I have not declared any of this Crown land to be agricultural land, but on a free selection of, say, 640 acres, there will always be a fair proportion of what even the Clarence farmers would call land fit for agriculture; and what a Clarence farmer says is fit for agriculture must be something very good—rich alluvial—or else, in his opinion, it will not grow anything.

381. Taking the general average of the land along this line, how many acres do you consider would be sufficient to keep the family of an ordinary settler? Taking it in the gross, and leaving out such things as small special areas along the railway line, and treating the whole area as dairy country, I estimate the area at from 500 to 640 acres. I should myself not hesitate to cut the land up into average blocks of 500 acres to a family.

382. You think that would be ample to maintain a family? Yes. I can give you proof of that I think. I estimate that when this land was ringbarked its grazing capacity, under dairy conditions, would be 5 acres to a cow, and it seems to me the whole thing hinges on that. That estimate, I have reason to believe, is a fair, and even liberal one. Of course I do not speak of the country in a raw state.

383. When you say a liberal estimate, I suppose you mean it might carry more cattle than a cow to 5 acres? Yes; if I put it from 4 to 4½ acres it would be nearer the proper average—that is, on ringbarked land. With the dairy system of small paddocks and winter fodder crop growing, on 500 acres, a man could keep 100 cows. If eighty of those are in milk, which is a frequent case, the produce is sufficient to keep a family in affluence. From a farm of that size the return from milk alone would be somewhere about £400 a year, besides the return from pigs and calves.

384. You said just now you could give some proof;—have you any figures? The best proof of all, I think, is given by the owner of Woorooloolgan, Mr. Griffiths. He has had to deal with this land for the last thirty years. His sworn evidence before a former Committee was that these lands in the gross or bulk, when ringbarked, would carry a beast to from 4 to 5 acres. That evidence will be found on page 18 of the Report.

385. *Mr. Watson.*] Do you know whether the squatters who held the land prior to the areas being resumed under the Act of 1884 ringbarked prior to that date? They did on their purchased land. The whole of the Crown lands are in an unimproved state right through the district.

386. You referred to Mr. Griffiths; I notice from the evidence he gave in 1889 he said that the greater part of the land between Casino and Grafton was exceedingly poor? Yes; he did say so. It is poor, relatively, in his opinion, because he got hold of the very best land along the flats.

387. When giving evidence on the Grafton to the Tweed railway, before the Public Works Committee, in Sydney, in November, 1889, Mr. Griffiths said:—

Our experience of the Woorooloolgan estate, which has been owned by my father and his partners since it was first taken up, in 1842, has been that we have carefully analysed the quantity of stock carried on the run, and we find, including the good country, that it has taken nearly 40 acres per beast all through.

—? That is not on ringbarked, but raw country—dense timber, where little grass is eatable, from insufficient sunlight.

388. But it would appear from the map that Woorooloolgan is pretty close to the Richmond River? Yes; it goes right back to Myrtle Creek from the Richmond River.

389. Could that station be taken as a fair sample of the general run of country through which the line would go? Yes; the back part could.

390. The back part would be the dairy part? Yes.

391. Towards the river the station would improve? Yes; with rich black alluvial flats.

392. It would appear that Mr. Griffiths included the rich black flats in his estimated carrying capacity of the run? I think not.

393. He states that the rich flats will carry one head of cattle to 2 or 2½ acres, and he says, “and taking the gross and large areas, we can calculate upon running a piece of ringbarked country of 4 or 5 acres to the beast”? The land is only relatively poor. Such land as he calls poor corresponds with that in Central Cumberland. From Campbelltown to Mulgoa the country is exactly the same as the great bulk of this country.

394. Do you know of any instances where men have taken up for dairy purposes within a reasonable distance of the town areas of this second-class land, as we might term it? No, not taken it up; they happen to have it, and they have turned into dairymen. You had the evidence yesterday of Mr. Baillic, and his is a typical case.

395. He has, it appears, some good land which helps his poorer land? Yes; he has flats on the river, but they are very small, and enable him only to grow feed for his dairy cows.

396. In designing holdings along this line, would you be able to give each man a little cultivation land? Yes; we always do that.

397. So that there would not be one unvarying quality over a great area? No.

398. Where the land has a clayey soil, do you think that is good grass growing country? Yes; it is when ringbarked, and more particularly when grasses other than native ones are sown. There is a grass here which has come largely into vogue during the last two years known as *Paspalum dilatatum*. That is the best grass for planting on clayey land. There are other grasses suitable for sandy soil, which as a rule, are better than the native grasses.

399. Will *paspalum* hold right through the winter? Yes, in this climate. We have very little frost here.

400. And there is a good rainfall, which would have some influence? Yes; the rainfall is about 36 inches in Grafton, and about 40 in Casino.

401. Would the average be higher as you approach the Richmond range? Yes; I think it would be about 50 inches almost all round the range. This country when ringbarked grows grass prolifically; but a squatter like Mr. Griffiths, who has his rich river flats, is never able to stock the back country so as to keep the rank growth of grass down, and the native grasses that grow are only succulent and good while they are young. When they grow up a foot or 18 inches high no animal will eat them. So that the country requires to be kept fully stocked, so as to keep the grass within moderate limits, and get the real benefit out of it. A dairyman does that, whereas a squatter, on the scale of Mr. Griffiths, does not.
402. It would seem that there is some Crown lands of this second quality within a reasonable distance of the town of Grafton—in the parish of Clifton, for instance? Yes.
403. That is available at the present time, I suppose? Yes.
404. Can you say why that has not been taken up? Only that they have not got the stock yet to occupy it. It is only just along the river fringes that people have sufficient stock yet to occupy land with dairy cows. It takes some time to rear a dairy herd, and the factories have only been here a comparatively short time.
405. There is a portion of this land in the parish of Clifton that is within the 12-mile limit from Grafton? Yes.
406. It seems rather remarkable that, if land is fairly suitable for dairying, and if a number of people are coming to the district looking for land on which to start dairying, they have not taken advantage of that Crown land? We do not get people coming here to look for dairying Crown land—not at present. They have been attracted north, to Lismore, along the railway to the Tweed.
407. We were told yesterday that inquiries were made here for land by strangers? At the Lands Office we have inquiries frequently for pieces of land along the surveyed route—reserves and water-courses, and so on; but, of course, the land is reserved at present. The only thing I can say about that Crown land near Grafton is, that hitherto such land has not been in request, but it is just beginning to be so. As a matter of fact, you have to ringbark, and that takes a year or so before you can get it into use. If people coming here can rent farms on the river, and turn their cows on the land immediately, and get a return from the creamery at once, they prefer to do that, and there have not yet been, as far as I am aware, many inquiries here for Crown land.
408. With regard to the land in the parish of Clifton, within the 12 miles radius from Grafton, is that open forest, or heavily-timbered land? It is open forest.
409. In that case a man taking it up would, while the trees were dying after ringbarking, get a fair amount of grass from it, with a climate and rainfall like this? Yes; no doubt he would. This particular land you speak of, I know, is suitable for dairying. It is a very fair piece of grass land; but the people originally on the river have shown no inclination to go out, except just where they touch the fringe. Those who have actual frontage on the river show no disposition at all to leave their farms to acquire other lands by conditional purchase from the Crown.
410. In the parish of Lawrence, again, we find a large area of Crown lands; is that similar country to what we have been considering? Yes. It is rather more heavily timbered. In its natural state it is hardly grass country at all, because it is heavily timbered with spotted gum.
411. More capital, then, would be required to take it up? Yes, to get it into order. It would cost about £1 an acre to do the improvements—ringbarking, and suckering afterwards.
412. What is usually charged here for ringbarking land like that? About 1s. to 1s. 6d. an acre; but with the suckering afterwards the cost may run into 7s. or 8s.—probably about 10s. an acre before you got rid of your suckers.
413. But what would be the cost, say, in the open forest land in the parish of Clifton? I think 3s. 6d. or 4s. an acre would clear everything out of that.
414. *Chairman.*] So far the evidence has been with regard to what would happen if the railway were constructed;—can you give us some practical item which would show that a line between these two places would bring in a large revenue? My estimate being 500 acres to a family, the principal item of traffic in connection with settlement would be the carriage of cream and passengers, and also of goods and stores in return.
415. Do you think there would be an interchange of commodities between Grafton and Casino? I think there would be very little, because both produce the same thing; but the railway, I take it, would open up this country for settlement, and be a feeder to the rivers, as any railway along the North Coast would feed the different rivers.
416. Then what you look to mainly to support the railway is the future settlement of people along the line? Yes; I think the time is at hand now, because there are indications of land being taken up away from the river. A few men like Mr. Baillie have begun to find out that you can profitably use these lands; the generally conceived idea up to the present time has been that they could not be so. Of course, you know that a railway by giving access does give a large expansion to settlement. I can show you that in the case of the Lismore line.
417. Suppose a settler took up 640 acres of this land between Grafton and Casino, what would it cost him to start operations as a dairy farmer;—to begin with, what would be his deposit? Assuming that he were located where the value of the land would be £1 an acre—a little away from a railway station, for instance, and where the value would not be influenced by position—he would have to pay at the rate of 2s. per acre deposit. That would cover three years. Then there would be the survey fee, about £11, which would make a total of £75.
418. Then he has to put up his house, which would cost him, say, £25;—what would it cost him to fence? He would require about 5 miles of fencing, which would cost him about £250.
419. What capital would he want to make a start with? They often start with eight or ten cows; but a man capable of taking up 640 acres would probably start with twenty or twenty-five cows. Probably he would have to give £6 a head, and you can put this item down at £100 at a low estimate.
420. He would want to purchase some farming implements, and you might put that down at £10; these items tot up to about £160; in round figures, I suppose, a man to begin in a small way would want about £500? In a small way he would want some capital. If a man goes into dairy-farming on a considerable scale with 640 acres, at the beginning he must have about that amount in capital. The class of men coming up into this Land Board District from the south coast have capital—they bring their own cows, which are capital. They are able to earn an income at once. They get on to rented land, and as long as they have grass to give their cows they get a return from the creamery at the end of the month.

- E. Ebsworth. 421. Have the class of settlers who have started here, and who are now prospering, been men of large capital or small capital? They are men who have been located on the river and who have taken to dairying as an adjunct. But in the case of Lismore, where South Coast men have been coming up, they frequently come with a capital of £700 or £800, and perhaps twenty or thirty cows, and they rent land because there is no grass on country there in its natural state.
422. I suppose it will be admitted that to start dairying a man does require some amount of capital? But there is room for small men all the same. Working on the share system is a common practice in the dairying districts, where a man has no capital. The family of children do the milking, and the landlord, in some cases, provides both capital and land. They have other arrangements, but the usual practice is to share, half and half, so that a man without any capital can come in and get half the profits from a dairy by doing the labour. That is, where the land is all in order, with milking yards, house, and everything.
423. But that applies to places already settled;—we are looking forward to settlement coming on? Cheaper than the ordinary conditional purchase there is another method of alienation, and that is by homestead selection, which suits a man with small capital, because he has not to purchase the freehold or to make compulsory improvements. He puts on just what suits him as he gets along.
424. Do you know of many instances, either here or between Lismore and Murwillumbah, of places being taken up on the share system? It is adapted in places between Lismore and Byron Bay. Many Sydney people took up land when the line was laid out. Taking a block of 640 acres, at the lowest estimate of £6 an acre, it would require a capital of £3,840 to clear, grass, and fence the land. Instead of that being done, the land in many cases was let on clearing leases; and, now that those clearing leases have fallen in, the land is being re-let at 10s. an acre to ordinary tenants, or worked on the share system. Both systems are in common use there. About Casino the share system is in vogue, as elsewhere. They have started it away up in the squatting district, in the north of Casino, where the landlord finds both cattle and land. That enables a man to save money, and eventually to work into a place of his own.
425. Is there anything else that occurs to you? The map I produce shows Grafton and the route of the railway line through the town. The terminal point of the survey is on the river bank opposite the end of Susan Island. Although I believe it is above flood-level there, yet I wish to point out that if the line were raised by embankment, it would be an additional safeguard to the town, which at present is in danger of being entirely flooded. With regard to the Crown land in the parish of Lawrence, shown on the map, it is being subdivided for homestead selection at the present time in areas of from 100 up to about 320 acres.
426. What approximate capital value has been placed on it? From £1 up to £2 10s. an acre.
427. Have you every reason to believe it will be taken up? I am certain it will be taken up.
428. People would not take it up as ordinary conditional purchase land, apparently? No. The reason was because I had it specially reserved for homestead selections.
429. With regard to the Crown land in the parish of Clifton, which has been referred to, are there any roads of access provided through that land? No, it is open. I myself am astonished that that land has not yet gone off. I think the explanation is that people have not yet got their farms stocked up, and do not want any more land about there at the present time. There is very fair grass land on parts of it, quite capable of making dairy farms, and it will go, there is no doubt. Whether this railway is made now or not, it is my intention to do exactly the same as has been done at Lawrence, and set apart this land at Clifton for homestead selection, and all other vacant parishes right out, because dairying has got a hold at Myrtle Creek, nearly halfway out, or 20 miles out from Casino, in the direction of Grafton.
430. So that you think that, even if the line is not constructed, a certain proportion of this land will be taken up under the new form of settlement? Yes, it will go gradually. If it were known that a railway was to be constructed, in two or three years there would scarcely be an acre of that land left, judging from what occurred at Lismore in regard to the spread of dairying. My difficulty, hitherto, has been to get the railway reserve cancelled. I estimate that about 6,000 people would settle here on dairy farms within two or three years, if the railway were started.

Angus McSwan, farmer, Woodford Island, near Lawrence, sworn, and examined:—

- A. McSwan. 431. *Chairman.*] Are you acquainted with the character of the country between Grafton and Casino? I am.
432. Were you in the room when Mr. Ebsworth gave evidence? I heard part of his evidence.
- 28 Feb., 1900. 433. He described the country as far as the Richmond Range as being of a somewhat sandy character, and further on towards Casino as of a more clayey nature;—is that so? Yes, along the road; but away from the road it is of a superior character to that; there are some black, loamy flats.
434. But along the line of road for, say, a mile on either side, it is not very attractive in appearance? No, it is not.
435. Does it improve on either side? Yes; the worst of the land is just along the road.
436. Is it fairly good along the whole length of the line between here and Casino? Yes, parts of it.
437. What do you think it is suitable for? It is capable of growing maize in some parts, also wheat, oats, barley, beans, and potatoes—that is, on the flats.
438. But the flats are only small in area in proportion to the rest? There are some miles of flats between Gibberagee and Coraki. I have been through the whole of that country, and taken particular notice.
439. The class of cultivation which you have just described is what the whole of that country is most suitable for? Yes; I do not think it is suitable for sugar-cane.
440. Is it suitable for grazing stock? Yes, for dairy purposes.
441. Have you had any experience in dairying? I have.
442. On your own land? Yes, on my own land here; and I have properties on the Brunswick.
443. How does that land compare with this in regard to its suitability for dairying? Of course, the brush-land is superior to any other land, but there are good rich flats along the route I have mentioned. There are large tracts of such land well watered.
444. If you had not your own property at the present time, would you like to take up 500 or 600 acres here to get a living on it? Yes; I would, with the greatest of pleasure.
445. What would you do with it? I would go in for dairying on a small scale first, and farming combined. I would grow various kinds of crops.
446. What area do you think a family would want to live on there? It would all depend on the place you selected. With a very rich flat you would not require so much land; but a man might take up a portion of a flat and some ridges that would not be so rich.
- 447.

447. But take the average of the land? A man could live with his family on 320 acres.
448. How many cows could he keep on that area? I consider he could keep one cow to about 5 acres. If it were improved and ringbarked he could feed more stock on it. That is by putting it under artificial grasses.
449. When it was cleared and improved, what would it carry? I think 3 acres would carry a beast easily.
450. Is most of the land around Grafton alienated—I mean the river flats and the rich land? Yes.
451. Do you look upon this land to the north of Grafton as an outlet for a dairying population? Yes, I do; that is, providing they have the means of access to market. Under present conditions there would be some difficulty in the way. But the country between Lawrence and Coraki is hardly known. It is only a bye-track; at the same time there is a lot of valuable land on it.
452. Does it not seem rather surprising that more land has not been taken up, say, within 10 miles north of Grafton on the proposed line of railway? The whole of the land between Grafton and what is called the Cross Roads is taken up.
453. Is that being settled upon and improved? Yes; most of it.
454. Most of it for dairying? Well, dairying is only a new industry in this district, and it is only lately that it has come to be known as a profitable industry. It is extending by degrees away out to the north.
455. *Mr. McFurlane.*] How long have you been engaged in farming pursuits on the Clarence? I selected on this river in 1862.
456. Have you been farming ever since? Farming and grazing combined.
457. With that number of years experience you should be a fair judge of agricultural and grazing land? You would think so.
458. In your opinion, what is the character of the land along the proposed railway line as regards settlement;—is it land that would carry a fair population? It would not carry a very heavy population—not the same as the river banks; but it would carry a fair population.
459. Would most of the land along the line, of which you have a knowledge, be free-selected or leased, if railway facilities were provided? I believe a good living could be made on it.
460. You believe it would be taken up? Yes; I believe so.
461. *Mr. Watson.*] Do you know the land behind Lawrence? I do.
462. There are some Crown lands there;—of what class are those lands? When you get up past Telemorgan, the country chiefly consists of large open flats.
463. Do you think that would be suitable for dairying? I do.
464. Is it taken up? Very little of it.
465. How do you account for that? Chiefly by the fact that dairying is a new industry in this locality. Formerly people went in more for agriculture. Now they find that dairying is a payable industry, and a great many have taken up a lot of country for winter purposes, for which it is very suitable.
466. Do you think that the land near Lawrence is as good as the general run of land through which the railway would pass between Grafton and Casino? Yes; within 5 miles of Lawrence. The land improves all the way to Coraki.

A. McSwan
28 Feb., 1900.

Cornelius Duggan, butcher and grazier, near Clifton, sworn, and examined:—

467. *Chairman.*] Where is your holding? Parish of Clifton, about 10 miles to the north of Grafton and on the proposed line.
468. Of how many acres does it consist? 640 acres; it was taken up as a selection in 1884.
469. What is the character of the land? The land is only fair. It is a sandy, alluvial deposit with clay bottom.
470. Is it watered by creeks? There are some water-courses. It is heavily timbered with ironbark, bloodwood, mahogany, and blackbutt.
471. Have you cleared it much since you have had it? Yes; I have both rung and cleared it. There are about 160 acres pretty well cleared, and about 40 acres I have brought under cultivation.
472. Is the balance ringbarked? Yes. I do not say it is wholly ringbarked. I have not destroyed any of the valuable timber.
473. What do you grow on the portion you have cultivated? I am not a farmer, and what I have grown has been more for experimental purposes than for anything else, except hay which I have grown for my own consumption. I get 2 tons of hay per acre; that is the lowest. It is oaten hay. Of green crops such as rye-corn, I get a yield of from 2½ to 3 tons per acre. Tares grow very well. I have grown from 30 to 35 cwt. of corn per acre. Cow peas I grow for green manuring. I got a packet some years ago from the Agricultural Department, and out of that packet only two seeds germinated, and in the third year I had a yield of 48 bushels as the product of the two grains that germinated. The cow pea as a fertiliser is excellent.
474. Does it grow luxuriantly? Yes. The first year the yield was not very large. By turning over the land and sweetening it it improves, either for agricultural or grazing purposes, to a remarkable extent. I may say that clovers do fairly well, and in a moist season very well. Grapes do remarkably well, and especially the Isabella. Potatoes I have only tried on two occasions. On the first occasion the yield was not very profitable, the season being very dry; but on the second occasion, from about 1½ cwt. of seed I had a yield of about 1½ ton. All that were not considered marketable were put into a 70 lb. sugar bag. Certainly it was a very favourable year. I would recommend green manuring as a factor in improving the condition of the land. This class of land is deficient in humus, and the more green soil you put into it the more it is improved. Anything that comes off the land in the shape of weeds I usually have placed in a pit for manure, and refuse from slaughter-yards and stables is also used by me as a manuring agent. After three years, I found a remarkable improvement in the condition of the land, with regard to grazing, as the result of ringbarking. I think the land is capable of carrying a beast to 5 acres, and keeping the cattle in fairly good condition.
475. Is that what you actually carry? Yes; as nearly as I can possibly say. I have no necessity to have any more—only fat cattle and sheep.
476. How many cattle have you on that land? I have fifty or sixty to-day, including milkers and working horses, and spare horses.
477. Do you use the milkers for sending milk to the creamery? No; only for the use of the place. I am not living on it at present, but I lived on it for ten years until the last year and a half.
478. You work it in conjunction with your town business? Yes. I grow hay, principally.
479. You employ labour to till the land and plant it? Yes. I do not understand anything about cultivation myself.

C. Duggan.
28 Feb., 1900.

- C. Duggan. 480. Your property being along the proposed line of railway, how does it compare with other land in the direction? There is infinitely better land between my place and Casino. I simply took up this property as an acquisition to my business, and not as being a suitable property.
- 28 Feb., 1900. 481. There is any quantity of land as good as, and better than, yours, between here and Casino? Certainly; some considerably better. I have travelled a good deal over that country, bringing cattle and sheep from the Richmond. I have on three occasions brought sheep in that direction from Queensland. It is a long way to travel, and I think the trade would be increased by railway communication with Lismore—the trade in sheep, and probably the passenger traffic would be increased by butchers and others going over to purchase cattle, the Richmond being a large fattening country.
482. *Mr. Watson.*] Where do you get your sheep from now, principally? From Sydney by steamer.
483. Is that the usual condition of things—where do you generally get them from? From Inverell; but it is a long distance and a difficult road to travel stock.
484. *Chairman.*] What did it cost you to ring your land and clear it? The cost of ringbarking and brushing, I should say, was about 3s. 6d. to 4s. 6d. an acre. The land I cleared for cultivation cost me about £8 an acre.
485. That would be cleared when green—is not that rather expensive? Yes. I had to use Rackarock to burst the trees open.
486. Any settler without means would not adopt that plan, but would wait until the trees were dead? Not only that, but they do not usually go down as deep as I have done. I had some idea of perhaps turning it into a vineyard some day, and for that purpose I went down from 2 to 3 feet deep.
487. Have you any neighbours who have similar holdings? Yes; there is a person named Paine, about a mile on the eastern side of my place.
488. What does he do with the land? He keeps sheep on it and cultivates a portion.
489. He has not gone in for dairying? I could not say; I have not seen him for a couple of years. The dairying industry is of very recent introduction here, especially in that direction, and the farmers have not gone into it largely yet.
490. So far, the dairying industry has not extended to your locality? No; I feel quite confident that the dairying industry would do very well on that land, especially if the people had a little capital. From the experience I have had of the place I consider ploughing over the land improves its condition wonderfully.
491. *Mr. Watson.*] With regard to the land on which you have grown 2 tons of oaten hay to the acre, is that higher land, or is it a watercourse? It is not on a watercourse, but on the gradual slope of a ridge, with a north-east aspect.
492. It is not on the flat part of the holding? No.
493. The flats would probably be a little better than the higher land? Yes; I should say they would.
494. *Chairman.*] Continuing beyond you, along the line, is that all fairly well-watered country? Yes; there are Sandy Creek, then Saltwater Creek and other smaller creeks. There are several creeks. I think the country is fairly well watered.
495. Sufficient for dairying? I think so.
496. *Mr. McFarlane.*] Have you a good knowledge of the country between Grafton and Casino? Yes; on the proposed route. I have travelled it a number of times.
497. Is it a similar class of country to that on your holding? Some of it is very much better.
498. You think it capable of producing the class of products you say you raised on your property? Yes, except that probably the yields would not be so large in places, without going to the trouble that I have done by green manuring, and so forth.
499. With similar farming it could be made as productive as your holding? I think so, and a farmer doing the work himself could, of course, carry on operations at much less expense.
500. Do you consider it country that would be free-selected or leased in the event of a railway being constructed? A person from Tenterfield, whose name I cannot recollect, at the time the new Act came into force, was camping for a fortnight out on the land I selected, waiting for the land to be thrown open. I think some months elapsed after the passing of the Act, before it was thrown open for selection. He found out that a mile on each side of the proposed route was reserved from selection, and that prevented him from taking up the land. A neighbour of mine named James told me within the last three months that if the land had been available his sons would have taken up some of it.
501. That would indicate that the land would be taken up if proper facilities for transit were provided? I think so. If the line were constructed, I think there would be a traffic in sheep which would be taken to Lismore, and which at present have to be brought from Wallangarra.
502. But it would not become a sheep-breeding country? I had sheep there for about eight years, especially in flood time. I do not say they would fatten there.
503. This part of the country is not looked upon as good sheep country? I do not think so. Cross-breds would do very much better here than merinos. I keep a few cross-breds. Except in small areas of 30 or 50 acres, I do not think it would become a large sheep-breeding district.
504. It is more suitable for cattle? Yes.
505. *Mr. Watson.*] With regard to green manuring, how long does it take in this district to get a crop of cow-peas planted and ploughed in again after it has reached a fair height,—how long is the ground kept out of use while you are manuring? About five months.
506. So that the ground would be practically out of use for one year? Yes.
507. Having done it once you would not need to do it again for probably three or four years? No.
508. What do you reckon it would cost per acre for cow-pea seed, taking the market price? I think you can buy it now for about 4d. a lb., perhaps less.
509. How much do you sow to the acre? It is sown like maize, 3 feet apart, and 4 feet between the rows. In a favourable season the vines spread all over the place, and grow most luxuriantly. I do not think it would cost much per acre.
510. If a man were dairying he would only require to treat, in that way, sufficient land to grow hay for winter feed,—he would not attempt to treat all his holding in that way? No; he might do about 10, 15, or 20 acres.
511. Your land, about which you have been telling us, adjoins the unoccupied Crown lands in the Clifton parish, coloured white on the map, and situated west of the proposed line? Yes.

Frederick Vernon Hunter, licensed surveyor, Grafton, sworn, and examined:—

512. *Mr. Watson.*] Have you been long in the district? Four years in the Clarence district; previous F. V. Hunter. to that I was on the Richmond.
513. Are you fairly acquainted with the road from Grafton to Casino? Yes. 28 Feb, 1900.
514. How would you describe the land generally between here and Casino? I should describe it as consisting of low undulating forest ridges covered with spotted gum, ironbark, bloodwood, and oak timber.
515. And the land itself? Varying, of course; richer in the valleys and gullies than on the ridges generally.
516. Would the valleys differ essentially in their characteristics from the ridges? The land would be richer.
517. And as to the character of the soil? The valleys contain more alluvial soil—deposits washed from the ridges.
518. Which class of land preponderates? I should say they would be about equal in area. The flats and the low-lying country would about balance the undulating ridges. That is, speaking roughly.
519. With regard to the ridges or higher land;—of what class do you regard that? Fairly good grazing country. I may say parenthetically that it is a well-known fact in the district that no country improves so much under ringbarking as spotted gum country. That, I think, is admitted by all practical men in the district, and that class of country predominates on the ridges.
520. Do you think that the higher land is suitable for dairying? Undoubtedly, I do—improved, of course. It is good, hard, dry country; sound in every respect.
521. Do you think the distribution of low and higher country is such as would permit of a man getting a little of each in the designs for small holdings? Yes; that is just my idea. I think that by judicious subdivision it could be so arranged.
522. What sized holding do you think would be necessary? I should say from 500 to 600 acres; I should say 600 acres as a maximum area, and I should go even as low as 300 acres. But I should suggest that it be dealt with according to the conformation of the country, without any hard and fast rule. You might even have an area as low as 100 acres in extent, for we must consider the immense number of people who have to be provided for.
523. As to water, would a man require to make dams or tanks? I think it could be so arranged that there would be a natural supply of water in each block; but if not, water could be easily conserved, either by damming or by sinking. Excellent water could be obtained at very little expense. One of the most striking features of that country is its excellent water supply.
524. You have, no doubt, had experience in other parts of the colony? Yes; on the Richmond for eighteen years, and in the Illawarra district for three years.
- 524½. From your experience at Illawarra, more particularly, you would have some idea of dairying possibilities? Yes; including the Clarence, I have been over twenty-five years in dairying districts; in fact, I was a pioneer on the Richmond.
525. Is it your opinion that, properly handled, this would become a better, or as good, a dairying district as Illawarra? The country in Illawarra, as you are aware, was originally all brush land. It would come more under the same treatment as the dense brush land of the Richmond River, and we know that the initial expense of bringing that land under dairying is £6 or £7 an acre.
526. Taking the general run of the Illawarra country, how would it compare with the country between Grafton and Casino—I mean with regard to dairying? I think the conditions in this part of the country are better than at Illawarra, because here we have a much milder winter. In the Illawarra district they have a hard, long winter, and a most trying one. Then, again, the whole of the Illawarra district, as regards dairy country, could be put into one of our creeks. There, the country runs away into inaccessible gorges, while here we have miles and miles of accessible country.
527. You think the country between Grafton and Casino would compare favourably with that in the Illawarra district? More than favourably, because, as I say, there is little or no winter here.
528. I suppose, because of that, grass will grow here at times when in Illawarra it would not spring at all? You would not require half the winter feed.
529. Have your observations of this district, during the last four years, and your previous experience further north, given you an idea as to the regularity or otherwise of the rainfall, and whether it comes at suitable times for keeping the grass on the move? My experience on the Richmond River was that we had too much rain. It is quite a common thing, both here and on the Richmond, to hear people talk of three weeks dry weather as being a very serious thing.
530. Does the rain fall with that regularity that would ensure steady growth? During twenty-five years' experience of the northern rivers I have never seen what I would call a drought. I have never known what it is to be without a blade of grass of some sort or other. In fact, I may say that droughts are unknown.
531. Is there anything else you would like to mention? The Members of the Committee appear to be surprised that the dairying industry has not made greater strides outwards from Grafton. I may say that when I came to take up work here, four years ago, I was nearly idle. There was nothing to do; in fact, the district was bankrupt. The people in nearly all parts of the river were practically insolvent. Sugar went down in one fell swoop from £40 a ton to £20. Old settlers had to pledge their estates, and farmers became financially embarrassed. At such a crisis the dairying industry presented itself as the only outlet, and I need hardly say how the industry has prospered within the four years that have followed. The factory at Grafton, which was only then started, has made astonishing progress, and everywhere there is evidence that the people are picking up and fast becoming in a more solvent position, being able to stock the land to an extent they were unable to do previously. Personally, as a surveyor, I have been kept well employed. People who live in Sydney have no conception of the possibilities of the dairying industry in these districts.
532. What you say, then, accounts for the dairying industry not having extended to the lands much beyond Grafton? Yes; people had their hands full. But now the industry is beginning to expand, as evidenced by the greater quantity of land that is taken up.
533. Have you had any inquiries for land from people outside? I have been continuously employed, and land has been taken up almost as quickly as I have measured it. I have been busily engaged during the last four years in cutting up land—a great deal of it under conditional purchase.

John Henry Munro, stock and station agent, Grafton, sworn, and examined:—

J. H. Munro. 534. *Mr. McFarlane.*] How long have you resided in this district? I came here in the year 1873, and I have resided here permanently ever since. I started business here in my present occupation on the 1st
28 Feb., 1900. January, 1894.

535. Have you a good knowledge of the country between Grafton and Casino? A very intimate knowledge.

536. Extending back for how long? Twenty-five years.

537. What is your opinion of the general character of the country with regard to settlement? It is good, fair, grazing land.

538. Does that apply to the whole district? Yes; you might, of course, find a little spot not as good as the rest. The ridges are good, sound, grazing land, and the flats with the wash of the soil from the ridges contain fair alluvial land.

539. Is it well watered? Very well watered indeed.

540. For the whole distance? Yes; you have no occasion to carry a water-bag between Grafton and Casino.

541. In a season of what is termed drought, would there be plenty of water for stock purposes? The farmers here call it a drought if the dry weather extends over four weeks. My experience of a drought in the western country, where I spent twenty years, is that sometimes we had eighteen months without any rain. Judging of the two places, I do not think we know what a drought is here. There is certainly never any want of water for stock.

542. Not even in a dry season? We really never have what I call a dry season.

543. When you describe this as fair country does that apply to, say, 10 miles on either side of the survey? Yes, roughly.

544. It is similar country? Very similar country. In fact, the country off the road is better than the country actually along the road. You must understand that the road is taken over the tops of the ridges, and consequently it is harder country. As it dips down from the ridges it gets better; you get more on the creek flats.

545. Do you think the country would be well suited for dairying? I am certain it would.

546. And what is your opinion of it with regard to agriculture? It would be suitable for certain crops. One great reason why these lands were not taken up when they were thrown open was because the people who came to this river originally settled on the rich alluvial banks of the river, and they would not go and look at anything else.

547. They naturally took the best land first? Yes; and anything that was not almost as good as that they would scarcely look at. In travelling through this Colony and through Queensland and Victoria, I have seen land fully taken up which is not to be compared to the land between Grafton and Casino; but then they had not to put against it our rich river flats.

548. Is there a very large area along the proposed route that is not yet alienated? Yes; it has been reserved.

549. But beyond the 1-mile reserve on each side of the road there are large areas of land not alienated? Yes.

550. In the event of a railway being constructed, do you think that land would be likely to be free-selected or leased? I am certain it would. I may say that in my business I have two or three applications daily from people who want land, and where we had any amount of land for lease four or five years ago, before the dairying industry started, there is scarcely a lease to be got at all now. The people will not part with the land at almost any price.

551. In your business capacity as an agent you have frequent applications for land—is that for leasing land? Yes. I cannot fulfil them, because those who are already within any reasonable distance of Grafton are utilising their lands and will not give them up.

552. Have you a good knowledge of stock? I ought to have; I have been amongst them for fifty years.

553. What area of land along the road do you think it would take to form a complete holding, sufficient to maintain a family? I think 500 or 600 acres would be a fair thing.

554. In the Richmond River district, and particularly the upper part of it, there are a number of graziers? Yes.

555. Do any fat cattle come from that part? Yes; I have known that portion of the district—the northern side of the Richmond River—for twenty-five years. It is a very rich district.

556. Is there any traffic in fat cattle between the Clarence and the Richmond? Yes; most of the Lower Clarence, say, from Lawrence down, is pretty well supplied from the Richmond. The upper portion, nearer Grafton, is mostly supplied from Clarence River stations.

557. With your knowledge of this particular portion of the district, is there anything else you would like to say? I may state that my business for the last twenty-five years has taken me from here to the Tweed. Formerly, in the boom time, I had an office in Casino, and one in Lismore, and I used to make monthly trips from here to the Richmond, and two or three times, or three or four times, in the year, over to the Tweed, selling lands and valuing lands; and I think there is one thing that probably might not have been brought under your notice, and that is the difference between dairying land that will only cost you a capital value of so much, and other land which, when improved, may be of greater value, but which, with the cost of improvements to make it available, would be much dearer land to dairy on in comparison with the land between Grafton and Casino. For instance, take the scrub lands of the Richmond. I do not think you can put them under grass under something like £6 an acre. You certainly could not clear them and stump them ready for cultivation under £10, and in some instances £12 an acre. In regard to the country between Grafton and Casino, you could ringbark it for 1s. 6d. or 2s. an acre. I am not talking about clearing the brush, but simply ringbarking. There are contracts all over the place at that price, and I am certain, from my experience here, that ringbarking, after two or three years, doubles the carrying capacity of the land, and as time goes on more than doubles it. The longer it is ringbarked the heavier you can stock it.

558. Have you taken notice of the timber growing on the land between Grafton and Casino? Yes; there is a lot of very good timber there.

559. Is the land heavily timbered? It is in patches; but I would call it a fairly timbered country, as regards the land through which the road goes. There are patches of heavy timber, but it is not by any means

means an expensive country to ringbark, and, if ringbarked, it would, in two or three years, double its natural carrying capacity. J. H. Munro.

560. *Chairman.*] With your long knowledge of the different districts, do you think there would be any interchange of traffic or trade between Grafton and Casino? I do. 28 Feb., 1900.

561. In what respect? A question was asked just now as to the Upper Richmond—that is, the northern side of the river from Casino up to Kyogle. I know that country very intimately, and, in fact, I know every inch of the Richmond, and I know that freight from Sydney to Richmond is more expensive than freight coming here. When you come to Coraki, where the north and south branches of the Richmond meet, any goods for Casino have to come up the South Arm, and for this purpose have to be unloaded at Coraki and put into lighters, which bring them within 3 or 4 miles of Casino, from which point they have to be carted. It would be much cheaper for the people, both at Casino and on the Upper Richmond, to have their stores brought this way and taken straight by train. It is true that, on the Upper Richmond, the land is mostly in the hands of private individuals, still it is good land, and would settle a large population.

562. Then it would be chiefly goods consigned from Sydney to the Richmond that would feed the railway? Not exactly goods to Richmond, but to Casino, because the ocean steamers go right up to Lismore. It is a well-known fact that the Richmond is not a first-class maize-growing district. At certain times of the year maize from the Clarence, the Manning, and other places has been sold in Sydney, put on board the steamer, and taken to the Richmond River. If there were a railway that would all be obviated, because the maize would go direct from here.

563. Do you think that the line would pay in itself, irrespective of its being part of a national line? Probably it might not pay for a year or two, but I am positive it would do so eventually. With reference to that, I might say that a great many of the settlers on the Richmond went from the Clarence River, and yet these two districts—two of the most populous districts in the Colony—though they are only about 50 or 60 miles apart, might just as well be separated by 500 or 600 miles. I think that the interchange of visits that would take place would create a considerable passenger traffic on the railway.

564. *Mr. Watson.*] I think you stated that most of the fat cattle come from the Richmond? No; I said that the lower part of the river was mostly supplied from the Richmond and the upper part from the Clarence.

565. Does the land between Grafton and Casino supply any fat cattle to the local market? Only a few. I may say that it is almost totally unimproved.

566. How do you account for that;—how is it that there was no ringbarking done on the leased land between Grafton and Casino prior to the leases falling in? If the lessees had ringbarked the country, and made it available, it would have been selected, and they would have lost it.

567. And, unless ringbarked, it would not be a fattening country? No.

568. Would it if it were? Certainly. The Camira paddocks fatten stock.

569. You have had a good deal of experience in estimating land values;—what value would you place upon the land between Grafton and Casino, taking it in the rough, as it is? Certainly not less than £1 an acre.

570. If a railway were taken through, what do you think should be its value? I should say it would increase 50 per cent.

571. Do you think it would be worth while for a man going in for dairying to pay 30s. an acre for it on an average? I am quite certain he could do better in that way than by taking up scrub lands and paying £6 an acre to put it under grass, and it is not then under grass for about two years. I assessed all the Clarence River district for the Crown, under the Land Tax Act, and I am a valuator for the A.M.P. Society. I was also the first valuator in the northern districts, under Torrens Act. I may say that during severe droughts in the west we must have had 8,000 or 10,000 cattle sent here to save their lives. They came from Moree, and in that direction. They got through and went back again, otherwise they would have died. In reference to my evidence with regard to the carrying capacity of the country affected by the proposed railway, I may say that there is a run called Bungawalbyn, about 40 or 50 miles from Grafton, on the east side of the proposed line. It lies at the back of Coraki, but further towards the line. It contains a total area of 56,868 acres. Out of that only 50 acres are freehold, and 4,883 acres are conditional purchase land, the rest being under pastoral lease and occupation license. Only about 5,000 acres have been in any way improved—that is, the purchased land and the conditional purchase land. It carries 5,190 head of cattle, 85 horses, and I believe that within the last two or three months 400 head of store bullocks have been sold off it. This makes a total of 5,675 head of stock depasturing on 56,868 acres. This bears out the estimate I gave of a beast to 10 acres. Nearly all the land on the run is unimproved. The station has been placed in my hands for sale within the last month. A great portion of the proposed line goes through the Camira run. That country is not improved, and is held mostly under Government lease, and is used for breeding cattle. Those cattle when of sufficient age are shifted to Mr. Vickery's fattening station on the Hunter, and other places.

Duncan Beatson, ex-Mayor of Grafton, sworn, and examined:—

572. *Chairman.*] I believe you are ex-Mayor of Grafton, and have been carrying on business in this town as a butcher and auctioneer? Yes. D. Beatson.

573. For how long? Twenty-eight years. 28 Feb., 1900.

574. Then you have an extensive knowledge of Grafton and the surrounding country? Yes.

575. Are you prepared to make a statement? I can speak from a knowledge acquired in my occupation as a butcher and auctioneer. I have seen most of the country between Grafton and Casino, on horseback, mustering cattle, and I do not think there could be a better opportunity of seeing country than in that particular way, because you travel over the most part of it. Referring specially to dairying, I may mention that I was reared on a dairy-farm in the Illawarra district, and I can say, from my practical knowledge and from my observation and experience of both districts, that the country between Grafton and Casino is better, generally speaking, than that in the Illawarra district. Taken as a whole, it is better, for some portions of the Illawarra district are very poor indeed.

576. Especially for this purpose? Yes.

577. This country is well watered, easily cleared, and favourable to the growth of suitable grasses for dairy cattle? Yes. It is fairly good grazing country. I do not speak of it as alluvial brush land at all, but

- D. B. Watson.
28 Feb., 1900.
- but as fairly good grazing country. The description which Mr. Hunter gave is, I think, a truthful one—undulating country, a great deal of it being spotted-gum ridges. As Mr. Hunter said, anyone who has had any experience about here of spotted-gum ridges knows that, of all other timber country in the district, that class of country improves most by ringbarking and clearing. These particular ridges which, under timber, grow absolutely nothing, become very fine grazing land when cleared.
578. Coming from the Illawarra district you might be able to tell us in what direction we are to expect the population to settle on this kind of country? In my opinion there will be no settlement, except a very slow and gradual one, without a railway. If a railway were even sanctioned between here and Casino, I am satisfied that people would commence to look about to see if they could acquire the land. That would occur even before the railway was started, if there were a certainty of its being carried out.
579. From your practical experience, can you tell us about the distance that a dairyman can afford to cart his milk to a creamery? I have known dairymen to cart milk as far as 1½ miles, but they get tired of that very soon. I think about 5 miles on a fairly good road is far enough to cart milk.
580. Does the milk suffer after that distance, or is it a matter of labour? I think the milk suffers, but the man's horses and carts and time suffer more.
581. In both respects it is a disadvantage to have to go a long distance? A very serious disadvantage.
582. Could you give us any reason explaining why we do not see any more settlement already outwards from Grafton along the line, seeing that some of the lands are within reasonable distance of the creameries? There is not a creamery within reasonable distance of the unoccupied country. With regard to the particular locality in the parish of Clifton, of which the Committee have spoken, that is at the extreme southern end of the range that divides the two waters, and anyone who is acquainted with it knows that up at Mountain View the poor class of country goes right to the river, and that that land is such a distance away that, though the edge of it might be within reach of the creamery, there are no roads. In addition to that piece of country, from a point near Mountain View, extending on both sides of the range up to Coaldale, there is perhaps the worst piece of country you could find in the whole Northern district, and there is only a comparatively small patch of that within 8 or 10 miles of the proposed railway line. It is infinitely worse country than anything between here and the Richmond.
583. You think the development of a dairying population would be gradual? It would be very rapid if the people had a railway, but without a railway it must be necessarily slow. Just now, the men who are dairying are doing so on the alluvial flats, and though there is an inquiry for the outside land, and a great deal has been sold quite recently, it is only for paddocks for surplus stock, and not strictly speaking for dairying. But if there were a railway line the people would know that creameries would be established, and the country would then be taken up. What would be the use, however, of a man going there if he had to cart his cream 15, 20, or 30 miles to Grafton.
584. The river flats, and the lands adjoining the river, have until lately been almost exclusively used for crops? Yes.
585. They are now developing into part dairy and part cropping lands? A great many of the farmers are using at least half of their land for dairying.
586. Do you think there is any fear of all that land being used for dairy purposes—it being so much richer and better than the land along the railway line—and the population there developing entirely into a dairy population, and not taking up what would appear to be the inferior land away from the river? I do not think you need fear that. There is a demand for land now. People are every day seeking to rent land, and it is not available—people who have not the means of purchasing.
587. Do you think that people are disposed to take up fresh land, country such as we are now considering? Some of them are not in a position to do so. One of the things that has prejudiced people against this particular country is the fact that men have taken it up who had not the means to utilise it. As you go along you may see some abandoned holdings, and that, I think, is mainly due to the fact that those who took them up had not the means to work them.
588. By that you mean that it is not exactly a poor man's country; but that a man would require to have some small means to start operations? It would not matter who acquired the land. If it cost them something they would have to let it to a tenant, if they did not work it themselves. I daresay a great deal of that land would be acquired by men who have capital, and who would subsequently let it on lease, or on the halves system, for dairying. A great number of men who are quite capable of running a dairy have not the means of doing so.
589. You think the halves system would come into operation? It would obtain in some cases, no doubt. Some men taking up country between here and Casino would make a failure of it, while others would succeed.
590. Have those people who have come here and engaged in dairying succeeded fairly well? Most of them have succeeded. It has made an extraordinary difference in this district.
591. Do you agree with Mr. Munro's opinion, that the land could be cleared for 1s. 6d. or 2s. an acre? I do; it is not difficult land to clear.
592. And do you think that the fact of clearing it would make it double its carrying capacity for stock? On the timbered country, to which reference has been made, the marketable timber would be a source of income to the man who had the land, while, at the same time, clearing would be effected. I may say that I have had fat cattle off the whole of the country between here and Casino. It is quite capable of fattening cattle. I remember an incident that happened to me at Myrtle Creek some years ago. A man induced me to go there to look at his cattle. When I saw the country I was passing through I said to him, "There is not much use taking me down here to look at your cattle." We were then passing through unimproved country. When I got to his home and went into his paddock, which he had ringbarked and improved, to my utter astonishment I selected eighty head of prime fat bullocks out of about 200. That is something which happened within my own experience on what they call absolutely poor country.
593. If a railway were constructed between Grafton and Casino, the main item of revenue would be dairy produce? I think the principal part of the business conducted by the people who would settle on the country would be dairying; but the country is capable of growing all the things that have been mentioned to the Committee, and no doubt these would be largely grown if there were a demand for them—such as hay for making chaff, and all the products already mentioned.
594. Do you think there would be any produce sent from the Richmond to Grafton? Perhaps not a great deal. I should not expect very much at first, at any rate. But I think the passenger traffic between the

the two places would exceed the average that might be taken, as a rule, in other places, owing to the close proximity of the rivers, and to the fact that many of the people are related to one another. For that reason, I think there would be a large interchange of traffic, especially on account of the convenience. Take my own case. I have not been on the Richmond for two years. If there had been a railway I would have been there three times within the last six weeks, for then I could have got there and back speedily. There are, no doubt, other cases of a similar kind.

D. Beatson.
28 Feb., 1900.

595. Is there a direct line of coaches between here and Casino on the line we shall travel? No; you have to go to Lawrence to get a coach to Casino. In my opinion a great many of the witnesses have not spoken as highly of the country between here and Casino as I think they might have done.

596. *Mr. McFarlane.*] It has been stated by a number of witnesses that if the proposed railway were constructed the whole of the unalienated land would most likely be free-selected or leased—is that your opinion also? Yes; I certainly think there would be a rush for the land.

597. It has also been stated that the reason why there is no more settlement along the route is because there are no means of getting the produce away? Yes; that is a fact.

598. Do you know any rich portions of this district that are not settled for the same reason? Yes; plenty. There is plenty of splendid brush land in this district where there is not a soul living.

599. Could you name any particular place? There is brush land out here to the south, and there is brush land up at the head of the river. Up about Yulgilbar there is plenty of good land. But a man would be mad to go there under existing circumstances. It is the same with the scrub land out here. The people locally know all about its existence, but they do not attempt to go there.

600. For the same reason—that there is no settlement between here and Casino? Yes. They know the land is there, and they are waiting for something to happen to enable them to get on to it. I should like to mention something which has just occurred to me with regard to the evidence of Mr. Baillie about his place at Copmanhurst. I have a personal knowledge of that place, and I can say unhesitatingly that the land is much inferior to that between here and Casino, and if Mr. Baillie can make a living there, then there is absolutely no doubt a man could make more than a living on the country between here and Casino if there were a railway.

601. And by all accounts Mr. Baillie is doing very well? So I understand.

Henry Jordan, piano and music dealer, Grafton, sworn, and examined:—

602. *Mr. McFarlane.*] Can you give us any opinion with regard to the traffic between the Clarence and the Richmond? In regard to the traffic that would be created by the construction of a railway—the passenger traffic connected with various branches of sport would, I think, be very large. At present there are no facilities for cricket and football teams to exchange visits with the Richmond. A Grafton team going to Lismore has to go down the Clarence to Chatsworth, then across to Woodburn, and up the Richmond River. There has only been one visit of a football team to Lismore this year, and I do not think it is likely to be repeated, as the journey takes too long, and the men have to go without sleep. In the event of railway construction I believe there would be a big interchange of visits among the sporting sections of the community, and in connection with races, shows, and so forth. The shows being held on different days, the exhibits at Grafton, for instance, could be sent on direct to Lismore if there were a railway, and *vice versa*.

H. Jordan.
28 Feb., 1900.

603. Do many visitors usually come to the annual show here from the Richmond? Yes.

604. And do many go to the Richmond shows from Grafton? I do not think so many go from here.

605. Is it your opinion that this class of traffic would be considerably increased if there were railway communication? Certainly.

606. Is there anything else? Only in connection with my own business. Though perhaps it may be a small matter, it goes to show how traffic would be created on the line. For some years past I have several times engaged companies to come up here from Sydney and give concerts; but I had to discontinue doing so, because it did not pay, as the companies could only show at Grafton, and then they had to go back to Sydney. If a railway were in existence they could go on to Brisbane.

Thomas Page, accountant, Grafton, sworn, and examined:—

607. *Mr. Watson.*] What is your occupation? I am an accountant. I have been a resident of Grafton for forty-five years. I am also Returning Officer for the Electorate of Grafton.

T. Page.

608. I understand you have some figures in relation to the town and district? Yes. The following are the figures in regard to population:—

28 Feb., 1900.

Population of the Police District of Grafton.		Population of the City of Grafton.	
1895	19,514	1895	5,046
1896	19,526	1896	5,082
1897	19,733	1897	5,115
1898	20,595	1898	5,321
1899	21,245	1899	5,750
1900	21,357	1900	5,862
Increase in five years	1,843		

The district includes the electorates of Grafton and The Clarence, with the exception of Solferino; it includes all the towns between Grafton and the Heads, and extends up the river above Copmanhurst, and also includes Dalmorton, on the south side of the river. In the electorate of Grafton the number of electors on the roll is as follows:—1894-95, 2,111; 1895-96, 2,094; 1896-97, 2,074; 1897-98, 2,105; 1898-99, 2,222; 1899-1900, 2,321. I also give the following figures with regard to the Borough of Grafton:—

Income of the Borough, 1899	£2,119
Capital value of ratable property	£384,000
Number of homes	889
Electors on roll (municipal)	873
Buildings erected and in course of erection, 1899	£6,125
Amount expended on public buildings since 1892	£35,000

The

T. Page. The following are the figures relating to the Municipal District of South Grafton :—

28 Feb., 1900.	Income for 1899	£567
	Capital value of rateable property	£66,000
	Elector's on roll	168
	Value of buildings erected, 1899	£5,000

609. Can you tell us whether the income in each of these instances is independent of Government subsidy? Yes; the two municipalities are beyond the stage of endowment.

610. Are there any debts owing? There is an indebtedness of £4,700 by the Municipality of Grafton for drainage and special work. The last loan was raised for the purpose of improving the main street in the borough, and partly also for the renewal of a previous loan. The following are the figures relating to stock in the police district of Grafton :—

	Horses.	Cattle.	Sheep.	Pigs.
1899	17,432	91,011	2,116	11,836
1898	16,480	86,917	1,199	11,538
Increase.....	952	4,094	917	298

The particulars in connection with the Grafton post-office are as follows :—

193 mails despatched weekly.
14 weekly to Richmond River.
262,900 letters posted at Grafton, 1899.
121,500 newspapers posted at Grafton, 1899.
£3,022 revenue from sale of stamps.
2,411 money orders issued for £3,886.
..... money orders paid, £1,450.
774 deposits made in Savings Bank to the amount of £6,270 in 1899.
384 accounts open on 31st December, 1899, with balances to credit of £13,153.
14,592 telegrams sent; £1,100 receipts from telegrams.
38 private boxes let.
5 subscribers to telephone service.

I also give the following extracts from abstracts published in the *Government Gazette*, giving information in regard to the Grafton Branch of the Savings Bank of New South Wales, for ten years ending 31st December, 1899 :—

On 31st December.	Number of Depositors.	Balance to Credit.
		£ s. d.
1890	748	27,303 6 1
1891	740	27,161 9 6
1892	765	27,180 3 5
1893	742	24,505 15 4
1894	776	28,932 3 4
1895	800	32,311 19 6
1896	805	33,108 16 8
1897	826	35,434 1 10
1898	870	40,449 18 4
1899	928	44,920 15 8

The following are statistics relating to the Grafton Hospital for a period of seven years :—

Year.	Indoor Patients.	Outdoor Patients.	Government Endowment	Local Revenue.
1893	159	40	£ 274	£ 343
1894	153	52	253	307
1895	153	68	253	400
1896	186	52	376	500
1897	218	122	328	303
1898	252	397	292	529
1899	247	439	453	633
Total	1,368	1,170	£2,229	3,015
	In Patients	1,368		
	Total Patients .	2,538		

Medical Staff, 4.—Nursing Staff: 1 Matron, 3 Trained Nurses, and 1 Probationer. Value of Buildings, £3,750.

I have prepared figures in reference to the Grafton Benevolent Asylum, which are as follows :—

	Local Revenue.	Government Endowment.	Indoor Patients.	Outdoor Relief
	£	£	£	£
1893	398	*1,066	13	893
1894	146	96	7	750
1895	162	376	9	776
1896	205	484	16	625
1897	174	133	15	455
1898	241	212	17	454
1899	216	380	18	407
	1,542	2,747	95	4,360

* Includes £750 special grant for food relief.

In regard to the registered Friendly Benefit Society, I also supply these figures :—

	Registered Members.	Total Funds.
1899	571	£5,300
1892	472	3,200
Increase	99	£2,100

Manchester Unity, the Ancient, and the Royal Order of Foresters—Three lodges.

The

The Grafton Lighting Company has a capital of £8,000 in £1 shares, with a reserve fund of £1,525. It declared a dividend in 1893 of 6 per cent., and since then the dividend has been 8 per cent. per annum. Shares quoted in 1895 at 16s. and 18s., are now quoted at 24s. 6d. The company's mains do not extend beyond the boundaries of the borough. I have obtained the following figures with regard to the Grafton ferry service:—

T. Page.
28 Feb., 1900.

RETURN of traffic between North and South Grafton from 1893 to 1899, inclusive.

Year.	Foot passengers.	Horses.	Vehicles.	Cattle.	Sheep, Pigs, &c.	Goods.	Cycles.	Revenue.
	No.	No.	No.	No.	No.	Cwt.	No.	£
1893	136,810	27,788	12,660	662	1,339	194	1,047
1894	226,480	48,520	20,325	341	161	210	1,098
1895	213,442	43,885	22,249	368	74	154	987
1896	271,290	62,010	30,370	260	110	297	1,075
1897	288,369	60,522	38,272	55	24	216	241	1,123
1898	318,477	94,003	53,840	232	138	259	2,489	1,196
1899	368,037	86,499	53,498	80	34	302	2,198	1,257

Passengers with vehicles are not included. Returning passengers and those travelling under weekly and monthly tickets are given approximately only. Non-paying traffic, viz., public officers travelling on duty, mail coach, school children, and persons travelling to church, are not included in the return.

The following is the rainfall for 1899, recorded in Grafton:—January, 4.12 inches; February, 8.27; March, 1.93; April, 3.42; May, 1.34; June, .96; July, 10.39; August, 4.64; September, 2.16; October, 2.11; November, 2.26; December, 5.14; total, 46.74 inches. I may mention that the town of Grafton is the centre of the Land Board District of Grafton, which embraces the whole of the eastern district from Camden Haven to the Queensland border. The head office of the Local Land Board is at Grafton, and the premises formerly occupied as the gaol, before the new gaol was erected, have been thoroughly renovated and enlarged at considerable expense, and are now the permanent offices for the whole of the North Coast district.

611. So that Grafton, you might say, is the administrative centre for the North Coast district? Yes; Grafton is also the assize town, the Supreme Court sittings being held here twice a year. The gaol, originally estimated to cost £17,000, but which ultimately cost over £24,000, has been completed, and is now the gaol for the reception of prisoners committed at all the various Criminal Courts in the North Coast district, and is occasionally occupied by consignments of prisoners to relieve the larger gaols in Sydney. In the matter of commerce, the Banks represented here, having buildings of their own, are the New South Wales, the Australian Joint Stock, and the Commercial. The English, Scottish, and Australian Bank has its offices in the building built by the Australian Mutual Provident Society, who have their central office for the Northern districts in Grafton. The erection of this building cost £7,000. The churches, which have all substantial structures, include the Church of England, the Roman Catholic, the Presbyterian Church Synod of Eastern Australia, the Presbyterian Church of New South Wales, the Wesleyan Church, the Baptist Church, and the Lutheran Church. With the exception of the Lutheran Church, each of these denominations has a parsonage attached to its property. I may also mention that the Quarter Sessions are held twice a year in Grafton, and the District Court three times a year.

612. *Chairman.*] The figures you have quoted with regard to population show an increase in every instance? Yes; there has been a gradual increase in the population of the town since 1895. In 1893 and 1894 there was very little movement. That was after the disastrous flood and the Bank crisis, and there was not much development in those years: but since then there has been a gradual improvement in every respect.

613. Has there been a greater increase in the way of settlement and population in the Grafton district during the last few years than in the Richmond district? No; I do not think there has, proportionately. I think there has been a greater proportionate increase on the Richmond.

614. That would be owing to its being a newer settlement? Yes, and the place being boomed to a certain extent by railway construction, and the consequent opening up of the land.

615. When you were examined before, you gave your views as to the probable traffic between Grafton and Casino; could you tell us again what you think about that? I think that the estimates given of the traffic, and particularly of the passenger traffic, between here and the Richmond, are, if anything, under the mark. I do not look upon the traffic that would be carried on the line as a traffic between Grafton and Casino only. A large majority of the people who would use the line as passengers would go to places beyond Casino, and also to Lismore. When the line is constructed from here to Casino, and there is railway communication on to the Queensland border, Casino will not be in the position of a terminal town but that of a roadside township. I do not mean as regards importance, but it would only be a stopping place along the line. The two great centres would be Lismore and Grafton. A greater number of people would go to Lismore than to Casino. Taking into account the amount of money that would be derived from the passenger traffic, credit should be given for the amount of money the Railway Commissioners would be in receipt of, in respect of the distance from Casino on to the Queensland border, from people who would not travel if there were no line between Grafton and Casino. On the advent of Federation, when anything in the shape of restrictions on the border will be abolished, we might anticipate a large influx of visitors from these districts to the neighbouring colony of Queensland. At the present time, every year some 500 or 600 people leave the Clarence on holiday excursions to Sydney. If facilities were afforded by railway communication direct from Grafton to Brisbane, many of those persons would prefer to make their holiday trips to Queensland instead of repeating their visits to Sydney, and in that way a large amount of revenue would be derived on the whole length of the line from Grafton to the Queensland border.

616. *Mr. Watson.*] Is it not more likely that they would go south in holiday time, so as to get away from the heat, instead of going to where the heat is greater? It is not necessary that they should go in the summer time.

617. *Chairman.*] Do you think that goods going to the Richmond would be more likely to go by way of Grafton, and then by railway, than direct by steamer to the Richmond? I think the bulk of the traffic from

- T. Page.
28 Feb., 1900.
- from Casino and around Casino would, from purely commercial considerations, go by way of the Clarence, because it could be landed there much more cheaply and more expeditiously than by any other route.
618. Have you the figures that would bear that out;—for instance, what is the freight to Grafton and then by railway to Casino, as against the freight direct from Sydney to Casino, on the Richmond? I have not made a comparison by actual figures, but the freights from Sydney to the Clarence are lower than those from Sydney to the Richmond. Then there would be the handling of the goods at Lismore to send them on to Casino, and there would be the railway rates still to be charged.
619. *Mr. Watson.*] Do not goods go up the south arm of the Richmond to Casino? But if the line were constructed to Lismore goods going up the Richmond River would have to be sent on from Lismore by rail to Casino, while, as against that, there would only be the railway carriage from Grafton to Casino. Bearing in mind the fact that larger steamers could trade to the Clarence than to the Richmond, as a matter of business the owners of those steamers would necessarily make their freights much lower, because it would pay them better to run full ships than ships only two-thirds full. As far as the passenger trade is concerned, if the railway were constructed to Casino, a business man, if he happened to be in Sydney, could leave there at 9 o'clock on Saturday night and be in Casino at 4 o'clock on Monday afternoon, taking the steamer to Grafton and the train to Casino. He could not do that by any other route, nor could he travel by any other route at as low a cost.
620. *Chairman.*] We are considering this line at present as a line by itself;—do you think it would pay, looked at from that point of view, irrespective of its being part of a North Coast railway, or irrespective of any junction with a line to the table-land? If the line stopped at Casino, and there were no further communication, and no further railway connection, I think it would be a mistake to construct it. But in view of the fact that there is to be railway communication from Casino through the Richmond and Tweed districts, on to Queensland, I say, having in view the traffic that would be brought to the other lines, this section would be a remunerative one within a reasonable time. A railway has to make its own trade, exactly as a line of steamers has to make trade for itself. Settlement would follow the railway, and traffic would necessarily increase in both passengers and goods. There is one other item that has not been sufficiently emphasized: A considerable amount of produce is shipped from the Clarence during the year. This is carried at comparatively low rates, because, when produce goes to the market, supplies come back in return, and, on these, higher freights are charged. The same rule is observed on the Railways. In particular lines produce is carried by the Commissioners at nominal rates, but they charge as much as they can when they are carrying return supplies. In our case, the amount of traffic in the shape of supplies would be very large indeed, because there would be so many new settlers on the land, who would have to take the whole of their belongings and household furniture, as well as stock and implements, to settle along the line of railway. The traffic given by Mr. Varley, in his evidence, is, if anything, under-estimated, especially in regard to passengers. I also think that, although the present inquiry is confined to this particular section of railway, consideration should be given to the amount of revenue that would be derived by, and credited to, other lines already constructed. Apart from the traffic along the route of the railway, I think that, in the interests of the people of these districts, it is advisable to connect two important centres such as Grafton and Lismore. They are both growing in importance every day, and it is desirable that they should be connected, on the same principle that the dense populations of Sydney and Newcastle are connected, for the convenience of the people at the extreme ends of the line; though, throughout the whole course of that line, there is not otherwise one ton of produce carried to contribute towards the working expenses of the railway.

THURSDAY, 1 MARCH, 1900.

[The Sectional Committee met at the Municipal Council Chambers, Grafton, at 10.30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

George Henry Varley, newspaper proprietor, Grafton, sworn, and further examined:—

- G. H. Varley.
1 Mar., 1900.
621. *Chairman.*] I understand you wish to give the Committee some further figures in regard to the dairying industry? Yes. In 1892 dairying under the factory system was first started at Ulmarra. The output that year was very small, there being only forty suppliers. In 1893 the quantity of butter manufactured was 64,800 lbs., giving an income of £3,312. There was a gradual increase up to 1899, when there were 150 suppliers at Ulmarra, showing a large increase, even in one centre. The factory in that year made 222 tons of butter, their income being about £20,000. There is now a central factory at Ulmarra and three creameries supply cream to it. The Co-operative Dairy Factory at Grafton started in 1895, in which year they made 55,898 lbs. of butter. There has been a gradual increase up to 1899, when the quantity made was 182,000 lbs. of butter. In 1892 the output of butter in the district amounted to £3,000, and in 1898 it increased approximately to £50,000, and in 1899 to £70,000. In the district at the present time there are two central factories, seven co-operative dairy companies, thirteen creameries, and from thirty-five to forty private separators.

George Smith Stening, Manager for the Fresh Food and Ice Company at Grafton, sworn, and examined:—

- G. S. Stening.
1 Mar., 1900.
622. *Chairman.*] How long have you been here? Since the institution of the Company's business here, nearly four years ago.
623. Of what do the Company's operations consist? Butter-making and bacon-curing, and we have also done a little in meat-killing and chilling.
624. *Mr. Watson.*] Do you deal with poultry? Yes; poultry and game.
625. How do your operations compare now with your operations when you commenced four years ago? Exclusive of Ulmarra, which centre was supplying us when we first started, the dairying industry has about quadrupled itself, and the bacon-curing has increased five times. 626.

G. S. Sten ng.

1 Mar., 1901.

626. And with regard to meat? We have done only very little in that line.
627. Is that only as occasion offers? Yes; we are of course prepared to go in for it; but on account of the very high rates prevailing, we cannot get the stock.
628. It is only when a man has to sell that you are able to purchase? Yes.
629. Is the poultry and game business an increasing one? The business in game is increasing, but that in poultry has not increased very much. We only purchase a certain class of poultry; we only take cockerels 9 months old. At the farms they want to dispose of mixed lots, and we cannot take them.
630. How do you deal with the poultry and game sent to market? We send the game down frozen, but the poultry we send alive.
631. Will you explain how you deal with the producer;—say the milk producer? We have separating stations on different parts of the river, and the payment to the supplier is based on a standard test showing the amount of butter in his milk.
632. You pay for the milk practically according to the butter contents? Yes, the butter-fat.
633. *Chairman.*] Do you run the separator? Yes.
634. *Mr. Watson.*] How is the milk collected? The milk is taken to the creamery by the suppliers, and we convey the cream from the creamery, daily, to the central works at Grafton.
635. How many separating stations have you? Nine.
636. About what distance apart are they? We have one at the extreme end of the river, at Copmanhurst, and they are spread all over the river down to Chatsworth.
637. We want to know how far a man can conveniently send his milk to a separator? Up to about 5 miles. Each creamery commands a radius of about 5 miles.
638. Do you convey the cream from the separator to your works in Grafton? Yes.
639. How is that done? By carts, and by boats taking it up along the river.
640. What becomes of the skimmed milk? It is taken back by the supplier for feeding purposes.
641. Do you look upon the dairying industry as one likely to increase in the district? Yes, I think it is bound to increase.
642. Have you observed the class of country on which dairy farmers do best? Yes.
643. Will you tell us the result of your observations, comparing the river flats with the more hilly and elevated parts? The higher bush lands, on which very little cultivation is done, are, I think, most suitable for dairying on account of the better quality of the product; and with a little improvement and careful management, the farmer can make the industry pay on such land as well as on the rich river flats.
644. Do you know the country between Grafton and Casino on and near the proposed railway line? No; I have only a very vague idea of it.
645. I suppose you know it for a certain distance out? Yes.
646. What do you think of that part of the country for dairying operations? The improved land is shown to be very well suited.
647. Would your Company be prepared to enlarge their operations there if they got a larger quantity of milk to deal with? I have no hesitation in saying that the Company will expend unlimited capital if the inducement is there.
648. So far, have the operations of the Company have been successful and remunerative? They have.
649. Has dairying, so far as you have heard, been fairly remunerative to the dairymen? I am certain it has.
650. Since you have been here, have you noticed an inclination to go in more largely for dairying than cropping? Yes.
651. Do you look upon that result as coming from the fact that it pays better to dairy, or is the soil better, suited to it;—is it mainly because it pays a farmer better to carry on that kind of industry? One reason is that it brings into operation a system of mixed farming, which undoubtedly is the best system.
652. Could you carry on mixed farming, as you call it, on these elevated or timber lands? Yes; you could grow hay, poultry, and pigs.
653. Why is it that the poultry industry is not a larger one? I think it could be explained in this way: Most of the farmers sell their poultry to the dealers, who go around and take them; whereas we require them to deliver their poultry to the central works, where there is a chance of the poultry being refused and having to be carted back again.
654. They do business with the dealer, who sends the poultry in crates to Sydney? Yes, exactly.
655. And the dealers go round and select what is suitable for the market? Yes.
656. Whereas, if the poultry were brought to your establishment, there would be the risk of their not suiting you, and having to be taken back? Exactly.
657. And I suppose there is a good deal of barter between the poultry-dealer and the storekeeper in town? I believe there is.
658. So that would account for a good deal of trade going that way? Yes.
659. That would be in poultry and eggs, I suppose? Yes.
660. Do you buy many eggs? No; we have not gone in for eggs yet, but I believe we intend to do so.
661. Do you deal with fish? No.
662. How far northerly from Grafton do you gather in produce to your establishment? I think we only gather it from a distance of about 12 miles.
663. Could you name the place? We have a creamery at Lawrence, and that gathers in milk from 5 or 6 miles outside of Lawrence.
664. Have you, in your experience here, come across any people who have told you they would go in for dairying between Grafton and Casino if they had proper means of communication? The only evidence I have as to that is that about three years ago we received a big requisition from the vicinity of Myrtle Creek, in which it was stated that if facilities were given for the opening up of the country, and an outlet were provided for their produce, a great many of the settlers would go in for dairying, and they would ask the Company to erect creameries at Myrtle Creek and other places.
665. For the purpose of dairying, is it absolutely necessary to have speedy and easy communication, first to the separator, and then to the central factory? There is not the slightest doubt of it, and that is where the success of the industry is going to lie in the future—the speedy transit of the product from the cow to the central factory.
666. After the cow is milked, is there any limit of time within which the milk must be treated? No.
667. When the cream once gets to the factory you can freeze it and treat it when you like? Exactly.

- G. S. Stening. If we get it soon after it is separated, we are able to handle it in such a way that it will produce a superior article, compared with cream that has been allowed to stand, or has been delayed in transit.
- 1 Mar., 1900. 668. In the case of milk going to the separator, it is necessary that it should be treated quickly? Yes.
669. Within a few hours? Yes; it would be better if it were treated within a couple of hours of milking.
670. But that is not the practice under present circumstances? No.
671. How long after receiving the milk do they generally separate? In some of the creameries on the river they separate only once a day. That means that the night's milk has to stand over until the following morning. If it were done within two hours it would be better.
672. Supposing it could not be done for ten or twelve hours? As long as the milk remained in a sound condition it would be all right.
673. But you run the risk of the milk going off? Exactly.
674. Therefore it is necessary that the separator should be within easy access of the farmer? Exactly.
675. Do you regard it as likely that the Company's operations will extend in any other direction besides those you have named? Yes; the Company are willing to extend their operations in any direction as long as there are inducements and facilities for transit. We have had offers to start out in another direction, about 30 or 40 miles from here, but we cannot do so on account of the rough transit of the cream to Grafton. The places I refer to are Coramba and Kangaroo Creek, away down south.
676. Apart from the rich agricultural lands on the river flats, and which have for so many years, until recently, been used chiefly for agricultural purposes, do you think there is a coming population to absorb these other lands that we are inquiring into? Yes, I think so.
677. Do you think the dairy business is illimitable in its extent? I think so.
678. We do not look now to the colonies only for the consumption of dairy produce of every kind, but export large quantities to England? Yes.
679. And that, you think, is likely to go on? Yes.
680. Has that been the experience of the Fresh Food and Ice Company? Yes.
681. Are the farmers who are going in for dairying all fairly substantial men, doing a good business as far as you know? Yes.
682. The industry is likely to be successful and lasting? Yes. I may say that the figures relating to the dairying industry in this district, supplied by Mr. Varley, came through me, and are correct.
683. What is the Company's general expenditure? We expended locally about £65,000 last year.
684. What is the general yield of a milking cow in this district;—is there any average you could put forward? There is only the experience of a couple of farmers who have kept account of their cows. I think the average ran between 500 and 600 gallons per cow per year.
685. That would be the average of the herd, including milkers and non-milkers? They started with a certain number of cows. One man had twenty-one cows, and I think the average for those twenty-one cows was between 500 and 600 gallons per year.
686. How many gallons of milk does it usually take to produce a ton of cream? About 2,000 gallons.
687. That is in this district? Yes.
688. And from that how much butter do you get? Between 800 lb. and 900 lb.
689. Taking it for granted that a railway was constructed between Grafton and Casino, and dairying entered upon along the line, what would be the extreme freight that a man could afford to pay per ton on his cream sent in to the factory, say, at Grafton—when would the freight become prohibitive? I think he could go up to about 15s. a ton.
690. Beyond that you think it would be rather dearer than would pay? Yes.
691. What has been the destination of the Clarence River butter usually;—has it been mostly exported, or mostly sent to the Sydney market? In the winter months the butter is generally used locally, and in the summer months about half is exported.
692. I gather from one of your answers to a question by the Chairman that you have rather a high opinion of the milk-producing properties of the grass lands? Yes.
693. I might assume from that that you would get a better quality of butter from grass-fed cows—cows fed on natural grasses—than from cows fed specially on artificial fodder? You would not get such a big return, but you would get a sounder article—an article that would stand carriage.
694. I suppose that, notwithstanding improvements in the methods of carrying butter, such as freezing and so on, some butters will stand carriage better than others? Yes, much better.
695. And you think the best in that connection would be the feed from natural grasses? Yes.

Edward Chapman Lewington, Manager, Bank of New South Wales, Grafton, sworn, and examined:—

- E. C. Lewington. 696. *Mr. McFarlane.*] What are you? Manager of the Bank of New South Wales at Grafton. I have occupied my present position for twenty-five years.
- 1 Mar., 1900. 697. Would you mind stating what your experience has been, as a banker, during that period, and also give the Committee some information with regard to the general financial condition of the district? When I came to the Clarence it was a period of great prosperity. That was in 1875, and that prosperity went on by leaps and bounds up to 1887.
698. To what was it due? To the production of cane and maize, high prices and large yields. In the beginning of 1887 we had one of the most severe floods that ever visited the district, which swept away practically all the product of that year, particularly as regards maize. From 1887 to 1893 there was a succession of bad years, owing principally to floods. We had nine floods in those years, every one of which came into Grafton, which will give you an idea of the damage done to the district generally. Then there was gumming in the cane and blight in the maize, all of which tended to depreciate the general revenue of the district. In 1893 we had three floods, each of which did a certain amount of damage, though they were not so severe as the floods in 1887 or 1890. Then on top of that came the great financial crash, which, of course, intensified the depression resulting from our previous disasters. About 1893, or between 1890 and 1893, the dairying industry commenced to be a factor in this district. It was taken up first at Ulmarra, in a small way, and it was so successful that the farmers began to look upon it as an occupation that would produce satisfactory results. They consequently took it in hand, and it has developed very materially from that time up to the present. The circumstances here were of an exceptional character. This district was opened up and settled for agricultural purposes only. It was never contemplated when the

E. C.
Lewington,
1 Mar., 1900.

the land was subdivided, that dairying, which requires a larger area of land than agriculture, would form part of the operations of the farmer. Most of the subdivision farms on the river average from 40 to about 70 acres. That was always considered sufficient on which to work a farm, but it is not large enough, in a great many cases, for dairying, especially where a man has to take up a certain proportion of land for agricultural purposes. Therefore, with the spread of dairying came the demand for larger areas. Many a farmer, perhaps, has enough land to graze twenty or thirty cows, but he wants, besides, a paddock on which to feed his dry cows, and a place to which he can remove his cattle in time of flood. Most of the lands under dairying at the present time are subject to flood. Fortunately the district has been without floods for seven years, but we must look forward to the recurrence of floods such as we have had in the past. Therefore lands which offer security to the dairy farmer must have an increased value. My experience is that year by year the demand for these lands is growing. Some time ago the bank I represent, like other kindred institutions, made advances on lands, believing at the time that the round of prosperity was never going to stop; and some of these lands fell into our hands, and we found great difficulty in dealing with them. But within the last two or three years we have dealt with nearly all of them, and I have constant demands for dairy properties.

699. By that, I would take it that the land is increasing in value? Certainly. Land for which I could not get £5 10s. an acre can now be disposed of readily for from £7 to £8.

700. Can you mention any particular locality where land is inquired for? A man will come to me, and he will say, "I want to know if you have got a dairy farm." I say, "Where do you want to go?" He says, "I want to go somewhere where I can get my milk and cream to a factory." Some people go on the south side of the river, and some on the north; they are not particular so long as they can get suitable land. A man came to me last week to make particular inquiries about land on the north side of the river, and from my knowledge he has gone out to have a look at a place about 15 miles from here on the Casino-road, near Lawrence.

701. That would not be far away from the proposed railway? No. This property was in the market, though not in connection with the Bank of New South Wales, and he said, "I am going to have a look at that place; it might suit me." I think these lands are capable of considerable improvement.

702. In making inquiries, I suppose it is a consideration that the land shall be as near the river as possible? That is, of course, the general desire, because it means easy communication. It is no use a man going in for dairying unless he can get his milk or cream within a reasonable distance of a creamery or factory.

703. The demand for land for dairy purposes commenced you say about 1893? Somewhere about that time. I think the factory at Ulmarra commenced between 1890 and 1893, but it was then only in an experimental stage.

704. Is the demand for land increasing? Yes, decidedly; land for legitimate settlement.

705. Do you think that demand will continue? I think we must have an outlet for our labour. Take The Clarence, for instance. Our population is increasing substantially year by year. The youths growing up must find an outlet somewhere, and if they cannot settle upon the land, what are they to do. I do not say that the land in this district is all of the same quality. Some is poor and some rich; but it is sufficiently good to be worthy of settlement—and satisfactory settlement. There is another thing in regard to dairying. If the communication is sufficiently good to make it worth a man's while to settle on these lands he can get the fee simple, which is a great thing to a dairy farmer, at a comparatively small price. At present, if a man comes from the South Coast, or anywhere else, and wants to buy a dairy farm he has to pay for an agricultural farm, which is a very different thing from the settlement of the Richmond, where a man was able to take up land as a conditional purchase. Purchasing a farm in the way I have pointed out, a man has to sink a large amount of money upon his fee simple, which under other circumstances might be profitably employed in purchasing cows, improving the surface of the land by draining and by artificial grasses. That is the drawback that dairying has had in this district as compared with the wonderful success achieved on the Richmond. The land here was all settled, while over there most of it was virgin land.

706. What is the financial position of the residents at present as compared with a few years ago? It is very much improved.

707. Owing to the starting of dairying? I consider that dairying has been almost as large a factor in that improvement as the establishment of the Sugar Company was in its day. I think the ultimate benefits which we shall derive from dairying, unless the industry meets with some unforeseen check, will be quite equal to the good done to the district by the Colonial Sugar Company, and we all know what that was.

708. And the dairying industry does not take the place of agriculture, but is an addition to it? Yes, to a great extent. A man having 70 acres would cultivate 35 or 40 acres, and the balance he would keep as a grass paddock, doing nothing with the land except running a few cows and horses. As dairying has come along, experience goes to show that he makes use of this waste land, and perhaps takes in addition a certain proportion of the land he had under cultivation, finding that he can do so well with his dairy. I know dairymen who are taking as much as £35 and £40 a month for milk.

709. The agricultural products of the district have not been materially reduced, notwithstanding the increase of the dairy industry? There is a falling off in cane, but I think that has been partly due to a feeling of unrest in the mind of the farmers as to the policy of the late Government in regard to the sugar duty. One of my constituents let his cane go out of crop altogether until the question of duty was decided, and he has now 30 acres under crop again.

710. You state that the financial position of the people is satisfactory;—does that apply to agriculturists and business people alike? I think it applies generally. As an evidence of this, and as showing the general prosperity of the place, we find that on the 4th of the month, storekeepers and others pay their bills promptly, and without anything like the amount of assistance they used to receive a short time back from their creditors in Sydney. Then again we find our fixed deposits increasing steadily. A little while back a fixed depositor would come in and receive his interest and take a little bit off his principal to pay his bills. Now we find that he adds his interest, and probably something else, to his fixed deposit.

711. Has there been an increase in the number of fixed deposits? Yes; both in number and value, as far as the Bank of New South Wales is concerned. In Grafton, the deposits, especially fixed deposits, even at the low rate of interest which obtains, have shown a very substantial increase during the last three or four years.

712. Referring to three or four years back, how did borrowers meet their obligations in the shape of mortgages and so on? With very great difficulty; they paid their interest, but not punctually.

713.

- E. C. Lewington.
1 Mar., 1900.
713. I mean during the past three or four years? My experience of them is certainly easier and pleasanter than it was previously.
714. You have not so much difficulty? No. I have two trusts, involving about £9,000, and I get my interest paid remarkably well, never losing a penny.
715. Has there been any increase or decrease as regards foreclosures or mortgages? As far as banks are concerned they are very averse to taking any extreme step of that kind. It is only when things become really bad that the bank decides upon foreclosure or sale under a mortgage. But things are now decidedly brighter. We have a number of cases which some time ago were not looking quite as pleasant as we should like them to look, but which have certainly improved; and if these go on for a year or two as they are now doing, we shall probably find that these people who, a little while back, were in "Queer-street," will be able to work on with a certain hope of getting clear of their liabilities.
716. The general tone of the district, then, is prosperous and much improved compared with what it was? Yes. The people are not so extravagant, of course, as in former days. In the first years of my experience on The Clarence, money was made easily and it was spent easily. It was never dreamt that misfortune and disaster could attack the lands of The Clarence. It used to be thought they had a permanent value from which they would never recede. People, however, have learnt the folly of that, and now if they make £1 they try to live upon 18s.
717. Is it your opinion that if proper facilities were given, people would settle and take up land between the different rivers here—between this and the Richmond? Certainly, and also between here and the Bellinger and the Macleay. There is a desire for settlement, but the difficulty is a fear that the farmer may not be able to send his produce to market at such a price as will leave him something for himself.
718. He is not disposed to take up land without proper facilities? No.

William Small, jun., Town Clerk, Grafton, sworn, and examined:—

- W. Small, jun.
1 Mar., 1900.
719. *Mr. Watson.*] I understand you are acquainted with the land between Grafton and Casino? Yes.
720. Could you give us your opinion of it, roughly? My opinion is that it is land which could be occupied profitably if people had facilities for getting their produce away. It has remained vacant simply because of the want of these facilities. If railway communication were established between here and Lismore the land would be taken up and occupied by people who would carry on dairying chiefly.
721. Do you think any of it is suitable for any other purpose than dairying? Yes; a lot of that land would grow oats.
722. Do you think there is any possibility of this tract of country becoming developed without railway communication? No, I think not; not for a long time.
723. Do you know of any people who have used that class of land and made anything out of it? Yes; I know several people on the same class of land. The same class of land exists chiefly between Grafton and Copmanhurst. Some of this land, close to a creamery, has been profitably occupied, and, from what I have noticed in the papers, the people living on this land, which is similar to that between Grafton and Casino, have the highest test of anybody supplying milk to the creameries in the district. It is very much like the land between here and Casino.
724. Do you think it is land that would require a large expenditure of capital to bring it to a producing condition? No, I do not. I consider that a man selecting such land, as soon as he had fenced it in and ringbarked a little of it, could profitably occupy it for grazing.
725. Are the natural grasses there good, or would the settlers require to introduce other grasses? If a man had 640 acres he could work the land for dairy purposes without putting a thing in it, although it would grow artificial grasses.
726. You think the natural grasses are sufficiently good to justify a man in putting stock on, if the country were ringbarked? Yes. Cattle are running in the district at the present time, and during last winter they were the best conditioned cattle in the district, not excepting the stations on the upper river.
727. Is that usual or unusual out there? It is not unusual. It is the same at the end of any winter. Cattle off the land there are better conditioned than cattle from any other part of the district.
728. We have been informed that the supplies of fat cattle for this district have not usually been got from there? The fat cattle for this district have been got locally, and from the stations on the upper river, simply because the owners of the station at Camira, on the road to Lismore, send their cattle away as stores, chiefly to the Hunter.
729. Does it pay them better to do that? They have never made the test; they have gone on doing it from the time when they first took the station up.
730. You have a very high opinion of the land as suitable for dairying purposes? Yes.

Thomas Trefusis Bawden, auctioneer, and Secretary, Stock Board, Grafton, sworn, and examined:—

- T. T. Bawden.
1 Mar., 1900.
731. *Chairman.*] You have been here for a number of years? I am a native of the district.
732. Would you like to make a statement of what you know on the subject of the Committee's inquiry? I know the country pretty well between here and Myall Creek, about 25 miles north of Grafton. I have had experience in dairying on country which, in fact, is inferior to that. I was only dairying for two years, and I did very well.
733. Did you take up the land in its virgin state? I leased an abandoned selection.
734. Was it improved? There were only about 140 acres of it ringbarked.
735. Did you do the rest? No. The other portion was a conditional lease. I had sixty-three head of cattle and my working horses on the land. In two years my clear profit was £230. At the end of two years circumstances cropped up which induced me to abandon the holding and come to town.
736. Was that during the last three or four years? That was in 1896 and 1897.
737. How far were you from a creamery? From 2 to 2½ miles. I was in similar country to that of Mr. Baillie's, only more sandy.
738. What did you make the profit out of? Out of milk and pigs. I started with nothing, and I paid for my cows with the milk.
739. Did you employ labour? I had a boy. When I first went up I had a man and a boy, as I had some fencing to do.
740. Who did the milking? Myself and the boy.

741. You say it was inferior land to that between here and Myall Creek? Yes; it was very sandy country, carrying apple-trees, honeysuckle, and ti-tree. T. T. Bawden.
1 Mar., 1900.
742. Is not the apple-tree a product of good country? Fairly good country; but that was sandy soil.
743. Would not that be better than the country you speak of between here and Myall Creek? No; there is a lot of honeysuckle—more like coast country.
744. How many beasts to the acre could you have carried on your land if it had been all rung? That class of country, I think, would carry a beast to about 10 acres.
745. When it was ringbarked? Yes; it is too sandy and rocky, especially in that particular paddock. If country like that is rung too much the sun strikes the grass, and where the sand is it destroys it. The class of country referred to, being sandy, is better not ringbarked to any extent.
746. Have you any objection to tell us how you started, or what rent you paid? I paid £20 a year for the place, comprising 540 acres.
747. How many cows had you? I used to milk between twenty and twenty-five cows. The largest number of cows we milked was twenty-seven.
748. It would have carried a great many more than that? I could have milked more and had a few dry cows, but I had to pick them up as I could get them.
749. On a holding of 640 acres between here and Myall Creek, do you think that after it had been ringbarked a man could run about 130 or 140 head of cattle? I am certain of it. That would be about 5 or 6 acres to the beast. That country would carry that. It is country that you can ring, because it is harder soil.
750. Is it fairly well-watered country? Yes; and it includes a lot of splendid flats that will grow corn; and, from my knowledge of the country, I think the land could be cut up in such a way that there would be some cultivation land in pretty well every holding.
751. As an auctioneer, what do you think that land would be worth? I should say its present value is about 15s. an acre.
752. And suppose it were improved by ringbarking, and a railway were constructed? To take it up under selection, I should say 30s.; but I believe that if a railway were made, and a freehold were submitted to public auction without any conditions beyond the payment of the money, there are parts of that country that would fetch between £2 and £3 an acre.
753. Do you know what farmers are now paying as rent for good land on the rivers—I mean farmers who carry on dairying to any extent, and who are renting their properties? The rent of good land on the river for mixed agricultural and dairy farms, ranges from £1 to £2 an acre. One man dairying on a 46-acre farm pays a rental of £60.
754. That of course is an improved property which has been fenced? Yes; and there is a small cottage on it.
755. Do you think it would suit the small man with a little capital to take up a piece of this land for the purpose of dairying? Yes, I am sure of it. I think a number of such men would take it up under homestead selection, when much capital would not be required. In regard to the land at Clifton, in reference to which evidence has been given by other witnesses, I wish to say that that land is not accessible, and there is not a creamery within a reasonable distance. In my opinion, that is the reason why it has not been taken up.
756. What is about the distance a man should be away from a separator? I think 5 miles is quite far enough. I know of two properties along the proposed line of railway—one owned by Mr. Heldt, and the other by the estate of the late Captain Hill. They are both about 7 or 8 miles from Grafton. These properties have been idle for a number of years, and now the fences are being made good, and the land is about to be utilised for dairying. Mr. Heldt has built a house which cost him £80; so that there is every prospect of the dairying industry having a great future, and the land between here and Myall Creek is being taken up for dairy purposes. I also know of two other properties along the railway line, about 12 miles from Grafton, which are being refenced with a view to dairy farming, in conjunction with farms on the river. In regard to the carrying capacity of the land along the proposed railway route, 9 miles from Grafton, on the Casino road, there is a selection owned by Mr. Joseph Payne. It is 4 or 5 miles from the proposed railway line. In 1897 Mr. Joseph Payne had 364 acres of land, and he had six head of horses, forty head of cattle, and 200 sheep on it; and in 1898 he had eight horses, fifty head of cattle, and 170 sheep. Mr. Duggan the other day gave evidence with regard to the use of cow-peas as a green manure. From what he said it might be inferred that during the five months that the crop of cow-peas was growing the land could not be used for any other purpose. I wish to say that you can grow maize at the same time that you are growing the cow-pea.
757. I understand this land was not suitable for maize? It will grow maize for home consumption, but not maize fit to compete in the market with rich maize. While you are growing the cow-peas for green manure you can always get something else from the ground. Mr. Stenning was asked why his company did not do a larger trade in poultry. It is a well known fact that there is so much opposition amongst dealers that, in order to get rid of their goods, they will take in exchange from the farmer almost any kind of fowls. The consequence is that the farmer can get rid of chickens two months old by sending them to Sydney with a mixed lot. They do not give the fowls time to grow. In dealing with the Fresh Food and Ice Company, the latter would only take poultry which is really good.

Abraham Lipman, commission agent, Grafton, sworn, and examined:—

758. *Chairman.*] Would you like to make a statement to the Committee on the subject of the proposed railway? Yes. I have been a resident of Grafton for twenty-three years. I have been travelling in these districts, representing Sydney houses, for twenty-six years, and during all that time I have regularly, at short intervals, visited the districts between here and the Tweed, more particularly the Richmond. I was one of the first travellers who was conveyed by coach to Casino from Lawrence, and, without taking into consideration the cost of transmission of samples, the expense from Grafton to get to Casino, 18 or 19 miles from Lismore, was, and I believe would be now, £1, which includes steamer fare, and then you would have to catch the coach leaving Lawrence on Tuesday and Friday. On arrival at Casino you would have to be conveyed to Lismore at a further cost of, say, 5s., independently of samples, and this last item varies from one to forty cases. I was the first traveller who was conveyed by coach by the Woodburn route, and nearly all the traffic is now that way, because the means of conveyance are better. Two firms hold the vehicle trade there, and each sends a coach every morning
- A. Lipman.
1 Mar., 1900.

A. Lipman. morning from Chatsworth on arrival of the 7 o'clock steamer from here, one earlier, at 6, and again on arrival of the steamer from here at 8, which arrives at Woodburn the same night. This is the quickest and cheapest way, even to Casino, by the present means of travelling, and at the lowest estimate costs, without samples, 18s. 6d. to get to Lismore, and if to Casino, 5s. extra. The works at the entrance to the Richmond seem to me a great improvement; still I believe as many people travel by way of the Clarence to Sydney from the Richmond as previously, and certainly more of an inter-district nature. I have seen as few as six a day, and as many as forty, travelling between the two rivers. I agree with Mr. Spencer's evidence, except that he only stated cost of travelling to Woodburn, and did not allow for the journey to Lismore, Casino, or Ballina. I have known storekeepers on the Richmond, at different times of the year, who were prepared to make large purchases of potatoes and maize from this river, and I am aware that large quantities of both have been received by steamer from Sydney when, if facilities existed, they might have been procured here. I am no judge as to the quality of the land, having only travelled by the coach road between the rivers; but, as a portion of the proposed North Coast line, I believe it should join at Grafton and Casino. I think there should be a connection with the coast from New England, at a point to be determined by Parliament; and whether this connection is made at Casino or Grafton, either the Richmond or Clarence district is too important to leave out of railway communication, either as from New England or with each other. I am aware of the existence of large quantities of valuable timber along the line, and believe it would go a great way towards paying the cost of the line. I also know there is a large exporting trade done in timber, and lately a saw-mill has been erected at Lawrence, to obtain timber from along the proposed line, or thereabouts. I believe a large item in the revenue would be the return from excursions. I have known, both on this river and on the Richmond, streams of people driving and riding, in some instances 60 miles, to attend a show or race-meeting. In the event of rail to Casino, the traffic that now goes by way of Harwood and Chatsworth would revert to Grafton, seeing that a train trip to Grafton from Lismore would take, say, six hours, and it now takes twenty hours at least to go by way of Chatsworth, and having to remain till next day to get to Lismore.

Edward Ebsworth, District Surveyor, Grafton, sworn, and further examined:—

E. Ebsworth. 759. *Chairman.*] You produce some maps for the information of the Committee? Yes. I produce the county maps from Port Macquarie on the south to the Queensland border. These maps indicate that the close settlement is confined to the lands within easy distance of the streams. Beyond that, there are no ready means of access, the Lismore-Tweed Railway in the County of Rous excepted, and the country is only used for grazing purposes for raising stock. There are now signs of a change along the whole of the coast district, with the extension of the dairying industry. It is the factory system which has enabled this change to come about.

Edward Farrell, master of the steamship "City of Grafton," sworn, and examined:—

E. Farrell. 760. *Chairman.*] What are you? Master of the steamship "City of Grafton," trading between Sydney and Grafton.

1 Mar., 1900. 761. How many trips do you make? One trip a week. We leave Sydney on Tuesday night and arrive in Grafton on Thursday afternoon, and on the return trip we leave Grafton on Friday evening, and arrive in Sydney on Sunday evening.

762. How long have you been in command of the North Coast Company's ships? Twenty-two years.

763. And how long in command of the "City of Grafton"? Exactly twelve months.

764. Are you able to make the trips at present with regularity? Yes; we are making the trips now with great regularity.

765. Would you give us your experience of the entrance to the Clarence River from the time when it commenced to improve? It is very good just now. I got 17 feet this morning at high-water when I came in.

766. How does that compare with the time before any permanent harbour works were undertaken? It is a very great improvement indeed, because the entrance is absolutely straight in and out.

767. From what date do you put the improvement in the entrance? Since the inner wall was completed down to the reef at Yamba—the middle training-wall. There used to be a sand-bank there, right in the centre of the harbour, and it used to force the ships right over towards Yamba, and they were compelled to make a big curve, and then to suddenly round the reef buoy; but now the course is straight in.

768. Then you approve of that portion of the work? Decidedly.

769. Before those works were undertaken, what depth of water used you have at the bar outside? It varied with the weather. The sand on the outer bar is affected by the wind and sea. With north-easterly winds and a long dry summer the bar will shallow up. In a wet season, when there is a certain amount of scour from the river, the bar will deepen. That is where the training-walls are of benefit.

770. What depth of water had you on the bar before the harbour improvements were undertaken? I have seen it so shallow that we have stuck at the black buoy.

771. What number of feet? 10 feet or 10 ft. 6 in. I was stuck there in the "New England" many years ago, right at the black buoy. "The Clarence" was stuck there for weeks, and "The Australian" was stuck there. This was a good many years ago, before there were really any harbour improvements here at all.

772. And now that is all done away with, and you can always enter? To give you a proof of that, I went out last Saturday at dead low water, and I then got 13 ft. 6 in.

773. And what does the "City of Grafton" draw? We were drawing 10 ft. 4 in.

774. Do you ever have to wait outside now? Sometimes, when the weather is very bad, and there is a sea on, the pilot will ask us to wait outside until the tide is favourable. Certain conditions of the sea and tide affect the state of the bar.

775. Which is the worst direction of the wind for entering? South-east, when there is generally a heavy sea.

776. What are your views as to the future improvement of the entrance;—what do you think would be advisable? I think when we get the southern breakwater, we shall have a good harbour.

777. You think the carrying out of the southern breakwater is a necessity? I think so. The southern breakwater will give the necessary shelter—similar shelter to that provided at Newcastle. 778.

778. How far do you think the breakwater should go out? It is a very difficult thing to say. I should say about 1,500 feet, judging from the length of the Richmond breakwater, and the Newcastle breakwater. E. Farrell.
1 Mar., 1900.
779. Would that be as far as the position of the present bar? Yes; it would be a little further out than the present bar.
780. The object being, I suppose, to disperse the sand and send it out to sea? Yes; the idea is that where there is a stone wall and a strong ebb-tide, the sand is continually carried out along the wall. That has been proved in every one of the rivers, without exception. I think the ordinary ebb-tide scour goes about 1,000 feet beyond the limit of the wall, so that we should have deep water outside the end of the wall, as is the case at Newcastle.
781. What is the formation of the bar—is it just like a bill of sand? It comes in from the north beach. We have a splendid south head here; that is the great protection to the Clarence.
782. But I mean on the ocean side of the bar, do you come suddenly into deep water before you come to the bar? Yes, very suddenly from deep water outside—into 18, and 17, and 16 feet, and so on, on the bar, according to the state of the tide.
783. How far does it extend? You run about two ships' lengths—say, 500 feet—on that ridge, and then you get deep water again inside. There is very good water inside—from 20 to 24 feet.
784. Does that bar extend northward to the sandy beach? Yes; it goes right across at present.
785. Then does it extend south also to the sandy beach? No; not southward to the sandy beach, but to the hill, or Rocky Point.
786. Has it altered its position? It has during the last two years. It used to be round the south reef and rocks. It then began to work across to east of north. It got very bad about this time last year, and after some little trouble we got the sand-dredge, "Antleon," to work, with the result that a straight, clear run was made over the bar. We are using that channel; but there was only 12 ft. 6 in. at high water, on a very narrow ridge. The "Antleon" came, and deepened it for us, and it is really better now than when she left it.
787. And do you advocate the construction of the southern breakwater? Most decidedly.
788. At the end of the middle training-wall there is rather a nasty turn, where a joggle gets up;—if the southern breakwater were continued would that point become protected? Yes.
789. And would small steamers always be able to go round to Yamba? I should not say that they would always be able; but the extension of the southern breakwater would certainly afford a great amount of protection—much more than is afforded now.
790. At the present time do small vessels experience a difficulty in getting round that turn to go to Yamba? On one or two occasions during the last three months I have known them to be very doubtful about going round; in fact, I have heard the harbour-master say he would not go round.
791. It is risky? Yes; it is dangerous. The vessel gets a broadside sea at the sudden turn at the end of the training-wall.
792. Would any improvements be required on the northern side of the entrance? They are running out the northern wall now, and that no doubt will have the effect of scouring the sand from the inner harbour and flats.
793. But is there not a bed of rock that requires to be removed at the entrance? Yes; that is what we call the northern reef. They will have to blow that up. The channel is not very wide there now, and to make a good entrance they will have to blow those rocks up.
794. Would it be advisable to do that before the construction of the southern breakwater;—could it be done now? It could be done in the ordinarily westerly weather. In the winter time we have weeks and weeks of very smooth water on the bar.
795. Suppose they were to blow this reef of rocks up, where would the stuff go to? A diver is sent down and the rock is blown up with dynamite, and then a grab dredge lifts it out of the way.
796. Are all captains trading to the Clarence River—Captain McGee, as well as yourself and others—always able to come in? Unless it is very bad weather, like an easterly or south-easterly gale—such weather, for instance, as that in which a mail boat would not go into Sydney.
797. That would be extraordinary weather? Yes; it would occur perhaps only twice a year.
798. It very rarely happens? Very rarely.
799. In fact, the steam service between Sydney and Grafton is now almost as regular as a railway train? It is undoubtedly very regular, as our books will show.
800. Having entered the heads, and having come along the training-wall in very deep water—24 feet, I believe—caused by the scour, how do you get on further on up the river, on your way to Grafton? We really have no difficulty at all in the river. The Clarence is a splendid river.
801. No shallows? There are only four places in the Clarence where we get shallows in flood-time, while other rivers have fourteen.
802. You are always able to get over those shallows in the Clarence? Yes; but they cause a little trouble if the ships are loaded very deep. Then we generally speak to our agents and they interview the harbour authorities, who dredge the shallows for us. The shallows only affect the ships at low tide.
803. The dredge is not required to be used frequently in the Clarence River? No; very rarely.
804. Are you able to navigate the river at night-time? Yes; we go down every Friday night.
805. And go right out to sea? No; we work down so as to get out on Saturday.
806. Do you come in or go out of the port at night-time? No; because there are no lights at the Clarence Heads.
807. With guiding-lights, would it be safe? It would be safe in fine weather and in the present state of the bar.
808. What would be the deepest draught at which it would be safe for ships to come into the Clarence River? If you want a boat to come up to Grafton the draught would be, say, 13 feet 6 inches to 14 feet, for ordinary work, but at the heads there is now nothing to prevent you bringing a vessel in drawing 15 feet.
809. But it would be difficult to get up the river with that draught? You could go to Maclean.
810. But not to Grafton? Not with a draught of 15 feet. There are one or two places that would be rather bad at that extreme draught; but they could be easily improved if necessary. Those shoals are only light sand and mud.

- E. Farrell.
1 Mar., 1900.
811. Without any further improvements at the Clarence Heads, do you think the bar is likely to get worse, remain as it is, or get better? It is bound to fluctuate with the weather.
812. Can you explain how it is that the bank of sand forming the bar accumulates? We have an idea that the sand comes along the north beach with the north-easterly wind; in fact you can see it flying along the beach. This sand gets shifted about until it locates itself in the channel, and then along will come a southerly or south-easterly gale, and the sea will bank it about in a different direction again.
813. You have been a considerable time on the river;—what has been your experience with regard to the increase, or otherwise, of the passenger trade, and the other trade of the port? There has been a very great increase of late years, both in passengers and goods. The dairying industry is over and above anything we have ever had before.
814. Do you always get a full freight both ways? Yes; we have not had any slack season this Christmas at all.
815. Do you bring much freight from Sydney? Yes; including general store goods of every description.
816. And you generally have a good cargo every trip? Yes; twice a month we are full without exception.
817. Tell us what you take back, as a rule? About 400 boxes of butter, each containing over 56 lb. Of maize our average is about 2,000 bags. We carry 150 pigs, and for nine months of last year we had forty-two bullocks every trip. We also carry hides, tallow, bananas, peas, beans, and tomatoes;—in fact it is a wonder where the stuff comes from, and where it goes to. Cream we also take to Sydney, wild ducks, and quarters of beef, which seems to be an industry in the winter time. Then again we carry from sixteen to twenty-four cases of fish, besides poultry and eggs. Sometimes we have 300 cases of eggs on one trip.
818. There is a pretty constant passenger traffic? Yes, you can see that by the published list of passengers. The single fare is 30s.; return, £2 5s., and 12s. 6d. in the fore-cabin.
819. Have you noticed a marked increase in the dairying industry? No one can have helped noticing it.
820. During the last four years especially? Yes.
821. *Mr. McFarlane.*] Will you explain the condition of the crossing inside the bar previous to the construction of the southern training-wall? We had to go round by Yamba. After coming in round the buoy we used to take a sudden turn along the track of the little steamer that took the Members of the Committee to Yamba, and then follow the stone wall round where it is now sanded up, and then we went round by Rabbit Island—right round where the training-walls are now. There is a place there where we had to anchor sometimes, and we had great difficulty to get to Grafton at all.
822. It was a very crooked channel? It was a dreadful channel.
823. What depth of water used your steamers draw? We have been stuck there with 10 feet. For years it was a common thing for one of the old steamers to lie in the Deep Hole partly loaded.
824. Had your boats ever to do that? Yes; I have done that in the old "Agnes Irving."
825. And lighter the cargo down? Yes.
826. Would that shallow depth continue for any lengthened period? Yes; I remember at one time it lasted for nearly two years.
827. Since the southern training-wall has been constructed have you noticed much improvement? There is now no difficulty at all, because there is deep water all along the wall.
828. What would be the shallowest depth along the wall? Twenty feet, and that is near the inner end of the training-wall.
829. Do you consider it a better and straighter channel than the original one? It is a beautiful channel now.
830. In view of the improvement made in that respect by the construction of the southern training-wall, is it your opinion that the carrying out of the breakwater would have a similar effect on the outer bar? Yes; it would have exactly the same effect.
831. For the same reason? Yes; because the ebb tide would scour along the rocks.
832. With regard to the shallows between the heads and Grafton, are those of any length? No; they are very short shallows in the Clarence.
833. How far apart are they;—where is the first one? At an island near Grafton—about a mile and a half from Grafton. That is a shingle shallow which sometimes gives a little trouble after a fresh, but never sufficient to stop our ship.
834. Could it be easily dredged? They do dredge it; it was dredged about four years ago.
835. So as to carry a depth of from 15 to 16 feet? Yes. The next shallow is what we call the Ulmarra crossing. That has kept good for years.
836. At Lawrence there used to be some little trouble? There is an elbow there that could be widened with advantage to us at the present time. Although it is deep in the channel it is very narrow.
837. These are the principal obstructions to large ships that are able to cross the bar? Yes. There is another just below Maclean with 11 feet on it at dead-low water.
838. You have traded on a number of the other northern rivers? Yes; I have traded on the Manning, the Macleay, Port Macquarie, and the Richmond, as well as the Clarence.
839. How does the Clarence entrance compare with the entrances of these other rivers? There is no comparison.
840. In what way? The entrance to the Clarence is protected by a southern reef or headland. Nearly all our bad weather comes in from the south or south-east. Consequently you will come along the coast with really a moderate sea, and when you come to the Clarence bar it is all right.
841. Improvements are being carried out on a number of these other rivers? Yes.
842. Have they been as successful, so far, as the improvements at the Clarence? They have not been so extensive, except on the Richmond, and the Richmond is not such a success inside yet, on account of the bank of indurated sand, that the dredge is now cutting through.
843. Do you think the entrance to the Richmond can be improved at a similar cost, and with similar good results, as in the case of the Clarence? No, I do not. They are building two immense breakwaters at the Richmond.
844. Will they have the effect of improving the bar? Yes; and they are building also a central wall in the river.
845. They have a crossing there also inside the bar? There is always a crossing there between the two breakwaters. They are doing their best now to pump it up and dredge it, and are doing all they can to improve

improve it; but so far not with success. According to the pilot's report they have 12 feet there now at high water.

846. What is the usual depth of the crossing? The pilot gives 12 feet at high water.

847. Is that deeper than previously? Deeper than it used to be, because they can work a dredge there now.

848. The breakwater smooths the water? Yes, considerably.

849. How does the navigable part of the Richmond from the crossing up to Lismore compare with the Clarence;—are there any obstructions? Yes, there are many obstructions. There are the Pinlico flats, the Wardell flats, and just below Broadwater there is a reef, and the channel is narrow, so that you cannot get a ship of any size through without a lot of trouble. Then there is some very difficult water up about Woodburn. Swan Bay is very shallow, also Long Reach, above Swan Bay, and Newby's Reach, further up still. You then go straight to Coraki, a little more than half way to Lismore, and after that the North Arm is very narrow, and is subject to land slips, which block up the channel.

850. About what size steamers could negotiate the river in its present condition—about what draught? A draught of from 9 feet to 9 feet 6 inches to Lismore to work the ordinary tides.

851. About what draught of steamers can, with safety, enter the bar at the present time? You could run a boat in now at about 10 or 11 feet.

852. Would that be over the crossing as well as the bar? Yes; there is 12 feet on the crossing at high water.

853. Would there be any difficulty in removing the obstructions up the river? Yes; some of them are very long—the whole length of a reach of the river.

854. Does the narrowness of the river interfere with navigation to any extent? Yes; up the North Arm. The main river itself is a fair width.

855. How would you compare the Macleay River with the Clarence? The Clarence is, in my estimation, five times a better river than any of the others, both as regards depth of water and width.

856. Would steamers of similar size to those entering the Richmond be able to enter the Macleay? The Richmond is a little better than the Macleay.

857. Vessels do not usually go up the Macleay? Yes, they go to Kempsey; they have to dredge away the flats a little.

Samuel Sec, Mayor of Grafton, sworn, and further examined:—

858. *Chairman.*] I believe you desire to add something to your previous evidence? I omitted to give some particulars regarding the trade on the river. The increase in our trade from the middle of the month of November, 1899, to the middle of this month, February, has been unparalleled. In previous years we always had a slackness during that period, and sometimes our steamers scarcely had any cargo. This year, during the whole of that time, we have had full ships, and sometimes have been compelled to leave cargo behind, and we now have steamers with larger capacity than we had in previous years.

859. And as to the character of the freight—is it anything special? It is of a more varied character; but never in the history of the trade—and I have been associated with it for twenty years at Grafton—have we had such a volume of produce to send away as we have had during the latter part of 1899 and the early part of this year. Every ship has been positively full. That is independently of our timber steamer, which has been constantly employed conveying timber from the Clarence to Sydney—a thing that has never occurred before.

860. Do you think the district possesses any other resources besides those connected with agriculture and dairying;—are there any mineral developments? Yes; this district is very auriferous. There is both quartz and alluvial gold, and at the present time I know of some twenty-five applications for dredging leases in the upper part of the main river, and on the arms of the river—at Orara and other parts of the river. A recent discovery of cinnabar has been made, which is likely to prove profitable, not only to the owners of land, but to the Colony generally. There have been two distinct discoveries; one was made two years ago on the Upper Clarence, about 50 miles from here, and another was made within the last month in the opposite direction at a place known as Corinda. Yesterday I saw the analysis of the stone, and it indicates a cinnabar lode, and shows good prospects, according to the depth they have gone down; thus giving a radius of 100 miles of the Clarence watershed. There are also coal deposits at a place called Coaldale, where there is a seam 6 or 7 feet thick. I brought the matter under the notice of the Government some years ago, and the seam was inspected by Mr. David, who pronounced the coal good, and whose report is in the Government offices. Judging by the indications, I believe there are also coal deposits along the proposed railway line. There are various other minerals to be found in the district, including asbestos, silver, antimony, and chrome. In regard to the navigation of the river Clarence by steamers, a steamer drawing 5 feet 6 inches can go up to Copmanhurst, a distance of 78 miles from the heads, without any obstruction, and the tide flows about 10 miles beyond that point. There is, therefore, a tidal flow of about 88 miles in the Clarence river. I should have mentioned that I know of the existence of coal at the junction, within 2½ miles of the boundary of the city. The proposed railway line crosses the locality. By reference to a map compiled by the late Mr. Wilkinson, Government Geologist, it will be seen that large coal measures exist under the whole of the area between Grafton and Casino.

E. Farrell.
1 Mar., 1900.

S. Sec.
1 Mar., 1900.

FRIDAY, 2 MARCH, 1900.

[The Sectional Committee met at the "Commercial Hotel," Myrtle Creek, at 8 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Edward Thomas Smith, grazier, near Myrtle Creek, sworn, and examined:—

- E. T. Smith. 861. *Chairman.*] What is your occupation? I am a grazier, engaged also in dairy-farming. I live about 8 miles west of Myrtle Creek, and have been there for twenty-five years.
- 2 Mar., 1900. 862. What size holding did you start with? 2,500 acres, taken up as a conditional purchase and conditional lease.
863. Have you since enlarged that area? I have at the present time about 8,500 acres.
864. Will you describe the character of the country in that block? When I first took up the country it contained some very valuable timber, including ironbark, spotted-gum, stringybark, black-butt, and various other scrub timbers, all of excellent quality, suitable for bridge purposes and for building. There was also some cedar and pine in the ranges. I have materially improved the land by fencing and so forth. At present, I have 1,500 acres entirely fenced into eight paddocks, and in these paddocks the land is capable of carrying a beast and more to 5 acres. I have 300 head of cattle and thirty horses on a total holding of 1,500 acres of improved land. That leaves about 7,000 acres of unimproved land.
865. How do you dispose of that? I graze stock upon it.
866. Have you much stock on that portion? I have about 150 head of breeding cattle. The land consists of mountain country, gullies, and ranges. I have it merely on occupation license.
867. You could not improve that? I have improved some of it; I have it nearly fenced in.
868. Are the 300 head of cattle which you carry on the 1,500 acres dairy cows? There are 150 head of dairy cows and heifers.
869. How long have you been going in for dairying? Only for five months—since the creamery started where it is at present. They removed the creamery to suit my convenience, and to make it more central for suppliers.
870. Do you find dairying a profitable occupation? It has been, up to the present. We shall be very large suppliers next spring; we intend to supply again.
871. Do you employ labour? Yes.
872. And do your own family work as well? I have had a son working with me and two hired men, besides female employees for milking purposes.
873. Could you tell us how much milk is produced per cow? About 1 gallon a day would be a fair average.
874. For how many months in the year? I think they would milk all the year round at that.
875. Is that a good result? It is a very fair average, I think.
876. Before the creamery was started and located so as to suit you, what used you do with your cattle? My operations were confined to fattening and selling stock—horses, cattle, and anything else I could sell.
877. Do you find that the dairy industry, so far, is more profitable than that? The dairy industry, I believe, will ultimately pay. In my own experience it has paid well up to the present time.
878. Do you know the character of the country between Casino and Grafton? Yes.
879. Have you been to Grafton? I have only travelled over the country in spots, as it were, where I have seen the line; I have never travelled over the whole route, but I have been on the country right through from Grafton. I know the country all through.
880. Could you tell us any part of the country that we have travelled along to-day that resembles your own holding? There is the country from Sportsman Creek. There seems to be some good agricultural country about there. And again, at Myall Creek and on the Camira station there are some excellent flats for growing maize, and, in fact, good land for dairying or any purpose whatever. As regards the hilly country, that, of course, is rather heavily timbered. It could be very much improved by ringbarking and putting stock on it. If you tickle the soil at all it will grow an excellent crop.
881. Does that ridgy or hilly country we have seen to-day in any way resemble the ridgy country on your holding, which, before it was improved, was not of much use, but which now carries about one beast to 5 acres? It is very similar country, and the whole of Myrtle Creek, from one end to the other, for 15 miles, is land of that character; there is good bottom land all the way through.
882. Going through the country to-day, it seemed to be pretty well supplied with grass all through;—do we see it now in its best condition, in its worst condition, or in its average condition? It is not in anything like as good condition as I have seen it in. We have had a very heavy drought lately, which has cut the grass up wonderfully.
883. Of what duration has the drought been—a fortnight or three weeks? It has dried the grass so that if a bush fire got into it a great deal would be destroyed. There is always good grass in this part of the country where grass grows at all.
884. There is always a good supply of it? Yes; fairly good. Cattle seldom get starved out for want of grass, though I have seen cattle very hard-up for grass.
885. It strikes one, coming through all this well-grassed country, as we have done to-day, that there is very little settlement compared with what one might expect;—how do you account for that? I suppose it is on account of the land being locked up to a great extent.
886. There is a railway reserve on each side of the line, and a great deal of Crown lands? Yes; and there is a great deal of purchased land, purchased by the different holders of the runs.
887. But there is a great deal of Crown lands available—land that could be selected? Yes.
888. Why do you think that has not been taken up? I suppose the river banks have invited the people first, where they have been open to selection, and the back country, where we are at present, has not been attractive; because if people came here they could not get their produce away. People with small means could not settle down in this big place, because they could not live upon it. There was neither dairying or any other industry, except stock-raising, until recently.
- 889.

889. Dairying is quite a recent introduction in this district? Yes. The lands probably would have been taken up wherever there was a chance to make a home, but people could not make a living on them because they could not send their produce away. They could neither send it to Lawrence, Grafton, Casino, nor anywhere else. They could only consume it, and they have to do that to-day. E. T. Smith.
2 Mar., 1900.
890. As an old resident, do you regard the dairying industry as quite a new feature in the development of the country? Yes; and I believe it will be a very great success here.
891. Tell us how you deal with your dairy produce;—do you milk twice a day? Yes; and take it to the creamery, which is about 4 miles from my place.
892. Have you to take it within a short time for the milk to be sound? We take the milk to the creamery once a day. The evening's milk is kept for the morning, and we take the two milkings to the creamery in the morning.
893. How do you get paid for your milk? According to the creamery test.
894. Then the creamery people send the cream on to the factory, and you have nothing to do with that? No; we have nothing further to do with it.
895. How far do you think a dairyman could conveniently and profitably send milk to a creamery? We have no trouble in sending ours. We run down to the creamery in about an hour. We are 4 miles distant, and I think we are the furthest away.
896. I think you said that formerly the creamery was in a position that did not suit you;—was that by reason of the distance? Yes; it was about 2 miles further away.
897. Then you think about 5 miles is far enough to send your milk? I could send it twice as far as at present if we had good roads; but the country is so mixed up with creeks and swamps that it is almost impossible to travel. With a good road you could run milk probably about 10 miles. I would sooner run along a good road 6 or 8 miles than I would do 4 miles along my present road.
898. Is your road to the creamery through your own paddocks or along the main road? Partly; it is a bush road.
899. If a railway were constructed, every man would not want a road laid from his dairy to the railway? No; of course, we have bush roads. If a railway came within reasonable distance the way would be open before us.
900. Are you able to maintain your stock all the year round on the natural grass, or have you to feed them? I only have to feed the working horses.
901. You do not have to grow corn or green stuff? We grow corn, oats, and barley, and we throw that to the cows occasionally and to the horses we are feeding, but we never sell any.
902. Is the natural growth sufficient to keep the cows all the year round? Yes.
903. You need not give them corn or anything else, if you do not like? No; of course they are all the better for it.
904. For producing milk, are they better for a little green stuff? Yes; during the winter—during April, May, June, and July.
905. Do cattle thrive well here, or is there any disease? There is disease, but it is not worse here than in any other part of the country, or nearly as bad as I have seen it.
906. Would it be an advantage to you if this railway were constructed;—as you now send your stuff to Casino, would it be any advantage to you to be able to send it the other way towards Grafton? We should be able to send it to another firm if we wanted to do so, so that if there were two competing for the cream instead of only one, it would be better for us. We could send it then to Grafton or any other place if we wanted to do so.
907. From your practical experience, you believe that between Casino and Grafton there is a tract of country which, compared with your own land, is well suited for dairying purposes? I firmly believe there is.
908. What area do you think a beginner would want to take up to get a reasonable living for himself and his family? A man should have thirty good cows and 100 acres of good grass land—paddocks that had been ringbarked and improved.
909. I am speaking of a man going upon the land in its natural state, who could only afford to put up a house and erect a rough fence around the property;—under those circumstances, how many acres would it take to support a beast? I think 6 acres would be sufficient.
910. Even when the timber was not rung? Yes; from 6 to 10 acres.
911. What part of the country do you refer to—the flat land or the ridges? Both combined. By gradual improvement the carrying capacity would increase.
912. The country is well supplied with watercourses and small creeks? In that respect I never saw better country in my life, anywhere; and I have been all over Australia, and can speak from an experience of over fifty years. I never saw better watered country in my life.
913. And do you really think that with better access this would be a place where a number of people would settle in the dairy line? I believe there is not an acre of land on Myrtle Creek, Wyandah, Dobie, or Wyon, that would not be taken up.
914. You say you have been here about twenty-five years;—had you any previous experience in the farming line? I came from Tabulam, where I was a grazier and farmer; I was there for ten years.
915. And you have been well satisfied with the change? Yes.
916. Are there many others like yourself in this locality engaged in the occupation of dairying? Yes.
917. Has that been a recent development? Some of them have been at it longer than I have been, although they have not been resident here so long. I did not start dairying until recently, and others started as soon as they came here.
918. Are they doing well? I believe they are.
919. Is it an increasing industry in the locality? Yes; they are giving a good supply at present, I believe.
920. And you account for the want of settlement so apparent between here and Grafton, mainly by the fact of the land being locked up, and want of better communication? I believe that is the principal reason why the land has not been taken up.
921. If you had better means of access to a market, do you think it would pay you also to grow crops on your land—hay or corn? Most undoubtedly it would.
922. Does hay grow well in this locality? Splendidly. I never saw better oaten hay, and lucerne grows here very well.
923. Have you grown hay? Yes.

- E. T. Smith. 924. What have you got to the acre? I daresay I have got as much as 30 cwt. of oaten hay to the acre. I have a good stack of hay at the present time, and others have good stacks of hay as well as myself. I never saw better hay in my life.
- 2 Mar., 1900. 925. That would be on the flat land? Yes; I believe the ridges would grow it, too, where I am.
926. And corn? And corn too. I have grown both hay and corn on the ridges.
927. What is the best crop of corn that you have grown? The crops are not extremely heavy, especially on the ridges. I think the last crop I got was about 40 bushels to the acre.
928. And that was on the ridges? Partly so.
929. If you could get your stuff away, where should you send it to? We should send it to Sydney if the freight allowed.
930. Would it go to Casino or to Grafton? I presume, to Grafton.
931. Why? The Clarence River is a deep river.
932. You would get your stuff away quicker? Yes.

Cunningham Henderson, grazier, Myrtle Creek, sworn, and examined:—

- C. Henderson. 933. *Mr. Watson.*] How long have you been in the district? Ten years.
- 2 Mar., 1900. 934. How many acres of land do you occupy? Four thousand acres conditional purchase and conditional lease.
935. Any under occupation license? No.
936. What amount of stock have you been carrying? At present I have about 300 head, and average from 700 to 800 on the holding, and turn off from 500 to 600 fats every season.
937. I take it, then, you usually take in stores? I buy stores and fatten them; that is my business. The balance of 150 or 200 odd would comprise a few breeders and mixed cattle.
938. How long would you have those 500 or 600 fats on the holding? From eight to twelve months, according to the condition when put on; none of them longer than twelve months.
939. Is your land improved at all? Yes; the bulk of it is well improved.
940. Of what do the improvements consist? Ringbarking and clearing. I have a little artificial grass, but not very much. I find, however, that what little I have put in is a great success. For instance, *paspalum* sown broadcast in the paddocks is a great success.
941. It takes on? Beautifully.
942. And is an improvement on the natural grasses? I think so. I think the greater the variety of grasses on any place the better it is. I would not say that I should like all *paspalum*, but it is a splendid mixture. I make it a rule every season to sow some *paspalum*, some clover, and perhaps some other grasses, but principally the two mentioned.
943. Does the clover seem to thrive well? Yes; just for a few months in the spring. The summer is too hot for it.
944. Your land is all rung? No; about 2,000 acres are ringbarked. It is not all exactly cleared. It has been well scrubbed; there are no suckers; it is kept in good order. That is what I meant by clearing. The timber is not burnt off.
945. What does your land consist of—principally flats? Mostly flat country.
946. Would it be rather above the average of the district, or would it be a fair average? It might be a little better than the average of the whole country.
947. Do you know the country between Grafton and Casino generally? Yes; I have a pretty fair knowledge of it. I have been through it a good deal with fat cattle.
948. Your land would be on the whole better, I suppose, than the average of that country? Yes; better than the average between here and Grafton.
949. Have you tried any cultivation at all? No; I have confined myself to fattening. I find it such a success that there is no need to go in for anything else.
950. Would the construction of a railway affect you personally? It would in this way: it would open up the Sydney market to me. I send a good many cattle to Sydney, and sell to Sydney buyers; but it is a difficult and expensive matter to get cattle to Sydney.
951. How do you send them? Both by rail and steamer. Tenterfield is our nearest point on the railway. That involves about 90 miles of very rough travelling over mostly hilly country, and then the stock have to stand in the trucks.
952. And from there they have to go to Sydney in the trucks? Yes.
953. The other route would be *via* Grafton, I suppose? They are shipped on the Clarence at Lawrence.
954. There is no shipping of cattle done on the Richmond? Very little. I think the bar is a bit too risky there for shipping cattle.
955. I suppose the larger vessels coming to the Clarence offer greater facilities for taking away cattle? Yes; in fact there is only one boat in the whole trade up this way that is constructed for carrying cattle—the “City of Grafton.”
956. If a railway were constructed you think you should be able to send your cattle from here to Grafton and thence by steamer, instead of driving them from here to Grafton? I do not know about that.
957. I understood you to say that a railway would be an improvement on your present arrangements? If I were sending cattle to Grafton to the butchers there I should probably truck them; but I do not know about shipping, because Lawrence is the shipping port.
958. Then how would the railway assist you, because your trade with Grafton would be a small matter? I conclude that eventually it would go right through to Sydney.
959. But we are considering it only as one section? The only way it would affect me in the cattle trade would be perhaps in sending to the Grafton butchers. I believe that if a railway were constructed here I should have to give up fattening cattle. The country would be closely settled. My opinion is I should have to cut up the land into dairy farms before many years.
960. You, yourself, would cut up your land into dairy farms? I think so. I do not think I should be fattening cattle for any great time after the railway were made.
961. I understand there are a number of creameries in this district, or at least one? Speaking of Myrtle Creek, there is only one.

962. How far is your holding from that creamery? East from it, about 10 miles.

963. As there is a creamery on Myrtle Creek, would it not be possible for you, without a railway, to cut your land up and utilise it for dairy farms? I am afraid the distance is a little too great, considering that it is only a bush road. It would be about 11 miles to the creamery.

964. But assuming that a number of settlers would be willing to send milk to a creamery from about your locality, would it not be possible to get a creamery established to treat their milk? I think so. If even two or three were to combine together I believe it would pay to send the cream 10 miles.

965. So that even if a railway were not constructed you think there would be a possibility of the dairying industry paying about the locality where you are? Yes. The change may occur gradually, but I believe this country will eventually become dairy country, whether there is a railway or not.

966. But a railway, you think, would give a spurt to the industry? I am sure it would.

967. How do you regard the general tract of country between this place and Grafton, as far as grazing is concerned? Taking it as a whole, you could not call it first-class grazing country; there are only patches of good country; but it is all fair grazing country, and it could be improved to a wonderful extent. At present it is thickly timbered, and consequently sour, because the sun scarcely ever shines on it.

968. Assuming it to be ringbarked, and scrubbed where necessary, what would it be able to carry on an average in the way of dairy cattle? Providing it were well improved, from 5 to 10 acres to the beast.

969. When you say well improved, what would that mean? Ringbarked, and kept in order; no scrub allowed to grow. Every year there are fires which clean up a bit of timber.

970. And it would also include, I suppose, doing as you have done—introducing a few new grasses? Of course, with the introduction of any artificial grasses, the carrying capacity would be much improved.

971. There would be an improvement on the estimate you have given? I think so.

972. And could the improvements you mention be done at a moderate cost? The ringbarking could be done at a cost of from 8d. to 1s. an acre, according to the thickness of the timber. The scrubbing would vary considerably. In the flat country it would be almost nil, and in the ridgy country it might cost another 3d. or 4d.

973. After you have got the land ringbarked and scrubbed, is the introduction of new grasses an expensive item? It is if done quickly; it is a thing that must be done gradually to make it inexpensive. The only method is to watch your chance, and after a fire sprinkle seed about where trees have been burnt. The grass will spread itself by cattle eating the seed, and in that way it can be done without any great cost, though it may take a little time.

974. So that a new settler would probably rely in the first instance on the natural grasses? He would require to do so absolutely for a time.

975. In that case you think he would not be able to carry more than a beast to 5 or 10 acres? Taking the average of the country from here to Grafton, I would not say 5 acres at all—that would be in an improved condition. I would say from 10 to 15 acres in its unimproved condition; but as soon as he began to get the benefit of ringbarking and scrubbing, he could increase his stock each season in proportion to the improvements, until he got up to 5 acres to a beast for the best land between here and Grafton—there is not a great area of that class of country—and then from that up to 10 acres.

976. You think then that the higher land, the hilly country, would need, even with improvements, about 10 acres for a beast? Yes, I think it would; taking it alone, apart from the flats.

977. If a settler with a holding of 600 acres had 200 acres of flat land and 400 acres of hilly country, ringbarked and scrubbed, what could he carry per acre, taking the average from here to Grafton? I should say a beast to about from 7 to 10 acres. That is without artificial feed, and provided he improved it pretty well. My experience is that the flat country is very much better as regards carrying capacity than the ridgy country in this district.

978. What is your impression as to the effect that railway construction would have upon the settlement of the land between here and Grafton? I think that wherever there is water available the country would be taken up, if not immediately, within a very short time.

979. For what purpose? Dairying and mixed farming—dairying principally. I think it would be a good country for fruit-growing. I think the nature of the soil would be very suitable for fruit-growing—vineyards for instance.

980. You said where water was available you thought the land would be quickly taken up;—do you intend to convey by that that water is not universally available along this country? If it were cut into small blocks of 600 acres, there would perhaps be a good many blocks without natural water on them. It would be difficult to cut up the country into 600-acre blocks with natural water on each block.

981. On those blocks which had no natural water would it be possible to so conserve water without great expense? Yes, I think so, in the gullies.

982. You have given us your opinion of the country between here and Grafton, and its carrying capacity; how does the country between Myrtle Creek and Casino compare with that? I think it is very much better.

983. Flatter country? The bulk of it is. For 7 miles from here towards Casino it is hilly country, and after that it is mostly flat.

984. And better soil? Yes, it is decidedly better soil.

985. Speaking generally, you think the railway would result in increased settlement? I have no doubt at all about that.

986. And would be a justifiable undertaking? I think so. In fact I have many inquiries from other parts of the Colony as to the advisability of taking up land here; but the want of facilities to get the produce away seems to block people. When they see that there is such a long distance to cart anything they seem to hesitate. They like to get in closer to a town where there is some means of getting rid of their produce.

987. If a railway were constructed, do you think it would have to rely for its freight mainly upon dairy products, or would there be other products which would assist to provide traffic? I think if we had a railway farming would be entered into in this locality—general farming, maize-growing, potato-growing, hay-growing, &c.

988. Do you think the settlers here could compete with people who are growing similar products on the river banks and other richer land? Yes, I think so, for this reason: that here we should be paying at the rate of only 1s. an acre for our land, while on the river banks they pay from £1 to 30s., and even £2 a year, rent. Under those circumstances I think we could compete with them successfully.

- C. Henderson, 989. It would be only on the flat land that you would be able to grow maize, hay, and potatoes? No, I think not; there is also a lot of very fine ridgy country in this district.
- 2 Mar., 1900. 990. Capable of agriculture? Yes, mostly, from here in the direction of Casino. Between here and Sandy Creek there is a great deal of ridgy country very good for agriculture.
991. You would not apply that description to the land between here and Grafton? No; I would not to the ridges, though I think they would be suitable for growing hay.
992. Are we not correct in assuming that the great argument for the construction of the railway is that by that means a large dairying industry would be fostered? Yes; I believe that to be the chief idea. It would settle a thick population in the district.
993. Any other production would be subsidiary to the dairying industry? Yes, perhaps so; although we have other products. There is, for instance, the prospect of an enormous timber trade between here and the Clarence.
994. You think that would be a considerable item in the traffic? I am certain of it.
995. There is good timber on the ridges? There is a marvellous lot of good timber within a radius of 10 miles of Myrtle Creek.
996. Just a little west of the route, I understand, there is good timber again on the Richmond Range? Yes; in fact, when you get 15 miles this side of Grafton there is a splendid lot of timber. On Camira station, and part of what was originally the Camira holding, but which has since been thrown up, there is a wonderful lot of ironbark. It is hard to say when it will be exhausted, unless there is a railway to carry it away. I think the timber trade would be about the biggest item of the lot for a number of years, and that would be an immediate return, without waiting for settlement.
997. I think you said the timber would go towards Grafton? Mainly, I believe, it would for shipping purposes.
998. Because of the greater facilities there for shipping? Yes.
999. Coming back to the question of agricultural development in this district, is it not a fact that a number of people who are paying high rents on the river frontages and the rich river lands, are entering into dairying and giving up agricultural production? I believe to a certain extent they are, more especially sugar-growers. I do not say much about maize-growers. But I think the chief reason for that on the river banks is a fear of floods. They are sure of the dairying.
1000. We have been given to understand that on land that is nearer Lismore and along the existing railway line, people have gone in largely for the dairy industry, where the land is quite good enough for agriculture? Yes; in the big scrub, for instance, it is very good agricultural ground.
1001. If it pays those people, who have land capable of much higher agricultural production than would be possible here, to go in for dairying, is it not possible that it would pay you even to a greater extent to take up dairying rather than agriculture? Yes; but I think it probable there will be a bit of agriculture done also, to supplement, or in connection with, the dairying, which I think would be the chief industry. I have a little knowledge of a firm engaged in the timber business on the Clarence, and I know that they have constructed a tramway for a distance of 12 or 13 miles from Deepwater, on the Clarence River, towards Myrtle Creek, and the bulk of their timber is taken from between here and 15 miles away to the south and south-east. They take the bulk of their timber from the locality of Myrtle Creek and Myall Creek.
1002. How many miles from Lawrence would 15 miles from here be? That would be, roughly, half way.
1003. So that they start taking timber 15 miles from Lawrence, and come right out to Myrtle Creek? Yes. In many cases they draw timber by road for a distance of 34 and 35 miles. I believe they have 200 men employed, including all hands; such as mill-hands, squarers, and teamsters.
1004. Why is it necessary for them to go that distance back for timber, when, as you say, there is good timber for many miles on the Grafton side of Myrtle Creek? The timber reserves have a good deal to do with it. There are a great many timber reserves along that road.
1005. But they can get on to the timber reserves? They have to pay a royalty and an extra license fee, and they avoid the reserves where possible, and they are now simply picking the timber.
1006. They go further afield in order to avoid paying the fees which they would have to pay if they cut on a forest reserve? I believe so. That is what I heard the timber-getters say themselves. That is the reason they go out so far.
1007. So that they pass by good timber in order to get the other cheaper? Yes.

Thomas Francis O'Keeffe, dairy-farmer, Myrtle Creek, sworn, and examined.—

- T.F.O'Keeffe, 1008. *Mr. McParlane.*] Have you a good knowledge of the district? Yes; I have known it for nearly forty years, although I have been away from it for some years.
- 2 Mar., 1900. 1009. Could you tell us how many residents there are in the locality? West of here there are about thirty-two or thirty-three.
1010. Is that on the creek? On the creek and its tributaries.
1011. What is their principal occupation? Dairy-farming principally, also grazing and some agriculture.
1012. Where is the agricultural land—on the banks of the creek? Yes; the alluvial flats on the banks of the creeks.
1013. What do they principally grow? At the present time principally maize and vegetables.
1014. Is that for market purposes? No; only for what local market there is.
1015. The maize must be for fodder? No; it is sold locally.
1016. What is your opinion of the district in regard to its capacity for dairying purposes? I believe when it is opened up and ringbarked, and otherwise improved, it will become a place of denser settlement. It is capable of carrying a large population. The country here, if ringbarked, would carry on an average a beast to 5 acres—the whole of it—and on some of the alluvial flats a good deal more.
1017. You consider the alluvial flats better for dairying than the ridgy portions? Yes, for grazing.
1018. Would that apply to cultivation also? Yes; the ridges would grow the lighter cereals, such as oats; but not the heavier crops, such as corn. In comparison with the west, this district carries a greater number of stock to the acre. The grass grows with a better sward. In the western country it grows in tufts. Here, with heavy stocking, the natural grass, such as the blady grass, would be destroyed, and a better quality of grass would take its place.
1019. What is your experience in regard to the blady grass—does it diminish after working the land? Yes; it diminishes by overstocking at first, and couch grass then takes its place. 1020.

T. F. O'Keefe.

2 Mar., 1900.

1020. Is that a better grass for stock purposes? Yes; it will carry more stock.
1021. Do you consider the land suitable for artificial grasses? Yes.
1022. It is sufficiently rich? Yes.
1023. Is the country between Casino and Grafton of a similar character, speaking generally, to the country you have described on Myrtle Creek? There are many flats along the various creeks—such as Sportsman Creek and Myall Creek—of the same character as Myrtle Creek, but I think on Myrtle Creek there is a larger scope of good country.
1024. Do you know the country well between Casino and Grafton, along the proposed line? Yes; I have been over it many times.
1025. What would you consider to be the value of the land along the line, in its natural condition, taking the ridgy land first? I notice that on the other side of the Clarence the Government have fixed the price of land at 30s. an acre. Well, I would rather give £6 an acre for this land than 30s. for that.
1026. But you would not put that as the value of the land? No; but if the Government valuation of 30s. for the other land is correct, then this land is worth £6.
1027. But what value would you put on it? I should estimate it in its natural state at about £1 per acre.
1028. And the value of land such as you describe at Sportsman Creek? If you pick the eyes out it would be worth a little more.
1029. But, putting the two together, and supposing the land were cut into blocks in an ordinary way so as to include with the ridgy land a fair proportion of flat land? In my estimate of £1 an acre I assume that it would be near railway communication. It would then be worth £1 an acre, independently of improvements and in its natural state. Of course, it would ultimately become enhanced in value by ring-barking and other improvements.
1030. What would you consider its value at the present time? I do not think it would be of much value at the present time. It could not be used for dairy purposes or farming. I think it would be worth 10s. an acre for grazing purposes alone.
1031. But, if it were ringbarked and fenced, its value would be considerably enhanced? Yes; I believe it would.
1032. In the event of the proposed railway being constructed, do you think this is a class of country that would be taken up for dairy purposes and for agriculture? Yes.
1033. Taking the general character of the country, in the event of railway construction, what area do you think would be sufficient to maintain a family? I should think about 100 acres should maintain a family—after it is improved.
1034. Would not that be a small area? Not of improved land. I think 100 acres used for dairy purposes would carry sufficient stock to support a family.
1035. I suppose a good deal would depend on the size of the family? Take an average family, say a man and his wife, and four children.
1036. How many cows would 100 acres keep, properly worked? About twenty cows; that would be 5 acres to the cow.
1037. Would the land of average quality maintain one cow to every 5 acres? Taking a general average it would. There are some sandy ridges between here and Grafton, and some inferior land that would not do that.
1038. Do you think the best portions of the land between Grafton and Casino—the flats, for instance—would be used for agricultural purposes; I mean for market purposes? Yes. I think in many places settlers would go in for mixed farming—dairying and agriculture.
1039. Is there much of that class of country along the proposed line—taking a scope of country 10 miles on each side? Yes. On the west side of Myrtle Creek alone I should say there are about 10,000 acres suitable for agriculture. I am not acquainted with the eastern side.
1040. At the average price realised in the Sydney market, do you think it would pay those engaged in cultivation to send maize to market? Yes; taking one year with another I think the land would always average 40 bushels to the acre—that is, the alluvial flats.
1041. Would that average pay the grower at an ordinary price? Yes. I believe it is only the average on the Clarence River banks.
1042. Have you any knowledge of timber? Yes; I have had some years experience in the timber business. I had saw-mills for a number of years. I think a large trade would be done here in timber if there were a railway.
1043. Do you think it likely that the railway would be used for carrying the timber? Yes; the rates are pretty reasonable.
1044. And the timber would go in the direction to Grafton? Yes; to deep water. The local mills at Casino might take some, but that for export would go to deep water, at Grafton.

Henry Valentine Rapp, dairy-farmer, Myrtle Creek, sworn, and examined:—

1045. *Chairman.*] What is your occupation? Dairying. I live close to Myrtle Creek, about 3 miles from here.
1046. How long have you been here? Twenty years.
1047. Have you been carrying on dairying all that time? No; only for the last two and a half years.
1048. What was your occupation before that? Grazing, and doing a little farming.
1049. What extent of land have you? 1,200 acres.
1050. What induced you to go in for dairying? I thought it was the best thing I could do. All my neighbours in the district seemed to be going in for it, and doing pretty well, so I thought I would have a try too.
1051. What has been the result? Very satisfactory. Like all other new places we did not start with the right class of cattle—with a picked herd of milkers, and that sort of thing. I have about 150 cows. They require a little more picking yet to make a good dairy herd. I have no particular breed. I have now gone in for the Ayrshire cross to get a dairy herd.
1052. Of these 150 cows how many do you milk? We milk, on an average, forty-five.
1053. Why only that number out of 150? Well, you cannot always be milking them. It is a bad thing to milk them out too far; it is better to let them go.

H. V. Rapp.

2 Mar., 1900.

- H. V. Rapp. 1054. But have you not rather a large proportion of non-milkers out of 150 cows? No, I do not think so—not as far as I have gone yet. There are times when I milk more, but in the winter time I do not milk so many as I do in the summer. I have never kept a diary to see what I really do milk, but I estimate about forty-five to fifty all the year round.
- 2 Mar., 1900. 1055. They told us in Grafton that they generally milk about eighty out of 120? People who have the real dairy cows will milk their cows longer. I send my milk to the creamery, a distance of about 2 miles.
1056. You heard the evidence of Mr. Smith, Mr. Henderson, and Mr. O'Keeffe, as to the capabilities of the district generally and its prospects in particular from a dairy point of view;—do you agree with the views expressed by those gentlemen? Yes; I think what Mr. O'Keeffe said was pretty correct.
1057. He puts down the land, in its unimproved state, at 10s. an acre; but do you not think that is rather low? Yes; I think it is worth more than that. I think it is worth £1 an acre. All the land about here has been taken up, and we all have to pay the Government £1 an acre for it.
1058. One pound an acre at present? Yes. I would not take £1 an acre for mine.
1059. Have you improved yours much? Yes; I have improved it a good deal. I have fenced and ring-barked, and burnt a good deal of the timber off.
1060. Do you agree with the former witnesses, that when this land is ringbarked it carries one beast to about 5 acres? Yes, that, I think, would be the average; but there are places where it would not take 5 acres to feed a beast.
1061. But 5 acres is about a fair average? Yes. I think so, on a good deal of it.
1062. What crops can be grown advantageously about this part? We can grow maize, potatoes, and hay. On good land on the flats I can grow almost any mortal thing. Everything I have put in has grown.
1063. Sugar? I have grown splendid cane, in small patches.
1064. Do you think that is likely to become a large industry on the flats? Yes; I think so.
1065. It is not necessary to cart that so far? No; if we had a railway we should not want to cart it far.
1066. The dairying industry, you have observed, has gone ahead a good deal? Yes. With regard to our creamery, we have to pay £3 to the company for running our cream to Casino. The cream goes in three times a week, and we have to pay £1 each time for running it in. That is deducted from our cheques, besides a halfpenny a gallon for working expenses. That is a big burden upon us.
1067. During the last three or four years have several other people started dairying here? Yes, several people; and there have been people here looking for places lately. There is one man who has recently come from the Clarence River, but he has not started milking yet. South Coast people, and other strangers who come here, think it is too far away; they try to get in nearer to the towns and centres of population. The land on this creek is as good as anything on the northern rivers. About a mile from here, up the creek, you get on to good open black-soil flats which would surprise you.
1068. But the distance from Sydney or the nearest port makes settlement almost impossible? Yes. We go in largely for pigs on the creek. The maize we grow is nearly all used for feeding pigs, except what is required for the horses in the winter. We have to drive our pigs to Lawrence or to Tatham, a distance of 20 miles, in order to get rid of them.
1069. Would you grow hay and corn for export if you had access to a market? Yes, I think so.
1070. We have been led to believe all through this inquiry that dairying has a great future on the land between Casino and Grafton;—do you believe that? Yes.
1071. And that ridgy country, when cleared and improved, you think is peculiarly suitable for grazing cattle? Yes; that is my experience and observation.

George Henry McKee, farmer and grazier, Myrtle Creek, sworn, and examined:—

- G. H. McKee. 1072. *Mr. Watson.*] What is the size of your holding? 1,280 acres conditional purchase and conditional lease.
- 2 Mar., 1900. 1073. Does it include any rented land? No. I have 3,000 acres under annual lease in connection with my brother.
1074. What stock do you run on your land? About 500 head on both properties. I have about 150 cows, which I am working into a dairy herd in the paddocks. I may say that I have only recently started dairying. I was away for five years on the Lismore side, at Alstonville. I left here when the cattle market was rather bad, as I was depending on fat cattle, and I went over on the Lismore side and started a butchering business, and I also did a little dairy-farming. As I did not require all the paddocks here for fat cattle, that gave me the idea of dairying, which I had found paid really well, and when the creamery was started here I made up my mind to return, and go in for dairying pretty extensively. I find that the same cattle I milked over there last summer milk equally well, if not better, here. I am perfectly satisfied that this country produces as much milk per cow as the big scrub, which is reckoned one of the best dairying districts in the Colony. I get better results here from the same cattle as regards the flow of milk, although I do not get as good results from the creamery.
1075. Is your land improved? The whole of the conditional purchase land and conditional lease land is improved, but the other is in its natural state.
1076. Does your conditional purchase and conditional lease land consist mainly of hilly country? No; mostly flat country.
1077. How far is it situated from Myrtle Creek? About 5 miles to the west.
1078. You have heard the general tenor of the evidence given about the suitability of this country generally for dairying and cattle grazing—do you endorse that evidence? Yes.
1079. There is a considerable trade in timber between this district and the Clarence, is there not? Yes.
1080. Do you know what the saw-mill proprietors pay the teams for carting the timber into Lawrence? Only for a certain distance. One carrier told me he got 1s. 6d. per 100 superficial feet for carting timber from the "Travellers' Rest" into Lawrence, a distance of something over 10 miles. We have an unlimited quantity of timber here, and it would be a great item of carriage on the railway.
1081. Some questions have been asked of previous witnesses with reference to the growing and exporting of hay in the event of a railway being constructed, and the opinion was expressed that that will be undertaken;—do you coincide with that idea? Yes; I think there would be a fair amount of produce grown for export if we had access to a market.
1082. The freight charged on the main railway lines of the Colony for hay in 6-ton truck-loads is, for
over

over 40 miles, 3s. 3d. per ton;—assuming that that rate were charged, do you think it would pay a man to send his hay by railway to Grafton for shipment from there to Sydney? Yes; because at present we could not cart it by road under 10s. a ton. G. H. McKee.
2 Mar., 1900.

1083. But you would not probably undertake to export it by road? No.

1084. Do you think the prices obtained in Sydney are sufficient to justify a farmer here in paying 2s. 3d. per ton for the carriage of hay, in addition to the steamer freight? Yes, I think so; in fact, I am sure of it.

1085. You endorse the statements of previous witnesses as to the necessity for a railway, and the good results that would ensue to the district? Yes.

Henry Harris, dairy-farmer, Myrtle Creek, sworn, and examined:—

1086. *Mr. McFarlane.*] What are you? A dairy-farmer. I have been residing at Myrtle Creek for about three years. I have a holding of 800 acres—a conditional purchase and a conditional lease. H. Harris.
2 Mar., 1900.

1087. How long have you been dairying? About three years.

1088. Do you find it profitable? Yes.

1089. Is your holding improved, and, if so, to what extent? I have ringbarked about 500 acres since I took it up three years ago.

1090. Is it fenced and subdivided? It is partly subdivided.

1091. And improved? Of course it has improved very much since I ringbarked it.

1092. Some of it is unimproved? Yes.

1093. And unfenced? Yes; some of it is unfenced—a small area.

1094. How many dairy cows have you? About fifty head.

1095. All milking? I am milking only about thirty now.

1096. Are you on Myrtle Creek? No; I am 6 miles from here—pretty well north towards Casino.

1097. How far are you from a creamery? I have a separator in connection with my brother; we send our cream to Casino, a distance of 16 miles. We take it to the New South Wales Creamery at Deep Creek, and it goes in from there.

1098. Do you cultivate any portion of the holding? Only a small area at present, principally for green feed for the cattle.

1099. Is your holding suitable for cultivation for market purposes? Yes; we can grow anything we have tried. White clover does well there.

1100. Is your holding fully stocked? No.

1101. How many acres would carry a cow, in its improved condition? The improved land will carry a beast to 3 acres well.

1102. Have you artificial grasses? Only a small percentage of white clover.

1103. Do you know the locality about Myrtle Creek and the different dairy holdings there? I do not know them very well except out where I am living and further from Casino. I have an intimate knowledge of the country between here and Casino.

1104. Do you know whether the holdings on the creek are similar to yours, or is yours superior? There is any quantity as good as mine; mine is about the average. There are some poorer and some a little better; the bulk of my country is very ridgy and rather steep.

1105. Was any portion of it scrub country? No; all forest.

1106. Thickly timbered? Medium. I consider the ridges between my place and Casino the best—better than the flats—either for grazing or agriculture.

1107. Do you know the country south from here towards Grafton? Not intimately; I have travelled over it by coach a few times.

1108. You could not say whether the ridges between Myrtle Creek and Grafton are similar to those on your holding? I do not believe they are, from what I have seen in travelling by coach.

1109. What is the character of the ridgy country referred to, similar to your holding? It is volcanic.

1110. With chocolate soil? Some chocolate and some black.

1111. What agricultural products do you think it would raise? We grow maize and potatoes, and we also grow lucerne in small quantities for the purpose of feeding for milk.

1112. Did you ever take a record of the number of bushels one acre could produce? No.

1113. Could you make an estimate of how many bushels to the acre the land would grow—say, of maize? I am certain we could grow 50 bushels to the acre.

1114. You consider that a good yield? A fair average yield for that country.

1115. Is there much of that class of country between Myrtle Creek and Casino? The bulk of it is of a similar character to mine and suitable for cultivation.

1116. Is it alienated—taken up in holdings? Most of it. I may say that three portions have been taken up within a very short distance of my place during the last month, in anticipation of the railway. Three years ago, when I came here, the population of the parish of Ellangowan did not number more than twelve persons, and now there are about fifty residents.

1117. How many holdings? I could not say. Some holdings are only used for grazing at present; no one is living on a good many of the holdings.

1118. In the event of a railway being constructed, would this land be placed under cultivation, or would it remain under dairying? I believe it would remain under dairying.

1119. The whole of it? Yes; pretty well.

1120. If this land is capable of producing 50 bushels to the acre, would not the people go in for cultivating maize? I do not think so, the country being too hilly; it is rather expensive to work.

1121. It is too steep? Yes. The soil is good enough, but the farmers will not go in for maize-growing extensively, for the reason just stated.

1122. You were present this evening when a number of witnesses gave their opinion of the character of the country along the line of the proposed railway, and also gave evidence with regard to dairying, and agriculture, and timber;—do you endorse the statements made generally by them? Yes; I do.

1123. Is there anything they have omitted which you would like to add? There is a large area of land between here and Casino that would be taken up almost immediately if it were open for selection and people had a railway or other means of getting their produce to market.

- H. Harris. 1124. Have you heard of many inquiries by people desirous of taking up farms for dairy purposes? I have heard of several during the last month—people who have come from the South Coast.
- 2 Mar., 1900. 1125. In the event of railway construction, do you think, from the statements of the different witnesses as to the quality of the land between Myrtle Creek and Grafton, that it would be likely to be taken up for dairy purposes? I believe it would.
1126. Where did you live before coming to the Richmond? I lived in Illawarra for many years.
1127. Were you carrying on dairying there? Yes.
1128. How does the Illwarra district compare with holdings such as yours in this locality;—is it inferior or superior? I believe the country where we are, between here and Casino, is better than the average run of the Illawarra country—that it will carry more cattle, and that the cattle will give more milk. At any rate, that is my experience. The soil is richer on the average.
1129. In your opinion, it is more profitable here than in the Illawarra district? Yes.
1130. That would be owing to the better character of the land? Owing to the better character of the land principally.
1131. How far would it pay to send milk to a creamery? About 4 miles in this district. According to our experience we could not send cream more than 10 miles by road.
1132. It would not pay to convey it more than 10 miles by road? It might pay; but it would be a big handicap to a dairy-farmer to have to send his cream more than 10 miles.
1133. You are more than 10 miles from Casino? Yes; we are 15 miles. We cart our cream 9 miles, and the company cart it the other 6 miles.
1134. Do you consider that if the proposed railway were constructed it would so materially benefit the dairymen as to cause a very large increase in settlement, even between here and Casino? Yes.
1135. In the event of a railway being constructed from Grafton to Casino in what direction would the cream be likely to go? I think the bulk of it would go to Grafton. Of course, the farmer always takes what is the best market; but I think it would go to Grafton, which would be its natural market; otherwise it would have to go to Lismore to be shipped to Sydney. As a matter of fact, we have only the two shipping ports—Lismore and Grafton—and I think it would go to Grafton.
1136. Casino is not touched by ocean-going ships? No.

Alfred Edward Harris, dairy-farmer, Myrtle Creek, sworn, and examined:—

- A. E. Harris. 1137. *Chairman.*] You are a brother of the last witness? Yes.
- 2 Mar., 1900. 1138. And you work in conjunction with him in the dairying business? I own the separator, and I separate for him.
1139. How long is it since you started? I have been dairying off and on for about nine years.
1140. In this district? Yes, at Ellangowan.
1141. How long have you been treating the milk for cream and butter? About five years.
1142. Have you been using your own separator all the time? Yes. I first had a hand separator, but now I have a steam separator.
1143. The milk of how many cows can you treat with that separator? I can treat 400 gallons of milk a day; that would be the product of about 400 cows.
1144. Do you treat the milk of any other producers besides yourself and your brother? I am treating the milk of six persons now.
1145. Do you charge the same as the other creamery? It is impossible to know what they charge. I charge $\frac{1}{4}$ d. a gallon.
1146. Does that pay you? It only just pays me, but it helps things along. Then we have to pay the company to take the cream to Casino.
1147. Are there only two separators in this district—yours and the one mentioned before? Between my place and Casino I should think there are nearly a dozen—towards Tatham.
1148. Have these all grown up within the last four or five years? Yes.
1149. Showing that the dairy industry is increasing? Yes.
1150. Have you had experience in dairying in any other parts of the Colony? Yes; I came from Dapto.
1151. Which district do you think the better for dairying? I think this district—that is, Ellangowan, and towards Casino, and out this way to Myrtle Creek—is fully equal to Illawarra. You get the tail-end of the volcanic country here.
1152. And, of course, you can get land cheaper here? Yes.
1153. What did you pay for yours? £1 an acre.
1154. What is the area? 1,280 acres.
1155. Free selection and conditional lease? Yes.
1156. Are you enlarging your operations, as you can do so, year by year? Yes; improving the place and enlarging it.
1157. And you are well satisfied with the district as a dairying district? I am well satisfied.
1158. Your brother has told us that there is a good deal of this land similar to yours, suitable for dairying—is that so? Yes; there are thousands of acres.
1159. Of this volcanic soil? Yes.
1160. I understand the Crown lands were mostly taken up? Still there are any amount of places where there is a small portion of this volcanic soil. I know a great deal of the land between here and Grafton. The land I have taken up is incomparably superior to the land between here and Grafton.
1161. What do you think of the land between here and Grafton from a dairy point of view? It is only summer dairying country.
1162. What do you mean by that? The grass is not suitable for winter dairying, but it is suitable for summer dairying.
1163. What is the matter with it in winter? The frosts cut it up, and I do not think it will grow artificial grasses very well. I would not like the country on the north side of Myrtle Creek to be judged by the country on the other side.
1164. Before selecting, did you look at the land between here and Grafton? I looked at some of it.
1165. And did not care about it? No, I did not; it is grazing country.
1166. Fattening country, but not for dairy purposes? Not proper for dairy purposes.
1167. Is that your opinion as a practical dairyman? Yes. 1168.

1168. If you had not been able to get this chocolate country you speak of, would you have taken up any of the land between here and Grafton? Not between here and Lawrence—not unless it was alongside the railway line. A. E. Harris.
2 Mar., 1900.

1169. But how would a railway help you to get over the frosts in winter? It would not; but, of course, one would prefer to take up land conveniently situated.

1170. But do you not want to dairy all the year round? It is not profitable in all cases. Your cows only milk well half the year, without feed. You can milk half the year without feed, and I think you could dairy on all this country all through the summer months well.

1171. But in the winter you would have to feed? You would have to turn all the cattle dry. You could dairy all through the summer—say for eight months.

1172. Would it pay a dairyman to work his cows only for half the year? Yes; because he could not work them for more than eight months at any time.

1173. Would it be practicable for you to grow crops in the summer months with which to feed your cattle during the winter months, and so go on milking them all the year;—would not that be a profitable occupation in that country? Yes, I think it would be.

1174. If this land were ringbarked and improved, would that help to make it available for dairying during the winter months? I do not think so. I do not think it is ever winter dairying country. I think it would pay a man better to sell all his winter springers and dairy through the summer.

SATURDAY, 3 MARCH, 1900.

[The Sectional Committee met at the "Commercial Hotel," Casino, at 6 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Francis Grant Fanning, grazier, Deep Creek, sworn, and examined:—

1175. *Chairman.*] Where is your holding? At Deep Creek, 6 miles south from Casino.

1176. How long have you resided there? I have resided there continuously for eleven years. I have been in the district for eighteen years, off and on. F. G. Fanning.
3 Mar., 1900.

1177. Do you know the surveyed railway line between here and Grafton—I mean at the Casino end;—there is one survey from Myrtle Creek in a straight line to Casino, and there is another which takes a more westerly course to Casino? Yes; I know those two routes.

1178. Would you compare those two routes in regard to the effect of floods? My remarks will apply to the 1891 flood—the big flood in these creeks. With regard to the deviation, on the west side of the main road the flood waters of Deep Creek are about a mile and a quarter in width, most of them being very light and shallow. They are comparatively harmless, as they are confined to two permanent water-courses—the Serpentine and Deep Creek. There are no waters on the Serpentine, but on each side of Deep Creek the flood-waters extend to some extent. In regard to the original survey I should say the flooded country through which the line would go would be from $3\frac{1}{4}$ to $3\frac{1}{2}$ miles across; in fact it is all heavily-flooded country. The greater part of it is dense ti-tree country, and in flood-time is covered in many places with 5 or 6 feet of water, running strongly. We never attempt to cross these waters in flood-time, there being a very strong current of water. The water flows over the main watercourse and spreads over the country generally.

1179. *Mr. Watson.*] It has been suggested that a deviation might be made more to the east, which would cross the Deep Creek waters about $4\frac{1}{2}$ miles further down, easterly from the main road;—for what distance along that line is the country bad in flood-time, what is the depth of water, and how far does it extend along that line—say 3 miles below your house? There is not quite as much water along that route as on the original survey, because there is a sand ridge by which the water is confined. The waters on the suggested route have not the same strength as those on the original survey.

1180. How does the original survey compare with the proposed easterly deviation, with regard to flood-waters;—would you class them as similar? No. I think the easterly deviation would be the better of the two. There is less force of water on the deviation, but I do not think there is much difference with regard to length. The adopted westerly route is the best of the three undoubtedly, because the water, as I have already explained, is confined to two watercourses, and can be much more easily dealt with.

MONDAY, 5 MARCH, 1900.

[The Sectional Committee met at the Town Hall, Casino, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Donald Campbell, grazier, Woodlands, sworn, and examined:—

1181. *Chairman.*] What are you? I am a grazier, residing at present at Woodlands. D. Campbell.

1182. That is in the direction of Kyogle? Yes, 4 miles from here, on the road to Queensland.

1183. How long have you been there? I have only been here two years; but I have been living on the other side of the road for some ten or twelve years. Before that I was manager of the Wooroooolgan station for eighteen years. 5 Mar., 1900.

- D. Campbell. 1184. That station is situated between here and Grafton? It is about 4 miles from here.
- 5 Mar., 1900. 1185. How far does it extend? It extends to Myrtle Creek, some 20 miles.
1186. What area is comprised in that run? It covers 20 miles from the head station to the head of Wyan Creek.
1187. And how much the other way? About 18 miles.
1188. The proposed line goes through a great deal of that station, does it not? Yes.
1189. Would you tell us briefly the character of the country comprised within its boundaries? Where the line is supposed to go, right across that country, it is not the best character of country.
1190. Is it ridgy or flat? Chiefly flat; but the road from Myrtle Creek through the run until it comes into Deep Creek here, is about the best part of the whole route—where that road actually goes.
1191. This end of the run is the worst? No; I think Myrtle Creek, until you come to Deep Creek—that is 5 miles from here. Coming from the Clarence this way there is, I should say, about 14 or 15 miles of the very worst. Going in any one direction from that it is much better.
1192. We will take that stretch of bad country;—is that of any use for agricultural purposes? There is no doubt the frontages of the creeks are very good.
1193. What would the land grow? It would grow maize, hay, and wheat.
1194. Is there any cultivation of that kind on that land? There are only maize, potatoes, and corn at the present time.
1195. In small quantities, for local consumption? Yes.
1196. With better means of communication do you think that land would be improved and used largely for cultivation? There is no doubt it would be. When you leave this stretch I speak of the country falls into better flats and the river frontages extend more, and then the ridges come in. These are not high; they are undulating ridges. In fact the ridges are the best of it. There are no ridges of any consequence. On both sides of the road you fall into Myrtle Creek and Myall Creek, and there is a good deal of frontage on these creeks.
1197. We want to distinguish between the ridgy and the flat country;—you have told us that the flat country on the edges of the creeks would be suitable for agriculture? They are at present, I suppose, chiefly used for grazing.
1198. With regard to the ridgy portion of this bad part you speak of, what is that suitable for? At the present time it is only used for grazing, but it would produce crops as good or better than some of the rest. There is very good land—a sort of reddish-brown soil, deep and very good; but it is chiefly low country.
1199. How does it compare with the country between here and Kyogle? There is no comparison. One acre of the country between here and Kyogle is worth 5 acres of that.
1200. For both purposes? For agricultural purposes. From Deep Creek right round until you come to Fawcett's Creek, for 40 miles each way. I do not think you could get a finer patch for agriculture in any part of the Colony. That is, going from Woorooloolgan, straight west and north, until you come to Fawcett's Creek.
1201. Is this rich country between here and Kyogle largely cultivated at the present time? Not very largely; but there is a good deal of cultivation on it.
1202. It is chiefly used for grazing? Yes; but there are a great number of selectors.
1203. This rich, good land is mostly alienated? Yes.
1204. With such a large area of much better land adjacent, and at present under cultivation, what are the prospects of the inferior land being taken up? This rich land, of course, will go a long time before the other. You may depend upon it not an acre of that would be left before people would go and select on the other.
1205. But they cannot get this rich land, because it is alienated? At the present time they are trying to get the people on it as fast as they can. Mr. Griffiths told me the last time he was up, only a month ago, that he had forty tenants now.
1206. Would it pay a man better to rent land of this rich soil from a large holder rather than go and take up the land we have spoken of, from Myrtle Creek this way, knowing that he would get the poor land at a very cheap rate, as compared with what he would have to pay for the rich land? It would pay a man to give 15s. an acre rent for this rich country.
1207. In preference to paying £1 an acre to free select the other land? It would pay him better, because he would get a greater return, and he could support a family on so much less land. The ground is undeniably good. It is good for anything we have tried it for yet, and the other land is much poorer.
1208. Then, your contention is that it is better for a settler to have a small area of rich reliable land than a large area of poor land? Much better. People, as a rule, some time ago went in for getting large areas, but they find now that a smaller area of good land is less costly, and keeps them better, and it is better looked after. When a family gets too much ground it is neglected, and it only grows weeds instead of a proper crop.
1209. Do you regard 640 acres as a large block of land for a poor man to handle in this district? Yes.
1210. Could you, from your experience, explain why it is that this large area is not suitable for a small beginner? Because the land is not so rich, and it wants the same labour; you must put the same labour on it for fencing, and all that. It costs a lot to put it under crop, and if it does not repay a man, he is done at once.
1211. In the case of poor land in its natural state, how many acres do you think it would take to carry one cow? About 14 or 15 acres; if ringbarked and improved, I should say about 9 acres.
1212. In regard to this better land, which you say a man could rent for about 15s. an acre, what is its carrying capacity? About 5 or 6 acres to a beast.
1213. As he gets it? As it is at present.
1214. Is that fenced in, or would he have to fence it? It is not fenced in. Any land a man would take up he would have to fence. He would just get the land. Of course, the owner or leaseholder from whom he rents the land would help to fence it for him at starting; but then the man is paying, say, from 5s. to 15s. an acre. He gets the land for the first three years perhaps for 4s. or 5s. Then the rent is raised half a crown every year; but it is better for a man to get 15s. or 20s. an acre for his land than to leave it under stock. At present he would only get about 5s. a year return for his land; but if he lease it out, as the owners

owners are beginning to do, then he makes that 5s. to begin with, and every year the rent is raised, until in a few years he will get £1 an acre. D. Campbell.

1215. That is very good from the landowner's point of view; but from a tenant's point of view how will he go on paying this increased rental? It pays him better to do it, because he makes a very good living out of it. 5 Mar., 1900.

1216. Has dairying increased much in this district during the last few years? During the last three or four years its increase has been something wonderful, and it is going ahead every day.

1217. What class of country have the dairymen selected for their holdings? The best country they could possibly get—the creeks and river frontages.

1218. Rented land? Yes.

1219. What size holdings have they chiefly made a start with? From 200 to 400 acres; some of them have a good deal more.

1220. Take a man with small means to begin with? From 200 acres to 400 acres.

1221. Then on this 200 acres, at your estimate, he can carry forty beasts? Yes.

1222. Can he make a living off that? He makes a very good living off it with his cows and his pigs—that is, if he has a family, and is not paying for labour. If he is paying for labour he wants 600 or 800 acres, because he must have about 100 or 130 cattle.

1223. But the small beginner must work with his own hands and with the assistance of his family? Yes.

1224. Can you point to any instances where a man has come here and taken up within a reasonable distance of Casino any of this bush land—not the red-soil land—but the land you speak of as inferior, land open for free selection? A good number have taken up land.

1225. Whereabouts? It is all taken up from Coraki right up within a mile of the Lawrence and Casino road—between Sandy Creek and Deep Creek, and on what they call Scrub Creek—on fringes in between.

1226. It is taken up as selected land? Yes.

1227. And what are the people doing? Dairying, and they are doing well. When I first knew the people were going there—I was then managing Woorooloolgen—I asked them if they were mad, and what they intended to do. But there they are to-day, and they are well off, and doing, and have lots of stock, dairying, and growing what crop they use for themselves.

1228. And they have holdings of about 500 or 600 acres? Some of them have 1,280 acres. They have taken up 640 acres, and then they have taken up their full quantity. Some of them would select 300 acres, and then would take three times that area again as a grazing right. Nearly all of them have taken up grazing rights as well as their first conditional purchases.

1229. Does not that rather point to the conclusion that the bad land you have spoken of is suitable for dairy purposes? There is no doubt it will be made available. Every bit of it will be taken some day, there is no question about it; but it is nothing like this other country.

1230. I suppose you know all that country pretty well between here and Grafton? I do.

1231. Do you think that the country on either side of the proposed railway line would also be likely to be taken up if they had a ready means of communication? There is no doubt that every inch of it will be taken up, although the country is far inferior to what it is when you come to Deep Creek, and 5 or 6 miles to Casino on the Tabulam, and going west and north from that. The country there is very different altogether. People who come from Grafton or Lawrence can never imagine we have such country at the back here, and unless they go out and see for themselves.

1232. You mean on either side of the line, but further back? Yes.

1233. As an old resident of the district, do you think there would be any interchange of products between Casino and Grafton, if there were a railway line;—is there anything you grow here that they do not grow, and anything they grow that you do not grow, that would bring a large revenue to the railway? There is nothing, I think, in which there would be any interchange between here and Grafton, except stock. We always did supply the Clarence River with cattle; they do not seem to fatten enough cattle for themselves. But I think the journey would be too short to take the trouble to put the cattle on the train.

1234. With good grass, and wide roads, you think they would travel the stock in preference to trucking them? I think so, because between here and Grafton the grass and water are good at all times of the year.

1235. If a railway were constructed between here and Grafton, do you think the main item of revenue in the way of freight would be dairy produce? I think that is all. On the Clarence they grow everything that we do here.

1236. You do not think there would be much interchange of produce? I do not think so.

1237. This a large cattle-fattening district? Yes.

1238. By what means are the cattle conveyed to market;—do many go by steamer? Not many. They go principally to Tenterfield. One or two small lots have gone by steamer from Lawrence to Sydney this year; but as a rule the cattle go from here to Tenterfield, and thence by train. The journey from here to Tenterfield is very heavy on stock. They have nine days on the road, and it is very hard on their feet. Cattle grown on the flat country are cut up a bit. A great number of cattle have gone to Sydney from here by train; in fact three or four drovers were continually going last year.

1239. I want to ask you a very important question with regard to the future development of the country: As an observer of this country, not only round Lismore but also between here and Grafton, do you think it is good all-the-year-round country for feeding cattle;—is the country sour and undesirable, or is it good fattening country all the year round? No; it is not. There is any amount of grass all the year round, but the country from Grafton here, or a good part of it—that is, when you leave Myrtle Creek and go towards Grafton, through Camira, and lower down—is sour country. The grass is inclined to be sour. It is not good fattening country, although on patches that have been ringbarked I have seen very good cattle.

1240. *Mr. Watson.*] That would imply that, though the country is sour under growing timber, it is capable of being improved by ringbarking? There is no question about it, because on Saltwater Creek, at Mr. Zuill's, I have seen very good cattle.

1241. Was that in the winter-time? Yes.

1242. At Myrtle Creek a witness stated that the country about there and towards Grafton was not good for feeding stock in the winter time, and that a man could only milk his cows in the summer months;—

do

- D. Campbell. do you think that is a correct statement? I think that is wrong. If the country is ringbarked and the grass is not allowed to get rank—because it does not matter whether you ringbark or not, if you allow the grass to go ahead it gets rank—if there is enough stock on it and sunlight let into it, a man can milk in the winter, because I have seen very good fat cattle there.
- 5 Mar., 1900. 1243. We do not suppose that a man is coming here to take up a bit of country and live on it without any effort to ringbark it;—as regards the greater part of the country between here and Grafton, if it were ringbarked and thinned out a bit, do you think it would be good fattening country all the year? I would not call it good fattening country, but ringbarking would improve it very much. From Myrtle Creek until you come to within 2 or 3 miles of the Clarence River the country is inclined to be sour. Ringbarking improves it, but I would not call it good fattening country.
1244. Is it country that would be despised and not be taken up, or is it good enough for a man to take up to run cows on? There is no doubt that every inch of it would be taken up eventually. If ever a railway goes there it is certain to be all taken up, and the people who take it up will improve it.
1245. Along the road the indications are that there is almost a profusion of feed wherever one goes,—is that a good quality of grass? That grass is not stocked enough, and then it gets sour.
1246. Is the blady grass bad grass? It is not so bad. Blady grass is good in the winter. When it is young it is not so bad, because it comes up very quickly, and if it is well stocked and kept down it makes good feed. But as a rule there is such a scope of country that it is never stocked.
1247. I suppose you can only keep it stocked really by small holdings—large holdings cannot afford to stock it? Unless the holdings are fenced into small paddocks you can never manage it.
1248. And that is too expensive in the case of large holdings? Yes.
1249. *Chairman.*] Although we know that a lot of the land is not open for lengthy tenure, the stock seem very sparse all along,—why is that? It seems to me they all have too much country. They all went in for too much country. It seems to me that if we had four times the population on the country, it would be much better.
1250. Would you mind giving your opinion as to whether it is or is not desirable that a railway should be constructed between here and the Clarence;—what do you really think are its prospects as a paying concern? I would not like to say. If a railway is constructed between here and the Clarence, I cannot see what is to make it pay for some years to come—for five or six years to come.
1251. At the end of that time do you think it would have a better prospect? There is no doubt that by that time there would be a better prospect, because directly the line would go through all that country, and before it would be anything like completed, a lot of the land would be taken up. But at the present time, after you leave here about 6 or 7 miles, the prospect all the way is very poor until you come within 3 or 4 miles of the Clarence.
1252. A little while ago you said you thought all the land between here and Grafton would be taken up if there were railway communication, and now you say you think it is doubtful? There is no question that if there were a railway it would be taken up; but it would not be as profitable for a man to take up that country as it would be for him to take up good country. He would not make such a good thing out of it. There is no question that if you put a railway there the country on either side would be taken up; but that does not leave it first-class country.
1253. Could you give us an instance of what you think is better country;—whereabouts do you find better country? From the time you cross Deep Creek, and going up both frontages of Deep Creek, you could go right across for 40 miles west and north, and 40 miles the other way straight on end, and you would get such a block of country the equal of which I do not think you would find in New South Wales, except the Big Scrub, and I question whether it is not more profitable than the Big Scrub, because there are plains there without trees, and beautiful black soil, where a man could go and plough 400 or 500 acres straight away—as good land as any man could wish to have. It is only lately they have begun to realise this. Mr. Smith is now letting out his land for dairying, and some two or three years ago we never expected to see a dairy up at Kyogle, and I am sure there will be dozens of them up that way. The quantity of cream that is coming from there daily is wonderful. The dairying population goes on increasing and they bring their produce into Casino to be treated, without any aid at all. It is not the dairying alone, but they have such good agricultural land. There are the creeks, for instance. There is as good land on those creeks as you will get on the frontages to the river, and, except very high up at the head of the creeks, the ridges are beautiful, undulating ridges, every bit of which will be cultivated. There is besides a lot of scrub lands that have been under cedar and pine. On the side of the range a good deal of timber is gone; but on the other side there has been timber for years, and the country that is under scrub is just as good as the big scrub land.
1254. *Mr. Watson.*] When you speak of the land between Grafton and Casino being poor land, you do so in comparison with the lands on the Upper Richmond? Yes.
1255. Suppose a line of railway were constructed from here to Grafton, and a man took up Crown lands with a view to dairying, how many acres do you think he would require—first, of average flat land, and secondly, of average ridgy land? He would want at least 640 acres.
1256. Of either? Of the land between here and Grafton.
1257. Taking the average? Yes.
1258. You think he could do with 640 acres? On some of it he would want a little more.
1259. That is improved, of course? Yes.
1260. You have told us that the land along the line of route between here and Grafton does not afford a very good criterion of the country? No, it does not.
1261. And you say that away from the line on either side the land improves, and would be likely to be taken up? Yes.
1262. Do you think it would be taken up to a distance of, say, 10 miles on either side of the line? Yes; dairymen would come right up to the line.
1263. But would they go out from the line on either side a distance of, say, 10 miles? Yes, and more; they would go up the creeks and the swamps a long distance.
1264. Is there valuable timber on the country between here and Grafton? Yes; there is a wonderful lot of splendid timber.
1265. Of what does it consist? Iron-bark, blood-wood, willibit—a brown timber suitable for piles, and lintels—and mahogany. There is some very fine red-gum and blue-gum—as fine patches of timber as there are in the Colony.

1266. Do you not think it likely that there would be a considerable demand for this timber for railway sleepers, girders, and such like, if it could be got to the steamers and exported at a reasonable price? It is now being taken away daily to Melbourne and New Zealand. D. Campbell,
5 Mar., 1900.
1267. What distance do they have to cart it? In some cases as far as 22 and 30 miles.
1268. To Lawrence? Yes; to Lawrence and Broadwater.
1269. You regard that as an increasing item in the industries of the district? Yes; it is a great item, because there is a tremendous lot of good timber extending a long way back on either side.
1270. As a man who has had great experience in regard to stock and different classes of country, is it not a characteristic of good country that it is generally thickly timbered, and that when once you get that timber ringbarked, and the property improved, it develops into good grazing country—is not that the general rule? No; I cannot agree with you there. My experience is that good grazing country is thinly timbered.

Alfred Clark Simpson, storekeeper, Casino, sworn, and examined:—

1271. *Mr. McFarlane.*] How long have you been residing in Casino? Thirty-two years. A. C. Simpson,
5 Mar., 1900.
1272. What are the principal industries in the Richmond River district? At present the dairying industry seems to be forging to the front.
1273. That is the most important? I take it to be so now.
1274. Is agriculture largely carried on? Yes.
1275. I am speaking of the Richmond River district? Yes; around Casino.
1276. Has this district progressed during the past five or six years? Yes; very much since the introduction of systematic dairying.
1277. How far would the initiation of dairying date back? Not more than four years, I think.
1278. Has it materially increased during that period? Yes.
1279. And is likely to continue to increase? I think so.
1280. Have you a knowledge of the country between Casino and Grafton, along the proposed railway route? Yes.
1281. Have you been along that line on different occasions? Yes.
1282. What is your opinion of the character of the country, say, for a distance of 10 miles on either side of the road? It is poor country; there are patches of it fairly good.
1283. When you say poor country, do you mean poor agricultural country or poor grazing country? Poor agricultural country is necessarily poor grazing country. Rich country for agriculture always means rich country for grazing.
1284. But are there not occasions when there is rich grazing country which is not exactly suitable for agriculture? It does not alter the fact that rich country for any purpose is better for agriculture and better for grazing. I am under the impression that most of that country would be utilised for grazing purposes—that is, for dairy purposes—in the event of a railway being constructed; but to render it fit for that I think it would be necessary to lay it down with suitable grasses, and I think that would be done. There is enterprise enough among the people to lay these poor lands down with grasses. They are doing it throughout the district. *Paspalum* and other favourable grasses are being freely sown just at present.
1285. That occurs also with those who occupy dairy holdings generally—they use artificial grasses? Yes. The stationholders often spread *paspalum* about their runs with a view of improving the pasturage.
1286. By that means, I suppose, it would carry more stock? Certainly. *Paspalum* is not only winter-resisting and drought-resisting, but it is in other respects a remarkable grass, very suitable for these northern rivers.
1287. It is not affected by the frost? No. It also appears to be very little affected by the drought. It is of strong, vigorous growth, and a very rich milk-giving grass. I am under the impression that poor land would be very largely availed of in the future for dairy purposes, which, as far as I can see, is the most profitable use it could be put to.
1288. If the proposed railway were constructed is the country of such a character that, in your opinion, it would be taken up for dairying purposes? Yes, certainly.
1289. That is, along the line and for a reasonable distance on each side of the line, so that it would not be too far to carry the produce to the nearest railway station? I have travelled a good deal throughout the Colony, and I have noticed that in other places where the country was quite as poor, and in some cases poorer, the graziers and agriculturists have made a success of it if they have had good means of communication.
1290. A good part of the land is heavily timbered, is it not—the ridgy portion? From Myrtle Creek down towards Bungawalbyn the country is pretty heavily timbered.
1291. Would the land be materially improved if it were ringbarked and properly cleared? Yes.
1292. It would be capable of carrying much additional stock? Yes. I do not know how it would affect the rainfall. This is a country which requires a heavy rainfall.
1293. Is this country well watered? Fairly well; there are a number of creeks through it.
1294. Do you consider it sufficiently well watered for the different holdings that might be taken up along the line? I do not know what the method of watering some of the country would be—whether there is water available within a short distance of the surface or not—but there are a good many creeks.
1295. I mean for watering stock? Yes; I should think they could all get access to water.
1296. With regard to the traffic likely to take place in the event of Grafton and Casino being connected by railway, do you think that would be of an important character? No, I do not think so.
1297. Do you think there would be a large passenger traffic between the two places? No, I should not think so.
1298. Is there a considerable passenger traffic at present;—I am not speaking particularly of Grafton and Casino, but between the Clarence and the Richmond? Not traffic that would be affected by the railway line. It would not affect any traffic that goes Chatsworth way.
1299. Have you a knowledge of the extent of the traffic between the two rivers at the present time? Not in figures; but from ordinary observation I should say the passenger traffic is limited.
1300. Is there any considerable traffic between Chatsworth and Woodburn? Yes.
1301. And between Lawrence and Casino? Not so much between Lawrence and Casino as between Chatsworth and Woodburn. But this railway would not affect that traffic. 1302.

- A. C. Simpson.
5 Mar., 1900.
1302. If a railway were constructed between Grafton and Casino would it not be probable that passengers who now travel by coach between Chatsworth and Woodburn would go by rail, seeing that they could travel in much less time and at a much lower rate than by taking the coach and river steamer? I do not think they would gain either in money or time. It is a very short span from Chatsworth to Woodburn, and the cost is very small to get across. I really cannot see where the economy would come in. There would be loss of time and loss of money in coming up from Grafton and travelling down by train.
1303. How long does it take to go from Chatsworth to Woodburn? A very bad trip, I think, five hours.
1304. Say four hours, and say a passenger wanted then to go to Lismore or Casino, how long would it take to go from Woodburn to either place? A slow trip would be three hours—less than three hours to Lismore.
1305. That would be seven or eight hours from Chatsworth, *via* Woodburn, to Lismore? I think that seven hours would not more than land him at Grafton.
1306. I am assuming that the passengers would start from Chatsworth in the one case, and from Grafton in the other case;—at present most passengers leave Grafton and go down to Chatsworth? I was under the impression that they came from Sydney, landed at Chatsworth, and came across to the Richmond. They do sometimes go from Lismore to Casino and on to Grafton.
1307. But coming back to Chatsworth, and beginning the trip there, would it not be an advantage for a passenger to come direct by train from Grafton to Casino, which would not take the same amount of time as going by Chatsworth and Woodburn? You would have some difficulty in getting passengers to see it in that light.
1308. Would there not be less inconvenience changing from steamer to coach and from coach to steamer? It would affect such a small portion of the traffic that I cannot conscientiously say it would be an advantage. I could not conscientiously say that I believe there would be a large traffic. I do not believe there would be.
1309. I am speaking of the existing traffic? I do not believe it would largely go by train.
1310. You think the passengers would still continue to go by coach? I think the greater number of them would. They touch the business centres more rapidly from Chatsworth going across to Woodburn.
1311. In the event of a railway being constructed, in the case of passengers leaving Casino or Lismore to go by steamer, would they still go by river steamer down to Woodburn and then take the coach over to Hardwood Island and take the steamer there, or would they take the train to Grafton and take the ocean steamer from there? I am under the impression they would still go to Chatsworth.
1312. Notwithstanding the railway? I think so. It is a long and uninteresting trip down the river, and there is nothing to be gained by going up there.
1313. With regard to carriage between here and Sydney, in your business which way do you get your goods? By the Richmond River steamers.
1314. In the event of Casino and Grafton being connected by rail, would you get them by the Clarence and then by rail to Casino? No; thank you. As an ordinary, intelligent man you must know that the carriage would be so expensive to me that I would be clean out of it as against wiser people, who would get their goods by the ocean boats. I would not be patriotic enough to do that sort of thing.
1315. Would that reply also apply to other business people in Casino? I would hope it would not.
1316. I mean in your opinion? Well, it would suit me very well if they thought otherwise. I would be quite content to let them have their opinion. I think it would be a most unwise proceeding for anyone to take that means of getting goods.
1317. You consider it would be more expensive? Considerably—that is, unless the railway were constructed on a new principle, enabling it to compete with ocean-carriage.
1318. Has the town of Casino improved materially with regard to trade? Yes; within the last two or three years it has improved very much indeed.
1319. In what direction—trade generally? Yes, trade generally.
1320. Any particular line more than others? We find that settlers are in possession of more money through the introduction of the dairying industry. There are more settlers to spend money, and more money to be spent. Another factor in the progress of the district is the larger number of pigs that have been reared and sent to market. The farmers in one part of the river have taken this branch of industry up very largely, and they have been shipping large numbers of pigs. This refers more particularly to Kyogle and up that way.
1321. Growing maize and turning it into pork? Yes; I am a saw-mill proprietor as well as a storekeeper, and some few years back I only used to run the mill from four to six months in the year; but now we cannot keep pace with the demands for timber for building purposes. Not only is this the case in regard to local town orders; but the people engaged in the dairying industry are all putting up a substantial class of buildings, and we find that the demand from outside sources is very large.
1322. Your opinion, then, is that business and trade generally is improved? Yes.
1323. Is that likely to continue? Yes; the nature and surroundings of the district warrant that assumption.
1324. Are any of the industries in a languishing condition, or more backward than they were four or five years ago, before the advent of dairying? The only industry that seems to have gone back is that of sugar-growing.
1325. Sugar-cane has not been grown so largely? No; It has of recent years been a loss to the growers.
1326. Sugar was not largely grown on this upper portion of the river? Yes; it was grown in considerable quantities between Coraki and Casino. The finest crops on the river are grown between Coraki and Casino. But those people have abandoned the growth of cane to a large extent.
1327. *Chairman.*] Although there would not be any traffic through from here to Grafton, do you not think that, if a railway were constructed, the settlement that would follow would create a passenger traffic from Myrtle Creek and that direction towards Casino, as well as a traffic in timber and dairy produce? Yes, there is no doubt it would. It would create a traffic for a certain distance, just as is done by a railway in every other place. The traffic for half the distance would come this way, and half towards the Clarence. No doubt it would increase the importance of the town, and there would be a certain amount of traffic, which would grow as time went on.

Granville Moore Elliott, Council Clerk, Casino, sworn, and examined :—

1328. *Chairman.*] What are you? I am Council Clerk of the Municipality of Casino, and I have occupied that position for about eighteen years, having been appointed shortly after the incorporation of the town. G. M. Elliott.
 1329. Do you produce certain figures to show the progress of the town from its incorporation until the present time? Yes. It was incorporated in 1880. It embraces an area of 16 square miles. The rates for 5 Mar., 1900.
 the first year amounted to £224 16s. 11d., and last year they amounted to £461 16s. 3d. The population of the municipality at the time of its incorporation was about 600, and at the present time it amounts to some 2,000. I have not the figures showing the value of the ratable property at the time of the incorporation, but the value of the ratable property last year when the assessment was made was £48,659 8s. 5d. The amount of the indebtedness is £2,085 on debentures. The rates in arrears amount to £137.
 1330. The town is not lighted at present? No. I may say that I am also Secretary to the Stock Board. The number of stock-owners in the Casino sheep district is about 950; that is the number of those who hold sufficient stock to qualify. The number of cattle is 157,000; horses, 11,000; pigs, 5,500; sheep, 4,000.
 1331. Generally, with regard to cattle and pigs, are you able to say that these have been considerably increasing items during the last three or four years? Yes; especially dairy stock.

James Golding Draper, sergeant of police, Casino, sworn, and examined :—

1332. *Mr. Watson.*] What are you? Sergeant of police, stationed at Casino. I am also inspector of dairies outside the municipality. J. G. Draper.
 1333. Speaking roughly, what is the extent of the police district of which you have control? It extends 5 Mar., 1900.
 down to Camira on the south and to Kyogle on the north. On the east it extends to within 6 miles of Lismore, or about 13 miles from Casino, and on the west it reaches pretty nearly to Tabulam—that is, nearly 40 miles.
 1334. Can you state the number of dairies within that district? There are about 250, with over 12,000 dairy cows. There are ten creameries and one butter factory.
 1335. Do pretty well all those dairymen have their produce dealt with at the Casino factory? Yes.
 1336. There is no other factory which draws supplies from here? No; the cream is all sent to Casino from the different creameries.
 1337. And from Casino it is sent as butter for shipment? Yes.
 1338. Have you noticed what progress has been made in dairying of late years? It has gone ahead of late years. It seems to be going ahead every year.
 1339. Has there been any disposition to convert to dairying lands formerly under agriculture? Yes; some have given up agriculture, and have gone in for dairying.
 1340. That would be mostly on the river banks, I suppose? Yes.
 1341. Near the Richmond itself? Yes.
 1342. Have any of the settlers turned their maize land into dairies? No; they still grow a little maize.
 1343. Have you seen any indications of ordinary pastoral land being converted into dairying land? Yes; Mr. Smith of Kyogle has let three dairies.
 1344. Land formerly used for grazing only? Yes.
 1345. Has there been any increase in the dairying lately in the direction of Myrtle Creek? No; not in that direction.
 1346. Has there not been a creamery established there? There is a creamery there. But Mrs. Greenstreet, at the hotel, who was milking about seventy or eighty cows, knocked that off. I do not know what her reasons were. Some of them said the creamery was rather too far away from the place.
 1347. Mr. Smith, of that locality, recently went into dairying? He went into it a little while ago, but he sent me notice during the last two or three weeks that he was knocking off again.
 1348. Would it be likely that he was knocking off for the winter, and would start again in the summer? I think he was knocking off for good. He has not sufficient labour there. He had only his son with him, and he had to pay for labour. He seemed to say that all that he got was going to somebody else; that he was making nothing out of it. I refer to Mr. Smith, at Wyon, 8 miles from Myrtle Creek.
 1349. He is some distance from Casino, where the factory is? Yes.
 1350. How far? It is about 21 miles from here to his place.
 1351. Do you think that would have any effect in preventing him from dairying at a profit? No; he sends his milk to the creamery at Myrtle Creek, and the cream is brought in from there by the Company.
 1352. Is that creamery far from his place? Between 2 and 3 miles.
 1353. Do you know whether the settlers there are under any disadvantage in having the creamery so far from the factory? I do not think so. I do not think they are at any loss in respect to the cream.
 1354. Have they to make any special payment for getting the cream into Casino? I could not say.
 1355. So the increase of dairying to which you allude has not been in the direction of the proposed railway line? No.
 1356. Do you think that the lack of development in the dairying industry at Myrtle Creek is due to poor soil, or to the want of communication? The people are not there at present. There is no one living there now who would be in a position to carry on dairying. The present state of the land, with water lying on it continuously during the winter months, and in rainy seasons, and the timber not being rung, would account for it.
 1357. If the timber were ringbarked, and the lower land drained, do you think it would improve the land? Yes.
 1358. Sufficiently to encourage dairying? Yes. I have camped there, and found that my horses would not stop there.
 1359. Does your answer apply to both ridgy and flat land? Only to the low-lying land.
 1360. It wants draining? Yes.
 1361. And on the ridgy land the timber wants ringbarking? Yes.

Edward James Robinson, manager, butter factory, Casino, sworn, and examined :—

1362. *Mr. McHarlane.*] What is your occupation? I am manager of the butter factory at Casino, for the New South Wales Creamery and Butter Company.

21 (a)—H

E. J.
Robinson.
1363.
5 Mar., 1900.

E. J.
Robinson.
5 Mar., 1900.

1363. How long have you occupied that position? Between four and five years. I have only occupied the position of Manager at Casino for the last fifteen months.
1364. Were you previously connected with the same company in another district? Yes.
1365. Has there been a material increase in the operations of your Company during the four years it has been established at Casino? During the fourteen months that I have been at Casino, there has been a marked increase—almost marvellous.
1366. Could you give the Committee some figures showing the amount of business done by the Company? When our Company started here in January, 1898, we were producing about 3 tons of butter weekly. Last January we were producing between 9 and 10 tons, and during that time an opposition company started at Coraki which drained a considerable amount of supplies which formerly came to Casino. So that the increase of the district would be considerably more than our own figures show.
1367. Where do your principal supplies come from? From close to the Richmond River—Tatham, Tomki, Kyogle, and out to the north of Casino.
1368. Can you mention any particular locality where there has been a greater increase than in other localities? The increase has been principally about Kyogle, north of Casino, and between here and Tatham, close to the south arm.
1369. Have you a creamery at Myrtle Creek? We have.
1370. How long has it been established? About eighteen months.
1371. Had you many suppliers when you first started out there? Yes. It was established under very fair conditions at first. We had a supply of about 1,800 gallons per week. That supply increased up to about 3,000 gallons weekly from ten suppliers, but the supply has since decreased considerably, and it has now gone back to what it was when we started, namely, about 1,800 gallons per week from about six suppliers.
1372. When did that decrease take place? It has been going on gradually.
1373. Can you give any explanation of the cause? The only reason I can give is that they are on poor country, and cannot make a living out of it.
1374. Would the distance they are away from the factory have anything to do with it? I suppose it has something to do with it, but not all. We have another creamery existing under exactly the same conditions, and in connection with that creamery there has been a marked increase. I refer to Kyogle.
1375. Is that richer country than at Myrtle Creek? Infinitely richer.
1376. Are the suppliers at Myrtle Creek scattered or close together? I think they are fairly close together. The creamery is in the centre of about ten suppliers, most distant of whom would, I think, be about between 4 and 5 miles away.
1377. You consider that is not too great a distance for the supply of milk? I consider it is too far to cart milk over rough country.
1378. Have you any personal knowledge of the country at Myrtle Creek? Only from observation when travelling over it.
1379. From your experience you would know good dairy country? From my experience I would say that it is very poor dairy country, not at all suitable, except in small patches close to the river banks or creek banks.
1380. Where it is not suited for dairy purposes, is it heavily timbered land? Not particularly so. The timber is principally spotted-gum.
1381. Has this land away from the creek been improved by ringbarking, or is it in its natural condition? Mostly in its natural condition, I think.
1382. Could the country which you class as poor country, not suited for dairying, be considerably improved by ringbarking and proper working? Yes, it could be considerably improved.
1383. If that improvement were carried out, do you consider it would make fair dairy country? I cannot say that, in my opinion, it would ever make fair dairy country. It could be made available to a certain extent, but it would never make fair dairy country.
1384. It would not be up to the standard of what you consider fair dairy country? No, it would not.
1385. In the event of the proposed railway being constructed, would the increased facilities thus given tend to develop the dairy country in that locality and other localities along the line? I think it might, to a certain extent—say close to the creeks or water-courses; but away from those I do not think it would.
1386. At what distance away from the line would it pay dairymen to convey their milk to the creameries;—I mean along the water-courses, where there is good land available? I should consider 10 or 15 miles along the creek. If that land were available—land as good as I have seen close to the water-courses there—no doubt dairy farmers would take it up.
1387. The Myrtle Creek farmers, I understand, convey their milk to the local creamery? Yes.
1388. Is any further charge made for conveying the cream to Casino? Yes.
1389. I mean an extra charge to the suppliers? Yes.
1390. What is that charge? The charge altogether for working expenses, cartage included, is a farthing per gallon.
1391. What price per gallon is paid to the suppliers? It varies with the Sydney market price.
1392. As compared with other creameries close to Casino? There is a difference of an eighth of a penny between Kyogle and other creameries that are close up to Casino. We charge one-eighth of a penny close to Casino, and a farthing for more distant ones.
1393. Do you give the same price to the suppliers at Myrtle Creek as you give to those in other localities? We give exactly the same all round, with the difference of one-eighth of a penny extra in the case of Kyogle and Myrtle Creek.
1394. What is the average price the farmers get? I could not give you that accurately; but roughly I should say about 3d. or 3½d. per gallon on a 3·6 test.
1395. Is 3·6 about the average? It is considerably over the average. About Myrtle Creek it is about 3·1 or 3·2.
1396. Then the quality at Myrtle Creek would be inferior as compared with other creameries? Yes, I think it is a little inferior; but not so much as you would think from the difference between 3·1 and 3·6.
1397. They do not all come up to 3·6? No.
1398. Before your engagement with the New South Wales Creamery and Butter Company had you had experience in connection with dairying? Yes.

E. J.
Robinson.
5 Mar., 1900.

1399. For how long? About twelve or thirteen years.
1400. In what district? The Bega district.
1401. Have you a fair knowledge of the dairying capacity of the Bega district? Yes, I think so.
1402. And the character of the land suited for dairying purposes? Yes.
1403. Generally speaking, in your opinion, how would the dairy land in this district compare with that in the Bega district? This district compares very favourably indeed with the Bega district.
1404. Would that imply that it was superior to the Bega district? Yes; in my opinion, given facilities for reaching the market and other improvements that would follow, it is superior to the Bega district.
1405. What is the quality of the land in the Bega district for dairy purposes;—does it fluctuate very much, some very good and some inferior? Yes, that is always the case.
1406. You say this district is somewhat superior to the Bega district;—do they use land for dairy purposes in this district as poor in quality as the land which you consider inferior to the Bega district? Yes, they do.
1407. Take the land about Myrtle Creek and that along the proposed railway line, of which you have a knowledge;—how would that compare with the dairy land in the Bega district? It would not compare favourably at all—with even the worst of it, except as regards certain places close to the water, close to Myrtle Creek, Sandy Creek, and the other water-courses, where there is land somewhat similar to some of the land in the Bega district.
1408. The Bega district has been improved for a considerable number of years, has it not? It has.
1409. It has been properly worked for a long time? Yes; it has been for a considerable number of years under dairy farming.
1410. Has it been laid down with artificial grasses? In some places it has.
1411. In regard to the land you know along this line, if that were similarly improved and laid down with artificial grasses, how would it then compare with the land in the Bega district? I do not think it would compare favourably at all. My opinion is that it would not compare favourably.
1412. Is that with the land generally in the Bega district, or with the worst land in the Bega district? With the land generally in the Bega district.
1413. *Mr. Watson.*] Apart from your experience as a factory manager and factory hand, have you had any experience of land;—have you worked on land yourself? Yes; I have worked as a dairy-farmer.
1414. So that you have a knowledge of the question from that point of view? Yes.
1415. *Chairman.*] Would it cost much to improve this Myrtle Creek land in the way you indicate by clearing? I do not think I could give much of an opinion with regard to that, because you cannot tell whether that soil will grow artificial grasses. I do not think it will to any extent. That poor clay soil I do not think will produce artificial grasses. If it does, then it might not cost much to improve the land.
1416. *Mr. Watson.*] How does the rainfall here compare in regularity with that of the Bega district? It is considerably better in this district. I think the average at Bega is about 30 inches, as against about 50 or 54 here.
1417. Is the rainfall here fairly regular? Yes.
1418. Would that greater quantity and regularity of rainfall here have any effect in making it possible to do with inferior dairy land? Yes; it would conduce to make the land more productive.
1419. They sometimes have severe droughts in the Bega district? Yes.
1420. If they are a short time without rain they are in trouble? Yes; that is principally on account of the sandy nature of the country.
1421. *Chairman.*] Do you think the land in the direction of Myrtle Creek would be likely to be taken up largely for dairying? I do not. I think that probably small blocks would be taken on the river or water-courses, but nothing further.

William George Simpson, Mayor of Casino, sworn, and examined:—

1422. *Chairman.*] How long have you resided here? About thirty-six or thirty-seven years.
1423. What is your occupation? I am a saddler, and also a grazier.
1424. You are acquainted with the proposal to construct a line of railway between here and Grafton;—are you in favour of that proposal or not? Provided it was a North Coast scheme I might be inclined to support it, but otherwise I am not.
1425. As a line on its own basis, you are not? I should not be inclined to support it.
1426. Why? I do not think it would pay. I do not see that there is anything to warrant the construction of the line. Not only would it not open up good country, but I do not see what there is to make the line pay.
1427. It has been urged as one reason that there would be an interchange of commodities between Grafton and Casino;—do you think that would take place? I do not think so.
1428. Would you give your reasons? We have a very good bar at the entrance to the Richmond. There is always plenty of water on the bar, and we have three steamers a week running. We get our goods up much cheaper by that means than we would if they were landed at Grafton and sent on by rail.
1429. What is the depth of the bar now at the Richmond Heads? I think about 14 feet.
1430. And what is the draft of the steamers? I think they draw from about 10 to 12 feet. We have had no trouble whatever with the bar for some years.
1431. Do the steamers come in regularly now? Very regularly.
1432. They are not bar-bound? No; and have not been for some considerable time.
1433. Could you tell us when any of the steamers were last bar-bound? I think once or twice some time back, but it was through stress of weather from a south-east gale, and not owing to the state of the bar in any way.
1434. Have the improvements at the Heads had a good effect in improving the entrance? Certainly; they have scoured the entrance out, and I believe it is still improving.
1435. Independently of goods from Sydney or otherwise by steamer, would there be any interchange of products between here and Grafton? No; I cannot see how there could be. On the Clarence they grow both sugar-cane and maize, and they carry on dairying. We do the same here, and I do not think it is likely that we should send any of these products from Casino for shipment at Grafton, when we have our own vessels trading from the Richmond.

W. G.
Simpson.
5 Mar., 1900.

W. G.
Simpson.
5 Mar., 1900.

1436. Is this town progressing? Yes; within the last year or so it has progressed wonderfully. It is prosperous at the present time.
1437. Have the exports increased? Yes, certainly.
1438. Of what have they chiefly consisted? Butter, bacon, eggs, pigs, and all farm produce—especially pigs.
1439. Any cattle? By rail.
1440. But not by sea? No, they do not send them by sea; they get knocked about too much on board the vessels. People prefer to truck them.
1441. What is the course of export from Casino? First by road to wharf at Tomki, about 4 miles down the river, then the goods are put on a drogher and sent down to Coraki—a distance of about 35 miles. They are there shipped on an ocean boat and go down the river for 40 or 50 miles to the Heads. But very little produce is sent from Casino, most of the settlers being on the river-banks. The butter is shipped from the head factory at Lismore. It is taken from here to Lismore by coach, a distance of 18 miles, and is from there carried in cool storage on the large ocean-going boats.
1442. Do you know what is the cost of freight for butter from here to Sydney? The freight on butter from Casino to Sydney is about $\frac{1}{4}$ d. per lb. Total cost of production, including freight, would be about 1.66 per lb. The freight of pigs is from 1s. 6d. to 4s. per head, the pigs being driven down to the big steamer.
1443. Do you know the freight of goods from Sydney to Casino by steamer, drogher, and road? The rates of freight for goods from Sydney vary considerably, and I could not give you the exact charges; but the road-carriage from Irvington, where the goods are landed from the droghers, is about 4s. per ton.
1444. If a railway were constructed, do you think, as a man of business, that goods or passengers would be likely to go from here to the Clarence by the railway, and from there by steamer to Sydney, or would they go the other way? I do not think many goods, except perhaps very light goods, would go by rail to the Clarence, and I do not know that the railway would affect the passenger traffic much. A few might avail themselves of it. But we find that the passenger traffic along that road by coach has not increased at all—the mail contractors complain very much about the falling off.
1445. Is there a line of coaches between here and Grafton? Not Grafton; they go to Lawrence, and then by the steamer. But there is very little traffic. If people want to catch a Clarence boat they go down the Richmond and then across. They either do that or take our own boats right out. We are getting a better class of boats now, and they go right out by our own boats.
1446. Is it any use asking you about the dairy view of the case? I know that dairying is making very rapid strides here.
1447. In Lismore and Casino and to the north towards Kyogle? Yes. As the land becomes opened up, no doubt a great many more people will settle here. People inquire for land every day, but they cannot get suitable land, and they go away. They want good land, and they cannot get it.
1448. Do they express any opinion about the land from here towards Myrtle Creek? They do not seem to care about it. I have travelled a lot over that land, and I know something about it.
1449. What are your views about it with regard to dairying? As a rule, it is of a sandy, spowly nature, and in very wet weather the grass is rather sour—grass that cattle do not seem to do well on; and in dry weather it seems to burn up very much. The reason it is not stocked is that it will not carry too many stock. Although the grass looks good, it is not.
1450. Do you know Mr. Cunningham Henderson's place? Yes.
1451. What do you think of that? He has a piece of rather good ground there. There is a bit of good country just along, towards Wyon and Busby's Flat, and along there. But in some places the ground is of a nasty sandy nature, such as it would not be safe to ride over in wet weather. Even on the ridges the land is rather of a spewy, soft, sandy nature.
1452. You say it would not carry many cattle—what would it carry;—you might distinguish the various kinds of land? Where, on the upper portions of the river, the land would carry, in some instances, almost a beast to the acre—I could pick out spots on Kyogle that would carry a beast to the acre—and larger areas which would carry a beast to 5 or 6 acres, on the land in the other direction, of which we are speaking, it would take 14 or 15 acres to carry a beast. That is in its unimproved state.
1453. Would it be costly to improve it? It would have to be ringbarked, and some of the thickly-timbered country would have to be cleared. Of course, ringbarking and sweetening the grass would improve the land.
1454. Would the creek frontages have to be drained in order to make them fit to run cattle upon? No; I hardly think so. There are some parts of the country where it would be necessary to drain the land, and where it would not be very costly. Of course, I am talking about a belt of land along the line. Back a bit you get into better country.
1455. When you get away from the line the country improves? Yes.
1456. How far off the line have you to go before you get into that improved country? It varies. In some instances you would get into it in 6 or 7 miles, and in others you would have to go back 8 or 10 miles.
1457. Do you know the land on Camira Station? Yes.
1458. Do you look upon the cleared portion about the homestead as good land? Fairly good. I do not think it is equal to some of our lands here, but it is good compared to some land I have seen taken up along the line in other places, where people seem to be making a living. Even along the line the land we call poor land is good compared with land taken up in other portions of the Colony. Even that, no doubt, will be settled on.
1459. Do you think that most of this rich land would be taken up by leaseholders, in preference to other people free-selecting the poor land along the proposed line of railway? Well, I do not know. Some people like to have a holding of their own, and to know that if they improve it they are improving it for themselves. There are others who would rather have a little bit of good land, and rent it. The only way in which it could be made to pay would be in large holdings, of not less than 600 or 700 acres, as dairy farms. Some have been dairying on 40 and 50 acres.
1460. Would a man want some capital to tackle one of those 640-acre holdings? I think so. I do not think it would be any use of a man taking one up without means. It would be an uphill game for the first year or so, when he would have to fence the land in and improve it.

1461. I understand from you that although this land between Grafton and Casino might be taken up from time to time, the development of that country would not be repaid? I do not know. People seem inclined to settle along a railway line, as a rule. I think the land would be taken up immediately the railway was made, and I think people would begin to settle on it.

1462. And you think their occupation would be chiefly that of dairying? Dairying and grazing.

1463. Not agriculture? I hardly think so.

1464. With such a large scope of good agricultural land in the district generally, do you think it likely they would go up there for agricultural purposes? I hardly think so.

1465. Except to assist in keeping their own stock? Yes. It would not pay them to grow maize—not in that part of the country just near the line.

1466. Then, you think, the chief item of freight on the railway would be dairy produce? I think so. There might be a little timber; there is some good timber along that line. Dairying and grazing would be the chief thing; I do not think they would cultivate much.

1467. Do you not think that the timber export would largely increase if there was a railway by which it could be sent direct? I think so. The only question is whether the freight on the railway would be such as would pay the timber-getters.

1468. The traffic on the railway would consist of dairy produce, and to some extent, timber? The land would be principally used for dairying and grazing; I daresay the people might cultivate a little.

1469. But not much for export? No, I do not think the land is suitable. Where you find those spotted-gum ridges, as a rule, the land is very inferior.

1470. I suppose you come in contact with most of the people at Casino? Yes.

1471. You think you voice their opinion generally with regard to the proposed railway in saying that it would not be a very paying concern? Yes, I am positive of that. It is proved by the very fact that it is so hard to get anyone to give evidence. I tried hard to get people to give evidence; but it has been very difficult to induce them to do so. They do not seem to be much in favour of the proposal.

1472. Is the feeling generally one of this character: that although you do not wish to oppose the railway, still you could not honestly advocate it as a paying line;—is that the kind of feeling that exists? That is exactly the kind of feeling. We do not wish to oppose it; but at the same time we do not feel that we can honestly advocate the construction of the line.

1473. You could not in your mind build up a set of figures or anything that would promise a substantial or reasonable revenue? No; we could not, although we do not wish to oppose the line. I believe the people here feel the same way.

1474. From this end of the line, then, you think the Government could not expect much revenue? I think not; I do not see where it is to come from. Even the commercial travellers coming to this district generally work the rivers from Lismore. Coraki is the centre. They leave the steamer at Chatsworth and go across to the Richmond, and then work the river right up.

1475. Do you not then regard Casino as a large distributing centre? There is a big business done here, and it is improving. Business people are all making additions to their premises.

1476. Still the goods, you think, must still continue to come by sea? I think so. If we had a line across to Lismore I do not know that we would not get our goods that way.

1477. Do you know the country between Murwillumbah and Lismore? I have travelled all through that district.

1478. Railway construction has developed a large dairying industry there? Yes.

1479. Is that a better class of country for dairying purposes than the country from here to Grafton? Yes; there is no comparison.

1480. You cannot make a comparison of what has gone on there and what would take place here? No; the soil there is very rich. It requires a big rainfall; but it will grow almost anything. There is a great depth of rich, chocolate soil, which, when cleared and planted with artificial grass, would carry a tremendous lot of cattle.

1481. Is there anything else you would like to say? No; except that Casino is progressing, and there will be a large population here. People are now inquiring for land. They are looking to this district for an opening, and are coming up here. If they cannot get good land they will settle on other land, provided they have communication with a market.

Laurence Edwin Cope, solicitor, Casino, sworn, and examined:—

1482. *Mr. Watson.*] What are you? A solicitor, residing in Casino. I have been here for fifteen years.

1483. You are acquainted with the proposal to construct a railway from Grafton to Casino? Yes.

1484. Could you give the Committee any information on that subject which would be of value? I know something of the country between Casino and Grafton. I have been over it several times, and I know it from my own observation and what others have told me. I do not think the line would be justifiable purely as a local line; but if it is proposed to construct a North Coast line right through from Newcastle, so as to junction on to Sydney that way, then I think the line might reasonably be constructed, simply as a matter of through traffic between Sydney and Brisbane. It would save about 150 miles. In regard to the question of the settlement of the country between here and Grafton I know that for some time there has been very little improvement in the settlement along that line; in fact, on the contrary, some of the small holdings have been sold and converted into large ones. I know of one case, not so very long ago, where three holdings were sold together to one man, the total area being about 3,000 acres.

1485. How far were they from the line? They were situated about Myrtle Creek. One of the places was the land on which the creamery was situated. That was used for dairying, but it is not now used for that purpose. The man who was dairying sold it, and the purchaser uses it for grazing.

1486. Do you think Myrtle Creek is a fair criterion of the quality of the remaining land? I think Myrtle Creek is about the best land along the line—the land on the borders of the creek there.

1487. In your view then, the best land along the line is not good enough for settlement? Not under present circumstances. If a railway were constructed it would make all the difference in the world.

1488. If a railway were constructed? Yes. I think in that case the country would be broken up again into small holdings—all the land along the banks of the creeks.

1489.

W. G.
Simpson.
5 Mar., 1900.

L. E. Cope.
5 Mar., 1900.

- L. E. Cope. 1489. Do you think that the general class of land between here and Grafton is such as with improvement would carry a large number of small holdings of 500 or 600 acres? It would not carry a number of holdings at an average of less than 640 or 700 acres.
- 5 Mar., 1900. 1490. They call that a large holding here? Comparatively large.
1491. You think that would be the average? I think so.
1492. There would be a fairly large population if the country carried one family to every 700 acres? Yes, I think it would carry a large population. But I consider that the land between here and Grafton is not so good as other land in the district, and I think the tendency would be to take up the better land first.
1493. Is there much of that better land remaining open for selection? No.
1494. It is pretty nearly all alienated? Yes.
1495. So that any settlement upon that land would be conditional upon arrangements being made with the present owners? Quite so.
1496. Is there a disposition on the part of the present owners to give easy terms for the occupation of the land? Yes, certainly. The great advantage in dealing with private owners is that there is no residence clause attached. I think the ten years' residence makes a great deal of difference in taking up land.
1497. You would have more speculation if there was no residence? A man would sooner give £3 an acre for land on which he was not compelled to reside, than £1 an acre for land on which he was compelled to reside for ten years.
1498. Is it not a fact that a number of homestead selections have been taken up recently beyond Myrtle Creek? I do not know about beyond Myrtle Creek; but there have been some homestead selections this side of Myrtle Creek—on Sandy Creek.
1499. We have had it in evidence from the District Surveyor that a number of homestead selections, which, of course, carry perpetual residence, have been opened further up Myrtle Creek, where the proposed railway crosses? They may have been opened up. I do not recollect any having been opened up here; I think they may have been in the Grafton district. I know there was some land thrown open for homestead selection in the Casino district on Sandy Creek, and for which there was no application at all; while, on the other hand, for homestead selections thrown open on the upper river land there were thirty-two applicants.
1500. That was capitalised as high as £4 an acre in its unimproved condition? Yes.
1501. So that that can be regarded as land above the average? Yes.
1502. Is there anything else you would like to add? I consider that a local railway between Grafton and Casino would be justifiable chiefly from a federal point of view. Under federation, Brisbane would probably become our principal market, and Grafton would be about the southernmost point, which would connect with Brisbane through this line. There is no doubt the construction of a railway would promote settlement along the line to a very large extent, and I think it is possible that the local traffic might after a time pay working expenses without the interest. But I think it would have to wait until people with sufficient capital took up the land, because it would not be of the slightest use for people without capital to attempt to occupy it. The question whether the land would be improved by artificial grasses, and cultivation is really problematical, because that has never been tried yet.
1503. We have evidence to the effect that in one or two cases where ringbarking and clearing and the sowing of artificial grasses were tried on land at the Grafton end, similar to the general run of the land towards Casino, it was successful;—do you think that would be so? I think that is quite possible. The construction of the railway would send up the average value of the land all through, and from a general point of view, the increased value of the land would probably meet the cost of the construction of the line.
1504. The Crown lands there now, which are large in extent, are practically non-productive? Yes.
1505. The Crown gets very little revenue from them? Very little.
1506. But if they were taken up the Crown would get the rental? Yes.
1507. Do you think there is any probability of their being taken without railway communication? I do not think so. At all events they would not be taken up until all the available land in other parts of the district was gone.
1508. That would be a good many years? Yes.
1509. If you go a good distance from communication, you want very rich land to make up for the distance? Yes.
1510. So that this not being very good land, it is not likely to be settled without some communication? No; most of the settlement that has taken place up to the present time has been off the line of railway, down towards Ellangowan, easterly.
1511. Is that better land than the average of the land along the route? I think it is rather better land. The fact of its being more largely taken up arises, I think, to a great extent, from the fact that the ordinary land on each side of the line was reserved. The land is also more freely watered down in that direction, and, unless it is too wet, pays them better.
1512. That is not very far from Casino? No.
1513. And it is probable that those now settled at Ellangowan would not use the line to any great extent? I do not think they would use the line at all.
1514. Could it be held to be fairly similar to the balance of the land along the line? I think it is rather better.

Charles Frederick Napier North, Road Superintendent, Casino, sworn, and examined:—

- C. F. N. North. 1515. *Mr. McFarlane.*] How long have you occupied your present position? About four years and nine months.
- 5 Mar., 1900. 1516. Have you a knowledge of the Casino district? A fair knowledge, I think.
1517. Have you any knowledge of the Clarence district? Yes.
1518. You were a licensed surveyor some few years ago, were you not? Yes.
1519. Where were you working as a surveyor principally? I worked all over the Clarence district, and on the Tweed and the Richmond—principally on the south side of the Clarence, although I have worked on this side also.

1520. How long were you residing in the Clarence district? About fifteen or sixteen years.
1521. Have you a knowledge of the country through which the proposed line of railway would go between Grafton and Casino? Yes; I know it generally.
1522. I do not mean so much along the marked track, but taking a scope of country 10 or 15 miles on each side of the surveyed line? Yes; I know it fairly well.
1523. What class of country would you consider it to be? Generally, it is poor grazing land. There are patches along the creeks fit for cultivation, but taking the general run of it it would be called, I think, poor grazing land.
1524. It is rather heavily timbered, is it not? Yes; in some parts it is very heavily timbered.
1525. Would ringbarking and the carrying out of other necessary improvements have the effect of considerably improving that land? I should say so.
1526. If those improvements were carried out, would it be made something like fair grazing country? The generality of it, I think, would. Of course there are patches that would never become fair grazing land, but the majority of it, I believe, could be made good grazing land by improvements.
1527. From your experience and knowledge of the district, do you think it is such land as would be likely to be taken up in holdings in the event of railway communication being established? I think it would.
1528. What area do you think would be sufficient for a holding? The areas would be large, I think.
1529. About how many acres? I should say it would take pretty well a section—that is 640 acres.
1530. Some evidence has been given with regard to timber country between here and Grafton, have you any particular knowledge concerning that? I cannot exactly locate the places, but I know there is plenty of good timber on Myrtle Creek, and between Myrtle Creek and the Cross Roads, and about the Saltwater there are some large forest reserves. I have been through these forest reserves in the old time, and there is certainly a large quantity of good timber on them—hardwood.
1531. Is it good marketable timber? Yes.
1532. Are you aware whether there are any considerable number of men engaged cutting that timber at the present time? Not from this side, but there are from Lawrence. I know they come out a long way.
1533. They draw it a considerable distance? Yes.
1534. In the event of railway construction, would this timber be conveyed by train to Grafton? There is no doubt it would. I suppose saw-mills would spring up in different parts, and the timber would be cut on the ground and sent in.
1535. In the event of a railway being constructed as proposed, would the road expenditure be necessary as at present? I do not think it would make much difference as far as the road expenditure is concerned.
1536. Which roads would it affect? There is only one road in that direction, and that is the road from Casino to Lawrence; the others are all branch roads. That is the only road it would actually affect.
1537. You think the construction of the railway would not materially affect the road expenditure? No, I do not think it would. We do not get a very large vote for the Lawrence Road (that is, the part within the Casino Road District)—about £800.

C. F. N.
North.
5 Mar., 1900.

TUESDAY, 6 MARCH, 1900.

[The Sectional Committee met at the Municipal Council Chambers, Lismore, at 10.15 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKEFF (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Wilfred Parsley Pope, Conditional Purchase Inspector and Forester, Land Board District of Grafton, sworn, and examined:—

1538. *Chairman.*] You are aware of the proposal to construct a line of railway between Grafton and Casino, as indicated on the map, the Government having chosen the western deviation? Yes, I know the line. I know the country thoroughly from Casino to Myrtle Creek. My boundary does not go over Myrtle Creek.
1539. Commencing at the Myrtle Creek end, would you describe the country between there and Casino? The country round Myrtle Creek travelling towards Casino is comparatively flat and is heavily timbered. The land is somewhat poor, but is greatly improved by ringbarking. That class of country extends pretty well up to Deep Creek—within a few miles of Deep Creek.
1540. Would you call it clayey or sandy soil? Sandy soil principally, with to a large extent clay subsoil not very far under the surface.
1541. And what is the character of the timber? Iron-bark, blood-wood, tallow-wood, stringy-bark, spotted-gum, and mahogany.
1542. Taking that stretch of country from between Myrtle Creek and Deep Creek, what are your views with regard to its future development;—what would it be most likely to be used for? For grazing purposes. It is not suitable for agriculture except in a few small pockets just immediately on the banks of the creeks. Otherwise it is not suitable for agriculture.
1543. In your description of the country, about how far do you go on either side of the proposed line of railway? The description I have given would apply for a good number of miles on either side of the proposed line.
1544. Would you say 10 miles on either side? Yes; in fact, on the western side it would extend up to the dividing range between the Richmond and the Clarence. The timber gets heavier as you go further west until you get to the dividing range.
1545. You have stated what you think this country would be likely to be used for;—what is its present occupation? Grazing. It is held by different stations, and there are a few small farms on the banks of the creeks. Between the creeks it is held principally under occupation license by the Woorooloolgan and Bungawalbyn Stations.

W. P. Pope.
6 Mar., 1900.

- W. P. Pope. 1546. What about dairying in that part? Dairying is carried on only to a limited extent. There is a small area between Myrtle Creek and Sandy Creek, and then along the fringe of Deep Creek there is some dairying carried on, but not to any very large extent. There is one creamery—I think it is called the Karwon Creamery—which takes in a few farmers on Myrtle Creek, and about the southern side of Sandy Creek. Then there is no other creamery until you get on to the banks of Deep Creek about Myrtle Creek—between Myrtle Creek and Deep Creek.
1547. Are the dairy-farmers increasing in number? They have increased very much during the last two years. I have held the dual position of Conditional Purchase Inspector and Forester since 1896, and there has been a very considerable increase in the dairying industry since that time. The creameries I speak of have been built since that time.
1548. Has dairying, as far as you have observed, succeeded? As far as I know it has succeeded quite well.
1549. Do you know any instances about there where they have started dairying and have given up their occupation? No, none; and I know there are people still going to the place looking for farms, and getting them.
1550. What extent of country do these conditional purchase holders take up? The dairymen I speak of have not so much taken up new land from the Government for dairying as rented land from the stations. The stations as a rule, and in this case, hold all the land on the banks of the creeks—the creek frontages. The dairy farmers rent those places from the station. There has been very little land taken up by selectors for the express purpose of dairying.
1551. Was there any land available for that purpose? Yes, when you get away from the creek frontage—say, a mile and a half or 2 miles back from the creek. But it is unsuitable; the country is not very well watered. It does very well for turning dry cattle into when it is fenced; but you cannot get away from the creek and carry on dairying properly.
1552. Then do we gather from that that there is really no land available there to any extent for dairying purposes, except that which can be rented from the large holders? Not to any extent.
1553. What extent of land have these people rented; what acreage? I am not prepared to say what acreage, because although you see a lot of houses along the creeks, I do not know the areas they have. I could only mention one or two individual holdings, and that would not give you any idea of the total area.
1554. But how much would each person have taken? I imagine from 200 acres to 400 acres. In that class of country that is about what they rent.
1555. Did they take it up in its natural state or was it partly improved—those creek frontages? They take it up in its natural state.
1556. And then did they have to spend money in improvements on the creek frontages? Yes; they have to fence and ringbark it, and build yards. On the country between Myrtle Creek and Deep Creek there are three large timber reserves which contain very valuable timber. There is almost an unlimited supply of stringy-bark, iron-bark, and spotted-gum, all along the line of railway there.
1557. Is the timber industry an active one? Not very; as far as my district is concerned the hardwood timber is worked very little. They are gradually working up from the south to my district; but so far there have been practically no operations in the hardwood. A few men might come out and cut a few logs occasionally, but there is no regular supply.
1558. What do they cut—girders, sleepers, and piles? Yes, principally; but that refers more to the land on the south of Myrtle Creek.
1559. And they take the timber over to Lawrence? Yes. The girders and piles that have been taken out in my district have been principally for local work, such as culverts and small bridges.
1560. But there is in your district, between Myrtle Creek and Casino, a large tract of valuable timber country? A very large supply of valuable timber on either side of the line, and it stretches away on both sides of the line for a good many miles.
1561. If a railway were made to connect the Richmond with that district, do you think it would develop saw-mills and encourage the timber industry to any extent? I feel very sure it would.
1562. Between Deep Creek and Casino, what is the character of the country? The country is very nearly all in the hands of small farmers who are dairymen, and all of whom, as far as I know, seem to be doing very well. They are constantly on the look-out for more land where they can get it. They have been taking farms from the stations. There is very little Crown land between Deep Creek and Casino.
1563. How does that land compare with the land between Myrtle Creek and Deep Creek? The land immediately on Deep Creek is better than the land south of Deep Creek, towards Myrtle Creek. There are better black-soil flats on Deep Creek, and the land is better suited for cultivation than is the case as you get further south.
1564. Is the land taken up more for dairying there? Yes, decidedly so.
1565. Can a man run more cattle on a given area there than between Myrtle Creek and Deep Creek? Yes.
1566. Does your observation lead you to believe that people would occupy these rich patches of country such as you have just described, rather than take up Government land by free selection for dairy purposes;—do you think it would be more advantageous for them to rent, in small areas, some of this rich land that you describe near Deep Creek than to take up larger areas by free selection from the Government of the land over towards Myrtle Creek? I think the tendency would be rather to rent a smaller area and get good land than to take up a larger area and get inferior land.*
1567. It would be easier managed? Yes.
1568. And more certain in its return? Yes. A man who has a good farm knows the capabilities of the place and he can manage it by himself. On the other hand, if he has a large rambling place he has to fence it and ringbark it, and it is always poor, until he has had it ringbarked for some years, and otherwise improved. I think he would rather take up a smaller area which would be easier managed and make sure of his crops, than he would take up a larger scope of country on which he has pretty well the same expenditure, and perhaps more, and is more uncertain of the return.
1569. Coming towards Casino, and away to the north up in the direction of Kyogle, does the country get very much better again? There is no sort of comparison at all between the land we have been speaking of, and the land on the north side. As you get north of Casino the quality of the land changes so much

for

* NOTE (on revision):—The land is not "rich," but is better than adjoining country at the back.

W. P. Pope.
6 Mar., 1900.

for the better that there is no sort of comparison between the land north of Casino and the land south of Casino. I daresay Kyogle has some of the best grazing land in the Richmond River district. It is open country on that side until you get up, say, to Wiangarie, and then you begin to get close to the mountains, and the country is very much rougher. But from Casino up to about 6 miles above Wiangarie it is magnificent grazing country.

1570. And how has that country developed in regard to population as compared with the country out towards Myrtle Creek? As regards population, it is not developing to any great extent, because the land I speak of is in the hands of two station-holders—Mr. Barnes, and Mr. Smith, of Kyogle. Mr. Smith is just beginning at New Park, about 20 miles from Casino, to let out some of his best land, and a creamery has been erected there.

1571. Do you know what he gets an acre for that land? I have no idea. I am not sure whether he has let it or not, but I know he is working the farm on halves, and he has taken for that purpose what is generally recognised as the best part of the station.

1572. Does the practice of dairying on halves obtain much here? Yes; to a very large extent.

1573. The small man I suppose likes that because it enables him to start with next to no capital? Yes; I think that is the object. They can commence with practically no capital. They get the use of the cattle, and they can make a start.

1574. And when a man has to take up land in its natural state, heavily timbered, and do the necessary fencing, that involves the expenditure of capital? Yes. A considerable area of land has recently been taken in exchange by the Government from the station at Kyogle. The station gave up a large area of country of very good quality, and it was very much rushed; a great number of selectors balloted for it.

1575. If a railway were constructed from Casino in the direction of Grafton, passing through the country you have described as far as Myrtle Creek, do you think that would assist settlement, and the taking up of that kind of country? I am quite sure it would assist it very materially.

1576. How would the railway improve matters? It would give so much easier access. It would be far easier for people to go there. That was the case along the line from Lismore to the Tweed, where their cream can be carried only a few miles to the railway platform instead of having to be carted 5 or 6 miles to the factory. In wet weather the roads down there are very bad, and sometimes it is as much as they are able to do to draw their cream along the road; whereas, if a railway were taken along there, there would be a siding within a few miles, and it would do away with the long drawing over a bad road. I heard a man say the other day that, with 3 miles drawing, he had to keep two horses employed all the time, and he had to feed them. That was during a spell of wet weather. That is where I think the advantage of a railway would come in.

1577. With regard to the land out in the direction of Myrtle Creek, is it good grazing land, having regard to the natural grasses that grow there? No; it is not good grazing land. You could not call it good grazing land.

1578. What is the matter with it? I do not quite know what is the matter with it, but it is poorly grassed. The grass is thin when you are riding over it. The roots of the grass appear to be far away from one another, and it is sour. Of course, it is very much improved by ringbarking.

1579. It is improved by clearing and letting the sun in? Wonderfully. I dare say the tract of country that would carry a beast to 20 acres in its unimproved state would, when improved by ringbarking, carry a beast to 12 or 15 acres.

1580. In your observation in moving about the district, do you think dairying is the one industry that has made the most advance in this district? I have no doubt of it at all.

1581. If this railway were constructed, do you think the Government would have to look for the main item of freight to the carriage of dairy produce, and, of course, store goods back? I think so.

1582. The main item of freight outward would be dairy produce? I think so. I think there would be a large quantity of timber sent along the line also, but the main freight on the railway would be dairy produce.

1583. With regard to the timber industry, spotted-gum seems to grow very largely here;—what is that timber used for? I have seen very little spotted-gum used. I am told it is a matter of fashion. I have been generally led to believe that spotted-gum was good for anything, but it is not a popular timber. I honestly believe it is as good timber as you can get. I have inquired of timber-getters and saw-mill owners why it is not used more largely, and they say it is simply because for the present it is not popular. I believe the same thing obtains in every market, as far as timber is concerned.

1584. Would it be largely used for beams for houses and that kind of thing? I do not imagine you could get any better timber for all purposes for which hardwood is required. There is an enormous quantity of it. I have seen a good deal of it felled for fencing and other purposes, and it seems to be of the very soundest description.

1585. It does not warp and twist? Not as far as I know. I think the same thing applies to other timber. It largely depends on the time of year you cut it. If you cut it when it is full of sap it will probably warp, but every timber will do the same thing.

1586. Is it much used in the district? Not very much.

1587. What do the people use? Principally iron-bark or red-gum—some call it blue-gum and some red-gum, but it is the same timber.

1588. Do they use that for building purposes? Yes; the gum is used more than any other timber for building purposes? I forgot to mention, with regard to timber, that on the dividing range between the Richmond and the Clarence there is probably enough pine to last 100 years even if they cut it as fast as they like. This timber in very large quantities would, I think, be drawn on to the line at Busby's Flat.

1589. Is the colonial pine in much demand in the market? Yes; it is in very great demand. I suppose there are forty or fifty teams in Casino now drawing colonial pine from the one reserve I spoke of, and it seems to me that they can always get rid of as much as they like to draw.

1590. Is it sawn locally? No; it is simply drawn in the log.

1591. The timber is in sufficient quantities to justify the belief that saw-mills would be started at different centres? I think so: the timber is there without doubt.

1592. *Mr. Watson.*] Is it not too much scattered? No; the timber is very close—a good number of trees to the acre—the spotted-gum in particular is very close. The iron-bark, of course, is rather more patchy. You can find spotted-gum all over that scope of country between Deep Creek and Myrtle Creek. It is

- W. P. Pope.
6 Mar., 1900.
- thickly covered with spotted-gum. Then you will find patches of iron-bark which runs right out some-times, and then comes again.
1593. Is the pine also near that line? No; the pine would not be nearer than about 14 or 15 miles from the line. Still with a good road that is comparatively nothing to a timber-getter.
1594. When country that is largely grown over by spotted-gum is ringbarked, does it not generally make fairly good grazing country? Yes; I think land originally covered with spotted-gum when ringbarked makes better country than any of the other. I know of one case in particular below Deep Creek where the main road goes from Casino to Grafton. On one side the timber has been ringbarked, but on the other side it has been left, and the difference is wonderful. On the side where it has been ringbarked there was a thoroughly good green sward of grass, and on the other side it was pretty well bare. Ring-barking sweetens the land.
1595. From what you have seen and heard of this country, do you think that a dairyman taking up a holding could, if it were ringbarked, rely on the natural grasses, or would he have to improve his grass? He would have to improve his grass.
1596. By artificial grasses? Yes.
1597. Is that being done in most of these places where dairying is successfully carried on? Yes; it is done pretty well universally.
1598. *Paspalum* is largely planted? Yes. I have known instances where people have ridden about on their horses and sown *Paspalum*. There are two kinds of *Paspalum*. The kind most commonly used is *Paspalum dilatatum*, and the other kind, which exists in this district, but is at present little known, is called *Paspalum compressum*. The latter, I think, is likely to become a good fodder grass when it becomes more known. It is a creeping grass, not unlike buffalo, but much finer and more succulent. It creeps along the ground and excludes everything else.
1599. It seems thoroughly to suit the country? Except that the frost damages it, whereas the frost does not damage the *Paspalum dilatatum*.
1600. Is the frost severe on the ridgy land as well as on the flats? Not so severe.
1601. Do you think the country between Casino and Grafton—the Myrtle Creek country, for instance—is country upon which you would have to cease dairying in the winter months, or do you think a man with an improved holding could go on milking all the year round? I think that, with improved land and artificial grass, the farmers could dairy all the year round.
1602. What are the timber-getters paying for haulage? A man can draw timber 8 or 10 miles almost as easily as he can 5 miles. Say, for 10 miles it would cost probably 1s. per 100 superficial feet.
1603. How would that work out per ton approximately? It would take 500 feet of pine to make a ton, so that would be 5s. a ton.

James Stocks, pharmaceutical chemist, Lismore, sworn, and examined:—

- J. Stocks.
6 Mar., 1900.
1604. Mr. Watson.] What is your occupation? I am a pharmaceutical chemist, residing at Lismore, and now out of business.
1605. You are acquainted with the proposal to construct a railway from Grafton to Casino? Yes.
1606. Do you know the country through which that line would pass? Yes.
1607. How long have you been in the district, and what experience have you had? I have been resident in the district of Casino and Lismore for about forty years.
1608. And have had frequent opportunities of viewing this land? Very frequent. Perhaps I ought to explain that I have bred and reared cattle myself somewhat freely, but relinquished that occupation some few years ago.
1609. So that you have had experience in grazing matters? Yes; experience as well as observation. I travelled frequently between Casino and the Clarence for the first twenty years of my residence here, though I have not travelled there so much lately. I know the land very well from Casino to Lawrence, and from Casino to Grafton.
1610. How would you describe the land coming north from Grafton towards Casino? Going the reverse way, at Casino and Deep Creek, the first 3 or 4 miles is fairly good land. Then commence, after crossing the swamp, what are commonly recognised as the spotted-gum ridges, which continue, in the main, to Deep Creek. The first portion of the land is fairly good—that is, up to the swamp—the next has been commonly recognised as being miserably poor—that is, up to Deep Creek—and is usually described as spotted-gum ridge land. On both banks of Deep Creek there is a slight improvement. The soil is better, having been formed, to a considerable extent, by frequent floods passing over it. That, of course, dies away, and in the course of from $\frac{1}{4}$ to $\frac{1}{2}$ a mile, there begins the same kind of land as on this side of Deep Creek—a very slight amount of loam on the surface, and, beneath, gravelly, poor, hungry soil, capable of producing nothing, so far as one can judge.
1611. How far does that extend? That extends to Myrtle Creek. Perhaps I ought to say that on the banks of Deep Creek there were a few farmers, some of whom continued to struggle, but others, of whom I know personally, could not endure any longer, and had to abandon their holdings.
1612. Could you mention the names of any of those people? The first one, as the most notable, was James Carlill. He gave up his land, and would have abandoned it altogether, but his father took it up, simply as a last resource, and his father owns it at present.
1613. How long ago was that? About sixteen or seventeen years ago.
1614. Were there others, then, who abandoned their land? Yes.
1615. About the same time, or later? Since then—not at that time.
1616. Not very recently? Within a year or two past, I could not say exactly.
1617. How do you describe the land between Deep Creek and Myrtle Creek? I think you said it was mostly spotted-gum country? Yes, and timbered generally. It is not confined so much there to spotted-gum as on this side of the creek; it is more of a mixed character, as previously described—that is, embracing other hardwood, such as iron-bark, red-gum, blue-gum, grey-gum, and mahogany.
1618. And the soil? The soil is what I should describe as miserably poor, fit for nothing but grazing.
1619. About Myrtle Creek? On the banks of Myrtle Creek it is similar to Deep Creek. It is somewhat improved by frequent floods washing over from the Creek. The first and principal occupant there was Benjamin

Benjamin Sellar. He was there as head station-keeper for the late Clark Irving. He kept an accommodation house there. I had frequent occasion to stop there during the night, and at those times had ample opportunities of making inquiries of Sellar as to the character of the country, and its capabilities. One thing that struck me was that surrounding the homestead he had always a good garden. My first impression was that it must be attributable to very superior soil. But he explained to me in conversation that notwithstanding its apparent productiveness he could never get a second crop, even there, without having it well manured. In explanation of its apparent richness he explained still further that it had been refreshed by continual floods; but by going back 100 yards or so it would be found that the land was very poor, and not capable of producing anything whatever.

J. Stocks.
6 Mar., 1900.

1620. Take the country further on towards Grafton? That is just a repetition of the same thing until you get to within 12 miles of Lawrence.

1621. What do you mean when you say it is a repetition? The same kind of country.

1622. Poor? Yes. I know of no farmers who have ever succeeded in doing any good there—not one. As a further instance of its character I may say that the New South Wales Creamery Company established a creamery in that direction somewhere, I understand in the vicinity of Deep Creek as the most likely place that could be selected on the whole route. They continued that creamery for three years, and from the first day to the last there was a continual loss until finally it was closed, and it is closed now.

1623. That is at Deep Creek? I understood the manager to say it was in that vicinity.

1624. Is there not a creamery working now at Myrtle Creek? I do not know.

1625. The men who abandoned the selections you spoke of about Deep Creek had no opportunity of going in for dairying on the modern system before they abandoned it? The man I spoke of, Mr. Carlill, went in for dairy-farming, and his explanation to me, and his father's also, was that he could not live at it, and his only alternative was to abandon the farm, and he went away and obtained a situation in ordinary employment down south.

1626. That was before the introduction of the modern system of factory dairying? No, it was not.

1627. If it was seventeen years ago it was before the introduction of that system here? Well, before the bulk of it was introduced here.

1628. Was there a factory or creamery here then? I had a large plant myself.

1629. But I am speaking of a factory with modern appliances? No.

1630. Is the land from Myrtle Creek to within 12 miles of Lawrence, as mentioned by you—that would embrace about 30 odd miles—unvaryingly poor? I should not use the word unvaryingly; that would be, perhaps, too sweeping. Of course, there are a few acres of fair land here and there.

1631. Do you know the Camira station? Yes.

1632. How would you describe the land about the head station there? I call that fair, nothing more.

1633. Would that description of fair apply to the flats immediately around the head station, or to the ridgy land about—there are both? It certainly would not apply to the land between the station and the Casino-road.

1634. It would apply only to the land about the station homestead, which is mostly flat? Yes.

1635. Do you know another station further along towards Lawrence, occupied by a gentleman named Zuill? I know the land generally.

1636. How long is it since you saw that land? Twenty years.

1637. Was it ringbarked or improved then? No, it was not, except certain portions, which were specially cleared so as to improve it.

1638. How did those portions which had been cleared compare with the balance of the land;—was there any considerable improvement visible? No. It is not in the nature of the land at all to improve materially by either ringbarking or the falling of the timber, except on a very superficial scale on the near surface. Of course, I do not mean to say that if the sun's rays are not able to get to the land properly that land would be the same as if the sun could operate upon it; but in regard to the depth of soil, it is idle to suppose that ringbarking would make any difference.

1639. When people use the term "the land improves," they really mean that the quality of the product improves? So it ought to do.

1640. That is what I mean by my question whether there is any material improvement in the grazing as a result of clearing? Yes; the grass would be more rank and of greater growth, and would do very well for stock simply for grazing; but as for cultivation, the thing is simply absurd.

1641. Do you think it would be sufficiently good grass for milk-production? I do not see how a man could live upon it. I never met with one who could. The land on the other side of that—that is, for the last 12 miles to Lawrence—is not worth considering, and it is not on the railway route.

1642. What about the land along the railway line towards Grafton from the point just referred to? The same kind of land continues until you get on to the township. The township of Grafton being on a peninsula is very often flooded, and to my knowledge has been under water for a depth of from 10 to 14 feet. The land there is, of course, altogether different, because it has been constantly fed with fresh loam brought down by the floods; but all the other land that has never been flooded to any extent remains the same, and that land continues to within about 3 miles of Grafton.

1643. Coming back to Myrtle Creek, do you know Mr. Rapp, who is living there? Yes, I know Mr. Rapp.

1644. I understand from his evidence that he has some 1,200 acres of land at Myrtle Creek;—how would you describe his land? It is a mixed kind of land. A large portion of it is what I should call moderate grazing land, with certain patches in it of fair agricultural land. That is all that can be said about it.

1645. He informed the Committee that he had carried on dairying there very successfully during the last two years? I am pleased to hear it.

1646. And his estimate of the carrying capacity of the land when properly improved and laid down with artificial grasses was a beast to 5 acres;—do you think that would be a rosy estimate? I do.

1647. What would you yourself put it at, taking the average of the land with your experience of stock? Suppose it were ringbarked and given a chance with some artificial grass—say, *Paspalum* or something like that—what would you think it would then carry;—how many acres would it take to feed a beast? I have had no experience of *Paspalum* grass, so I could not say.

1648. Well, take the natural grass? With the natural grass I should say not more than one beast to 10 acres.

1649.

- J. Stocks. 1649. That is, when it was improved? Of course, it would depend upon what the improvement was.
- 6 Mar., 1900. 1650. I say if it were improved as a man could improve it, by ringbarking and giving the grass a fair show? It certainly would not carry more than one beast to from 8 to 10 acres. Perhaps in one thing I may be misled in some degree. I have always been accustomed to very good land, especially in this district; and that being so, I may probably be inclined to undervalue what another would esteem very highly. Some years ago, when travelling along the southern line of railway, from Goulburn to Sydney, I met one or two gentlemen who were stock-owners. On one part of the road I observed what I thought to be some fairly good grass, about 6 in. high. The manager of a station asked me if I did not think that was very superior land. I told him I thought he was joking. I did not consider that superior land, but fairly good land. I said, "How many beasts would it carry to the acre; would it fatten any now;" and he said he thought it would if it were allowed a little more freedom, and that sort of thing. I said, "In order to know what good land is compared with this, you must go on the Richmond, where they will show you some land on which the cattle and the horses can feed on the grass all the year round." However, I did not succeed in convincing him that that land was not very superior land; at the same time, if he had talked from then till now, he would not have convinced me that it was superior land. In giving my evidence on this occasion I wish, of course, to make a reasonable allowance for a difference in that way. I do not wish my description of the land to apply absolutely to every acre along the route of the proposed line. I say that, generally speaking, along the road from Casino to Grafton the land is so poor and unsubstantial that nothing like dairying could ever be entered upon. I notice that the other day Mr. Ebsworth, district surveyor, made a statement to the Committee with regard to the land that was alienated, and so on. He said the land comprised 23,000 acres of railway reserve, 93,000 acres alienated, 100,000 acres in process of alienation, 139,000 in forest reserves, 35,000 in other reserves, and 320,122 acres available for settlement. In all the particulars given there, there is not one word stated as to the different uses to which these portions of land were made available. If he had stated how much were used for dairying, and how much for grazing by stations, then there would have been some force in his remarks.
1651. But is it not possible that some of the land may be quite suitable for dairying but would not be put to that purpose owing to the lack of communication? Not owing to lack of communication. It is quite possible there may be some; but they would comprise, in my opinion, a very small area that would be suitable for dairying.
1652. You think that lack of communication would have no deterrent effect on the taking up of land for dairying? No, it would not have a prejudicial effect. A railway established anywhere would have a beneficial effect, and I should be very pleased to make use of this railway if I were travelling that way; at the same time I am equally convinced it would be a disastrous mistake to spend money in making a railway which would never be likely to pay.
1653. That is another question. The point I asked you about was whether, in your opinion, the lack of railway or other communication would not deter people from taking up that Crown land, even if it were moderately suitable for dairying? Probably it would deter them.
1654. So that, as far as that argument is concerned, it is possible that some of the land would be suitable for dairying, though it is not taken up? Well, it would be a very small area. I know the land.
1655. As to the general aspect of the railway, you say you think it would be inadvisable to construct it? Very.
1656. Because it would not pay? It would have no prospect whatever of paying.
1657. You do not think that this land would be taken up for dairying purposes? I am quite sure it would not.
1658. What effect would the construction of the line have upon the trade in Lismore? None whatever.
1659. Do you think there would be no traffic from a point, say, about Myrtle Creek towards Lismore, if the railway were constructed? I should not regard the traffic as worth consideration.
1660. There would be so little? Yes.
1661. Not even in timber? No.
1662. Do you not regard the timber along there as of any value? It would not go that way. If it came from Myrtle Creek it would go down towards Coraki; it would go down on the eastern side of the road a long way from the line of railway. It would be so far that, in fact, it would be a considerable additional cost. In all probability the timber could be drawn to the wharf at Coraki at as little expense as if it went by the railway.
1663. But we are informed that the better timber lies to the west of the proposed line some few miles;— is it not possible that that timber would be brought to the railway for shipment at deep water on the Richmond or on the Clarence? That is possible.
1664. So that it is possible there would be some amount of freight in that way? Yes.
1665. But not sufficient, in your opinion, to justify the railway? Certainly not.
1666. I think you said it was some time since you were over this country, and then there was not much done in the way of ringbarking, or anything of that sort? No.
1667. So that you saw the land in its natural condition, unimproved? Yes.
1668. In commenting on Mr. Ebsworth's evidence, you will recollect that he had recently been over the country and seen it, or a portion of it, in its improved state? Yes. That would not alter the matter; it would make no material difference.
1669. There would be no passenger traffic of any moment? None worth speaking of.

Denis Carroll, Sub-Inspector of Police, Richmond and Tweed Districts, sworn, and examined:—

- D. Carroll. 1670. *Chairman.*] Do your duties take you in the direction of Casino, and Deep Creek and Myrtle Creek, on towards Grafton? I notice by my note-book that on the 6th, 7th, 8th, 9th, 10th, and 11th of February, 1897, I was in the country out between Casino and Wyon, Myrtle Creek, and between Wyon and Tabulam. The people in the neighbourhood of Myrtle Creek and Wyon petitioned the Government to have a police-station established there, and I was directed to go out and report as to its necessity, which I did on the dates just mentioned. I went through the country generally, from farm-house to farm-house, had a look at the country, and inquired as to population, and the necessity for a police-station, and I know that my report was that there was no necessity for a station there, and one has not been formed.

1671.

1671. The district was not sufficiently populated? Yes. I remember that I said in my report that I did not think the country was likely to carry a big population, and I did not think there was any necessity for the police-station. I inquired as to the class of country, and whether it would be likely to carry a population. D. Carroll.
6 Mar., 1900.

1672. What was the nature of the information you obtained? The upshot of the inquiry was that I did not think there was any likelihood of a population ever being settled in that country, except, perhaps, along the banks of the creeks. The ridges and the country back off the creeks was very poor.

1673. Had the dairying industry started then? That was three years ago; there was no dairying to speak of then, or very little. I have not been there since.

1674. They were using the land then just for grazing purposes? Yes.

1675. Did they say it was not good grazing country? No. It seemed to me to be very fair grazing country about Wyon, and from there on to Myrtle Creek.

1676. Was it all in its natural state or improved? It was pretty well all in its natural state, except in odd places, where paddocks were fenced in and ringbarked.

1677. Has not the dairying industry pretty well advanced since 1897? Yes. I do not think very much of it out in that neighbourhood.

1678. We have come through there, and we have had evidence from the residents who are actually carrying on dairying in that locality? I could not offer an opinion upon that.

1679. Has the country in your district, and in other parts, advanced more materially than has been the case out there? Yes; much more so. The country between here and Byron Bay, and between here and Ballina—in fact, the whole of the Richmond and Tweed lying east and north-east from here—has gone ahead very much.

1680. In what direction? It has increased in population, and has been occupied principally for dairying purposes.

1681. Has that occurred since the railway was built between here and Murwillumbah? The railway between here and Murwillumbah has lent great assistance to the increase of the dairying industry. It has given great facilities to the people on each side of the line to bring their cream and milk to the factories. The railway has helped settlement along very much.

1682. How does the country between Lismore and Murwillumbah compare with the country you went out to report upon about Myrtle Creek? There is no comparison. The country between here and Mullumbimby is first-class land. It is of volcanic formation, and it grows lovely grass, while the country about Myrtle Creek, to which I have before referred, is poorer soil—sandy, pipe-clay soil.

1683. Do you think there is anything else you could tell us? I do not think so. I do not pose at all as an expert in the knowledge of land.

1684. You concluded that they were a law-abiding population at Myrtle Creek? There is only a sparse population there. In fact, there is no crime reported from there. The police from Casino and Coraki patrol out there occasionally, and they are able to attend to all the work required in that locality; so that I did not see any necessity for a station there.

John William Pidcock, hotel-keeper, Lismore, sworn, and examined:—

1685. *Mr. McFarlane.*] How long have you followed your present occupation? About five or six years. J.W. Pidcock.

1686. Previous to that were you a resident of the Richmond district? Yes; I was a resident of Sandy Creek for five years. 6 Mar., 1900.

1687. What part of Sandy Creek? In the neighbourhood of Sandy Creek Station, down the creek.

1688. Were you a landholder? Yes.

1689. Is that near the proposed railway line—the surveyed line? About 7 or 8 miles from the proposed line, east.

1690. What area of land had you in that particular holding? I selected 1,280 acres, but was only granted 996 acres.

1691. Did you occupy it for any lengthened period? Five years.

1692. What was your experience with regard to the character of the land at that particular place? The land is very poor indeed, and as a matter of course, the grass is equally so.

1693. When did you first take it up? About the end of 1888 or the beginning of 1889.

1694. For what purpose did you take it up? For grazing.

1695. There was not so much dairying carried on at that time? No, there was no dairying. It had been attempted, but it was not a success.

1696. You had not then the modern improvements which exist at the present time for carrying on dairying successfully? No; there were no dairy factories then.

1697. Have you had much experience in dairying? Yes, I have had a great deal. I have been all my life among stock—nearly all my life on the Richmond amongst stock and dairying.

1698. How far would your land be from Casino? About 12 or 13 miles.

1699. Would that be your nearest town? Yes; Coraki was about the same distance away—it may be a mile nearer.

1700. Did you experiment in dairying? On a very small scale I did.

1701. Was your holding a fair sample of the land in the locality? It was a choice piece.

1702. That would imply that the lands near you were of a worse character? Decidedly.

1703. Did you carry out any improvements in the shape of ringbarking? Yes, I ringbarked.

1704. What was the area? 1,280 acres.

1705. Would that all be conditional purchase land? No; there were 596 acres of conditional purchase land, and the balance was under conditional lease.

1706. How much of the conditional purchase land did you improve? About 400 acres.

1707. With what result;—was it suitable for grazing purposes? On some of the land that I ringbarked an extra outlay was entailed in keeping down the suckers.

1708. That is invariably the case, is it not? In that country, yes.

1709. It was the second growth? Yes, that was the trouble.

1710. How many head of stock had you grazing on the property? On the 1,280 acres, from the end of September, or the beginning of October, until February, I used to graze about 180 or 200 breeders.

1711. How many milking cows? I only milked at most about nine or ten.

1712.

- J. W. Pidgeon
6 Mar., 1860.
1712. As far as dairying was concerned, your operations were on a very small scale? I was satisfied it would not pay, and my dairying was very small indeed. I might add that I did not grass half the number during the winter time, as the land would not then carry the same number of stock.
1713. Was it fully stocked during the best part of the year? Yes.
1714. Taking the result from the time you were there, do you consider that in taking up the land as a selection you made a fair speculation? Not for the purposes for which I took it up. I took it up for breeding cattle on—to raise cattle.
1715. Did you sell the selection when you left? No; I sold an interest to my brothers.
1716. You disposed of it? Yes.
1717. Have they got it now? Yes.
1718. If you had had the appliances for carrying on a dairy farm which are now available, do you think that industry could have been successfully carried on? I would not attempt to dairy on that country at all. It can be done successfully for three or four months in a good season.
1719. Do you know what your brothers use it for now? Yes; for feeding. You cannot breed cattle successfully on it; there is no lime in the country.
1720. They take cattle on agistment? No; they breed cattle elsewhere, and put them there to grow.
1721. Not to fatten? No; unless it is lightly stocked in a good season.
1722. Have you a knowledge of the land between Casino and Grafton along the surveyed line? Yes.
1723. A good general knowledge? Yes; I have known it for the last thirty years.
1724. Does your knowledge of it extend up to the present time? Yes; I have been along it within the last eighteen months—along portion of it.
1725. Does your knowledge extend away from the road on either side, say, for a distance of 10 or 18 miles? Yes; I know the country intimately from mustering stock on it.
1726. You know it from between Casino and Myrtle Creek in the same way, and the other portions right through to Grafton? Exactly; within 5 or 6 miles of Grafton. I have only been along the road from Saltwater Creek to Grafton. Over there I have not been off the road on either side.
1727. What is your opinion of the general character of the country, taking the whole distance between Casino and Grafton;—I am not speaking exactly of the country you can see from the road, but what is your opinion of the country on either side of the road, say, for a distance of from 10 to 15 miles? My opinion on the country is that it is poor sandy soil, and only capable of being stocked very lightly.
1728. Does that apply to the whole country? With the exception of a few favoured spots. There is one spot they call Kangaroo Hills, on Mr. Vickery's station, and there is Pumpkin Swamp, held by Camira Station. There is a fairly good tract of country there, and at Saltwater Creek there is another small area of fairly good pastoral country.
1729. Do you know the Camira Station? Yes, I have been at Camira head station.
1730. What is your opinion of that country? In a good season the ridges round there look very nice.
1731. Is it not a fact that a considerable portion of it is flat country? Only Pumpkin Swamp, and in that neighbourhood.
1732. There is a flat where they cultivate, and where we were told they raised a crop of maize which went 80 bushels to the acre? I do not think so. I should be surprised if there were 40 bushels.
1733. Coming back to Myrtle Creek, is that a similar class of country to your selection? Exactly; the same timber, the same grass, and the same country.
1734. Do you know Mr. Henderson's property? Yes; I know Mr. Cunningham Henderson's property.
1735. What is your opinion of that? His is a fairly good selection.
1736. Do you know the property held by Messrs. Harris, two brothers? Yes; they are at Ellangowan.
1737. What is your opinion of that? They hold a very nice little piece of land. It is of volcanic formation such as exists only in two or three places between Casino and Grafton.
1738. Do you know Mr. George McKee's property;—does that compare favourably with yours? It is no better; it is poor.
1739. Does he not carry on dairying on his selection? He may do it a little, but he did not do it.
1740. We are informed that he carries it on with some degree of success? It is very recently. He was a butcher a few months ago.
1741. Do you know the property of Mr. Smith, one of the oldest residents at Myrtle Creek? Yes.
1742. What is your opinion of the character of his land? It is similar to Mr. McKee's; it is very good for three or four months in the year.
1743. Are you aware that he is carrying on dairying to a considerable extent? I am aware that he is dairying and milking a lot of cows; as to the result, I cannot say for certain.
1744. In view of the testimony of those who own these lands as to the results that have been obtained from dairying—which we believe to be successful—would not your selection, assuming it to be of a similar character, be equally successful? I cannot think that any of those farmers can have carried on dairying successfully; in fact, I am positive that it cannot be done.
1745. In regard to the character of the land along the railway route, it is mostly heavily timbered, is it not? In places, yes.
1746. What is the nature of the timber? Spotted-gum and iron-bark.
1747. Have you had any knowledge of country thickly timbered with spotted-gum? Yes.
1748. In its natural condition, is there much grass? No; there is not much grass.
1749. When ringbarked and cleared, have you noticed any marked result? I have noticed a marked result—that is, in gravelly, spotted-gum country.
1750. But it is nearly always gravelly with spotted-gum? Some spotted-gum country is dark soil.
1751. What is the character of the soil where the spotted-gum grows to which you refer? The soil is of a spewy sandy nature—very pale, almost white.
1752. Does that apply to the spotted-gum ridges extending between Grafton and Casino? Generally. There is a volcanic formation at Ellangowan, which carries spotted-gum and iron-bark, and that is excellent country when ringbarked.
1753. With regard to iron-bark, is there much timber of that class along the line? Yes, there is a good deal; there is a good deal of very mixed timber along the line.
1754. Would this timber be of any considerable market value? A good deal of it has been already cut.
1755. Where would that be? All along from Lawrence to Myrtle Creek.

J. W.
Pidcock.
6 Mar., 1900.

1756. They are at present cutting there? I could not say whether they are doing so at present, but numbers of parties have been out there cutting, and teams have been drawing piles to the mill and drawing timber both to the Clarence and the Richmond for shipment to New Zealand and Melbourne.
1757. There is a considerable quantity of timber cut and drawn there? Yes; there has been a considerable quantity.
1758. And there is ample scope for continuing the industry to a much larger extent? That would be the case on the western side of the line, but on anywhere near the road any really good timber has pretty well been cut.
1759. Taking land in its natural condition, such as the land we are now referring to, when it is ringbarked and properly worked, what would you say would be its increase in value? I suppose you could not expect an increase in value of more than 10 per cent.
1760. Is that the general result of ringbarking? That is my experience.
1761. Would that class of country grow artificial grasses? I do not know; I have not had much experience in artificial grasses. But I do not know what artificial grass could be raised there successfully.
1762. Do you know Mr. Duggan's free-selection, near Grafton? Yes.
1763. Did you know that before it was selected? Yes; it was a box ridge principally—white-box.
1764. What sort of country did it strike you to be when you saw it? Box ridges are fairly good ridges. They are far before stringy-bark, black-wood, or tallow-wood country.
1765. Did you think at the time that that selection was a desirable choice? Well, not at that time. There was better land, but not better land in that neighbourhood. It was the pick of that part of the district.
1766. How many acres in its original condition would it take to keep a cow or one head of cattle? I should imagine these ridges would take about from 7 to 8 acres. It would vary a lot, according to the season.
1767. Do you mean to say that that was its carrying capacity when it was a box country;—it was thickly timbered with box, was it not? Fairly thickly timbered, but not out of the way; it was the pick of that country round there.
1768. Was it similar land to that across the road? No; the hill was decidedly superior to the land on the opposite side of the road.
1769. How many acres would it take of the land on the opposite side of the road to maintain a cow? When I was along there last, immediately opposite Duggan's selection was an undergrowth scrub—a sapling scrub, and it would take a good many acres—12 or 15—if it were all like that. I never was across the road, but I have been over Duggan's place before it was ringbarked.
1770. Do you consider Duggan's selection considerably improved? Yes, decidedly.
1771. How many acres do you consider, in your experience, it would now take to keep a cow? Four or 5 acres all the year round.
1772. Is it a class of country that would be suited for agriculture? No. No form of agriculture could be carried on there successfully without manuring—no crops such as maize, lucerne, or sugar-cane.
1773. Taking that particular selection as an illustration of the country for some miles further along, how would you compare that in its original state with country 10 miles further towards Casino? The country generally 10 miles further from that selection towards Casino is, in its natural state, decidedly inferior to Duggan's. That is the case until you get to Saltwater Creek, where there is a good patch of pastoral country. But the average could never be put in the same condition that Duggan's is in at present. Ringbarking would not do it—the country is too poor.
1774. With regard to the unimproved country along the surveyed line, how many acres do you consider it would take to keep a cow? From Saltwater Creek to Myrtle Creek, taking the average, it would take 10 acres to the beast.
1775. That is without improvements? Yes.
1776. Suppose it were improved to the same extent as Duggan's selection, how many acres would it then take to maintain a cow? Well, it would make very little difference to the majority of the country. I daresay it would take about 7 acres.
1777. If a railway were constructed, and facilities given for sending produce to Grafton at one end and to Casino or Lismore at the other, is the class of country along the line of such a nature that it would be likely to be settled upon? I do not think so—not for dairying or pastoral pursuits. It might be for timber possibly.
1778. Land is very seldom taken up for timber purposes, is it? They might take up land for a home, as it were, while they were working the timber, and abandon it afterwards.
1779. *Mr. Watson.*] You had your place for five years? Yes.
1780. Did you ring it all? I rung about 400 acres.
1781. That is about a third of it, roughly? No; about two-thirds of what was thickly timbered. The other was thinly timbered. It was a third of the holding, but it was really two-thirds of the timbered country.
1782. How long did you attempt to thicken stock that land?—I think you said your brothers now use it, but what did you attempt to do with it in the early part? I attempted to breed cattle on it.
1783. Seeing that you had only a portion of it ringbarked, you would not for some time get, even from what was ringbarked, any benefit, would you? No, but I could make a calculation; I could reasonably allow for the improvement that would accrue.
1784. For some time ahead? Yes.
1785. How long do you reckon it takes for the improvements to be effective? That country would not improve. After two years, as soon as the timber is dead, the improvement is very noticeable. There is an early spring on it, and the grass looks nice, but it is always thin. After two years the suckers begin to come, and then you have the trouble.
1786. If a man has a small area he can keep the suckers down, can he not? Yes; but it is worth the land to keep them down.
1787. You say you carried, speaking roughly, a beast to 6 acres in the summer? Yes, for four months.
1788. And half that number in the winter? Yes—and not half that number in the winter. Not quite a beast to 6 acres. I carried from 180 to 200 on 1,280 acres.
1789. You have already said your land is not all improved? No, not all improved. That which was not timbered, or was very lightly timbered, could not be improved by ringbarking. There were at least 120 acres that ran into a flat with no timber at all on, or only sufficient for shade.
1790. And on the other you had 400 acres cleared? Yes.

John Gibson, Manager for the New South Wales Creamery and Butter Company at Lismore, sworn, and examined:—

- J. Gibson. 1791. *Chairman.*] How long has the factory been established at Lismore? Five years. I have been here all the time.
- 6 Mar., 1900. 1792. Have you a statement in regard to the dairy industry in the Richmond district? Yes. It is as follows:—The New South Wales Creamery Butter Company established a butter factory at Casino about three years ago, and started operations on an output of about 3 tons per week. At the beginning of this year the output had increased to 9 tons per week, a very satisfactory increase of 300 per cent. since starting. The principal supply to Casino factory came from farmers settled on the main arm of the Richmond, North Casino, Kyogle, and Upper Richmond, all of which, judging by results, are eminently suited for dairying pursuits. At the request of ten farmers, who signed a requisition, the company erected a creamery at Myrtle Creek, and, owing to the poor nature of the country for dairying, the supply is now much smaller than when we started there, and we do not hope for any increase from that direction. A creamery was also erected at Mongogarie, which, however, we are now compelled to close down. The falling off in supply at the creameries at Myrtle Creek and Mongogarie is mainly due to the inability of the farmers to continue the payment of rent, which is 2s. 6d. per acre. One supplier from that part told me that 1s. per acre was as much as the majority of them could live at, as with improvements and the benefit of a favourable season it took 10 acres to keep one cow. It may be as well to add that the farmers of these localities are treated, as regards cost of manufacture, exactly as they are at Kyogle, North Casino, and those places, where the industry is on a progressive footing. On the whole I consider the country in the direction of Myrtle Creek unsuitable for dairying, excepting in small patches along the watercourses, and do not think a line of communication would induce the settlement of those intending to follow this industry. On the other hand, the country mentioned around Kyogle, Upper Richmond, North Casino, and the main arm, are so favourably considered by this company that they are prepared to expend a considerable amount of capital to induce settlement of farmers intending to follow dairying. Owing to the impossibility of direct shipment from Casino we are compelled to carry the butter made there to Lismore, which entails an additional expenditure of $\frac{1}{4}$ d. per lb., which, on 9 tons of butter, comes to £21. The supply at the Lismore factory since it started has been steadily increasing, although showing a slight falling off in 1898, owing to a long spell of dry weather. The figures are:—1895, 350 tons; 1896, 700 tons; 1897, 900 tons; 1898, 896 tons; 1899, 1,000 tons. The cost of butter to the farmer landed in Sydney, is $1\frac{1}{2}$ d. per lb., this charge covering manufacture, freight, and selling charges.
1793. You made the statement that farmers about Myrtle Creek could not afford to pay 2s. 6d. per acre per annum rent to the squatters for the use of their land;—what rental do they pay in the districts that prosper? From 5s. to 7s. 6d. an acre.
1794. Do they get on better than these other farmers? Yes.
1795. Could you tell us about the size of the holdings on fairly rich land? About 200, 300, 400, and as much as 500 acres.
1796. How many beasts do they carry to the acre? In these particular districts, on good land, one cow to 3 acres.
1797. Is that mostly cleared land? Yes, mostly cleared.
1798. Do the tenants have to do the improvements when they take up the land;—do they have to fence in every block? They are generally put on a sliding scale, and the rent gradually increases.
1799. What do they start with? I think it is about 2s. 6d.
1800. And in most cases they are able to make their improvements and pay the increased rent? Just so.
1801. You have not had to discontinue your operations at Myrtle Creek? At Mongogarie we have ceased operations.
1802. How does the character of the milk from those districts compare with the milk from land of a better class? It is much poorer.
1803. Is that owing to bad feed? The grasses are not as good.
1804. Have you yourself seen that country under grass? Yes; as district inspector I periodically visit those districts. I visit them a dozen times a year.
1805. What was your experience before you came here as manager of the Company? My experience was on the South Coast.
1806. For a considerable number of years, then, you have been looked upon as an expert in dairying? I have been twenty years in the business. I have followed up dairying in the South Coast district, in the Mudgee district, and in the Wellington, Monaro, and Shoalhaven districts.
1807. Suppose you had left one of those districts, and had come to this part of the country, and you could not get any of this good land for which they pay the higher rentals, and where dairying is admittedly a success, would you, as a practical dairyman, have taken up any of that land between Casino and Myrtle Creek for the purpose of dairying? Certainly not.
1808. Why? Simply because it is not suitable. The ground is poor. In good patches it could be improved by putting down *Paspalum dilatatum* and other grasses such as that, but on the high lands the grass is generally useless for dairying.
1809. *Mr Watson.*] Would not *Paspalum* grow on that land? No, not on the land I speak about between Casino and Myrtle Creek. It is nothing but that volcanic formation where the iron-bark and spotted-gum ranges are. *Paspalum* might grow on the flats, but it would not grow on the hills.
1810. *Chairman.*] Is there enough of that level good land to induce a large dairying population to settle on that country? I do not think so.
1811. It is somewhat limited? Yes.

William Kennedy, Surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- W. Kennedy. 1812. *Chairman.*] You had charge of the survey of this line from Casino to near Myrtle Creek? Yes.
- 6 Mar., 1900. 1813. Do you hand in a statement making a comparison between the original survey and the proposed western deviation? Yes. It is as follows:—The western deviation was surveyed by me in 1891, after examining the country with Messrs. Lloyd and Gillett, railway surveyors. I think this deviation was suggested

suggested by the Engineer-in-Chief, partly with a view of making a junction station near the junction of W. Kennedy, Mongogarie and Deep Creeks, to suit a connection with Grafton, Casino, and Tenterfield surveys, and also to locate the line on higher and drier ground, as against the permanent survey to the east of the Casino-Lawrence Road. I have never actually followed the eastern survey, but from its closeness to the main road, and from frequent inquiries from residents living on the spot, and an experience of the 1891 flood in Deep Creek, I am confident that the western deviation is greatly to be preferred to the eastern from an engineering point of view—that is, with regard to crossing the flooded stretch of country lying between Richmond River and Deep Creek.

6 Mar., 1900.

Christian Balzer, cordial manufacturer and coach proprietor, Lismore, sworn, and examined:—

1814. *Mr. Watson.*] Have you had a mail contract between Woodburn and Chatsworth? Yes.
1815. For how long? For one term of three years, and another term of about twelve months. I started in 1894, and finished in October, 1898.
1816. What was the passenger traffic like between those two places? There was a fair amount of passenger traffic; not out of the way though.
1817. Could you give us any figures on the subject? For the twelve months from the 1st of May, 1895, to the 30th April, 1896, the gross takings amounted to £668 8s. 2d. That is the only year for which I had the line of coaches to myself. At any other time there was opposition on the road.
1818. You continued to run the coaches after the date you have mentioned? Yes; I was running from the 30th April, 1896, till last October twelve months.
1819. Was there any sign of an increase or decrease in the passenger traffic during that time? There was no increase; it would be about the same. Opposition came, and I was very glad to get off the line.
1820. But during the time for which you gave the figures you had practically control of the whole thing yourself? Yes; I bought the opposition line out, and for that twelve months there was no opposition on the road.
1821. So that you had a knowledge of every person who travelled that road? Yes.
1822. Would that include commercial travellers with their samples, and things of that sort? Yes; it includes the whole of the takings as shown by the books.
1823. Have you any means of ascertaining where those people came from before they got to Woodburn or Chatsworth;—would they come from the river or from Sydney? Often from Sydney. There was a Sydney mail twice a week to Harwood Island. That came through the same line. Then there were passengers from here to Sydney and Grafton, and passengers from Grafton and Sydney here.
1824. Would many of the passengers from Lismore make towards the Clarence to get to Sydney? If the bar was bad on the Richmond they would. There would be less passenger traffic when the bar on the Richmond was good than when there was a bad bar.
1825. So that many passengers would not go across from Woodburn to the Clarence if they could go out of the Richmond without hindrance? Not many.
1826. I understand that there has been a good bar on the Richmond of late? Yes.
1827. And there has been no serious detention of the steamers? No.
1828. In view of that, has the direct passenger traffic between here and Sydney increased—I mean between Lismore and Sydney by steamer direct? Yes, it naturally would.
1829. With a proportionate decrease in the number who have travelled *via* Harwood Island? Yes.
1830. Take commercial travellers, would they in most cases come to both rivers on the one general trip from Sydney? As a rule they would come from Sydney, perhaps, to Grafton, and then come over here. Sometimes they would go back to the Clarence, and at other times they would go back direct to Sydney from here.
1831. I think you said that when the bar was good there were not so many passengers going across by coach? No.
1832. When the bar was bad, would there be any considerable number? Yes. We used to say it would be good for the coaches when the bar was bad, and when the bar was good the traffic would fall off a good bit.
1833. But when it had fallen off, would it then be small, fair, or what? There was a fair amount of traffic for one line of coaches at any time; but when the two lines came on there was not sufficient for them.
1834. How many times a week did the coaches run? Every day each way.
1835. There was just about enough traffic to keep one line going? Yes.
1836. That would be on the average, allowing for a good bar and a bad bar? Yes, one line of coaches would pay at any time.
1837. What was the fare across? Seven shillings and sixpence between Woodburn and Chatsworth, and 10s. between Woodburn and Harwood Island.
1838. Supposing a commercial traveller wished to reach Lismore from Grafton, what would he have to pay under present conditions? It would depend on the size of his load.
1839. Leave his load out of the question, and say just one passenger? It would cost him 3s. down the river to Chatsworth, 7s. 6d. over in the coach to Woodburn, and 5s. from there to Lismore. His total payment, from Grafton to Lismore, would be 15s. 6d. If he took a return ticket his coach fare, both ways, would be 12s. 6d. instead of 15s.
1840. Suppose there was a railway between Grafton and Lismore, would there be on the down-river towns, both on the Clarence and the Richmond, anything in the way of business which would compel a traveller to go to those places in any case? Yes, in a great many instances.
1841. Say at Coraki and Maclean? If they come from the Clarence they want to do Ballina and Lismore. When they get to Woodburn they often go down to Ballina first, or they could come to Lismore first, and then go down to Ballina.
1842. So that, coming across the short distance between Chatsworth and Woodburn, those towns, such as Ballina and Coraki, are easily reached by the travellers? Yes. Then there is Maclean, on the Clarence River, they often go from Grafton to Maclean, perhaps stop a day or two at Maclean—that is 6 miles above Chatsworth—and then they go to Chatsworth and across to Woodburn.
1843. Do you think the travellers would use a railway from Grafton to Casino—the general run of travellers? I am sure they would not; they would come Chatsworth way.

C. Balzer.

6 Mar., 1900.

- C. Balzer. 1844. Why? Because it is more convenient. By the railway a passenger would have to go from Grafton right away round to Lismore, and then he would have to go to Ballina and back to Woodburn; whereas by going from Grafton to Chatsworth and across to Woodburn he could go down to Ballina and up to Lismore; or he could go right round the river, starting from Woodburn. Say he arrived in Woodburn from the Clarence, he could go up to Coraki, from Coraki to Casino, from Casino to Lismore, and from Lismore to Ballina, and then he could go on to Sydney, or come back to Woodburn and across to the Clarence again.
- 6 Mar., 1900. 1845. You think they would not have so much dead time on their hands that way? Not nearly so much, because they leave Grafton at 3 o'clock in the afternoon and get to Chatsworth at 7. They can get over to Woodburn that night or wait till next morning if they like; then they can get up to Lismore next morning, or go to Ballina.
1846. You do not seem to think, then, there will be much traffic for a railway between here and Grafton in the way of passengers? No, I do not think so.
1847. Are there many travellers on the northern rivers who take their own conveyances, or engage special conveyances, in addition to those who travel by the ordinary coaches? Yes, a good many get specials, and some, not many, have their own vehicles.
1848. The figures given by you would not allow for special conveyances, I suppose; but would include only your own takings; or did you have the special conveyances for hire? They would only hire special vehicles from me up in Lismore. It was very seldom that a special went from Woodburn, because nineteen times out of twenty when the passengers came to Woodburn they would take the steamer. Very few specials went from Woodburn; but I have coaches and buggies here which would be hired perhaps to go from here to Casino or Coraki, or perhaps to Ballina.
1849. I was referring more particularly to those who would be going right through between the two rivers? Not many have their own vehicles down there.
1850. Would there be many who would hire special conveyances to carry their samples? Yes.
1851. That would be between Woodburn and Chatsworth? Yes.
1852. Suppose you were able to say how many had engaged such traps, and the amount paid, would that mean any considerable addition to the figures given by you for the year? I have put down all that passengers paid for conveying their samples as well as themselves.
1853. Were there any other people from whom they could hire conveyances? No, there was no opposition on the road.
1854. Not even in the way of special conveyances? No.
1855. So that the figures you gave included all that traffic? They included the whole of the traffic on the river, except people with private vehicles.
1856. Those would not form a large proportion? No.

George Nesbitt, storekeeper, Lismore, sworn, and examined:—

- G. Nesbitt. 1857. *Mr. McFarlane.*] How long have you been engaged in your present business? Four and a half years.
- 6 Mar., 1900. 1858. And previous to that? I was a commercial traveller for over thirteen years, principally in the North Coast district.
1859. Would that include from the Clarence or the Macleay north? From the Manning north.
1860. I suppose you have frequently travelled between the Clarence River and the Richmond River? Yes; during the last five years, prior to my leaving off, I travelled between the two rivers on an average every five to six weeks.
1861. Would you make a round trip in that time? Yes.
1862. That is, coming from Sydney and returning? Yes; travelling right up to the Macleay and the Manning, and then taking a steamer up to the Clarence or the Richmond, as the case might be.
1863. Suppose you wanted to make a tour over the whole of the district you have mentioned, how would you work it—from the Manning River north? I would take the Manning and the Macleay together. I would either go to the Manning or the Macleay, and work on to the other rivers and go to Sydney, or I would ship my samples to Sydney and travel overland by buggy to Grafton from the Macleay, provided I started on the Manning.
1864. And your samples would then go by steamer to Grafton? Yes.
1865. And how would you work the Clarence River? I would work down the river to Maclean and Chatsworth where I had customers.
1866. And then to the Richmond? I would then go over to Woodburn, and would work from there either to Ballina or Lismore, so that I would not cover the ground a second time.
1867. You would visit Casino, would you not? Yes.
1868. How would you get to Casino? I would go out from Lismore to Casino and back.
1869. That would complete your tour? Yes.
1870. And in returning to Sydney? I would either go from Ballina to Sydney, or, if I wanted to do a second trip the same month—overlap the other as it were in the trip—I would return to the Clarence.
1871. Generally speaking, what was the practice during the time you were engaged in that capacity—would you more frequently in returning to Sydney go by Ballina or by the Clarence? In the early part of my time as a traveller I invariably went back to the Clarence, because I would get blocked on the bar on the Richmond in the old days. But in the later years I generally went direct from the Richmond to Sydney.
1872. When you intended to visit the Clarence and the Richmond in leaving Sydney, which steamer would you take—one to the Clarence or one to the Richmond? It would not matter which.
1873. What was the usual custom? There was no usual custom. I either went direct to the Clarence or direct to the Richmond, just as I fancied business was.
1874. Could you not say which way you would mostly go? In the first portion of my travelling, the first years, I went to the Clarence, but in later years I have as often come to the Richmond.
1875. Was it the usual custom of those engaged as commercial travellers to follow the same lines you have yourself indicated? I believe it was.
1876. As far as your knowledge goes? Yes; I could instance two or three who invariably went to the Clarence, but they made longer trips; that is to say, they spent two months perhaps on the two rivers, and went back to the Clarence for the second month's trade. 1877.

G. Nesbitt.
6 Mar., 1900.

1877. In the event of a railway being constructed from Grafton to Casino, and also from Casino to Lismore, do you think the passenger traffic—I am referring now particularly to commercial travellers—would go by rail? I should say, having a knowledge of the mode of travelling, that it would be more convenient to adopt the present system of travelling from Chatsworth to Woodburn.

1878. Would you say how it would be more convenient? Well, you arrive at Woodburn, and you travel down the river, touching at the little townships, until you get to Ballina. There is less loss of time doing that, because, after having finished your business at Ballina, if you are carrying samples you can ship those on the returning boat to Lismore direct, and travel from Ballina to Lismore by coach, which occupies little more than three hours; consequently, you have half a day to make your appointments in Lismore before the arrival of your samples—you get your outside work done before you touch your samples. Then, having arrived at Lismore, you work Casino from there, and work to Coraki either by coming back to Lismore and down to Coraki, or, if the road between Casino and Coraki is anything like fair travelling, you go that way to Coraki, and you arrive back at the place you started from without loss and without traversing the distance twice.

1879. That is Woodburn? Yes.

1880. You made your starting point at Woodburn, but you did not tell us how you got to Woodburn? From Chatswood—that is, if I came from the Clarence.

1881. Say you came from Sydney to the Clarence by an ocean steamer, what would be the track? I would go direct to Grafton, and work down to Chatswood by way of Maclean, and then come across to Woodburn. I would then either go up to Lismore and finish at Ballina, or the reverse, if I wished to go back to the Clarence.

1882. Would that be the most speedy way to go through the whole of the two districts? I found it so.

1883. And the least expensive? It would not be more expensive than travelling from Grafton to Casino.

1884. Could you not, coming up by ocean steamer from Sydney, land at Maclean, then take Grafton, and come to Casino by rail;—how would that compare with the route you have indicated? From my experience it would not be advantageous, because in going from Grafton to Casino, a distance of over 60 miles, a commercial traveller would be travelling dead country. There is not a township between

1885. But it would not take long to do that journey by train? To send samples by train is rather expensive. That would stand in the way of going that way.

1886. We had a commercial traveller who gave evidence that it would be less expensive? I am afraid he did not travel much by rail.

1887. He gave his experience, and his statement was that it would be more speedy and less expensive? It would be more speedy, but more expensive, with no equivalent.

1888. Have you travelled the line between Lawrence and Casino? Yes.

1889. Is there much traffic on that line in the shape of commercial travellers and ordinary passengers? I never went by that road, except when the road between Chatsworth and Woodburn was very bad, and my experience amongst them was that with one or two exceptions travellers did not go that way.

1890. That would be going through a lot of dead country—40 odd miles? Yes.

1891. By coach? Yes.

1892. The journey from Lawrence to Casino is through dead country, and would take a considerable time by coach, whereas the journey by rail from Grafton to Casino is only 20 miles further, and would be done in much less time? But I explained that I never travelled the road from Lawrence to Casino, unless I was forced to do so by the bad state of the road between Chatsworth and Woodburn.

1893. What is your observation in regard to other traffic—say, in the first instance, between Chatsworth and Woodburn;—was there much travelling in the different coaches, and by private vehicles, and on horseback? Private vehicles and horsemen were very scarce. The only vehicles I noticed were the mail coaches and the coaches carrying the travellers' samples.

1894. That would be the principal portion of the traffic? Yes.

1895. It is some years ago since you were a traveller? Four and a half years.

1896. Have you any means of ascertaining whether that traffic has increased or diminished since you left the line? I cannot speak positively, except that I never go that way myself now. During my four and half years' residence at Lismore I have only travelled that road three or four times.

1897. Do you frequently go to Sydney? Yes; on an average twice a year.

1898. And you take the ocean steamer direct from Ballina? Yes; they are more regular now.

1899. The bar has improved to a considerable extent, and there is not the same delay that used to occur in years gone by? I would not attempt it when I was travelling at first.

1900. I suppose you are aware that the practice now in going to Sydney is for people to take the river steamer to Woodburn, and then go over by coach to catch the Clarence steamer, and go by that way to Sydney? I believe there are passengers who go that way.

1901. Do you know whether that traffic has shown any increase of late years? I could not say.

1902. *Chairman.*] The people do not seem to interchange visits in these districts very much? No; nor goods either. I consider that we should not have any goods going from here. I was looking into the matter this morning, and I find that the only products we could get by railway from the Clarence would be potatoes and maize. We have sufficient maize on this river. I made inquiries this morning, and I found that we have not had 20 bags of maize by steamer from Sydney for the last twelve months. As regards potatoes, the freight from Grafton to Lismore by rail would be equal to the water carriage from Sydney to Lismore.

1903. What is the freight on potatoes from Sydney to Lismore? One shilling a bag. It is 9s. a ton by rail for 80 miles; that would be 9d. a bag. The ton rate would be charged. Then we get a superior potato. The ocean steamers make tri-weekly trips to this river now that there is a good bar, so that in registered tonnage the shipping is equal to that on the Clarence with two steamers a week. We have trading here regularly the "Tomki," 600 tons; the "St. George," 500 tons; and the "Electra," 400 tons, making an aggregate tonnage of 1,500. The steamers trading to the Clarence are the "City of Grafton," 825 tons, and the "Kalatina," of 680, or an aggregate of 1,505 tons. I might mention that within the last month all our letters have come direct, and we do not get any letters *via* the Clarence, as we formerly did. This is in consequence of the good bar. A statement has been made that it is customary to unload the steamers coming up this river. I have made inquiries from the agent of the N.C.S.N. Company, and I find that such is not the case. The steamers land their cargo at the wharf to which it is consigned, and they do not unload any cargo at any wharf to lighten the ship.

WEDNESDAY,

WEDNESDAY, 7 MARCH, 1900.

[The Sectional Committee met at the Municipal Council Chambers, Lismore, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).
 JOHN CHRISTIAN WATSON, Esq. | JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of railway from Grafton to Casino.

Thomas Borton, mail contractor and coach proprietor, Lismore, sworn, and examined:—

- T. Borton.
 7 Mar., 1900.
1904. *Mr. Watson.*] Do you know anything of the passenger traffic between here and the Clarence? I know very little from personal observation of the passenger traffic between here and the Clarence.
1905. What is your line at present. From here to Ballina.
1906. Can you say whether there has been any increase in the traffic from Sydney to the Richmond of late years? There has been a very great increase, indeed.
1907. What course did that traffic take previously? Some few years ago the main traffic used to go *via* Woodburn to Harwood Island to meet the Clarence ocean boats.
1908. But recently? Recently, for the last three years, there has been no delay whatever at the Ballina entrance.
1909. With the result? That the main body of the traffic goes direct. I may say that three years ago I had only one coach on the line to Ballina. I have now three, and there are others on the line as well. Three other people are in the same line of business, taking passengers between here and Ballina, and there are besides a great number of private vehicles used by people driving down to meet their friends.
1910. A portion of the traffic between here and Ballina would, I suppose, be a local traffic? Yes; but that would be only small in comparison with the through traffic.
1911. The greater number would be passengers proceeding to and from Sydney? Yes.
1912. Why do they take the coach from Lismore to Ballina rather than go by the steamer down the river? That coach trip often saves twenty-four hours.
1913. That is because of the steamer loading on the river? Yes; she has to travel 73 miles, and the overland journey is only 22 miles.
1914. So that practically all passengers by the Richmond River boat to Sydney go by Ballina? I suppose seven-tenths of them do, and half of the balance travel down the river by the boat through not knowing the advantage of the land line. Anyone who knows the advantage and the saving of time, and that sort of thing, does not hesitate a moment.
1915. What is the coach fare from Lismore to Ballina? Seven shillings and sixpence.
1916. And the time occupied? It takes the coach from three to three and a-half hours. It is broken country; you rise about 700 feet on the journey.
1917. How would the Ballina route compare in point of time and cost with the route to Lawrence;—for instance, you say it costs 7s. 6d. from here to Ballina, and takes three hours. Well, if a man wished to get to Chatsworth, how long would it take him, and what would it cost? It is 26 miles to Chatsworth from Woodburn.
1918. He would have to pay something on the river steamer to get to Woodburn? Yes; I think the fare is 3s. 6d. to Woodburn. The coach fare to Chatsworth was 10s.; but I believe that owing to opposition it is now considerably less—I think 7s. 6d.
1919. How long would it take? Not less than four hours.
1920. I mean the journey altogether? It would take ten hours from Lismore to Chatsworth; there is generally a delay at Woodburn.
1921. The fare from Woodburn to Lismore is 3s. 6d.? I believe it is.
1922. Your evidence, then, is to the effect that, owing to the improvements on the Richmond River bar, the Sydney traffic now comes by the Richmond boats? Yes. I can also say, from personal observation of the entrance to the Richmond, that there has been no delay whatever for the last two years.
1923. Any delay that may have occurred to the steamer would be up the river, and would not affect the passenger traffic? It would not affect the passenger traffic to the river.
1924. I should suppose, then, that, in your opinion, if the railway were constructed from Grafton to Casino, it would not attract any of the Richmond River passenger traffic? No. I do not believe there would be one passenger in twelve months who would go that way, except, perhaps, those who had business at Grafton.
1925. Or on the road? Exactly. The railway would not be used as a means of transit to Sydney. I have been travelling the district for the last thirty years, and I know the country along the proposed line between the two rivers. I was carrying the mail along that road in 1866. If the country between Casino and Grafton were anything like equal to any part of the district on this side of the river, it is only natural to suppose that it would have been settled; but though it has been open for settlement ever since the Free Selection Act was in force, people have not been able to make a living on that side of the river at all. I do not think the fact of there being a line of railway there would improve the quality of the land, and enable the people to get a living off it; consequently, there could be no settlement there of any moment. There is not an acre of land available on this side of the river that has not been taken up years and years ago. It costs people £10 an acre to clear it, and yet they can go out and make a living off it, while on the land along the Casino to Grafton road they cannot make a living off land already cleared.
1926. *Mr. McFarlane.*] You say there has been a marked increase in the passenger traffic between the Richmond and Sydney during the last few years? Yes, very marked indeed.
1927. And you gave, as a reason, that it was owing to the improved condition of the Richmond bar? Yes; on account of there being no delay—no uncertainty as to crossing the Richmond bar.
1928. What is the fare between Ballina and Sydney at the present time? £1 5s. saloon, single fare.
1929. What was it three years ago? £1 15s., as well as I can remember.
1930. Would not that reduction account for the marked increase in traffic? I think the fares have been reduced throughout on all the lines, that of the Clarence included. 1931.

1931. Is it not your experience that where there is a material reduction in fares the effect is to induce traffic? Certainly. T. Borton.
1932. Would not that, to a large extent, account for the increase in traffic between Ballina and Sydney? Not as between the two rivers. 7 Mar., 1900.
1933. Apart from that, would not that reduction of fares have a material effect in increasing the traffic? I do not think it would have very much effect.
1934. You do not think the reduction of fares would cause more people to travel? It does, as a general thing, but I think that most of the travelling public coming to the Richmond would come at any price; that is my experience of the district.
1935. Have you any knowledge of the passenger traffic between the Clarence and Sydney? None, personally.
1936. Are you aware that the reduction in fares there caused an increase of nearly 50 per cent. in the passenger traffic? The same thing would apply to this district.
1937. You said just now you did not think it would have any effect? I think it would proportionately.
1938. That is what I am asking you—whether such a substantial reduction in the fares would not have a material effect in increasing the traffic? Yes, I believe it would.

Louis O. Paulsen, master of the steamship "Tomki," sworn, and examined:—

1939. *Mr. McFarlane.*] You are master of the S.S. "Tomki," belonging to the North Coast Steam Navigation Company? Yes. L. O. Paulsen.
1940. How long have you been trading to the Richmond River? Off and on, for the last nine years, but permanently, for a little over twelve months. 7 Mar., 1900.
1941. The last twelve months? Yes.
1942. I suppose you are well acquainted with the river and the entrance? Yes.
1943. When you commenced trading here first, nine years ago, what was the condition of the entrance? It was very much inferior to its condition now. There is no comparison between its condition at the present time and what it was nine years ago.
1944. You consider it was a bad entrance nine years ago? Yes, very bad; that was before they began the breakwaters.
1945. Was the shallowness of water on the bar? Yes; on the bar and on the crossing.
1946. The bar was rather difficult to negotiate? Yes.
1947. Were there frequent delays to steamers getting in and out? Yes.
1948. That was owing to there not being sufficient water? Yes; there was too wide a spread.
1949. From that time up to the present have you noticed any marked improvement? There has been a continual improvement since the harbour works were commenced.
1950. You consider there is a marked improvement in the entrance? Yes.
1951. Do you meet with the delays now in crossing in and out that you did previously? We meet with no delays whatever. Since I have been here, during the last twelve months, I have crossed the bar at high-water, at low-water, and at any state of the tide.
1952. What depth of water does the "Tomki" draw? About 10 feet when loaded.
1953. What would be the average depth of water on the bar about nine years ago? At that time I have known it to be as low as 6 feet.
1954. I mean the average depth when it was crossable? Between 8 and 9 feet, sometimes only 7 feet. Nine years ago when I was sent here, the "Tomki" had to be taken off the line owing to insufficient water, but that state of things is altered now.
1955. What depth of water is there on the bar now? It has averaged 15 feet during the last twelve months.
1956. That would be an increased depth of between 7 and 8 feet? Yes.
1957. There is a crossing, is there not, inside the bar? Yes; but we have not had any trouble on the crossing either.
1958. An improvement has also taken place in the crossing? Yes, an equal improvement; in fact at the present time we have more water on the crossing than we have on the bar—we have about 15 or 16 feet.
1959. Captain Farrell told us the other day there was only a depth of 9 ft. 6 in. on the crossing inside the bar? There is an equal depth at the crossing and the bar. I have been coming here for twelve months, and I have had nothing less than from 10 to 12 feet on the crossing, and I have had 14 feet on it; there was a depth of 14 feet to-day. Probably Captain Farrell was speaking of some time ago.
1960. Your experience is that at the present time both the bar and the crossing are very greatly improved, and carry a depth of about 15 feet? Yes; I came in yesterday at dead low-water, drawing close on 10 feet.
1961. There are other steamers trading between the Richmond and Sydney, are there not? Yes; but the "Tomki" has the deepest draught.
1962. So that if the "Tomki" can trade here there can be no difficulty as regards the other steamers? None whatever.
1963. Leaving the entrance, are there any obstructions to navigation in the river between Lismore and the Heads? There is of course a little obstruction in some places; there are crossings here as well as in other rivers.
1964. Where would these crossings be, beginning at the Heads? We have none that we have any trouble with until we get up to Swan Bay. Of course at dead low-water you may have a little difficulty if you are drawing about 12 feet of water.
1965. Where would that difficulty be? Below Broadwater, that is the only place.
1966. How far would that be from the entrance? About 18 miles.
1967. What depth of water would there be there at low tide? At dead low-water there would be about 10 feet.
1968. Do you know what kind of bottom it is? It is a muddy bottom.
1969. It could be dredged? Yes; without any trouble.
1970. Coming further up the river, what other obstructions are there? We have not much trouble then until we get to McPherson's, about 2 miles below Swan Bay. The dredge was working there once before, I think.

- L. O. Paulsen. 1971. Is that the most serious obstruction? That is one of the worst at the present time, at low-water.
- 7 Mar., 1900. 1972. What is the depth there? I should say about 9 feet at low-water. It would carry quite that much.
1973. Then if your vessel drew 10 feet there would be some difficulty in crossing? Yes; even if we drew 9 feet there would be some difficulty, because it is very narrow. When the dredge worked there before she only got a narrow passage, not sufficiently wide for ships to get through.
1974. And with regard to other obstructions further up the river? We have none of any consequence. Of course it is a muddy bottom everywhere.
1975. Speaking generally, these obstructions between Lismore and the Heads are such as could be dredged? Yes, easily.
1976. The reason I ask is because Captain Farrell said there would be very great difficulty in removing these obstructions, as a number of them were on rocky bottom? I have no experience of that kind. There are plenty of rocks about the river, of course, pretty close to the channel, but if there were rocks actually in the channel we should not be able to negotiate it.
1977. You think that in the channel all the obstructions can be removed by dredges to a sufficient depth to enable steamers crossing the bar to navigate the river as far as Lismore? Yes, I think so. There are places in the North Arm which could be improved as well.
1978. Have you noticed in connection with your steamers a marked increase in the number of passengers between here and Sydney? Yes; there has been a wonderful increase both in passengers and cargo.
1979. What do you think has been the cause of the increase in the passenger traffic? The improvement in the bar, the regular depth of water, and the regularity observed by the steamers trading between here and Sydney. There are now three boats a week regularly, and passengers can depend upon coming and going with certainty. Except in exceptional weather, when all the northern rivers are affected, we have no difficulty in communicating with Sydney and keeping up our regular trips.
1980. What is the passenger fare between Ballina and Sydney at the present time? £2 5s. return, and 25s. single.
1981. The fare was considerably higher, was it not, a couple of years ago? Yes; there has been a reduction since the beginning of the year.
1982. Was it not the beginning of last year? No; the beginning of this year.
1983. What was it three years ago? The same as it is now; but about twelve months ago it was raised to £2 10s. Three years ago it was £3 to Lismore.
1984. Then there has been a reduction of 10s. on the return fare? Yes.
1985. In your opinion, would that reduction in fares cause an increase in the passenger traffic? No, I do not think so. It would not have anything to do with it.
1986. It would not cause people to travel more? Not to any great extent. The greatest number of people travel at Christmas-time and other holiday seasons, and then there are excursion rates.
1987. Has not that the effect of causing people to travel? Certainly.
1988. And when there is a general reduction has not that a tendency to create traffic? No doubt, as population increases in the district. I put it down to an increase of population in the district. Without the population there could not be an increase in the passenger traffic to any great extent.
1989. *Chairman.*] Has it ever been necessary in your experience, since the river has been improved, to discharge the cargo of the "Tomki" into droghers and bring it up the river? No; not since I have been in charge of her.
1990. Your practice is to load up the river and go right down to Ballina, picking up cargo on the way? Yes; going and coming I have never had to unload or do anything of the kind since I have been in charge of the "Tomki."
1991. And do you discharge as you come up the river? I discharge as I come along. I had a full ship this time—as much as I could put into her.
1992. Going down you do pick up some cargo by droghers;—that is for the convenience of the shippers, and not on account of the shallowness of the river? Exactly; we discharge our cargo at various places as we come along—a little here and a little there. The main portion of our cargo, of course, comes to Lismore.
1993. Do any of the other steamers have to discharge cargo on the river to enable them to come up? Not to my knowledge. I have never heard of their having to lighter the ship before getting up the river. The "Oakland" comes up loaded, drawing 11 feet 6 inches.
1994. *Mr. Watson*] Does she come right up the river with that draught? As far as Coraki. She does not come right up to Lismore with a full cargo. She generally brings about 200 tons up here.
1995. Could a vessel drawing 11 feet 6 inches safely come up to Lismore? She could come up here drawing 11 feet at high-water. There are places at low-water that would have to be improved; but a steamer can come up with the tide drawing from 10 feet to 10 feet 6 inches—that is, at a certain time of the tide. At low-water you could not do that. It is all right if you can use the tide—that is, up the arm.
1996. What is the difference in the flow of tide at Lismore? About 3 feet. The rise and fall is between 3 and 4 feet.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Grafton to Casino.

SECTIONAL COMMITTEE.

APPENDIX.

A.

[To Evidence of Mr. E. Ebsworth, District Surveyor, Grafton.]

SCHEDULE OF PARTICULARS OF CROWN LANDS UNDER LEASE AND LICENSE ALONG THE ROUTE OF THE PROPOSED RAILWAY.

Sir,

District Survey Office, Grafton, 15th March, 1900.

At the request of the Chairman of the Sectional Committee of Public Works, when taking evidence at Grafton from the 27th February to the 1st March, 1900, on a proposed Railway from Grafton to Casino, I have the honor to forward a Schedule (attached), giving particulars of the Crown Lands under lease and license along the proposed route.

I have, &c.,

EDWD. EBSWORTH,
District Surveyor.

The Secretary, Public Works Committee.

SCHEDULE of lands shown on map laid before Sectional Public Works Committee at Grafton, of lands along the route of the proposed Railway from Grafton to Casino, held under occupation licenses and annual leases.

Occupation Licenses.

No. of Licenses.	Area under License.	Rentals.	
		Average per section of 640 acres.	Total.
35	acres. 351,864	s. d. 14 11 (0.28d. per acre.)	£ s. d. 408 14 6

Annual Leases.

No. of Leases.	Area under Lease.	Rentals.	
		Average per acre.	Total.
178	acres. 125,695	d. 1½	£ s. d. 790 6 10

The rents for these lands are very low in each class of holding under present conditions. The reasons for these low rents are—

That the land is heavily timbered generally with growing trees, and includes several forest reserves.

The lands are held by a few holders, principally the original lessees of Camira, Wooroooolgan, Bungawalbyn, and Southgate former pastoral holdings, who do not compete against each other when tendering for these leases.

These holders require the grass mainly to rear cattle, which they fatten on other properties for market.

That the tenures are not secure enough to encourage ringbarking and suckering where now allowable.

That the country is always understocked; and the prevailing native blady grass, though nutritious when kept short, quickly outgrows its present capability of being eaten down, and becomes long and coarse, in which state no beast will eat it. It is the practice, if possible, to annually burn this long grass, but it is usually too green to do so, except after an occasional touch of frost in winter.

That better tenures cannot be given to the present lessees, as it is known the lands will be wanted during the next few years for close settlement in dairy farms and cultivation.

Much better rents are obtainable by the Crown for the same class of forest lands in areas of from 40 to 320 acres, where they are becoming tried for dairying, near the Clarence River, under longer tenures, as special leases of from five to seven years, the rents ranging from 6d. to 1s. 9d. per acre, according to position, with compulsory conditions also of ringbarking, fencing, and sowing additional grasses—improvements to revert to Crown at termination of leases.

An example of the present value of private land for dairy use, 4 miles from Grafton, being a subdivision of portion 83, parish of Great Marlow, intersected by the Grafton-Casino Road and proposed Railway, is furnished on an accompanying plan of Mount Edgcombe Estate. Of this subdivision, lots 7, 8, 9, 10, and 11 (ringbarked forest ridge land), compare in quality of soil and everything else but position to Duggan's land in the parish of Southgate, viewed by the Sectional Committee. These lots were purchased in 1899 to make a dairy farm at a price equal to £3 per acre unimproved.

EDWD. EBSWORTH,
District Surveyor.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PARLIAMENTARY STANDING COMMITTEE ON
PUBLIC WORKS.

REPORT

TOGETHER WITH

MINUTES OF EVIDENCE

RELATING TO THE

PROPOSED RAILWAY

FROM

WELLINGTON TO WERRIS CREEK.

Presented to Parliament in accordance with the provisions of the Public Works Act,
51 Vic. No. 37.

Printed under No. 10 Report from Printing Committee, 30 August, 1900.

SYDNEY: WILLIAM APPELGATE GULLICK, GOVERNMENT PRINTER.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

- * The Honorable ANDREW GARRAN, LL.D., Vice-Chairman.
- * The Honorable WILLIAM JOSEPH TRICKETT.
The Honorable PATRICK LINDESAY CRAWFORD SHEPHERD.
- * The Honorable SOLOMON HERBERT HYAM.

LEGISLATIVE ASSEMBLY.

- * WILLIAM THOMAS DICK, Esquire, Chairman.
JOHN CHRISTIAN WATSON, Esquire.
ROBERT HENRY LEVIEN, Esquire.
JOHN MCFARLANE, Esquire.

[* On the 14th June, 1900, The Honorable WILLIAM JOSEPH TRICKETT having accepted the office of Chairman of Committees of the Legislative Council, retired from the position of Chairman, and a Member of the Committee, Mr. WILLIAM THOMAS DICK, Vice-Chairman, was elected Chairman in the place of Mr. TRICKETT, and The Honorable ANDREW GARRAN was chosen as Vice-Chairman. On 4th July, The Honorable SOLOMON HERBERT HYAM was elected to the vacancy on the Committee caused by the resignation of Mr. TRICKETT.]

GENERAL INDEX.

Report.
Minutes of Evidence.

LIST OF WITNESSES.

	PAGE.
Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works.....	1-6, 18, 146-148
Hugh McLachlan, Secretary to the Railway Commissioners.....	7-11
John Harper, Chief Traffic Manager, Department of Railways.....	11-17
Roger Taylor Burton Gaden, grazier and farmer, and President of the Railway League, Wellington.....	18-21
Stanley Septimus Lowe, farmer and grazier, Spicer's Creek.....	21-22
Alexander Ross, farmer, Spicer's Creek.....	23-24
William Smith, junr., farmer and grazier, Mitchell's Creek, and Chairman of the Bodangora Progress Committee.....	24-25
Donald Ross, farmer and grazier, Spicer's Creek.....	26
John McLean, farmer and grazier, near Cobborah.....	26-27
Robert Patten, farmer and grazier, Comobella, near Wellington.....	28
Thomas Quirk, farmer, grazier and flour-mill owner, Gladstone.....	28-29
John Perry, farmer and grazier, Walhallow.....	29-32, 43-44
Murdoch McLeod, miller, Wellington.....	32
Lachlan McAlister, farmer, Wellington.....	33
Robert Porter, newspaper proprietor, and Secretary, Railway League, Wellington.....	33-34
Walter Prideaux Pridham, auctioneer and stock and station agent, Wellington.....	34-35
John Irving, auctioneer and land agent, Wellington.....	35-36
Charles George Scott, storekeeper, Wellington.....	36
Frederick James Rodda, farmer and commission agent, Wellington.....	36-37
Frederick Henry Kennard, Mayor of Wellington.....	37-38
Charles Hampden Darton, Manager of the Wellington Branch of the Commercial Banking Company of Sydney.....	38-39
William Patrick Mitchell, stock and station agent.....	39-40
James Bonnor, general merchant, Orange.....	40-41
James Stuart Leeds, stock and station agent, Orange.....	41-42
George Hawke, farmer, Orange.....	42
Joseph Aarons, farmer and grazier, Wellington.....	42-43
James Andrew Ryan, Mayor of Dubbo.....	44-45

	PAGE.
John Miller, station manager, Murrungundy	46-47
William Henry Baker, station manager, Barbegal	47
Edwin Henry Utley, ex-Mayor of Dubbo.....	48-49
William Webb Baird, farmer and grazier, Cootha	49-50
Craven Hyde Fitzhardinge, solicitor, Dubbo	50-51
Roderick Baylis Mackenzie, Acting District Surveyor, Dubbo	51-52
Richard McGee, railway station-master, Dubbo.....	52-53
William Mortimer Beckles Dayrell, manager, Dubbo, Flour-milling Company	53
James Charles Tibbits, farmer, Myton Fields	53-54
James Heane, stock and station agent, Dubbo	54-55
Charles Cadell, stock and station agent, Dubbo	55
Jacob Matthews, Mayor of Peak Hill	56-57
John Dight Mackay, pastoralist, Bulgandramine	57-58
Thomas Bridle, farmer and grazier, Peak Hill	58-59
Robert George Dulhunty, Inspector of Stock, Dubbo	60
William Handover, produce merchant and timber contractor, Dubbo	60
George Paterson, farmer, Bonny Plain, near Cobborah.....	60-61
Thomas Paterson Yeo, farmer and grazier, Elong Elong, near Murrungundy.....	61-62
Francis Scheibel, senior-constable, Cobborah	62
James Bell, farmer and grazier, Narran, near Cobborah	62-63
Alexander Douglas, grazier, Bomely, near Murrungundy.....	63
Thomas Holden Richard Preston, first-class constable, Coolah	63-64
John William Swanston, station manager, Booyamuirra	64-65
Hugh McMaster Kennedy, station manager, Old Coolah	65
Thomas Regan, station overseer, Coolah	65-66
Francis John Piper, grazier, Coolah	66
David James Watt, grazier, Ullinda	66-68
Frank John Shepherd, grazier and farmer, Mooren	68-69
Robert Beames, farmer and grazier, Binnaway	69-70
Samuel George Scheumack, farmer, Binnaway	70-71
Charles Naseby McWhirter, hotelkeeper, Binnaway.....	71
Kenneth Murchison, journalist, and a member of the Local Land Board, Coonabarabran	71-73
Robert Neilson, storekeeper and miller, Coonabarabran	74
Richard Johnstone Parker, manager of the Australian Joint Stock Bank, Coonabarabran	74-75
William Nash, grazier, Gorah	75-76
Frederick George Failes, M.R.C.S., Eng., Coonabarabran	76-77
George Edgar Wright, road superintendent, Coonabarabran	77-78
Alexander Deans, butcher, Coonabarabran	78-79
John Henderson, grazier, Ullman	79-80
Nelson John Proctor, grazier, Coonabarabran	80-81
Edward May-Steers, Inspector of Stock, Coonabarabran	81-82
John Taylor, farmer and carrier	82-83
Thomas Deans, farmer and grazier, Coonabarabran	83-84
James Mair Alison, grazier, Oakey Creek.....	84-85
John McMaster, grazier, Binnia	85-86
Donald McGillivray, station manager, Bomera	87-89
Charles John Smith, farmer and grazier, Tambar Springs	89
Frederick John Turner, farmer, grazier, and storekeeper, Tambar Springs	90
James Nicholas O'Rourke, farmer and grazier, Tambar Springs	90-91
Hugh McMaster, grazier, Rockgedgiel	91-93
Thomas James Finley, junr., Bundella	93-94
Thomas Davidson, farmer, Merrigala.....	94-95
Robert Thomas Slack Smith, station manager, Merrigala Holding.....	95
Edward Hayden, farmer, "The Plantation"	95-96
Richard John Stevenson, grazier, Brennan's Gap	96
Boyd Peter Sievers, grazier, Brennan's Gap.....	96-97
Richard Curtis, farmer and grazier, Brennan's Gap	97
John Ewbank, grazier and storekeeper, Bundella	97
Thomas Woore Frederick Bushy, grazier, Colly Bluc	98-99
Alexander Pyke, farmer, Yarraman	99-100
Francis Lord, farmer, Spring Ridge	100-101
Francis William Darby, grazier and farmer, Coolanbilla	101
William Douglas Simson, grazier, Trinkey	101-102
George Clift, grazier, Breeza	102-103
Archibald Campbell, grazier, Spring Ridge	103-104
Richard Kingston, farmer, Spring Ridge	104
David Lawrence, saw-miller, Spring Ridge	104-105
Charles Binnie, grazier, Spring Ridge	105-109
Samuel Clift, pastoralist, East Maitland	110-111

	PAGE.
James Scott, farmer, Terrible Vale	111-112
Michael Joseph Daly, farmer and grazier, Currabubula	112
Michael Henry Ryan, grazier, Walhallow	112-113
Henry Thomas Lucerne, butcher and stock-dealer, Werris Creek	113-114
Alexander Matheson, farmer, and Mayor of Tamworth	114-115
William Silver, engineer and saw-miller, Tamworth	115-116
Charles Wane, manager for Budge & Co., timber merchants	116
Alexander Johnson, auctioneer, Tamworth and Scone	116-117
Henry Charles Ison, builder, Tamworth	117-118
Henry Light Cousins, stock and station agent, Tamworth	118-119
Francis Wyndham, auctioneer and stock and station agent, Tamworth	119-120
Charles Graham Wilson, Esq., M.P.	120-121
William Cyril Higinbotham, farmer and storekeeper, Armidale.....	121-122
Richard Wearne Nicholas, farmer and grazier, Tilbuster, near Armidale.....	122-123
John Cameron, farmer and grazier, Morden, Saumarez Creek, near Armidale.....	124
Joseph Monteith, farmer, Guyra.....	125-126
George Hargrave, farmer, Armidale	126
Richard Pearson, produce merchant, Guyra.....	126-127
Michael John Walsh, storekeeper, Walcha	127
Robert Brown, pastoralist, Aberhaldie, near Walcha.....	128-129
Edwin Parsons, grazier, Ellershe, near Guyra.....	129
Joseph Scholes, farmer and fruit-grower, Armidale	129-130
George Wigan, M.D., honorary treasurer, Armidale Proprietary School	130
Russell Blaxland, stock and station agent, Armidale.....	130-131
George Smith, mining manager, Hillgrove	131
Sydney Henry Wickerson, journalist, and Secretary Railway League, Armidale	131
Thomas Henry Hall Goodwin, Esq., M.P.	132-133
John Joseph Poole, grazier, farmer and coal-mine manager, Curlewis	133-135, 161
Frederick James Young, farmer, Curlewis	135-136
George Henry Peard, farmer, Curlewis	136-137
Alfred Arthur Mudie, commission agent and Secretary Gilgandra Railway League, Gilgandra	137-138
Arthur Frederick Garling, storekeeper, Gilgandra	138-139
Archibald Campbell Berry, senior-constable, and Acting Clerk of Petty Sessions, Gilgandra	139
Richard Gwarc Hitchen, farmer and grazier, near Gilgandra	139-140
Charles Lancelot Garland, mining expert.....	140-144
Charles Edward Rennie, Chief Draftsman, Department of Lands	145
Henry Chamberlaine Russell, C.M.G., Government Astronomer	148-149
Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works	149-150
John Haynes, Esq., M.P.....	151-156
John Connelly, storekeeper, Wellington	157
Robert Edward Jones, M.L.C.E., District Engineer, Roads Branch, Department of Public Works	157-161
William Henry Hall, Sub-editor, Statistical Year Books, Government Statistician's Department	161-163
The Hon. Francis Bathurst Suttor, M.L.C.	163-167
Alexander Wilson, stock and station agent	168-172
George Charles Yeo, draftsman, Stock Branch, Department of Mines and Agriculture	172-173
Simcon Phillips, Esq., M.P.	173-175
Thomas Brown, Esq., M.P.....	175-179

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM WELLINGTON TO WERRIS CREEK.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred, for consideration and report, the expediency of constructing a line of Railway from Wellington to Werris Creek, have, after due inquiry, resolved that it is not expedient the proposed railway should be constructed; and, in accordance with the provisions of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

REASONS ADVANCED FOR THE PROPOSED RAILWAY.

1. The question of connecting the northern and western railway systems of the Colony by means of a cross-country line has, according to the official statement put before the Committee, been discussed for many years past, the reasons advanced in support of its construction being that such a line, besides effecting a complete connection of the railway systems west of the dividing range, would afford facilities for speedier intercommunication between the northern, western, and southern main trunk lines, be a good stock-carrying line, by providing a means for the transference of starving stock from the western plains to New England and adjoining districts, open up to New England farmers a market in the dry west for all kinds of produce, be a line of military and strategic value by greatly aiding, should occasion arise, in the transport of troops to and from any part of New South Wales or the other colonies, preserve intact the continuity of the Colony's railway system in the event of the Hawkesbury Bridge being damaged or rendered uncrossable, and shorten the journey between Brisbane and Melbourne by about 100 miles, and, if the Cobar line were carried on to Broken Hill, that between Brisbane and Adelaide by about 320 miles.

POINTS OF JUNCTION ORIGINALLY PROPOSED.

2. The originally proposed points of junction with the western and northern railway systems were Dubbo and Werris Creek, Dubbo affording a more direct route for extending the line further south towards Parkes and Young. The proposal to make Wellington the junctioning point was brought before the Department of Public Works in 1890, when it was urged that by starting from Wellington the line would serve better country, and pass through more settlement than would be the case by going from Dubbo. The routes differ only for a distance of 30 miles, as far as Murrungundy; from that point they are identical.

DESCRIPTION

DESCRIPTION OF THE PROPOSED RAILWAY.

3. The proposed railway would be 159 miles 27 chains in length. Leaving the Great Western Railway at about $2\frac{1}{4}$ miles north of Wellington Station, the route proceeds nearly north to the Talbragar River, the valley of which it follows, in a north-easterly direction, to a point about 46 miles from Wellington. Cobborah is left to the south-east, at a distance of about 10 miles from the line. Thence the route is northerly to the neighbourhood of Mundooran, where the valley of the Castlereagh River is followed north-westerly for about 15 miles, and more easterly to the point where it crosses the ridge between the counties of Napier and Pottinger. The spurs of the Liverpool Range are then skirted, and the general direction maintained to the crossing of Werris Creek and the junction with the north-western line about 5 miles west of Werris Creek Station. The works are described as moderate in character, no large rivers having to be bridged; but a considerable extent of the country through which the route passes is undulating. The ruling gradient is 1 in 75, and the sharpest curve 15 chains radius.

ESTIMATED COST.

4. The estimated cost of the line, calculated at the present price for rails, £7 10s. a ton, is £511,149, or £3,207 18s. 3d. per mile.

RAILWAY COMMISSIONERS' REPORT.

5. The Railway Commissioners, in their report upon the proposal, say they are unable to recommend the construction of the line. The annual cost, calculating the interest on capital expenditure at 3 per cent., and maintenance and locomotive expenses on the basis of a tri-weekly train service, is given as £26,954, and the traffic revenue, based upon local rates for all traffic except live stock, as £8,586, which leaves an estimated annual loss of £18,368. In their opinion there is no immediate prospect of the line paying working expenses, nor reasonable ground for assuming that it would materially increase the volume of traffic. A better method for a more direct and speedy means of transporting stock in times of drought, and one that would serve the best interests of pastoralists and the country generally, when the time comes for the construction of such a line, would be, they say, to make a connection between Brewarrina (to which place a railway is now being constructed from Byrock) and the Collarendabri district.

THE COMMITTEE'S INQUIRY.

6. The Committee have inquired very fully respecting the proposed railway—the necessary official witnesses having been examined in Sydney, the country along the route inspected, and evidence taken at various places.

As it was considered advisable that as many of the Committee as could make it convenient should go over the route, four members left Sydney for that purpose on 27th April, and the inquiry in the country was opened at Wellington, where not only residents of that town and district, but also witnesses from Spicer's Creek, Mitchell's Creek, and Orange were examined. The following day it was continued at Dubbo, at which town it was directed chiefly to the question of making Dubbo the point of connection with the Great Western Railway in preference to Wellington; but the evidence there included also representations from the district of Peak Hill in advocacy of a line from Narramine, through Tomingley and Peak Hill, to Parkes or Forbes.

From Dubbo the Committee returned to Wellington, and thence, accompanied by an additional member, and by an engineer from the Railway Construction Branch, Department of Public Works, they proceeded to inspect the route of the railway and to take further evidence.

Travelling by way of Mitchell's and Spicer's Creeks they reached Murrungundy, the point near which the routes from Wellington and Dubbo converge, and thence proceeded to Cobborah, and from Cobborah to Coolah, *via* Leadville.

Leadville. Leaving Coolah, the Committee, taking the main road to Gunnedah, passing Queensborough and Binnia, and then branching off on the road to Coonabarabran, went direct to Weetalibah—which is on the railway route—and on to Ulinda and Binnaway.

From Binnaway the Committee proceeded to Coonabarabran, which, being an important town closely interested in the question of railway construction through the country in its vicinity, was regarded as a place that should not be overlooked in the inquiry. The townspeople were found somewhat apathetic in the matter—chiefly for the reason, as they explained, that their past efforts towards obtaining railway communication, though long sustained, had been so unsuccessful that they regarded the prospect of obtaining railway facilities as almost hopeless. The construction of the railway from Dubbo to Coonamble they considered to be a serious blow to their interests, inasmuch as Coonamble being their principal market for flour they would have Dubbo as a competitor, that town having the advantage of the railway, while Coonabarabran would be handicapped by a road journey of 60 miles. In view of this they now desire railway communication which will enable them to find a market at Newcastle, and urge the construction of a line from Coonabarabran to connect with the proposed Wellington to Werris Creek railway at Bomera, about 60 miles from Werris Creek.

Coonabarabran was left for Bundella, on the route of the railway, the Committee travelling *via* Binnaway, Ulinda, and Weetalibah, and taking evidence on the way at Weetalibah Homestead, and at the Flags, Bomera. From Bundella they proceeded to Colly Blue, Spring Ridge, and Werris Creek, evidence being taken at each place.

Werris Creek, though the terminus of the proposed line and the point for junctioning with the Great Northern Railway, is not the place through which the trade of the country along and in the vicinity of the route of the Wellington-Werris Creek line, and within reach of the Great Northern Railway, passes. That position is held by Quirindi, and in view of this the Committee deemed it advisable to visit Quirindi and examine witnesses there. They, therefore, at the conclusion of the Werris Creek evidence, left by train for Quirindi, arriving there the same morning; but on interviewing the Mayor of Quirindi and others, it was found that no evidence was forthcoming.

Meantime the Committee had received a telegram, and subsequently a letter, from the Council Clerk, Tamworth, asking them to visit Tamworth, and take evidence respecting the proposed railway, as a number of witnesses desired to be examined there. A reply was telegraphed that the Committee would be prepared to hear the evidence at Werris Creek or Quirindi; but in view of no witnesses appearing at Quirindi, the Committee went to Tamworth in the afternoon of the day upon which they visited Quirindi, and the following day examined seven witnesses.

The next day the Committee continued their inquiry at Armidale, to which place they had been urged to go, as twelve witnesses connected with the town and district, in addition to delegates from Inverell, Tenterfield, and Glen Innes, all representing the Farmers and Settlers' Association, were anxious to give evidence. To the first communication received on the subject the hon. secretary of the association was informed that the Committee could not visit Armidale, but would be prepared to examine the witnesses at Quirindi. Another letter, however, represented that the expense of sending delegates to Quirindi would be very heavy, and very probably would prevent Tenterfield, Glen Innes, or Inverell from sending representatives; and the Committee, reconsidering the matter, and finding that a visit to Armidale need not occupy more than one day, went there, and took evidence from fifteen witnesses. Arriving at Armidale on the morning of the 16th May, they left the same night for Curlewis, where four other witnesses were examined, principally with reference to an alternative line from Curlewis to Gilgandra; and the inquiry relating to the proposed railway was closed until the 2nd June, when evidence was taken at Gilgandra. Subsequently some witnesses were examined in Sydney.

AN ALTERNATIVE LINE FROM CURLEWIS TO GILGANDRA.

7. The alternative line from Curlewis to Gilgandra was suggested by one of the witnesses examined in a previous inquiry, and, afterwards, at the Committee's request, investigated to a certain extent by the Engineer-in-Chief for Railway Construction, and the Chief Railway Traffic Manager. From the report of the engineer sent over the route to make an exploration, it will be seen that a fairly easy line, with a grade of 1 in 60, or possibly better, could be obtained, through country "eminently adapted for farming purposes," and at a cost per mile not much greater than the estimate in connection with the Wellington to Werris Creek route. By the alternative route there would be 38 miles less of new line to construct. The traffic prospects also favourably compare with those connected with the line referred to the Committee.

TRAFFIC PROSPECTS OF THE LINE.

8. In his report upon the traffic prospects of the proposed line, the Chief Traffic Manager of the Railway Department points out that though the line would serve several townships, at varying distances, there is no large settlement on the route. Mundooran would be at a distance of 3 miles from the line; Cobborah, 9 miles; Leadville, 20 miles; Coolah, 17 miles; and Coonabarabran, 25 miles. Dealing with the known traffic coming from the district through which the line would pass, as it exists to-day, and allowing a margin for development, the following estimate is given, assuming that local rates would be charged on wool, goods, and wheat:—

Wool, goods and wheat	£4,821
Passenger traffic	1,195
Parcels, &c.	350
Mails, 160 miles, at £12 per mile	1,920
Add, to meet expected traffic	300
Total	£8,586

If, as is usual in such cases, an extension of the through rates were applied to wool, general goods, and wheat, the estimate would be:—

Wool, goods and wheat	£2,871
Passenger traffic	1,195
Parcels, &c.	350
Mails, as above	1,920
Total	£6,336

If local rates were charged in the case of wool and general goods, the Chief Traffic Manager states, the disposition would be on certain sections of the line to continue forwarding to existing railway stations by road, and he is doubtful whether local rates could be maintained. The estimated annual cost to be set against the above estimates would be £26,954.

CHARACTER OF THE LAND ALONG THE ROUTE.

9. There is a considerable quantity of good land along the route, but most of it is alienated. The Crown land available for settlement is generally of an inferior description. From information placed before the Committee, it appears that the total quantity of alienated land within the trafficable area of the line is 1,134,450 acres, in addition to which there are 248,000 acres of settlement leases, 393,400 acres of reserves, and 907,200 acres of Crown land. Of the Crown land, the leasehold areas expiring in 1900 amount to 223,700 acres, there are 373,500 acres representing occupation licenses, 310,000 are untenanted, and 184,400 acres consist of land designed for settlement. The population estimate of the district is, in round numbers, 8,000, and the stock, taking the figures for 1899, number 769,219 sheep, and 9,243 cattle.

RESULT

RESULT OF THE INQUIRY.

10. What the Committee saw of the country, and most of the evidence given, were not favourable to the construction of the railway.

At Wellington it was contended that the country between that town and Murrungundy, the point at which the routes from Wellington and Mudgee converge, was far superior to that on the route to Murrungundy from Dubbo, and from what the Committee saw on their journey from Wellington, and what was seen during their inspection of the country from Dubbo to Mundooran when considering the line from Dubbo to Coonamble, it seems clear to them that so far as relates to the nature and capabilities of the soil, there is somewhat more to be said in favour of Wellington as the point from which the proposed line should be constructed than can be said for Dubbo. Much of the land, however, between Wellington and Murrungundy is already within reach of the Great Western Railway, and the same may be said of the land on the route to that point from Dubbo. Regarding the other matter for consideration in dealing with the rival claims of Wellington and Dubbo—that is, the best point of connection with the Western Railway, if the line from Werris Creek should in the future be continued southwards towards Parkes and Young,—the Committee consider that there is no need to express any opinion as they do not recommend at present the construction of a cross-country line.

For about 16 miles from Wellington most of the land in the vicinity of the route is under cultivation, and about the same distance from Werris Creek there is a considerable quantity of land under the plough; but, along the route generally, the land is used for pastoral purposes, most of it being included in a few large estates consisting chiefly of purchased land.

It was stated in the course of the inquiry that, if the railway were constructed, three or four times the quantity of land now under cultivation would be put under crop, as the railway would enable land to be utilised which could not be dealt with under present circumstances.

Cobborah farmers favour the Wellington route, and urge that it is difficult to grow wheat in competition with those possessed of railway facilities. Farmers to the east of Cobborah now send their wheat to Mudgee, a distance of 50 miles, and those to the west send it to Dubbo. Around Coolah township, which is about 17 miles from the surveyed route for the railway, not much land is cultivated, but in the district, taking the counties of Lincoln and Napier, there are about 17,000 or 18,000 acres under crop.

All but one station-owner beyond Coolah expressed themselves in favour of the railway, and stated that the progress of the district—especially in farming—had been greatly retarded by the want of such a means of communication, but they were not to any extent disposed to contribute in the form of a special tax towards meeting the estimated loss in connection with the line.

THE ALLEGED SPECIAL ADVANTAGES FROM THE RAILWAY.

11. With reference to the special advantages mentioned in the official statement as having been urged in support of the construction of the line, the evidence points to the following conclusions:—

Connecting the Railway Systems.—Except for the interchange of rolling stock between the western and north-western districts, which would be an exceptional thing, the railway authorities do not see any advantage from a railway point of view in connecting the two systems. Nor would a further connection between the western line and Parkes or Forbes be, in their opinion, of any consequence in regard to traffic. The interchange of traffic between the north and the west, by this cross-country line, would be comparatively limited; the railway traffic generally is to and from the coast,—not intra-provincial.

Carriage of Stock.—As for the railway being a good stock-carrying line, the railway officers do not consider there is sufficient reason on this ground to justify its construction. The movements of stock from the north and north-west in

times of drought are towards the south-east, or practically from west to east, at right angles to the proposed line. It is admitted that the railway might afford a certain measure of relief in connection with starving stock, but not to an extent that would make such a thing important from a railway point of view. Fat stock would probably continue to go to Morpeth and Newcastle, the Aberdeen Meat Works, and Sydney.

A Western Market for Northern Produce.—The prospect of the farmers between Wellington and Werris Creek, and further north, finding, by means of the proposed line, a market for their produce in the west, is not a very attractive one, inasmuch as produce sent in this direction would have to compete with that grown in the agricultural centres along the western line from Orange to Narramine.

Military value of the line.—The alleged military and strategic value of the line may be a matter of some importance, but, in the opinion of the Committee, the consideration of a question of that kind, as a special reason for the construction of a cross-country railway, is premature.

Shortening the journey to Melbourne and Adelaide.—With regard to shortening the journey between Brisbane and Melbourne, and Brisbane and Adelaide, as, according to a statement by the Secretary to the Railway Commissioners, the trains on the proposed line would be of a mixed description, the traffic estimate of the Commissioners being based on three trains a week, it is hardly likely that anyone would travel by this line such long distances as those involved in the journey to the southern capitals. The traffic now between Brisbane and Melbourne is very limited, but whatever it might be people would naturally travel by the quick trains, and these would not run between Werris Creek and Wellington.

THE BLAYNEY-HARDEN CROSS-COUNTRY RAILWAY.

12. The line from Blayney to Harden is a cross-country line, with some features in common with the proposed railway. This line, the railway authorities say, has never been a paying one; last year the loss in working expenses and interest amounted to, practically, £42,000. Yet it goes through a fair area of good country, and through a much more thickly populated district than that through which the Wellington to Werris Creek line would pass, there being, for instance, on the route, the towns of Carcoar, Cowra, and Young. It was stated, on behalf of the Railway Commissioners, that if the proposed line would develop new country, and bring business on to the existing lines, they would not object to a temporary loss, but of this they see no prospect.

CONCLUSION ARRIVED AT.

13. From the evidence, and their inspection of the country along the route, the Committee have arrived at the conclusion that it is not expedient the proposed railway should be constructed. Except within a few miles of either end of the route (which areas are already served by railways), the country is very sparsely populated, and though the construction of the line would probably increase the amount of agricultural production, and, perhaps settlement, in the district, it does not appear that the extent of the increase would be very material. An immediate and large increase in agriculture, as the result of constructing a railway, is advanced as a reason in support of such proposed works in every inquiry carried out by the Committee, and yet nothing is more evident, in relation to railways already constructed, than the many miles of splendid agricultural land traversed by them which has never been touched by the plough. The Wellington to Werris Creek proposal exhibits the additional disadvantage of having but very little land along the route, outside the large private estates in the district, that is suitable for agriculture. From the partial inquiry already made, the alternative line between Gilgandra and Curlewis would appear to be worthy of investigation whenever the policy of a cross-country line is again considered. Much of the country through which the proposed line would pass, including the mining district of Leadville, would be better served by a railway suggested by the Committee in their report upon
the

the railway from Dubbo to Coonamble, and regarded favourably in the district, viz., from Mudgee to the country east of Cobborah, in the direction of Dunedoo, and on towards Caigan, eventually continuing northwards in the direction of Coonabarabran.

While, however, the Committee are not disposed to recommend the construction of the proposed railway, they desire to draw attention to the condition of the roads in the district, which, to a considerable extent—especially in the vicinity of Spring Ridge, Werris Creek, and Quirindi—are in a state of disrepair, and which, in the absence of a railway, should receive attention in order to provide the settlers with a fair means for getting their produce to market.

RESOLUTION PASSED.

14. The following extract from the Minutes of Proceedings shows the resolution passed by the Committee:—

Mr. McFarlane moved,—“That, in the opinion of the Committee, it is not expedient the proposed railway from Wellington to Werris Creek, as referred to the Committee by the Legislative Assembly, be carried out.”

The motion was seconded by Mr. Watson, and passed.

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
24th August, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM WELLINGTON TO WERRIS CREEK.

WEDNESDAY, 18 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Wellington to Werris Creek.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Do you produce a statement, giving particulars of this proposal? Yes. It is as follows:—

H. Deane.
18 April, 1900.

RAILWAY FROM WELLINGTON TO WERRIS CREEK.

THE proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration on 12th December, 1899, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Wellington to Werris Creek."

The question of connecting the Northern and Western railway systems by means of a cross-country line has been discussed for many years past, and there is no doubt there has existed a widely expressed opinion in favour of the connection being effected. The originally proposed points of junction were at Werris Creek on the Northern line and at Dubbo on the Western line.

The proposal to make the junctioning station on the Western line at Wellington in place of Dubbo was first prominently brought before the Department in July, 1890, when a deputation representing the Wellington district waited on Mr. Secretary Bruce Smith, and indicated certain advantages attaching to the Wellington route over that from Dubbo, asserting, *inter alia*, that the line from Wellington would serve better country and pass through more settlement than the Dubbo rival route.

The respective lengths of the two routes are:—

Wellington-Werris Creek.....	159 miles 27 chains.
Dubbo-Werris Creek.....	157 " 35 "

With the exception of about 30 miles at the western end the routes are one and the same.

It will thus be seen that the present proposal is, for all practical purposes, the same as the Dubbo route, differing only as to the junctioning point. So far as the commercial and industrial aspects are concerned, all arguments advanced for or against the one route may be equally applied to the other.

It is claimed that special advantages will be gained by the construction of such a cross-country line. These may be briefly stated as follows:—

- (1) The line will make a complete connection of the whole railway system of the Colony west of the Dividing Range.
- (2) It will afford facilities for speedier inter-communication between the Northern, Western, and Southern main trunk lines, and will, therefore, tend to create increased traffic.
- (3) It will be a good stock-carrying line, and in times of drought will provide a ready means for the transference of starving stock from the western plains to New England and adjoining districts where the seasons seldom fail; on the other hand, in the great dry West there is often a good market for all sorts of produce which at present, in the absence of such a line, is closed to the farmers of the district mentioned.
- (4) Its military and strategic value as a connecting line will be considerable. It will greatly aid, should occasion arise, in the transport of troops to and from any part of New South Wales or the other colonies.
- (5) In the event of the Hawkesbury bridge being damaged or rendered uncrossable, such a line will be found most useful in preserving intact the continuity of the Colony's railway system.
- (6) The construction of this line will shorten the journey between Brisbane and Melbourne by some 100 miles, and assuming the Cobarr line was carried on to Broken Hill, it will effect a saving of about 320 miles between Brisbane and Adelaide.

H. Deane.
18 April, 1900.

The Railway Commissioners have reported on the proposed line in accordance with the provisions of the Public Works Act. Their report, which does not favour the construction of the line, is as follows:—

Proposed Line of Railway, Werris Creek, Wellington—160 miles.

In accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as follows:—

<i>Cost of Construction—</i>		
Estimate of Engineer-in-Chief for Construction (exclusive of land and compensation)	£511,149	
<i>Annual Cost—</i>		
Interest on capital outlay at 3 per cent.	£15,336	
Cost of maintenance, and traffic and locomotive expenses ...	£11,618	
		Total annual cost
		£26,954
<i>Traffic Revenue Estimate—</i>		
Merchandise and live stock	£4,820	
Passenger, parcels, and mails.....	3,766	
		Total estimated traffic
		£8,586

The revenue estimate is based upon local rates being charged for all traffic except live stock, and that of expenditure upon a tri-weekly train service.

There is no immediate prospect of the proposed line paying working expenses, nor is there, in our opinion, any reasonable ground for the assumption that the construction of the line would materially increase the volume of traffic.

We are unable, therefore, to recommend its construction.

It is assumed that, in the proposal to connect the Northern and Western lines by a cross-country railway, an important object is to afford a more direct and speedy means of transporting stock in times of drought, and if that be so we venture respectfully to suggest that, when the time comes for the construction of such a line, the best interests of the pastoralists and of the country generally will be served by making the connection between Brewarrina—to which place a line is now under construction—and the Collareubabri district, which we are recommending in another report should be connected with Narrabri.

The following is the official description of the proposed line:—

Length, 159 miles 27·179 chains; estimated cost, £511,149, or £3,208 per mile, exclusive of land and compensation.

This line begins about 2½ miles north of Wellington Station on the Great Western Railway at 249 miles 60 chains from Sydney, and proceeds nearly north to the Talbragar River, which it strikes at about the 280th mile. The line then follows up the Talbragar River Valley north-easterly to about 296 miles, leaving Cobborah to the south, thence the line is northerly to the neighbourhood of Mundooran, where the Castlereagh River Valley is followed north-westerly for about 15 miles. A more easterly direction is then taken, crossing the ridge between the counties of Napier and Pottinger, near 350 miles; the spurs of the Liverpool Range are then skirted, and the general direction is maintained through to the crossing of Werris Creek, and to the junction with the North-western line at 409 miles 7·179 chains, about 5 miles west of Werris Creek junction with the Great Northern line.

The works are moderate in character, no large rivers having to be bridged, but there is a considerable length of the line on which the country traversed is undulating in character.

The ruling gradient is 1 in 75, and the sharpest curve is 15 chains radius.

With the rails at £5 5s. per ton delivered in the Colony the cost is £2,963 18s. 6d. per mile. But these rates have been revised. The rails are £7 10s. per ton, so that the cost per mile comes to £3,208 as given in the statement which I have just read.

2. Will you give us your usual detailed description of the cost? Yes. Before I read that I wish to say that I hand in a book of reference and a section of the line in two parts and a compilation of county maps showing the position of the line. The estimate for this line is divided into three parts, the first part being about 29 miles in length, the second part 87 miles, and the third part 43 miles, making a total of 159 miles.

WELLINGTON TO WERRIS CREEK.

Revised Survey.—Part No. 1.

ESTIMATED cost of a single line of railway 29 miles 23·18 chains in length, with 60-lb. rails. Ruling grade 1 in 75. Sharpest curve, 15 chains radius.

- H. Deane. These three parts added together, as shown in the statement, gave a total of 159 miles 27·18 chains. It is stated that the Dubbo connection will cost from £5,000 to £6,000 more than the Wellington connection.*
- 18 April, 1900.
3. That extra cost occurs between Dubbo and 29-mile point at Sandy Creek? Yes. The rest is common to the two.
 4. Can you tell us how it is that although the Dubbo to Werris Creek connection is 2 miles shorter than the Wellington to Werris Creek route, the expense of that line is so much greater? It is a little rougher. The earthworks are heavier. I will submit the details.
 5. *Mr. Watson.*] Does not the item for engineering contingencies seem high—15 per cent.? It includes surveying, supervision, and office work, and comes out at about 7 or 8 per cent. as a rule. It is rather low.
 6. It seems higher than we have had previously in the estimate? On those very flat lines you are not liable to the same increases, and there is a considerable element of uncertainty as regards conditions on a line of this character. There are no townships to go through, and we do not know what may be required.
 7. Has there been any survey made of a suggested line between Curlewis and Gilgandra? No.
 8. I notice that on the map supplied by Mr. Harper that line, which I think was first suggested to the Committee in the evidence of Mr. Alexander Wilson, is shown;—I thought that some flying survey had been made? No. I could have it examined; but I think it is very doubtful whether you could get a good line across there. You would have to traverse ridges and valleys.
 9. Mr. Wilson says that that part of the country is much easier? It cannot be.
 10. He says that the ridges flatten out as you go westward, and that you get round the bottom of the spurs, which otherwise you would have to cross? At the point where the divide between the Castlercagh and the Namoi is crossed, the end of the Liverpool Range runs across, and the same ridge continues to Coonabarabran. You have there a great deal of mountainous country. I should say that that country would be very difficult through which to make a railway. I may say, for the information of the Committee, that a line has been surveyed right up to Coonabarabran from about Mundooran, and it is a very rough line.
 11. *Chairman.*] What is the distance in a straight line from Wellington to Werris Creek? The distance from the Gap is about 127 miles, in a straight line.
 12. It would be as well to explain why you have to go so far to the north and to make the line so much longer? It is to get the best location. The dotted line marked on the map going through Dunedoo and Coolah has been surveyed, but the line, although shorter, is not so good.
 13. Is it more expensive country? It is, and I believe that there would have to be a tunnel to the north of Coolah. The country between Wellington and Dunedoo is very much rougher than the country along the route that has been adopted.
 14. Would a railway over the lesser mileage come to as much as, or more than, a railway over the extended mileage? Yes.
 15. There is a difference of about 32 miles in the distance? You would only be able to cut out a very small portion of that, and probably when the line comes to be worked up to put it on a footing with the present proposal it would be very nearly as long.
 16. If you got to Coolah, would you then have to go to the north? Yes; I think too that the dotted line on the map goes through better country, and it is very much nearer to Coonabarabran than the other one. It would serve Coonabarabran very well. The Coonabarabran-road comes down nearly in a southerly direction, and would strike the line in about 32 miles.
 17. You have lately been over the proposed line from Wellington to Werris Creek? Yes.
 18. What is the character of the country in the first 30 miles? In the first 30 miles it is good country throughout, with the exception of some small patches. From Wellington to Mitchell's Creek it is basaltic. This is 10 miles out. From there it is chiefly sandstone. The soil is very good, chiefly light, and suitable for agriculture. On the Castlercagh River there is a patch of basaltic country again, then there is sandstone. There are one or two patches of barren sand, but there is not any large extent of it. When we get to Oakey Creek station, we get on to the basaltic country again, and you follow that pretty well all the way to the Gap.
 19. Is there cultivation along the route? It is too far away from railway communication to offer inducements for cultivation, but where crops have been put in, they have been very successful. That has only been done in a very small way. Of course we find cultivation at the southern end, and also patches at the Werris Creek end.
 20. I suppose that about half way the cultivation ceases? You do not see cultivation to any extent after you pass the Talbragar.
 21. The last half of the line towards Werris Creek is badly watered, is it not? No; it is very well watered. With the exception of the black soil plains, which do not appear suitable for cultivation, nearly all the country is suitable for cultivation where it is not ridgy.
 22. How would you get on as regards obtaining railway material on the line? Ballast would be plentiful, and there are patches of iron-bark; but I am afraid the best of the iron-bark in the west has been cut out.
 23. *Mr. Shepherd.*] There seems to be a great many curves;—are these to avoid hills? Yes.
 24. Taking it altogether, the country is comparatively level, is it not? Yes; the location of the line is a very fair one. The grades are not steeper than 1 in 75, and for a very large part of the length it is almost a surface line. At the same time you have low spurs and ridges to get round and over, and you cannot make it a straight line; you must curve about a great deal in some places.
 25. *Chairman.*] There would be no very expensive bridges, would there? No; the most expensive will be those over the Talbragar River and the Mook.
 26. This line averages about £3,200 a mile in cost? Yes.
 27. The lowest being £2,900. I suppose you would not regard any portion of this line as being a surface line;—could it be made as light as the Moree line? Not any one of these sections, but there are long stretches which would be on the surface like most of the Moree line.
 28. Could the line in those places be constructed by just throwing up earthworks? Yes, just by low embankment. Taking, for example, the part from a point about 277½ miles up to 279 miles, that bit is almost

NOTE (on revision).—After going into the estimate of the route *via* Dubbo, I find that there will be very little difference between the cost of the two lines. They may be taken as practically equal.

H. Deane.
18 April, 1900.

almost a surface line with very small cuttings; but when you get to 279½, you have a long and very awkward cutting, which, of course, adds seriously to the expense, and, like many other cuttings on the line, causes the average cost of the line to mount up. From Spicer's Creek, 275½ miles, it is pretty even; but that big cutting would more than make up for all that cheapness.

29. What rails will be used? 60-lb. rails.

30. Have you gone into the comparative distances looking at it as a transcontinental line? I gave instructions for the preparation of the comparative distances, and I have had them partly completed. I will submit them when ready to the Committee.

31. The fifth reason in favour of the line is as follows:—

In the event of the Hawkesbury Bridge being damaged or rendered uncrossable, such a line would be found most suitable in preserving intact the continuity of the Colony's railway system.

I should think that that is rather a remote contingency? I suppose that is in case an enemy's gun destroyed the bridge.

32. *Mr. McFarlane.*] There is hardly any agricultural land on this line, is there? I think that nearly all along, the land would be suitable for agriculture.

33. You stated that cultivation did not extend very far along the route at present? No.

34. But you say that the soil is fit for cultivation? Yes.

35. What produce do they grow principally? When I spoke of cultivation I meant chiefly wheat, oaten hay, and lucerne. Further away from the railway wool is pretty well the only produce.

36. That would be outside the agricultural area? Outside the cultivated area.

37. If this line were constructed, do you think it would have the effect of causing the balance of the land that is suitable to be put under cultivation? I believe it would. I believe that the owners would be very glad to let out the land on the share principle, and I believe there is a good deal of Crown land left which would be suitable for agriculture.

38. Can you give us any idea of the amount of Crown land within reasonable distance of the line? I think the officers of the Lands Department ought to be able to give that information.

39. What do they use the land you spoke of as suitable for cultivation for outside the actual agricultural area? There it is all sheep stations.

40. Are they principally large holdings? Yes; on the Talbragar they seem to be mostly small holdings, but beyond there they are more or less large.

41. Are there many leasehold areas? Yes. Each pastoralist has a certain area of purchased land, and a considerable quantity of leasehold land.

42. Is it a class of country which will carry a large population if railway facilities are provided? I believe it would. I think it is a very fine piece of country, taking it altogether. The wonder is that there is so large a tract so near the Dividing Range destitute of railway communication.

43. Did you notice the Crown lands along the route;—are they as good as the lands that have been taken up? I made inquiries about that, and I was told that the alienated land by no means comprises all the best land.

44. The unalienated land is considered of good quality suitable for agriculture? Yes. Of course, included in the unalienated land there are many patches of very bad land.

45. Of course, there are considerable areas that could not be selected on account of the reserves? Yes.

46. Could you give any information as to how the Commissioners arrive at the estimated increase of traffic? I could not.

47. I understand that they make the same rule apply in all cases, and reckon on so much per cent. increase in traffic as a result of railway communication? I do not know.

48. Do you not think that that should depend on the character of the country that the railway goes through? Yes.

49. It is your opinion that there would be a greater increase in an agricultural country? Yes; as far as my opinion is of any value on the point, that is what I should expect.

50. Do the Commissioners propose to charge local rates? Yes; they say so in their report.

51. Will not the freights be very high, seeing that the Sydney market will be the nearest one for the local products, and will not the high freights be a great handicap on the producers? I have not studied the subject sufficiently to be able to give you any reliable information on that point. I should think that for a long time to come there would be a considerable demand for the produce locally, so that the distance to Sydney may, perhaps, not have much bearing on the matter.

52. *Mr. Leven.*] I suppose it would be possible to mark on the parish map all the principal stations which the railway would pass through? Yes.

53. There is no population between the stations? No; the wool from two-thirds of the distance is conveyed to Mudgee.

54. Where does the other go to? On the Namoi side, probably to Quirindi.

55. *Dr. Garran.*] There are some very fine stations on the route? Yes.

56. Is the land purchased? Yes, largely.

57. Then the line would run where the land is good? The good land is not all purchased. Many years ago the low alluvial land and black soil was most in demand, the red soil and the box-tree country not being so much cared for. But it is just the box-tree country that is so suitable for agriculture; it is magnificent soil.

58. *Mr. Watson.*] Has any attempt been made in this connection to see how far it will fit in with a further connection with the Western and the Southern lines? Yes. Surveys have been made between Dubbo and Parkes and Wellington and Parkes.

59. Of course, that seems of some importance, if we are to take any heed of one of the reasons advanced in the summary you placed before us—that is, touching the military aspect of the question, and the moving of troops, and stock also, from the Northern to the Southern line;—would you care to express an opinion as to which point of junction with the Western line from the north would best fit in with a further extension from the Southern line? I would point out that if you want a connection between, say, Dubbo or Wellington and Young, that has already been pretty well done through *via* Blayney and Cowra. If you want a connection further west between the Western and Southern lines, the easiest point would be Narramine. That is a far cheaper bit of country than from Dubbo to the same point, and a line from Narramine to Parkes or from Dubbo to Parkes would be far cheaper than a line from Wellington to Parkes. From Forbes to Grenfell, with the exception of the Lachlan Bridge, the connection is easy.

H. Deane.
18 April, 1900.

60. Then you say it is cheaper to reach Parkes, supposing you want to make for the southern line in that direction, from Dubbo or Narromine than from Wellington? Yes.
61. An additional advantage, I suppose, would be that the line would pass through at least two settlements—Tomingley and Peak Hill? Yes.
62. Have you been over either of these routes between Wellington and Dubbo and Parkes? No.
63. Is there not a suggestion before the Department to make a line from Parkes towards Peak Hill? It crops up periodically.
64. It would seem that the best point of junction between the Southern and Western lines enters into the proposed starting point for the connection with Werris Creek, because if you are to utilise the existing Blayney-Harden line between the Western and Southern lines, it would be more in a direct line to junction at Wellington? Yes, it would. There are many advantages, no doubt, to be gained by a junction at Wellington.
65. That would mean the abandonment of any further attempt to run a cross-country line between the west and south? Yes.
66. I think you said you were getting a table of distances prepared? Yes.
67. Would that include the distance by Wellington and Blayney to Harden, and on to Melbourne? Yes.
68. As compared with, say, Dubbo to Parkes and Grenfell, and thence to Melbourne? Yes.
69. *Chairman.*] With regard to the grade which you have got of 1 in 75, have you not a worse grade in the south on the main line? Yes, there are heavy grades on the Mountains; but the others are being gradually improved.
70. Have you not a worse grade between Werris Creek and the Border? Yes, there are long grades of 1 in 40 north of Tamworth.
71. Is a grade of 1 in 75 the best that you can get on this route without very great extra expense? Yes; I think a grade of 1 in 75 is about the most suitable, but it is a very fair grade.
72. *Mr. Levien.*] Do you not think, considering that we are going to Coonamble Junction, that it would be far better to go from Werris Creek to Dubbo, as the distance is 2 miles shorter? It is 2 miles shorter, but it is not any cheaper.
73. But do you not think, considering that that is the junction from Coonamble to Dubbo, that it would be far better to make that junction at Dubbo? I do not think there is much to be gained by it. If you wanted to get across from Dubbo or Wellington to Parkes, I should be inclined to recommend the Dubbo junction.
74. All the business of that district is done at Dubbo, is it not? It is an important centre; but Wellington is a very good district too.
75. Yes; but is not Dubbo an important centre as far as pastoral pursuits are concerned? Yes.
76. To give a disinterested opinion, would you junction at Dubbo or Wellington, looking at it from a commercial point of view? I think that, looking at it as a north to south line, I should take Wellington.
77. But looking at it as a commercial line? Taking it altogether, I think I should prefer Wellington. At the same time, looking at it from another point of view—that is to say, that you want to bring stock from the extreme west into the good country, Dubbo would be the shortest.
78. Suppose you want to bring stock from Nyngan, Warren, Nevertire, and further out west, would you not make the junction at Dubbo? I should, if that were the only reason.
79. Is it not a fact that this line was at first proposed as a cross-country line for the interchange of stock? That is one of the great arguments in favour of it.
80. Do you not think it is an argument that will have force? I think it has some force. I do not know that it has as much force as it used to have.
81. But considering that population is increasing, and that irrigation is to be carried on out west, do you not think it would be better to have that Dubbo to Werris Creek connection? As it really means only an extra 30 miles of travelling, taking it altogether, looking at the completion of the railway system, the formation of a road from north to south, on the whole I should take Wellington.
82. *Mr. Dick.*] It is stated, amongst the special advantages coming from the line, that—
It will afford facilities for speedier intercommunication between the Northern and Western, and Southern main trunk lines, and will, therefore, tend to create increased traffic.
And further down it is stated by the Commissioners:
- There is no immediate prospect of the proposed line paying working expenses, nor is there, in our opinion, any reasonable ground for the assumption that the construction of the line would materially increase the volume of traffic.
- Could you say who is responsible for the first of these two directly conflicting statements, viz., that the volume of traffic will be increased? No. I read that statement for the Under-Secretary.
83. *Dr. Garran.*] It is stated in your evidence that this line will shorten the distance between certain points? Yes.
84. If it does that, there will be less money levied by the Commissioners for taking stock from one place to another? Yes; but the shortening of the distance must tend to an increase of business. It appears to me that in dealing with the advisability of making a line of this kind, you have to take a great many circumstances into consideration. You have this question of running a line north and south, and shortening the distance, say, between Queensland and Victoria. There is the question of running stock from the dry districts to the better watered districts, and you have further to look at the line as an inducement to further settlement and agriculture. The people up there at present make use of the Mudgee line, and when they get on to the railway system at Mudgee, the distance is very much shorter from there into Sydney than it is from Wellington.
85. *Mr. Shepherd.*] Was any consideration given to the running of that line from Werris Creek to junction with the Dubbo-Coonamble line near Gilgandra;—it would appear to be a much shorter line? No; no consideration has been given to that. I do not think it would be at all suitable, because I know Gilgandra and the country round it. You could not make a cheaper line there.

THURSDAY, 19 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
 THE HON. ANDREW GARRAN, LL.D.
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVITEN, Esq.
 JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

86. *Mr. Dick.*] I find that the statement read by Mr. Deane, which sets forth the views of the Commissioners in reference to this railway to a considerable extent denies the claims set forth on behalf of the line? Yes; they do not recommend the line.

H.
 McLachlan.

87. One of the main reasons given in support of the construction of the line is that it would be a good stock-carrying line, as it would enable stock to be removed from droughty to more favourable districts? Personally I do not think there is a great deal in that, because when a drought takes place in the Western District it is pretty general. If there is a drought about Narrabri and Moree the stock are shifted to the coast or to the New England District. It would not appear that it would make any large traffic for a cross-country line.

19 April, 1900.

88. It is urged that they would be able to transfer stock to where droughts do not so often occur? That would be the case as far as local conditions are concerned, along the line of route. That, no doubt, would be an advantage, but not sufficient to warrant the railway being made.

89. Do you think it is likely that stock about Nyngan would be sent to Werris Creek, and Murrurundi? No, unless in a very exceptional year. Stock from Nyngan and that district found good country during the last drought in the Central Western Division.

90. Could you state where the stock were conveyed which were taken from the district, between the proposed line and the proposed Mudgee to Coonamble line, and the Western and North-western districts last year? The greater part of the stock from that district have been coming in from the Northern line at Quirindi. The stock from the Northern Districts were removed towards the coast or into the New England country.

91. Would the construction of this line materially alter that condition of affairs? I think not. I thought the Committee might, perhaps, ask for information on that question, and I asked an officer to get out particulars for the month of November, one of the drought months, giving an idea of the number of stock shifted during that month from the different stations. In that month 68,000 starving sheep and 440 cattle were shifted. I submit the following return:—

STARVING Stock shifted during November, 1899.

From	To	No. of Cattle	No. of Sheep	From	To	No. of Cattle	No. of Sheep
Narrandera	Dubbo	4,400	Darlington	Hay	60
Jerilderie	Gundagai	5,500	Hay	Goulburn	1,000
Carrathool	do	2,900	Burrumbuttock	Woolabra	3,600
Uardry	do	10	3,600	Whitton	Wagga	600
Whitton	do	5,600	Centerfield	Goulburn	80
Groongal	do	10	200	Bourke	Dubbo	30
Carrathool	Culcairn	110	13,600	Condobolin	Trangie	2,500
Bundure	do	6,400	Bourke	Girilambone	6,300
Yanko	do	500	Cobar	Byrock	2,600
Carrathool	Bowning	5,200	Cowra	Bourke	140
Morindah	Yass Junction	2,100				
Culcairn	Bredalbane	1,900				
					Total	440	68,500

These were the movements of stock during the month of November last.

92. Were they miscellaneous stock, or special kinds of stock? It was ordinary stock; there were some fairly big flocks, but nothing special about them. During the two succeeding months we shifted 300,000.

The months during which there were heavy removals were November, December, January, and February.

93. This line runs practically from north-east to south-west. I gather from your statement that the climatic conditions make it necessary that the stock in that district should come practically at right angles to the line? We move the stock, as far as the north and north-west is concerned, from outlying districts towards the central division.

94. That would be practically from north-west to south-east? From west to east you may say.

95. In that list of removals there are practically none from the Northern district? At about that time the Moree and Narrabri districts had rain.

96. Is that a general thing when there are droughts in other parts of the Colony? Well droughts are sometimes partial.

97. Would that lend any colour to the theory that you might transfer stock to that district? The Narrabri and Moree district is at present in fairly good condition; but not the Bourke district.

98. Narrabri is further north and west than Werris Creek? Yes, it lies north-west.

99. Is the character of the country around Werris Creek such that at most times it is in a satisfactory condition? I should not say that that is the case immediately around Werris Creek. We have had bad seasons about Werris Creek; but, as a rule, it is not so bad as the country further west.

100. Then, even after arriving at Werris Creek, stock might be sent further on? Yes; they might be sent either to the coast or into the New England district; they would not go to Werris Creek.

101. But you think that the line would, in that aspect, be an important one? Not essentially important. Of course it would afford a certain measure of relief, but not sufficient to justify its construction.

H.
McLachlan.
19 April, 1900.

102. The first claim put forward is that the line will make a complete connection with the whole railway system of the Colony west of the Dividing Range;—could you indicate what benefits would be derived indirectly? We might want at some time to interchange rolling stock from the western and north-western districts, but that would be rather an exceptional thing. Five years ago there was a drought in the western district, and the Riverina district was exceptionally good, and the fat stock driven to Sydney was being sent from the Riverina; consequently we found it convenient to remove rolling stock to Riverina, and the cross-country line between Blayney and Harden was an advantage. Personally, I do not see what material advantage there would be from a railway point of view in having a connection between Wellington and Werris Creek.

103. Many regard this line as the first section of a further connection between the various lines of the colonies to Parkes and Forbes;—would a line of that character offer any advantage to the railway authorities? Certainly not such as would justify the cost.

104. What advantages would follow from a complete line of that character—anything more than you have indicated? No; I do not see any further great advantage, because, as a rule, the traffic is from and to big centres. I do not think that the local traffic between Wellington and Parkes would be considerable, or the traffic between Wellington and Werris Creek.

105. You do not anticipate much local traffic between Wellington and Werris Creek? No.

106. Mr. Deane told us yesterday that the line would pass through some very fair country; is it likely that the railway will cause the land to be opened up for agricultural settlement? The idea of the Commissioners is that for 20 miles out of Wellington there is good agricultural country—at Mitchell's Creek, Spicer's Creek, and Stony Creek—but it is limited to that distance. The average distance from the railway is about 10 miles, and the Commissioners do not consider that too big a handicap for the agricultural produce to be brought in by road. They do not anticipate any big development in agriculture, however, if the line is made.

107. Do you expect much traffic in the shape of wool and other pastoral products from that country? The Commissioners have given an estimate of £8,500, assuming that local rates are charged, but through rates would probably have to be conceded, and that would bring it down to a little over £6,000; so the prospects of profit are most unfavourable, considering the cost of the line.

108. Would the construction of the Dubbo to Coonamble line interfere with the prospects of a cross-country line? It would, about Gulgandra, because you would have two lines competing for the traffic. I may state that the idea of the Commissioners is, as they have stated before, that they prefer to see that country opened up by a line starting from Mudgee—perhaps, from Mudgee to Mundooran—where they consider the possibilities of agricultural development very much better, in addition to getting a more direct route to a market.

109. I find that the Commissioners indicate in their report that, as far as a stock-carrying line is concerned, they prefer to see a connection between Collarenebri and Brewarrina;—would you indicate what advantages that would have over this more southern connection? It is not a thing that they would recommend. If a line is to be made to give relief to drought country, they think that it should be made in that direction; but they do not wish it to be understood that they immediately press it. It is excellent stock country, and if such a line were made, stock would be removed to Collarenebri, then to Narrabri, and towards New England. If the western country were good, they could move down the Western line.

110. They think that a more northerly connection would give relief to a larger area than a line from Werris Creek to Wellington? The Commissioners think so. It would give relief where facilities are not so easily obtained.

111. Do you think it preferable to wait till we have a connection between Mudgee and Coonamble instead of building this cross-country line? The Commissioners would rather see a line from Mudgee towards Mundooran.

112. Is there any hope that a line from Werris Creek to Wellington would develop into a paying line? No; the Commissioners see no prospect of it developing into a paying line within a reasonable time.

113. You altogether deny the claim that the construction of the line would increase the volume of traffic on the existing lines? The Commissioners do not think there is much in that.

114. Do you know in a general way what is the trend of pastoral products from the district crossed by this line? The greater part of it goes by the Northern line, and a good deal comes in at Quirindi.

115. Do the people in that district suffer great hardships from drought? Not that we have heard.

116. *Dr. Garran.*] Where does the traffic between Werris Creek and Wellington come on to your line now? The greater part of that traffic is drawn to the Northern line. A good deal comes in at Quirindi, and some into Muswellbrook; but, speaking of the traffic as a whole, the greater portion would come towards the Northern line.

117. All that there is to get you get now? I think so.

118. You do not think that the pastoral business would be intensified as to its products? Not to any remarkable extent—the country is well settled now. I believe there is very little Crown land left. Most of that line would run through private property.

119. The excellent stations on that line are well looked after now? Yes.

120. And they produce about as much as they can? Mr. Harper, who has been over the route, could give you a better idea of that than I can.

121. This is to be a cross-country line? Yes.

122. Have you any other cross-country lines at work? We have one, which has some characteristics in common with this, that is the line from Blayney to Harden.

123. When that was started it was thought that a great deal of stock would go down that line through Young on to the south? Some years back there was a good deal of stock traffic from the Northern line to Albury for the Melbourne market; but I am sorry to say that, for the last few years, that traffic has practically fallen away.

124. That is due to the stock tax, very likely? Yes, and I dare say the tick has had something to do with it. In addition to that the Victorian people get store stock down by the Darling into Riverina, and are feeding their own market.

125. You think that they feed themselves better from the west than from the north? At present there is nothing going from the west by rail.

126. In ordinary seasons they get their stock better from the Darling than they can from the Northern line? They get store cattle from the Darling and fatten them.

H.
McLachlan.
19 April, 1900.

127. I want to know whether, in ordinary seasons, they have a better market on the Darling than the Werris Creek way? The store stock may come from Queensland; but, taking as an instance, November and December last year we carried no cattle at all from Bourke to Albury.
128. When the Blayney, Young, and Murrumburrah line was doing its best, was it ever a paying line? No; it was a line which lost us a great deal of money. In 1892, for instance, we earned £38,000 on that line, and last year £32,000. I think a good deal of that has been due to the falling off in the stock business. Last year the loss was practically £42,000—that is, in total working expenses and interest.
129. *Mr. Watson.*] How do the working expenses compare with the earnings? The working expenses and earnings are very nearly equal, but there has been a dead loss in interest. On the 31st December, 1898, the working expenses came to £32,390, and the earnings to £33,914, so they practically balanced. The line is an expensive one, and the interest has to be paid. At the same time you have to recollect this in connection with the Blayney-Murrumburrah line—that it is a connection between very much more important sections of the country, and in addition to that it passes through country which I believe is much better than that through which this line would pass, and it is much more thickly populated. For instance, on the Murrumburrah to Blayney line we have three or four important towns, such as Carcoar, Cowra, and Young.
130. *Dr. Garran.*] The line is paying working expenses but not interest on the capital? Practically.
131. That is the only important cross-country line that we have experimented with, and it has failed? It is losing a lot of money.
132. Is the experiment on that line any encouragement to make another cross-country line? It certainly is not any encouragement.
133. And the circumstances are very much more in favour of that line than of the proposed Werris Creek line? Yes.
134. Has the Blayney line induced much new settlement? I think it has encouraged agricultural settlement.
135. You have more wheat and other produce on that line? Yes.
136. Have you more passenger traffic? I think so.
137. But it has not to any considerable extent improved the receipts? No.
138. Do you recollect what was the cost per mile of the Blayney to Murrumburrah line? It cost pretty well three times the amount per mile of the estimated cost of the line now proposed.
139. If you were making it now, you could do it at a much lower cost? It is difficult country.
140. They took the wrong route? That is an engineering question.
141. But could we not make the line more cheaply now than we did? Certainly; you would get material, and labour, and other things, at a more reasonable rate.
142. Supposing we could make that line now as cheap as we expect to make this line, would it be a paying line then? No.
143. Do you think that this line would draw the traffic from the other railway, assuming that the Dubbo to Coonamble line is made? That is a question that I find it difficult to answer, but Mr. Harper has worked out the statistics.
144. When you said that the Commissioners would prefer an extension of the Mudgee line, did you mean an extension from Mudgee to Coonamble or from Mudgee northwards? Northwards to go towards Mundoran.
145. I suppose that on the eastern side, about Gulgong, the country is rough? Well, the estimate of the cost of the line from Mudgee to Coonamble is not an excessive estimate, it is a little higher than that of the Dubbo to Coonamble line. I think Mr. Deane estimated that it would come to about £1,000 per mile.
146. Talking of travelling stock, we had some evidence on another inquiry that if we had a railway made like this one, to take stock from the dry country eastward—there really is not grass in the east to accommodate all the starving stock that would want to go there;—do you know anything about that? No.
147. The assumption of those who are in favour of this railway is that it would result in the saving of starving stock? I know from some squatters that in the last drought the western people found it difficult to find grazing country—they had to pay very high prices about Orange and Wellington. The Riverina people had also difficulty in getting grazing country.
148. This line is to cost about £500,000 without purchasing the land, and I suppose we might add £50,000 for that? There would be extra cost. A great deal of it is private land.
149. You think there is no chance of the line paying fair interest on such a sum of money as that? No.
150. You do not want your capital account overloaded? No.
151. It is as much as you can do to show a good return for the capital you have to pay? Yes, and the Commissioners do not see that the construction of this railway would be justified, even in the light of some prospective advantages. If they could see that it was going to develop new country, and would bring business on to the parent lines, they would not mind the loss at first; but they see no prospect of that.
152. You do not mind feeling your way with a pioneer line into new country if it would pay? No. The Commissioners think it is a very proper thing to open up new country with promising conditions.
153. You do not think that the increased settlement would correspond to the increased expenditure? The Commissioners think it would not.
154. The question as to whether the junction should be at Dubbo or Wellington is a very minor question? Yes, it is a matter of detail. As a matter of fact, Mr. Harper has been asked by the Committee to get information in regard to the route from Curlew to Gilgandra and Dubbo, and he has done so.
155. Any wool or fat stock travelling on that line marked red on the map would be stock for Sydney, would it not? Yes. The northern stock and wool would probably go to Morpeth and Newcastle, or be shipped to the Aberdeen meat works.
156. So far as the traffic to Sydney is concerned, it would suit better to have the line from Wellington than from Dubbo? I think so.
157. The traffic in starving sheep comes only in drought years? Yes.
158. Whereas the traffic in wool and fat stock goes on every year? Yes. The trend of the traffic will be to the seaboard.
159. *Mr. Shepherd.*] How is the traffic revenue estimate arrived at? We send an officer to the district who goes in advance of Mr. Harper; then Mr. Harper picks him up and gets his figures, and any further evidence that he can, and submits an estimate to the Commissioners. They check it; then it is adopted

H.
McLachlan,
19 April, 1900.

as their estimate. You may say that the estimate of probable revenue is derived from information furnished by Mr. Harper.

160. Is it proposed that this revenue will be in addition to the revenue already obtained on the existing line? Yes. There is the revenue which will be created by the line if it is made.

161. I suppose that grain is included? Everything—general goods, merchandise, wool, live stock, passengers, and maize. The estimate of £8,000 odd includes revenue from all sources.

162. I see that the Commissioners do not favour this line at all? No.

163. *Mr. McFarlane.*] Is there any regular system in regard to how the amount of additional revenue is arrived at—is it from actual knowledge by making inquiries? Yes. First of all we know pretty well the traffic that comes from the district by the returns from the stations which the district feeds.

164. That is the traffic that comes in the usual way by team? Yes. We send a man into the district who finds out the probable population of the township, the number of sheep, and an estimate is based on that. It is based as far as possible on the actual facts.

165. How is the estimate of revenue from the prospective traffic arrived at? That is an estimate which the Commissioners, as a rule, would not care to make, it would be problematical.

166. I understand from a previous inquiry that there is a certain percentage allowed for increased traffic when the railway is carried out? Sometimes the Commissioners add say 25 per cent. on for the development of traffic after the railway is carried out.

167. What I want to know particularly is this: Is that 25 per cent. increase allowed on a sort of rule-of-thumb system, or is it based on actual facts as to the development of the district? There is no rule. Everything depends on the merits of each particular case.

168. In this case, it has been stated in evidence that the land between Wellington and Werris Creek is agricultural and capable of carrying a fairly large population in the event of the railway being constructed? Yes. As I have mentioned already the Commissioners do not hold a very strong opinion in regard to that matter. The land for 20 miles outside of Wellington is fairly good; but outside that it is principally pastoral country.

169. Is it not a fact that the country throughout the whole distance is similar to that within the 20 miles from Wellington? No. The Commissioners think the first 20 miles out of Wellington is better than the rest.

170. From a previous inquiry, it would appear that the Commissioners base their estimate on the probable increase of traffic by a certain percentage without taking into consideration the capabilities of the district through which the line passes? What the Commissioners look at is the traffic that exists.

171. I am speaking of increased traffic? They do not, as a rule, deal with increased traffic. Sometimes they will say that a district will develop so as to make the line a paying one, but, of course, what they give you are the figures of the existing traffic.

172. What I want to know is whether they take into consideration the capabilities of the country through which a line is proposed to be made? They look at it more from a commercial point of view. That would rather be a matter of policy. I do not think the Commissioners would care to make an estimate as to prospective traffic.

173. I was given to understand that they did make such estimates? No; not as a rule.

174. In the event of a railway being constructed, do they not make some estimate in regard to the probable increase in traffic? Not as a rule—it is a matter for you gentlemen to consider whether the prospects are good enough to warrant you in recommending the line.

175. I understood that you allowed a certain percentage for increase of traffic? No; there is no rule of that kind.

176. There has been some diversity of opinion as to the route of the proposed line, would you care to express an opinion as to whether the route proposed is the best? The Commissioners would rather not do that. They were asked to report on the proposed Wellington to Werris Creek line, and they did not go into the question of an alternative line.

177. What, in your opinion, would be the best method of connecting the two lines? The opinion of the Commissioners is that the connection had better stand over.

178. But, in the event of its having to be carried out, what would be your opinion in regard to the best connection? That is a matter which the Commissioners have not considered. They would not hazard an opinion, unless the matter were directly put to them. They simply went over that one line and looked at the merits of that.

179. It has been stated in evidence that whilst the land is suitable for agricultural purposes, which also carries with it closer settlement, owing to there not being proper facilities for conveying the produce to market, large areas of land there have to be placed under grazing? Yes. The Commissioners do not anticipate that a development in agriculture would take place if the line were made.

180. Will you explain the method in which the Commissioners ascertain the capabilities of the country in which it is proposed to make a railway;—do they go over the land so as to obtain a correct opinion as to its capabilities? They go as nearly as possible over the route of the proposed line. In this case they went to Werris Creek and drove through to Wellington, meeting local people on the route, and getting information at both junctions. They have also been from Mudgee to Coonamble.

181. In traversing the proposed route they may come on land of indifferent quality, though 3 or 4 miles away it may be very good country;—do the Commissioners take that into consideration, and do they make due inquiry as to the country which will be served by the proposed railway? They always make due inquiry.

182. Do the Commissioners always investigate the matter themselves? Yes; they make it a rule to go over the land personally.

183. One, two, or three of the Commissioners? As a rule, three Commissioners. The three Commissioners went over the route of this line.

184. And they were satisfied that it was not a country that would carry a large population? Yes. They do not think there is any prospect of its carrying a sufficient population to make the line pay.

185. I am not speaking about its being a paying line, but as to the increase of population—would you care to express an opinion about that? The Commissioners are of opinion that there would be no great increase of population following the construction of the line.

186. It was stated in evidence yesterday that the area between Wellington and Werris Creek is good agricultural country, and that the reason why agriculture has not developed there is that there are not proper

proper facilities to convey the produce to market. We are told that if there were facilities for getting to market, the land would be turned into agricultural areas;—is that in harmony with the Commissioner's report? No. The Commissioners do not think there would be any great development of agriculture in that district following the construction of a railway. That is their opinion after going over the line, and making themselves acquainted with the district.

H.
McLachlan.
19 April, 1900.

187. A great deal depends on how they go over the country. They may go along some beaten track, which is usually the cap of a ridge, whence they see the country at a great disadvantage, whilst 2 miles away they might come upon a different class of country altogether. I should like to know whether the Commissioners have followed the usual bridle track, or have made a sufficient exploration of the country to enable them to form an opinion as to its possible development? In this case there is no main road between the two places, and the Commissioners were quite satisfied that what they saw enabled them to judge accurately as to the prospective traffic. I think they took three days to examine the district, and they got sufficient evidence to warrant them in making the report, which they did make.

188. If the officers of the Department gave evidence to the contrary of that, would it be correct? I think not.

189. *Chairman.*] I understand that the Commissioners cannot see one valid reason for recommending this railway? No; the Commissioners do not see any ground upon which to recommend the line.

190. Not even upon the broad ground of a transcontinental connection? No; they see nothing in that to recommend it as a thing of to-day. That might come in many years time.

191. I thought you seemed rather to make a little of the idea of the connection of the two systems;—do you not think there is a little more advantage in that respect than you seem to indicate? No; I do not see any great advantage in it, because the interchange of traffic would be comparatively limited, between the north and the west. Our traffic is to and from the coast; it is not inter-provincial.

192. If this line were constructed it would deprive other parts of the railway of revenue, would it not—of some through traffic? You might say that it would take a little from the Mudgee line; but we should get a longer mileage for freight. Wellington is further from Sydney than Mudgee, consequently if you get traffic midway between Werris Creek and Wellington, you would get a much bigger railway mileage than we get to-day.

193. As a means of shortening the distance between Brisbane, Melbourne, and Adelaide this railway would be of considerable advantage, would it not? No; I do not think any one would ever travel. If trains were running they would have to be mixed trains. The estimate of the Commissioners was based on the three trains a week. People would naturally use the quick trains. There would be no through-traffic between Brisbane and Melbourne by this route. The traffic now between Brisbane and Melbourne is very limited.

194. Your experience is that people would sooner come by rail to a large city like Sydney? Yes.

195. You really cannot advance one reason in support of this railway? No.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

196. *Mr. Watson.*] I understand that you prepared an estimate on which the Commissioners based their report as to the traffic to be expected from the proposed line of railway? Yes.

J. Harper.

197. Can you give the Committee the details? Yes; I have here a report, which is as follows:—

19 April, 1900.

PROPOSED LINE, WERRIS CREEK TO WELLINGTON, 160 MILES.

(Estimated cost, £511,148; ruling grade, 1 in 75.)

As directed by the Commissioners, I have had very careful inquiries made as to the probable traffic and prospects on this proposed line. It has, necessarily, been rather difficult to estimate what the traffic would be, as it might be more or less affected by the railway proposals still under consideration.

On the immediate route of the line there is no large settlement, but it serves several townships at varying distances, as follows:—Mundooran, at a distance of 3 miles; Colborah, at a distance of 9 miles; Leadville, at a distance of 20 miles; Coolah, at a distance of 17 miles; Coonabarabran, at a distance of 25 miles.

From Werris Creek, until the neighbourhood of Talbragar River is reached, the agricultural development is not large, and the population is sparse. Approaching Wellington, in the districts of Mitchell's and Spicer's Creeks, considerable agricultural development exists. A considerable quantity of the land is available for agriculture, and no doubt as opportunity offers will be thrown open for such purpose.

The population, including Mitchell's and Spicer's Creek, and Coonabarabran, is between 5,000 and 6,000.

Dealing with the known traffic coming from these districts, as it exists to-day, and allowing margin for the development which may be regarded as close at hand, the estimate would be, assuming local rates were charged on wool, goods, and wheat:—

Wool, goods, and wheat	£4,821
Passenger traffic.....	1,195
Parcels, &c.....	350
Mails, 160 miles, at £12 per mile	1,920
Add, to meet expected traffic	300
Total	£8,586

If, as is usual in such cases, an extension of the through rates were applied to wool, general goods, and wheat, the estimate would be:—

Wool, goods, and wheat	£2,871
Passenger traffic.....	1,195
Parcels, &c.....	350
Mails, as above	1,920
Total.....	£6,336

If local rates were charged in the case of wool and general goods the disposition would be on certain sections of the line to continue forwarding to existing railway stations by road, and I am doubtful whether local rates could be maintained.

198. I understand that you have had some statistics prepared as to the way in which the land is held on the route between Wellington and Werris Creek, and on the suggested route from Gilgandra to Curlewis? Yes.

199. I believe you have a map prepared which shows the trafficable area which would be served by the proposed line between Werris Creek and Wellington, and also the area which would be served by the suggested line from Gilgandra to Curlewis? Yes; the boundaries of one being shown by a deep red line on the map, and of the other by a broken red line.

200. In what way is the land held between Wellington and Werris Creek? On the map referred to the alienated land is shown marked blue; settlement and improvement leases, blue etching; reserves, green; Crown

J. Harper. Crown lands, brown; leasehold area, brown etching; land designed for settlement, brown with white spots; land taken up for settlement between 1st July, 1898, and 31st October, 1899, blue, white etching, and diagonal crosses; land taken up since 31st October, 1899, blue, white etching, diagonal crosses and circles. The total area of alienated land on the proposed line is 1,134,450 acres. Settlement leases, 248,000 acres; reserves, 303,400 acres; Crown land, 907,200 acres. Of the Crown lands the leasehold areas expiring in 1900 are 223,700 acres; occupation licenses, 373,500 acres; untenanted, 310,000 acres; land designed for settlement, 184,400 acres. On the suggested line from Gilgandra to Curlewis the total area alienated is 780,700 acres, 302,200 acres of settlement leases, 235,100 acres of reserves, 853,600 acres of Crown land.

201. Have you made an inspection of the two routes? No; I have had a very careful inspection made of the alternative route, and I have myself inspected the route between Wellington and Werris Creek.
202. And you have had an inspection made by another officer of the other route? Yes.
203. What class of traffic would be got on the proposed route under present conditions? Under existing conditions, the bulk of the traffic at the Werris Creek end of the line, and for a distance of about 70 miles, would be chiefly pastoral produce. At the Wellington end, for a distance of 18 or 20 miles, it would be agricultural produce. Over the balance of the distance it would be chiefly pastoral produce.
204. Could you describe the character of the land going north from Wellington;—is it good, bad, or indifferent? For 18 or 20 miles it is very excellent land, about Spicer's Creek and Mitchell's Creek. Then you pass into very dry country until you get on to the Talbragar. Of course, it is patchy. Until you get within 12 or 15 miles of Mundoran it is good country. Then you get into indifferent country.
205. Whilst you follow that valley near the Castlereagh, the land is pretty fair? Yes.
206. Then after leaving the Castlereagh and going to Werris Creek, what is it like? For 20 or 40 miles it is mixed black and red soil. I should think the black soil predominates.
207. Is the black soil of a clayey nature? I think it is, and I do not think it would be suitable for agriculture.
208. For 30 or 40 miles from there it is patchy? Yes.
209. Would you say that the bulk of the land is suitable for agriculture, or that only a small portion of it is? There is a good deal of it suitable for agriculture. It would be impossible for me to say what proportion; but I should think at least one-third of it would be suitable for agriculture.
210. It would appear that until you get between Cobborah and Wellington you do not get much agriculture? No; and between Cobborah and Wellington there is some very bad country, some good country, and some indifferent country.
211. Right on towards Werris Creek from there, there is at present no agriculture? Not worth mentioning except on Mr. Binney's estate, who has 5,000 or 6,000 acres under wheat. But I do not think that this line would serve that estate.
212. And there there is no agriculture carried on? Not to any great extent.
213. Is the land such that, in your opinion, it would induce agriculture if the line were constructed? I think there is a lot of land on that line which agriculturists would be glad to get hold of; but the greater part of the line passes through alienated land.
214. Do you think it is not likely that those who at present own that land would go in for agriculture? I think they probably would. The line would give added value to their land; but I do not think the Crown land would be improved to any great extent.
215. Is that because the alienated land comprises the best for agricultural purposes? Yes.
216. It has been found in other parts of the Colony that the early settler who had the first opportunity of choosing land made an error by taking the black soil country and leaving the timbered country, which has proved to be better for agriculture? I do not think they are perpetuating that mistake now; they have realised which is the best.
217. Has that red soil been taken up on this route? I think it has generally.
218. On the map you have had prepared there is a fairly large area, coloured brown, representing Crown land? Yes.
219. Taking that first bit directly to the north from Wellington that is rather rough, is it not? Yes.
220. That would be of no value for settlement? No; of none whatever.
221. Getting further north and east we find another large patch of brown? Yes; that is also unoccupied.
222. What is the country like north of Weetalibah? It is very rough country, unsuitable for agriculture or any other settlement.
223. Those areas which I have referred to would appear to be the larger part of what now remains of the Crown lands? Yes.
224. That would reduce the quantity of Crown lands available for settlement? Yes.
225. There seem also two or three large reserves on the route—are they of any value? They are either timber or water reserves.
226. From what you have said it would seem that the Crown lands are not sufficiently good to be greatly improved by the line? No.
227. Assuming that there is, including alienated as well as Crown land, a considerable area suitable for agriculture, but not now under agriculture, would that, in your opinion, be a sufficient justification for the construction of the line? I do not think so.
228. Are we to understand, then, that we are not, in your opinion, justified in constructing a railway into agricultural country, to depend upon the local traffic only? No; I should say that under certain conditions it is a very desirable thing to make a railway into agricultural country, even assuming that it will not pay at the commencement; but I do not think that the area which this line would traverse is of such a character as to warrant the construction of the line for agricultural development. I would unhesitatingly favour a line to go through land of which 80 or 90 per cent. was available for agriculture. I should say that such a line deserves very great consideration, and should very probably be constructed. But as regards this line, there is so much land on the route that is not suitable for close settlement and agriculture, that I do not think it is a desirable one to make.
229. Do you think that the through traffic would amount to anything considerable if the line were constructed? I can scarcely conceive what the through traffic would be.
230. It has been contended that we might expect a fair amount of traffic in stock between the Northern and the Western lines, with a view of getting south to the Melbourne market; do you think anything of that? I do not. I think that if the stock tax is withdrawn, the fattening for the Melbourne market will take place in Southern Riverina.

231. But before the stock tax was imposed a great deal of fat cattle went from Queensland, did they not? They would not find their way on to that line; they came in at Bourke, and were fattened on stations to the north-west of Bourke; but the properties to which those cattle came have been abandoned as cattle stations, and are now carrying sheep.

232. May not that have been due to the loss of the Melbourne market through the stock tax? I do not know. I should imagine that they had found sheep to be more profitable. I think that Southern Riverina, on the Murrumbidgee, and the Murray would be largely devoted to fattening. Store stock may come from Queensland, but it would not pay to bring them by rail.

233. As against the opinion you have expressed, it seems peculiar that before the stock tax was in operation cattle were not fattened in Riverina for the Melbourne market? No; because under the existing conditions it would not pay them. The late Mr. Tyson sent 75 per cent. of all the cattle that went to Melbourne; but he cleared out his cattle to make way for sheep.

234. You do not think that the trade would assume any great dimensions? I do not think so. If it did it would be probably about Bourke and the Western line rather than for the Northern.

235. So it does not affect the present proposal to any extent? No.

236. Then, again, the argument has been put forward that the line would be useful for taking starving stock towards New England;—do you think there is anything in that? It might have its value for that purpose; but I should imagine that a line further west would be infinitely of greater value. I do not think that this line would be of much value for that. A line further west would answer very much better, which I would suggest should go from Brewarrina to Collareendabri, giving an opportunity for stock from the west to be picked up and taken towards the northern high-lands, and that that line should be reached by the extension of the Coonamble line towards Walgett, and from Walgett to a point between Collareendabri and Brewarrina. That would then serve the whole of the northern district to the Queensland border.

237. Have you given any thought to the possibility of reaching Coonabarabran? The air-line shown on the map would bring Coonabarabran 10 miles closer to the line of railway than would the proposed line from Wellington to Werris Creek.

238. You can now give us the result of your investigations regarding the suggested line from Gilgandra to Curlewis? I may explain that I have formed no estimate of what the probable traffic would be on that line, it would be impossible to do it. I will read the report which I have received, and which I have verified:—

PROPOSED CONNECTION WITH NORTHERN AND WESTERN LINES.

COMMENCING at Curlewis, the country to be served right through to Gilgandra is excellent for the purpose of mixed farming, and after getting over the "Bando" plain, it is of a generally undulating character, chiefly box, pine, and apple tree, and fairly well improved. A considerable amount of new and close settlement is taking place between Curlewis and Coonabarabran. Around Curlewis alone, and in the county of Pottinger, which includes Tambar Springs and a portion of Gunnedah, there were 10,000 acres of cultivation last year, the average yield being from 20 to 25 bushels per acre. Similar land is procurable almost right through to Bearbong, which is 22 miles from Gilgandra. On the Werris Creek-Wellington line the country for the first 50 miles, i.e., between Werris Creek and Oakey Creek, is more suitable for pastoral than agricultural purposes.

The Gilgandra line, which has not yet been surveyed or explored, it is understood could be put down as indicated approximately on the accompanying map, would make the distance between Curlewis and Gilgandra something like 115 miles as against 160 from Werris Creek to Wellington. At two central points, viz., Bomera and Piambra, the two lines would only be 7 miles apart; and, with the exception of the settlement on the Talbragar River and on Mitchell's and Spicer's Creeks, it may be said that both of the proposed lines would serve the same country on the south side, whilst on the north side the Gilgandra-Curlewis connection would, in addition, serve a large tract of good country known as Tooraweenah, Margon, &c., in the vicinity of the Warrumbungle Mountains, and also the excellent pastoral country on "Bando." In the year 1898—not a good one—this holding produced 600 trucks of fat stock. Gunnedah, 33 miles from the Bando woolshed, and 25 miles from the drafting or delivering yards, is the nearest railway station to "Bando."

Setting aside for the time being the question of engineering difficulties, which it is understood are as great on one line as on the other, there is no doubt that some strong arguments can be brought forward in favour of the connection from Curlewis as against Werris Creek:—

- (1.) The distance from Werris Creek to Dubbo, *via* Curlewis and Gilgandra, would be about the same as *via* Wellington, i.e., 190 miles.
- (2.) The length of new construction would be about 45 miles less, *via* Curlewis.
- (3.) The Gilgandra-Curlewis line would not enter into much competition with a line from Mudgee to Coonabarabran, but the Werris Creek-Wellington line would.
- (4.) Coonabarabran (population 1,450) would be within 20 miles of rail communication as against 25 on the Wellington proposal.
- (5.) Coal is procurable at Curlewis.
- (6.) A connection with the Walget *via* Coonamble would give both these towns a serviceable connection with the north and west. The distance from Walgett to Newcastle, *via* Gilgandra, would be about 422 miles, as against 366, *via* Narrabri (north bank of river). On the other hand, the distance from Coonamble to Newcastle, *via* Gilgandra, would be 20 miles less than from Sydney, *via* Dubbo. Under a scale of maximum rates, Newcastle would be able to compete with Sydney for the Coonamble and Walgett trade.
- (7.) A greater area of agricultural land would be served, and to some extent the Gilgandra-Curlewis line would feed the north-west and Coonamble branches.

239. No effort has been made in that case to make up an estimate? No; it would be impossible to give an estimate.

240. But looking at it generally, would you say that, in proportion to its length, the Curlewis-Gilgandra line would serve the traffic of as large an area as this line? Yes; I am inclined to think it would. If I remember rightly this Committee has expressed the opinion that an extension should be made from Mudgee. This line keeping further north would enable that line to be built with more advantage.

241. We suggested that the line might be taken in the direction of Dunedoo? Yes. This line, assuming it were necessary to make it, would give a better connection with Coonabarabran, and would not stand in the way of a connection from Mudgee.

242. From the report of the officer, whose statement you have read, it seems that the engineering difficulties are not great? I give that for what it is worth. He is not an engineer.

243. Your officer will be able to form some idea of the character of the country, and he seems to be favourably impressed with it? Yes, that is compared with the other line.

244. Did I understand you to read from the report that on as far as Bomera the land from Curlewis was fairly good? Yes. Between Bomera and Tooraweenah the land is not so good. There is a lot of good land between Tooraweenah and Coonabarabran.

FRIDAY, 20 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.		JOHN CHRISTIAN WATSON, Esq.
The Hon. ANDREW GARRAN, LL.D.		ROBERT HENRY LEVIEN, Esq.
WILLIAM THOMAS DICK, Esq.		JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek:

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 245. *Mr. McFarlane.*] I notice that the Commissioners do not recommend the construction of this line?
 No.
 20 April, 1900. 246. On the ground that it is a non-paying line, I presume? I should not like to say what their motive is in not recommending it; but I should think that it is in the interests of public policy. I should not like to say that they do not recommend it because it is a non-paying line, because they have recommended lines for the consideration of the Government which were non-paying lines.
247. Is it not a fact that its being a non-paying line is a great objection to it? Certainly, from a financial point of view; but there are lines which may be non-paying in the first instance, but which may offer a reasonable prospect of paying subsequently, and which will open up the country. I should not like to put this line in the same category as other lines which will probably come before the Committee, which, on the surface, do not appear to be paying lines, but which have a good prospect of becoming paying lines by-and-bye, and also of developing the country.
248. Is it not a fact that this line passes through good country? I have said so. It passes through some good pastoral country, and through some good agricultural country. The same thing may be said of a number of existing lines.
249. That alone would not be sufficient to justify the carrying out of the line? I do not think so. I do not think that, as a matter of public policy, it would be a wise thing to make this railway.
250. The Commissioners take into consideration when a railway passes through good country that there will be a considerably increased traffic? Yes; that is always considered.
251. I should like to get some information as to how the Commissioners arrived at the estimated increase in the traffic? I do not know that they have shown any estimated increase.
252. As a rule they do? I do not think so.
253. They generally anticipate an increase in the traffic? Yes.
254. I should like to know how they arrive at that? Of course, it has to be more or less arbitrary. It depends on the nature of the holdings, the character of the land and the rainfall, and a lot of considerations which any business man would weigh, and an addition is made to the estimate of the absolute traffic by the Commissioners to represent any increase which is within a measurable time of being realised.
255. I should like to know what steps are taken to ascertain the character of the country along the route of the railway to justify the statement that it is good agricultural country or good pastoral country, whether there is any actual exploration made, not only of the line but also of the country for some distance away from it? Not by individual officers. The Commissioners prefer to rely upon experts connected with the Lands Office.
256. Who would they be? The district surveyors.
257. In getting reports from district surveyors with regard to the character of the country, is it always taken for a fact that the district surveyor inspected the country in view of a proposed railway? Whatever information he has to give is taken for what it is worth and weighed in connection with our experience of what comes from the district. We have an absolute means of testing precisely what that area of country is producing.
258. On the route of this proposed railway, although the land is good, there are not many agricultural holdings, because there is no means of getting produce to market. I do not, therefore, see how the Commissioners could form an estimate of the traffic from the existing state of things? I would suggest then that you should discard their estimate, and build railways in view of the traffic which may be developed by it. The Commissioners cannot possibly say that in any district there are so many thousand acres of land which is going to be devoted to agriculture. That is a matter for this Committee.
259. The conclusion is that if the country is good, a railway will have the effect of inducing cultivation? Do you not think it would be a fair thing for the Committee to determine that, instead of for us to do it.
260. I want to ascertain whether sufficient steps have been taken to find out whether the land along this line is good agricultural country? That is not our mission; it is yours. Our duty is to give an estimate of the probable traffic. In my capacity of manager of the railways, I cannot tell you the character of the country.
261. The best reply to the question would be that you do not know? I am not going to say that I do not know. I have already stated what my impression of the country is.
262. I have seen it stated that so much of the country is fit for agriculture;—I should like to know whether the country has been sufficiently explored to justify the statement? I think I can answer the question by saying that the Commissioners think the greater part of the land on the route of this line is more suitable for pastoral occupation than for agriculture.
263. Do you not think it wise before constructing a line, to procure reliable data as to the capabilities of the district? If you can tell me how you are going to get reliable data I should be glad to accept it. I have been looking for reliable data for the last twenty years.
264. Surely there would be some officer of the Department capable of giving a report as to the character of the land, and whether it is suitable for agriculture or for dairying purposes? That sort of inquiry is no part of the Commissioners' duty; that is the function of this Committee. I give the only information that I am prepared to swear to. Matters of conjecture I am not able to swear to.
265. I am making inquiries to find out what officers give the data? I should be only too glad to assist you. The best of my experience of the Colony I give to the Committee; but I cannot go into details as to the quality of every acre of land.

266. We want to find out where we could get the data? I should think the local land office would be the best place. J. Harper.
267. You would get it from the district surveyor? Yes. 20 April, 1900.
268. Does he get instructions from the Railway Commissioners to report on the country through which a railway is to be made? No. Whatever information he obtains we get by our own initiative. We send an officer who obtains the information from the district surveyor.
269. It would appear that there is not very much pains taken about it? I deny that—very great pains, indeed, are taken.
270. You stated just now that the Railway Commissioners do not make inquiries as to the character of the country from the district surveyor? I did not. I said distinctly that the Railway Commissioners did have inquiries made from the district surveyors. We gather the information from them.
271. We have got it in the shape of a report? Yes.
272. In the event of this line being constructed, is the country of such a character that it would carry a large population, say for 10 miles on either side of the line? If you would say where the population is coming from, and state the terms on which the owners will let them have the land, I could tell you.
273. I am asking your opinion as to whether the country to be traversed by this line would be likely to carry a large population? As far as this line is concerned, you will notice that there is a great deal of alienated land. I cannot tell what are the intention of the owners of that land.
274. I am asking whether the country is of such a character that it would carry a large population? That I prefer not to answer.
275. *Mr. Levien.*] Have you been over that country? Yes.
276. Is there much good agricultural land near the Werris Creek end? Not in the immediate neighbourhood.
277. It is pastoral land there? Yes; in the neighbourhood of Werris Creek. Most of the agricultural land is south of the projected line.
278. *Mr. Shepherd.*] Are you acquainted with the country on the proposed line from Gilgandra? No.
279. You could not say whether it would be practicable to make a cut across there? The officer who was deputed to go and look into the matter says it is practicable, but he is not an engineer, and I should not like to endorse his opinion.
280. Are you aware what the principal stock is on the proposed line? Sheep chiefly.
281. They really want a more easy way of getting their wool and produce to market? Yes.
282. The roads in that district are rather bad, are they not? The way we went, trying to follow the route of the line, was very bad indeed. It was simply bush tracks. There are roads through the district which do not follow the proposed line.
283. From the character of the line I should imagine that the country is very rough there? Yes. The deviations in the line are intended to avoid elevations along the route. It is broken country when you have got a few miles from Werris Creek.
284. From the estimated cost the country must be rather difficult for railway construction? Yes. For a pioneer railway it is rather a heavy cost per mile.
285. Is there sufficient timber there to provide sleepers for the railway? I think that, adjacent to the line, they might get what sleepers are necessary. About the Talbragar there is plenty of iron-bark.
286. Did you notice what timber is growing there? The only timber of any value will be the iron-bark on the ridges. Practically the same timber will be available for that line as would be available for the Mudgee to Coonamble or the Dubbo to Coonamble line.
287. Is the route of the line well watered? I would prefer not to answer that question. A lot of the country there is supposed to be badly watered.
288. *Dr. Garran.*] You say that, for many years, you have been trying to get a good test as to the probable increase of settlement? Yes.
289. You have had to make a great many guesses during the course of the last twenty years, would you tell us whether, as a rule, your estimate has been above or below the mark? I think that, as a rule, I have been above the mark.
290. You have been too sanguine? I think I have generally. I have also been below the mark. For instance, I was below the mark in regard to the Cobar line. I do not think I was above the mark in regard to the Moree line.
291. Were you below it? I was a little below it.
292. The Department did not expect that that line would be such a success? No.
293. At Cobar you were above the mark before the mining was resumed? Yes.
294. But since it was resumed you have been below the mark? When I made my estimate of that line the mining was a dead letter. Since then it has been revived.
295. Your original estimate has been exceeded? Yes.
296. In regard to the Berrigan and Finley country, has your estimate been above or below the mark? It has been exceeded.
297. As far as experience goes that line has been justified? Yes.
298. Where a railway goes through private land much will depend on the willingness of the land owners to subdivide and sell or lease their land? Yes.
299. And you have no means of knowing beforehand whether they will do that? No.
300. And you do not know even when they have subdivided the land what they will do with it? No; I could mention a case in which a railway was projected where the owners of the land determined to place it all under lucerne to fatten stock for the market; but we had thought that population would be allowed to settle on that land.
301. I suppose the squatters study how to turn their land to the best account? Yes.
302. Sometimes you get into their confidence? Yes.
303. Do you know whether it is better to grow wool or wheat? I think most of them say it is better to grow both.
304. One plays into the hands of the other? Yes.
305. Is it better for the squatter to grow his own wheat or to let the land to small farmers, and take his share of the produce? It depends on the class of farmers he can get. Almost any squatter who can get a good class of farmers will be content to let them have the land. The difficulty is to get a good class of farmers.

- J. Harper.
20 April, 1900.
- farmers. There have been a lot of very indifferent farmers, who have not done justice to their contracts.
306. I suppose that farming, like everything else, is an industry that requires some knowledge of the character of the work? Yes.
307. It is not every man who has land hunger who would make a good farmer? No.
308. It is impossible for you to tell whether, if we make a railway through all that land marked blue on the map, any considerable portion of it would be devoted to agriculture? Yes.
309. Has there, in recent times, been a considerable sale of agricultural land belonging to the Peel River Company near Tamworth? I have heard that land there was going to be sold, but I do not know what the result has been.
310. It has not affected your traffic? No.
311. Would the land on the route of this proposed railway be as good as that land? That is rather a large question. The line would be 160 miles long.
312. I am referring to the first part? In the first part the black soil is as good as the best part of the Peel River Company's land, where the soil is black.
313. If it would pay to cultivate on the Peel River, it might pay to go to Werris Creek and do the same thing there? Yes. The line to Manilla passes through a large portion of the Peel River estate, and there is also a river.
314. Does the Peel River experiment cast any light on what might be done on the route of this railway? I think it would be better for the Committee to form their own opinion after they have been in the district.
315. But the Committee riding over and looking at the land would not be able to see whether it would be better to grow wheat or wool? No; but the Committee would have local witnesses before them who could give better information than I can.
316. But as the land has not been under wheat, even local witnesses can only say what they expect? I do not think the Committee would expect me to express an expert opinion on the subject.
317. Witnesses vary much in their quality;—some witnesses that we get in the country are so perfectly certain that a line will pay from the jump that if we acted on their opinion we should have railways all over the country? That is so. But I take it that the common sense which characterises the proceedings of this Committee is enough to guard them against snags of that kind.
318. Looking over our records, we see extraordinary assertions from people, all of which have been falsified? No doubt.
319. This projected line passes through a district which is at present occupied pastorally? No, not entirely. For a distance of 18 or 20 miles from Wellington there is good agricultural land.
320. The traffic which the line would get comes to the railway somewhere already? Yes; either at Quirindi or Wellington.
321. Would you get any more traffic if the railway were made? Only so much as could be expected to arise from having a railway close to an area devoted to agriculture.
322. You do not think that the railway would stimulate the growth of wool? No.
323. The squatters produce all the wool that they can, and if they had a railway they could not produce more? No.
324. It is only from the produce of tillage that you could get increased results? Yes, barring the discovery of mines.
325. The chance of getting increased traffic depends upon the chance of increased cultivation? Quite so.
326. And if there were a railway continued northward, from Mudgee to the west, that would take all the agricultural produce just as well as a cross-country line? No; it would not take it all. It would not affect the cultivation at Spicer's Creek.
327. You mean that it would not increase that? I should expect that it would increase it.
328. But there is no prospect of such an increase of traffic as would pay the interest on £500,000? No.
329. And you do not think that the pastoral reasons for making a cross-country line are, at present, very urgent? No.
330. The starving stock trade only comes in starving years, and then it does not pay? Exactly.
331. Does it pay the stock-owner? It is very good relief to the people who are able to take advantage of it.
332. Are not the charges which you make and the charges which they have to pay for the grass when they get to the grazing land so high that it barely pays them to save the lives of the sheep? That is so. I am quite sure that a drought which affects the Western District would probably also so much affect the district in the neighbourhood of Moree, and out to the Queensland Border that the whole of the available grazing country would be absorbed by stock from that district.
333. Suppose that we made this cross-country line, and you fixed your fares as low as possible, could the lands in the east, which are better watered by rain, take all the stock from the Darling country? No.
334. To make a cross-country railway in the hope that it will meet the difficulties of a drought year, is to rest upon a broken reed? It would be indicating that the people who own the New England country do not know their own business, that is to say, that they would hold the country on the off chance of their being able to let it in time of drought to people who want to bring their stock on to it instead of doing the best they can with it themselves.
335. I suppose that the New England people stock their land pretty well? Yes.
336. Then if holders of land had their land fully stocked, how could they take stock from other places? They could not do it, if they were managing their land properly.
337. You do not think that the good land would be used in a dry year to grow food for the western sheep? No; I have noticed that when we have been carrying stock during the last two years, people will acquire land to which to remove their stock. The big financial institutions do that, but as far as a general movement of stock is concerned in such cases it is impracticable; they cannot get the land for the purpose.
338. That is not the case in the Murrumbidgee district? Practically the whole of that land was acquired by Mr. McCaughy. He leased it, but I think he will be shrewd enough to acquire it absolutely in the future.
339. It might pay him to go to a great expense to save superior stock, but it would not pay in the case of ordinary stock? I do not think it would.
340. Has it come under your notice as traffic manager that these sheep which have come from the west to get food have gone back again? Yes; we are carrying sheep back now. 311.

J. Harper.
20 April, 1900.

341. After how long? Some have been there about twelve months.
342. Has New England taken much of the starving stock? Not very much. The pastoralists on the plains have been timid about sending their sheep there on account of fluke. It is sour country.
343. In a droughty season there is not so much risk of fluke, is there? Fluke is always there.
344. Do they get foot-rot there? No.
345. The people on the western slopes feel a drought as well as the people in the far west? Yes.
346. Then they will have the first pull of the grass-land in New England? If they have grass they reserve it for stock for the market; they will not turn a lot of store sheep on it.
347. It occurs to me that it would be far better to send the stock to market than to send it back to the Darling? When they rent the land they put so many sheep on it that the animals do not fatten, it merely keeps them alive.
348. Do you charge low rates for those who send them back? We allow 50 per cent. on all stock forwarded under a certificate from the local stock inspector, stating that it is necessary for the preservation of the lives of the stock that they should be removed. We also require a certificate from the stock inspector of the district to which they are sent. If he furnishes a certificate to the effect that the stock are fit to travel again, and we get a certificate from the inspector of the district to which they are going back that there is grass and water available, we carry the stock back at a reduction of 75 per cent.
349. Then in your opinion this route from Wellington to Werris Creek would not be of any great value as a starving-stock route? No; in my opinion the whole thing is premature. I do not see that the circumstances of the Colony warrant the construction of this line.
350. If it is not valuable as a starving-stock route, and it is doubtful whether it will induce much fresh agriculture, and as you got the traffic already, where is the advantage of making the line? As I have said, I do not think the circumstances of the Colony warrant the construction of this line. I cannot see what advantage is to be gained by it. I may mention that the Wellington people expect to be able to supply Moree and other districts with forage; but they will probably have plenty of competition from the Inverell district.
351. All the district between Narramine and Orange is good fodder-growing country? Yes; and so is the district between Moree and Inverell.
352. Would that be as great a length of country? There is about 100 miles of good country.
353. You think that the real market for Inverell produce will be in the west, not in the east? Yes; and as far as that is concerned, from Murrurundi and at least as far as Gunnedah there is a lot of agricultural land that will grow all they want in the shape of produce.
354. Then the Inverell people will be better off when the line is completed than they would be if they had a line made to Glen Innes? Yes; I think they are beginning to discover that themselves.
355. Of course, their market to the east is the market of the world, where they have plenty of competition? Yes; they have an advantage, as far as the west is concerned.
356. If the west is to trust to the east for forage that would be supplied in the shape of preserved food, hay, and so on, and not sending the sheep to the food, but sending the food to the sheep? Yes.
357. That is the service which the line will render to the western country? Yes; I am sure that the solution of the difficulty will be by carrying food to the stock.
358. *Chairman.*] This line is advocated by some as having national advantages in connection with the trunk line;—what are your views on that? I do not know where the national advantages will come in.
359. Did you make a note of the population between Wellington and Werris Creek? Yes; it is 6,000 for the whole district.
360. Did you notice what kind of a water supply there is at the Werris Creek end? There is only creek water, and it is highly mineralised in some of the creeks. We cannot use the water for our locomotives.
361. It is not a permanently-watered country? No.
362. Have you formed any opinion as to the two rival connections—Dubbo to Werris Creek and Wellington to Werris Creek? No; the only matter I looked into was that which I reported upon. I should think the route would be from Wellington, not from Dubbo.
363. Why do you favour Wellington in preference to Dubbo? I do not favour either; but I should say that the connection would be better made from Gilgandra, because you have got through the worst country when you get to Gilgandra. Starting from Gilgandra you get into a better class of country.
364. Can you tell us what proportion of the produce from the trafficable area at present goes to Mudgee? No; I could not tell you that. A good deal goes to Quirindi. The dividing point would be at Morven.
365. I suppose that the bulk would go to Mudgee, that being the nearest route to Sydney? Yes. Some of the Coonabarabran traffic goes to Gunnedah, and some to Quirindi. This line would take the Coonabarabran traffic at Morven, about 70 miles from Werris Creek; then Bomera, 45 miles from Werris Creek would take a portion of the traffic, and Walhallow would take another portion. That is the traffic which would go north. That which would go west would be taken from Mitchell's Creek, Spicer's Creek, and Cobborah.
366. From Spicer's Creek to Werris Creek it is all Crown land, held under long leases? No; some of the land is worthless, and is untenanted.
367. I suppose you could not advance one valid reason in favour of the construction of this line? I could not.
368. *Mr. Dick.*] What are the advantages, from a railway point of view, of a cross-country connection? The only advantage that I know of is that if you had a quantity of rolling-stock locked up in a wrong district, which we always take care to avoid as far as we can, it might expedite its removal. We find, as a matter of experience, that that cross-country line between Blayney and Harden is little availed of by people travelling to Melbourne; nine-tenths of the passengers prefer to come to Sydney, undertaking the longer journey.
369. That disposes of another claim urged on behalf of the line, that it might shorten the distance to Melbourne by 100 miles? My experience is that travellers who go to Melbourne want a day's spell by the time they get to Sydney.

WEDNESDAY, 25 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, LL.D.
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 370. *Chairman.*] Have you some documents to hand in in connection with the proposed railway from Wellington to Werris Creek? Yes. Following my evidence given on a previous occasion, I now hand in a tabulated statement giving particulars of the cross-country connection between the Northern and Western railways:—

WELLINGTON TO WERRIS CREEK.			
<i>Length of Cross-country Connection.</i>			
	Miles.		Miles
Brisbane to Wallangarra	233	Brisbane to Wallangarra	233
Wallangarra to Werris Creek	236	Wallangarra to Sydney	490

SATURDAY, 28 APRIL, 1900.

[The Committee met at the Court-house, Wellington, at 10.30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |
 JOHN MCFARLANE, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Roger Taylor Burton Gaden, grazier and farmer, and President of the Railway League, Wellington, sworn, and examined:—

R. T. B. 371. *Mr. Shepherd.*] The Committee would be glad to hear any remarks which you wish to make in regard to the proposal into which they are now inquiring—the construction of a railway from Wellington to Werris Creek? I believe that the proposed railway should be, and will be, constructed, because it forms the missing link which is required to connect the Northern with the Western and Southern railway systems. I believe, too, that the line would be a paying one, because I know the greatest part of the country which

it

R. T. B.
Gadon.
28 April, 1900.

it would traverse, though I have not travelled through some of it for a number of years. The land along the line is such as people could easily settle upon, inasmuch as a great deal of it is agricultural land, and, I understand, nearly two-thirds of it is still unalienated. I would add that there is good timber for a good part of the way which the line will take—timber which could be used for sleepers and for building purposes.

372. What kind of timber? In some places there are belts of iron-bark. Upon the agricultural land the timber is chiefly white box.

373. Is much of the land you speak of at present under cultivation? Nearly all the land along the proposed route, for a distance of 16 miles from Wellington, is under cultivation.

374. What stock does the land carry? Principally sheep.

375. Is any dairying now carried on between Wellington and Werris Creek? No; because that country is now too far removed from centres of population to make dairying there profitable.

376. Would the construction of the proposed railway give an impetus to agriculture or to dairying? I am certain that it would. Many of those who are now settled on the land would put three or four times as much ground under crop as they cultivate now, and the railway would cause them to utilise land which they cannot utilise now.

377. What are the principal crops grown here? You can grow in this district nearly anything that you care to plant. That statement is well borne out by the exhibits which my son has shown at Bathurst, Dubbo, Bourke, Orange, and Wellington. In each of those places his exhibits of produce have beaten the Government exhibits. You can grow wheat, potatoes, sorghum, millet, and barley in the district.

378. Are they growing those crops here now? Yes.

379. Has the fruit industry received any attention here? Only to a limited extent. Fruit does very well here.

380. Are there any vineyards of any extent? Not of any great extent; but vines do very well here, and I do not think you can beat this part of the Colony in wine-producing.

381. Do you find that wine arrives at maturity here more quickly than it does in warmer districts? I am hardly able to express an opinion on the subject; but I know that they make very good wine here. As a rule, it is a very strong wine, and resembles the Albury and Hunter River wines.

382. How far have you been along the proposed line from Wellington to Werris Creek? I have been as far as Mundooran from Wellington, and, years ago, I went through the greater part of the whole district that the line would traverse.

383. What is the character of the country between Wellington and Werris Creek? It varies a great deal. When you get on to the Liverpool Plains, and on to the Castlereagh, you get into black soil country; between Wellington and Mundooran it is mostly red soil and chocolate soil.

384. I suppose agriculture is not carried on at any great distance from the existing lines? Wherever land can be got it is put under cultivation, out as far as Cobborah; but the farmers out there are at a great disadvantage because of the cost of haulage.

385. Is any mining done in the neighbourhood of the proposed line? Yes; the Mitchell's Creek Mine is not far from the proposed line.

386. Is that a gold mine? Yes. Copper is also found in the district.

387. How far is Mitchell's Creek from here? About 9 miles.

388. Then it is near enough to be benefited by the existing railway? Yes; but the carriage from that mine would add very much to the returns of the proposed railway, and there are other mines being opened up which the construction of the proposed railway would greatly benefit. There is a place where coal could be got very close to the proposed railway.

389. How far from here? About 36 miles, on the Talbragar Creek. I know that the Railway Commissioners have looked at the proposal before the Committee only from the commercial point of view; but I look at it also from the national point of view.

390. What is your opinion as to the likelihood of the line paying;—we have had rather an unfavourable estimate of its possibilities? I was astonished when I read the Railway Commissioners' report. I believe that this would be a paying line, because I feel sure that a large population would settle on each side of it if it were constructed.

391. Do you think that the Commissioners' estimate of revenue is too low? Yes. There is a lot of land now locked up which will be settled upon when the leases fall in, and a railway would assist that settlement. Of course, there are spots which are somewhat barren; but their barrenness is made up for by the goodness of the timber growing there.

392. Do the people living along the route say that they would go into farming more largely if there were a railway? Yes; and there is no doubt that they would. At the present time it costs them about 4d. a bushel to get their wheat carried from Spicer's Creek to Wellington, whereas, if there were a railway, it would be carried for less than 1d. a bushel.

393. Is the clearing of the land you speak of very expensive? Not as a rule.

394. What does it cost per acre to clear it? In some parts it would not cost more than 10s. an acre, while in other parts it would cost 30s. an acre.

395. Is the soil easily worked? Yes. There is a great deal of good agricultural land in the district—really first-class land—though people seeing it under timber might not think that it was good. The average yield of wheat here would compare favourably with the yield in any other part of the Colony.

396. *Mr. Watson.*] What bearing do you think the construction of the proposed line would have upon national interests? The proposed line would connect the Northern railway system of the Colony with the Western and Southern systems.

397. Do you think that such a connection is required at the present time? Yes.

398. How would it be used? It would be a great saving of time to people travelling either to the north or the south of the Colony. It would enable people to make direct journeys without the necessity of going to Sydney.

399. Is it not probable that, even if the railway were constructed, it would be necessary for some years to run only slow or mixed trains upon it, so that it might still be quicker for a traveller to make his journey *via* Sydney than directly across country? I think the Commissioners would run the trains in such a way as to produce the most revenue. If they ran quick trains across the proposed line the public would, of course, travel by them, and I think that even slow trains would make the direct journey more quickly than

R. T. B.
Gaden.
28 April, 1900.

than it can be made now. Mr. Engineer Jones stated to the Under Secretary for Works, in his report on the proposal in 1891, that :—

The value of a cross line to Werris Creek is more especially due to the facilities it affords for intercommunication between the different sections of our railway system, and thus creating increased traffic.

It is a midway connection, thereby insuring a great saving in distance over the existing routes. Taking Wellington and Werris Creek as common points, I find there is a gain of 352 miles compared with the present railway journey, *via* Sydney.

Should the line from Cobar to Broken Hill be made, the Wellington-Werris Creek cross-line would bring Adelaide within 1,439 miles of Brisbane, as against 1,808 by the present route, *via* Melbourne and Sydney, thus giving a saving of 369 miles.

With respect to Melbourne and Brisbane, assuming the present Harden to Blayney branch be used, the Werris Creek connection would shorten the journey by 143 miles.

I think there can be little doubt a cross line would be largely used for the carriage of mails.

It will also be a good stock carrying railway, and, in time of drought would afford facilities for the transfer of starving stock from the west to New England and other districts.

The military and strategic value of such a connecting line as the one under consideration cannot be overlooked. It would greatly aid, should occasion require it, in the speedy massing of troops or their transport to any part of New South Wales or the other colonies.

In the event of the Hawkesbury Bridge being damaged by an enemy or otherwise rendered uncrossable, the Werris Creek line would be found most useful as preserving intact the continuity of our railway system.

I quite agree with that statement.

400. It has not been found that the Blayney-Harden connection is much used by through passengers? I contend that that connection is not on all fours with the proposal before the Committee. What we originally wanted was a line from Werris Creek to the western line, and then on towards Harden. The Blayney-Harden line, however, has now been constructed, and although it passes through a great deal of inferior country, it furnishes a connection between the western and the southern lines. If another connection were made between Werris Creek and Wellington that would answer the purpose in hand. The Blayney-Harden line has really no feeders; but the proposed line would make up for the mistake which was made when that line was constructed, and it would pay the Railway Commissioners to run quick trains on it.

401. Are you able to form an opinion as to whether any considerable number of people from this district, or from places further to the west, would wish to travel to places on the northern line more quickly than by going round through Sydney? If the proposed railway were constructed anyone who wished to visit the northern part of the Colony would use it in preference to going round through Sydney, because of the saving in time and expense. The proposed line would also provide means of moving stock in times of drought. Only a very short time ago some thousands of tons of chaff were sent from Wellington to Moree. That chaff had to be sent round by way of Sydney; but, if the proposed railway had been constructed, it would have gone direct. I am certain that if the line had been constructed during the recent drought a lot of stock from Forbes and the districts out in that direction would have been saved.

402. Was not stock sent to Dubbo, and places round about from the western district, only a year or two ago? Yes.

403. This district would not get many stock from the country between Wellington and Werris Creek? If the country were properly settled I think it would.

404. But people living between Wellington and Werris Creek would not be likely to send stock to Wellington for agistment? If the district were as bad as it has been during the last two years they would do so. I have known them to have a very bad season out north when we have had a good season in Wellington.

405. What would cause stock from Parkes and out that way to pass Wellington to get to the northern line? The Wellington district is not sufficiently large to meet the requirements of all the stock that requires food. I have known thousands of sheep to pass through Wellington going northwards, and great numbers of them to die on the roads, whereas if the proposed railway were constructed they would be trucked direct to the New England country, or to the country about Tamworth and Werris Creek, where there was good feed during the last drought. The stock I speak of could not make that way, because of the want of grass and water on the road.

406. Do you think a trade in fodder between Wellington and Moree is likely to develop;—we understand that the Hunter River District supplies a great deal of fodder to the northern districts? The Hunter River District does not supply it all.

407. It has been suggested that a less expensive connection, and one which would go through better country, would be a line from Curlewis to Gilgandra, junctioning at Gilgandra with the Dubbo-Coonamble line;—can you offer an opinion as to the relative merits of the two routes? I think that the proposal into which the Committee is inquiring is a better one than the suggested Curlewis-Gilgandra line. A line from Wellington to Werris Creek would pass through better country than a line from Curlewis to Gilgandra.

408. *Mr. McFarlane.*] What crops do you grow? Wheat, corn, barley, rye, oats, potatoes, sorghum, pumpkins, and marrows.

409. What area have you under cultivation? My place is about 3 miles from Wellington, and I have only lately gone into farming. I have only 300 or 400 acres under cultivation.

410. What is the average yield of wheat per acre in a moderate season? I think that the average yield in the district through which the proposed line would pass might safely be put at 16 bushels to the acre. During the last two or three years the yield has been as much as 30 bushels and more to the acre.

411. Do you grow maize to any large extent? Maize does not do so well here as other crops. As a rule we do not get rain at the right time for it; but when we get good crops they are very heavy. I have known a crop of maize to yield as much as 90 or 100 bushels to the acre. During the last thirty years I have never known failure in the wheat crop.

412. How does your land compare with other agricultural lands in the district? I think it is fair average land.

413. How would your land compare with the land along the route of the proposed railway? Some of that land is quite as good as mine, some of it a little better, and some of it worse.

414. Generally speaking, would it be similar to your land? Yes.

415. Would it grow the same crops as your land grows? I cannot see why it should not. That district must have a similar rainfall to ours.

416. How many acres in the district you speak of would be sufficient to enable a man to maintain himself and his family by agriculture? That is a very hard question to answer; but I believe a man would do very well with 1,000 acres, if he went in for mixed farming.
417. Do you think that if the proposed railway were constructed, most of the people who would settle in the district would use the land for agricultural purposes? Yes; but, in my opinion, settlers would act more wisely by going in for mixed farming. By spelling the land, and running stock on it for a year or two, you conserve its fertility.
418. How many acres used solely for agriculture would be sufficient to make a farm? About 320 acres; but I do not think the farms should be as small as that, although many of those who are making a living in this district have not one-fourth of that area.
419. Do you consider the district that we are speaking of a first-class grazing district? Some parts of it are very good for grazing, and could not be surpassed.
420. Is the land 10 or 12 miles back from the route of the proposed line similar to that on the route? There is a great deal of land back from the route of the line which is superior to that nearer in.
421. Would that superior country be served by the proposed line? Yes.
422. Is the unalienated country which you have mentioned close to the proposed line, or at some distance from it? It is land that would be served by the proposed line.
423. Would it be taken up if the proposed line were constructed? Yes; on the first land day after it was offered. There is a continual cry for land now.
424. Are the holdings along the route very large? There are some pretty large holdings close to Wellington. I suppose Mr. Barton has the largest holding, and he has about 5,000 or 6,000 acres under cultivation. I believe that the proposed line would go through his land.
425. If the proposed line were constructed, is it likely that these holdings would be cut up into small areas? When population comes to the district, that must be a matter for the consideration of the landholders.
426. How far is Mr. Barton's place from Wellington? His head station is about 6 miles from Wellington, but his land extends 12 miles further out along the proposed line.
427. Is the district well watered? You can get plenty of water in Mitchell's Creek by sinking wells.
428. Can you get water all through the district by sinking wells? Yes.
429. If the proposed railway were made, would the district between Wellington and Werris Creek carry a fairly large population? I am certain that it would.
430. With an increase of population, there would naturally be an increase of traffic? Yes; that would follow.
431. *Vice-Chairman.*] Do you think that within 20 miles on each side of the proposed line there is much land as suitable for agriculture as the land from which you obtained 16 bushels of wheat to the acre? I think that there is.
432. Mr. Harper has told us that the best land for agricultural purposes within the influence of the proposed railway has been alienated? Yes; but that land would be made more reproductive if it were served by a railway.
433. Do you know what the rainfall is between Wellington and Werris Creek? Between 24 and 25 inches. The rainfall increases as you get towards the Liverpool Plains.

R. T. B.
Gaden.
28 April, 1900.

Stanley Septimus Lowe, farmer and grazier, Spicer's Creek, sworn, and examined:—

434. *Vice-Chairman.*] How far is Spicer's Creek from Wellington? Twenty-two miles.
435. Will you describe the country on Spicer's Creek? It is country very suitable for wheat-growing, with a rich chocolate soil.
436. Is there much of it suitable for wheat-growing? Yes, a great deal.
437. What is the area of your holding? 4,500 acres.
438. How much of it do you cultivate? I have not done much farming hitherto, because I am rather far from the railway; but I have about 240 acres now under cultivation.
439. How much of your land is suitable for agriculture? About 500 acres. My land is situated at the head of the creek.
440. Do the holdings further down the creek contain larger areas of arable land? Yes.
441. How much of the land in those holdings is fit for cultivation? I should say quite 60 per cent.
442. In what direction does the good land extend? It is equally good in all directions.
443. How far does it extend along the route of the proposed line? It is good all the way from Wellington to Cobborah. My run was thrown open last year, and the greater part of it was taken up on the first day, while, after the second day, there was not an acre left.
444. Is the Crown land there suitable for agriculture, or is it suitable only for pastoral occupation? It is suitable for both agricultural and pastoral pursuits.
445. Then why has it not been used? It is held under a ten years' lease.
446. The Crown lands on the Medway Holding have been open for selection for some years;—why has it not been taken up? I am not acquainted with that land, but I know that all the Sandy Creek country to the east of it has been taken up. I do not say that all the land is good, but, generally speaking, the land is good.
447. Your holding is now about 22 miles from a railway station? Yes.
448. Do you find that a serious handicap to agricultural operations? Yes.
449. What do you pay for carriage? About 4d. a bushel on wheat.
450. Is the road a good one? Fairly good, but it is very hilly.
451. What do you pay for back-loading? The carriers generally bring back-loading at about half rates.
452. Would the construction of the proposed railway stimulate agriculture in that district? I think so.
453. At the present time landholders are prevented by the high rates of road-carriage from going in for agriculture? That is true to a great extent, but the land is so good for agriculture that, in spite of the disadvantage to which you refer, a good many people are farming it, and they are increasing their cultivation areas.
454. Would the proposed line confer any other benefit upon the district that you speak of besides cheapening the carriage of produce? Yes; it would also provide facilities for sending away wool and stock.

S. S. Lowe.
28 April, 1900.

S. S. Lowe. stock. The people of Spicer's Creek would not dream of asking for a railway simply to serve themselves; but the district is a good one, and would contribute a considerable amount of traffic to the proposed railway if it were constructed.

28 April, 1900.

455. What is the average size of the holdings near Spicer's Creek? They vary very much; but I know of several farms which comprise over 500 acres of cultivation. There are a good many holding of all sizes.
456. If the proposed railway were constructed, would the land be used only for agriculture, or would it be used for mixed farming? It would be used for mixed farming. There are some rocky hills which could not be farmed at all, unless they were used for grape-growing.
457. *Mr. Shepherd.*] The estimated cost of the proposed railway, exclusive of what must be paid for land resumption and compensation, is very large;—do you think that the people through whose land the line would pass would be willing to give the Government what was required for railway purposes? I cannot speak on that point.
458. Is the country you hold average country? No; there is better agricultural land lower down the creek, and nearer to the proposed railway.
459. How much of the country within 20 miles on each side of the proposed line is fit for agriculture? I think about 60 per cent.
460. How far along the line would country of that nature extend? For about 12 miles beyond where I live, so far as I know the district.
461. That would be about 34 miles from Wellington? Yes.
462. Do you think that if the proposed railway were constructed there would be a disposition to largely increase the area of land under cultivation in the district? I am sure of it. The area of cultivation is being largely increased at the present time. A large paddock on a holding next to mine gave 40 bushels of wheat to the acre the year before last, and last year there was every probability of a similar yield when an early frost destroyed the grain in the ear, and the crop had to be cut for hay.
463. Was that crop grown on river land? No; on the land that is usually used for wheat. Last year I myself had an average of 24 bushels to the acre all through.
464. *Mr. McFarlane.*] Is there much land under cultivation in the vicinity of Spicer's Creek? Yes, a considerable area.
465. Would that land be largely increased if the district were given railway communication? I think so.
466. What is the character of the land in the reserves along the route of the proposed line? The land in the reserves is similar to the rest of the land in the district. A mile of country was reserved on each side of the first surveyed line.
467. What is the value of the land on Spicer's Creek? Freehold land is worth, on the average, about £2 an acre.
468. Improved or unimproved? That is land which has been fenced and ringbarked.
469. What would be the value of unimproved land there without a railway? From 15s. to £1 per acre. The quality of the land varies in different localities.
470. Would those prices apply all along the line, as far as Cobborah? They apply as far as the fall between Spicer's Creek and Sandy Creek.
471. If the proposed railway were constructed, would it materially increase the value of the Crown lands of the district? I should think so, because of the facilities it would afford to settlers.
472. Is the country well watered? Not naturally.
473. *Mr. Gaden* told us that water is always obtainable by sinking wells? Yes; I have sunk wells in the creeks myself.
474. Do you ever suffer severely from droughts? Yes; in 1880 we suffered very severely from a drought; so much so that all the stock had to be removed.
475. If the Crown lands in the district were thrown open for settlement what would they be used for? Chiefly for agriculture, I think.
476. That would mean closer settlement than would follow pastoral occupation? Yes.
477. Where would you remove sheep to in the event of a drought? I was only a schoolboy at the time of the 1880 drought, and I know that our own stock were removed to the Mudgee River, but I cannot say where other people took their stock.
478. What other crops are grown besides wheat? The chief crop is wheat, but maize is also grown, and so are lucerne, oats, and rye.
479. Where is your market? Wellington is our chief market, but we also send to Mudgee and to Gulgong.
480. If the Crown lands in the district were thrown open for settlement, would the market you have now be sufficient to absorb the whole production of the land, or would you have to find other markets? Last year a great deal of wheat had to be sent away from here, and the year before last wheat was sent from here to Johannesburg.
481. Would it pay you to grow wheat for the Sydney market? I should think so. It is the opinion of older farmers than myself that it would pay us.
482. *Mr. Watson.*] The Railway Commissioners estimate that a loss of £18,000 per annum will be incurred if the proposed railway is constructed;—*Mr. Harper* expects to receive a total revenue of only £8,586? I think that the Railway Commissioners have over-estimated the probable loss. In my opinion they have not made sufficient allowance for the increase of traffic that may be expected. The proposed line would complete the connection between the Northern, Western, and Southern railway systems, and would no doubt take a great deal of intercolonial traffic.
483. The intercolonial traffic would have to be passenger traffic, because it would be too expensive to send goods by train from Brisbane to Melbourne? At any rate, trade always grows after a railway is made, and many railways which did not pay at first have come out well in the end.
484. I believe that last year the Commissioners lost about £40,000 on the Blayney-Harden line? That is an incomplete connection.
485. Do you think that the proposed line would increase the chance of the Blayney-Harden line paying? Yes.
486. Do you think it would be worth the while of the landowners along the route to guarantee any proportion of a probable deficiency—(say) an amount equal to what they now pay in land tax? I am 12 miles from the line, and practically it would not benefit me very much more than the existing line does; but it might pay me to give one-half.

Alexander Ross, farmer, Spicer's Creek, sworn, and examined:—

487. *Mr. McFarlane.*] Have you resided long where you are now living? I have resided about twenty-three years at Spicer's Creek. A. Ross.
23 April, 1900.
488. Have you a good general knowledge of the country through which the proposed railway would pass? Yes; for the first 50 or 60 miles.
489. What do you grow on your land? Wheat.
490. How many acres have you under cultivation? 1,100 acres.
491. What is the size of your holding? 1,326 acres.
492. Is the land well suited for agriculture? It is splendidly suited for agriculture.
493. What is the average yield of wheat to the acre? Eighteen or 19 bushels; that is the average yield since I have been there.
494. Is your land a fair sample of the country for the first 50 or 60 miles along the proposed route? It is just about equal to the average run of the country for the first 50 miles along the proposed route.
495. Is the land along the route of the proposed line as suitable for agriculture as your land? Yes; but a small belt of iron-bark comes in about 24 miles from Wellington, on the left side of the road. That belt comprises about 2,000 acres.
496. Is your property near the route of the proposed line? My boundary is about 2 miles away from it.
497. What distance from Wellington is your holding? Twenty miles.
498. Do you bring your produce to Wellington? It mostly goes to Geurie, about 18 miles from my place.
499. What does it cost you per bushel to take it there? Twopence-halfpenny per bushel.
500. Do those who are engaged in pastoral pursuits devote themselves chiefly to the breeding of stock? Yes; all the Crown lands in the district is given up to stock.
501. Is much dairying done in the district? Not after you get 10 or 12 miles from Wellington.
502. Is the land suited for dairying? Yes; it is splendid land.
503. Is dairying profitable where it is carried on? Yes.
504. If the proposed railway were made would more land be used for dairying? Yes; dairying would then be a live thing right through the district.
505. Would dairying pay better than sheep-farming? On the average it would; but last year was an exceedingly good year for wool-growing, because the price of wool was so high.
506. Is any large area of Crown lands open for settlement in your district? On Gillinghall Holding there are about 3,000 acres of Crown lands, which fall in next July; on Bodangora Holding there are 12,000 acres, and on Murrumbidgee Holding there are 40,000 acres.
507. What kind of country is it? Splendid country; you could not get better.
508. Will that land be taken up when it is thrown open for settlement? Yes; it will not remain open a day.
509. If the proposed railway is made will people take up the land for agriculture or for stock-raising? For agriculture.
510. How many acres of that land would be required to maintain a family by farming? 400 acres.
511. For stock-raising a larger area would be required? Yes; 1,600 or 1,800 acres.
512. Is it land which would carry a large population? Yes.
513. The map shows that there is Crown land not held under lease still open for settlement? Some of the land on Cobrauraguy Holding is thickly timbered, and would cost a great deal to clear.
514. Have you a knowledge of the country for any distance from Wellington, extending 15 or 20 miles on each side of the proposed line? Yes.
515. How would that land compare with the land nearer the surveyed route? It is of equally good quality.
516. For what distance out would the railway serve that district? It would serve the land to a distance of about 18 miles.
517. What is the greatest distance which the farmers now send their produce by road? The farmers living about Cobborah have to cart their wheat 50 miles, which takes away all the profit.
518. What is the value of improved land in your locality—land which has been fenced and cleared? About £7 an acre; that would be average land.
519. What would be the unimproved value of the unalienated land? About 30s. an acre.
520. Would the construction of a railway increase the value of that land to any marked extent? Yes; if the railway were made, and that land thrown open to selection, it would not be many years before it would be all under cultivation. The following statement shows the acreage under wheat between Spicer's Creek and Mitchell's Creek:—

Holder.	Area of Holding (C. P. land).	Area under cultivation.	Holder.	Area of Holding (C. P. land).	Area under cultivation.
	acres.	acres.		acres.	acres.
F. G. Lowe	5,000	500	A. Williams	400	250
T. Jordan	1,250	300	J. McLeod	1,500	400
J. Horwood	570	90	M. Finn	320	200
W. Creigan	1,985	130	D. Laws	300	100
G. Antes	320	90	D. Gollan	1,265	700
J. Horwood	240	115	A. McLeod	240	120
P. McCabe	1,170	15	Lockrey Bros.	740	350
J. Ross	1,680	400	T. Crick	920	700
A. Ross	1,263	1,000	J. Courts	400	110
G. Rowe	1,665	1,100	John Courts	450	270
S. J. Squires	40	30	J. Hollow	600	280
J. W. Ross	480	260	P. Bright	80	20
D. Ross	1,165	600	G. Astill	80	30
T. Speechly	120	50	E. Bright	80	15
A. Speechly	240	100	Jas. Rutherford	5,000
A. Williams	240	160	H. Bird	120	80
J. Bourke	320	90	Thos. Slack	640	300
T. Newby	120	40			

Of the land to be thrown open for selection, there is already surveyed, on Gillinghall, 3,000 acres, in four blocks; on Bodangora, 12,000 acres, in nineteen blocks; and on Murrumbidgee, 150,000; but only about 40,000 acres would benefit by the construction of the proposed line. All that land is suitable for cultivation, and the district contains plenty of timber for railway purposes. The area under cultivation has been increasing about 25 per cent. every year.

All the holdings I have mentioned are within 6 miles of the proposed line,

521.

- A. Ross.
28 April, 1900.
521. Some of the holdings are very small;—have the holders no other occupation? No.
522. Are they men with families? Three of them are not.
523. In the event of the proposed railway being constructed, would the large holdings be cut up into agricultural areas? I should think so.
524. You think that the land would either be cut up or would be used by the land-holder himself for agriculture? Yes.
525. *Mr. Watson.*] How long does it take you to get to the railway station now? The trip takes two days.
526. Would a line from Mudgee to Duncadoo serve you? No; it would be too far away.
527. Would it pay you to make any contribution towards the annual upkeep of the proposed railway, with a view to reducing the large annual loss which the Railway Commissioners anticipate upon the construction of this line;—could you pay, for that purpose, as much as you now pay in land tax? Yes.
528. Would you be prepared to give a guarantee to pay that amount? Yes, because it would be nothing to what I pay now for carriage.
529. Do you think that the people generally who would be served by the proposed line will look at the matter in the same light? Certainly. There is no comparison between the land tax and what we have to pay for road carriage.

William Smith, junr., farmer and grazier, Mitchell's Creek, and Chairman of the Bodangora Progress Committee, sworn and examined:—

- W. Smith, junr.
28 April, 1900.
530. *Mr. Watson.*] Bodangora is 12 miles north of Wellington? Yes.
531. What are the views of the people in your district in regard to the construction of the proposed railway? The construction of the line would lessen the cost of carriage to farmers and pastoralists, and would enable persons engaged in the mining industry to obtain coal for their operations instead of wood, the supply of which is now beginning to decrease. It would also give facilities for the transport of mining machinery and other requisites for mining. The following memoranda have been sent to me by the manager of the Mitchell's Creek Freehold Gold Estate, Wellington, in connection with the proposal before the Committee:—

Amount of quartz crushed—14,200 tons per annum.
Quantity of gold won, average for three years—9,000 oz. per annum.
Gross value of gold won, average for three years—£32,000 per annum.
Number of men employed directly—240 (all year round).
Annual freight paid to Railway Commissioners at present—£660.
Weight of goods carried at present—200 tons per annum.
Amount of firewood consumed—2,800 cords, valued at £1,650 per annum.
Amount of wages and salaries paid—£21,000 per annum.

If railway constructed, coal would be used instead of firewood; calculated consumption, say 60 tons per fortnight—1,560 tons per year—

Freight on coal from Lithgow to Bodangora would be	£936
Goods—extra freight, Wellington to Bodangora, say	£40

Increase in freight account

£976 per annum.

Amount paid to Railway Commissioners as freight from commencement of operations to date (January, 1900), say £5,000.

I am also instructed by the manager of the mine to say that they can be certain of at least seven years' work, and that they propose to shortly place in position machinery of the most modern type at a cost of £10,000; the machinery now there being worth something like £100,000. In addition to the Mitchell's Creek Mine, there are five other mines known to me. Applications for the erection of a public battery have been made by those on the old Kaiser field. It has been stated that all the reefs will pay wages, and the field would give a great deal of traffic to the railway. It is proposed to construct a station $2\frac{1}{2}$ miles from Bodangora, and another station would be necessary at Comobella. There is also a copper-mine at Bolaro. If the proposed railway were constructed, the traffic to and from that mine would go to Bodangora instead of coming to Wellington as it does at present. There are numerous indications of mineral deposits throughout the district, and the assayer, the metallurgist, and the manager at Mitchell's Creek are all highly impressed with the metalliferous character of the country. I have no doubt that, as years go by, the district will be one of the richest mining districts in New South Wales, and that opinion has been endorsed by Father Curran. There are larger copper deposits within 2, 4, and 8 miles of Bodangora; but owing to the cost of carriage it is impossible under present conditions to work them at a profit, though they would pay if there were a railway to carry coal, machinery, and other mining requisites. There are also large deposits of limestone within a mile and a half of the proposed railway station at Bodangora, and also large deposits of ironstone, and as the country progresses, these will be made use of. The population of Bodangora is about 900, and of the surrounding district 1,650. The industries of the district comprise pastoral, agricultural, and mining pursuits. The estimated area of the land under cultivation there is 5,500 acres, giving a yield of 50,000 bushels of wheat and 3,750 tons of hay. The town has a public school, with an average attendance of 120 children; there are three places of worship—Anglican, Roman Catholic, and Wesleyan, and a post and telegraph office; there is a police station, a Mechanics' Institute, and a licensed hotel. Most of the land around the town is alienated, but away from it there are 5,000 acres of Crown land, which will shortly be made available for settlement. Several of the miners hold small blocks of land under special lease. This land they cultivate. There are about 35,000 sheep and a large number of horses and cattle in the district. The Mitchell's Creek mine runs a stamper of 50 head, and it is intended to bring the battery up to 100 head. Lincoln is a small settlement, about $2\frac{1}{2}$ miles from Bodangora. It has a public-house and a post office. There is another small settlement at Kaiser, a mile from Bodangora, and there are several dwellings there. The following is a statement of the

the business done at the Post Office, Bodangora, during the year 1899, and was furnished by the local postmaster:—

I exchange mails daily as under:—To and from Sydney (and parcel bags), once; to and from Wellington, once; to and from Jabbone, once.

*This does not include calls; records only in Head Office.

There is a daily mail to and from Wellington.

532. I suppose most of the land around Mitchell's Creek is already alienated? Yes.

533. There is very little Crown land there? Out towards Mr. Ross's holding there are large areas of Crown land, the leases of which fall in next July.

534. Is that good land? Splendid land.

535. Do you think it would be taken up if the proposed railway were constructed? It will be taken up in any case, and the wisdom displayed in throwing it open for settlement in large blocks will make the land doubly valuable.

536. How far are the copper deposits you spoke of from Bodangora? There is one at Bolaro, about 20 miles from the proposed Bodangora station, in a north-east direction; another one about 2 miles from the proposed line, and another about 4 miles from it.

537. Are they being worked now? No; because the rates of freight are too high.

538. The field that is 20 miles from Bodangora is only 30 miles from Wellington;—would a saving of 10 miles road carriage make all the difference between profit and loss in its working? I think so; it would mean 10 miles each way.

539. Are the deposits large? Very large.

540. Do you know what assays have been made? All I know is that the mines would pay to work if it were not for the high rate of carriage at present prevailing.

541. I understand that the manager of the Mitchell's Creek mine has stated that if the proposed railway were made he would use Lithgow coal;—would it cost him much to cart coal from Wellington to the mine? Yes; and it would not pay him to cart it. About two years ago the Lithgow people supplied the mine with coal at reduced rates, but it would not pay to cart it from Wellington. The manager of the mine has told me, however, that if coal could be brought within 2 miles of the mine he would use it. The supply of wood is lessening.

542. Do they chlorinate at the mine? Yes. I think that there will be an increase of 30 per cent. in the cultivation in this district, and out towards Mr. Ross's holding the area of land under cultivation will be very large indeed.

543. Will the construction of the proposed railway greatly stimulate agricultural production? Yes; because it will give better means of transport. The transport by team is too expensive for a low priced product like wheat.

544. Do you know enough of the people along the route to hazard the opinion that they would exchange pastoral for agricultural operations if the proposed railway were made? They would combine pastoral pursuits with agriculture. The late Mr. Thompson, of the Agricultural Department, spoke of the land as some of the finest agricultural land in New South Wales, and he considered that dairying, if ensilage were used, would pay 20 per cent. better than agriculture.

545. Did he say where you would find a market for your produce? I think that if we produced a good article we could find a market for it in Great Britain.

546. You have to take the produce a long distance to get to the sea port? Yes; but dairy produce takes up comparatively little space.

Donald Ross, farmer and grazier, Spicer's Creek, sworn, and examined:—

- D. Ross.
28 April, 1900.
547. *Vice-Chairman.*] You have heard the evidence which was given to-day by your brother;—will you make a statement embodying what fresh evidence you have to give to the Committee;—I think you know the country further along the proposed route than he knows it? The country to the south-east of the line is for the most part fine agricultural land, and along the Talbragar River there is a lot of land suitable for grazing. The agricultural flats are similar to those about Wellington, but they are larger.
548. What proportion of the land within twenty miles of the proposed line would be suitable for agriculture? To the south-east about three-fourths of the land would be suitable for agriculture; out towards the Talbragar the land is more suitable for grazing.
549. Is much of the land being cultivated now? No; there is very little cultivation out that way.
550. What is the reason of that? The people out there complain about the cost of carriage; they have now to send their produce to Mudgee.
551. Do you think that, with the construction of a railway, they would turn their attention to agriculture? I believe that the agricultural increase would be as much as 50 per cent. within a short time after the opening of the line. Between Wellington and our place agriculture is increasing at that rate.
552. Would an increase in population follow the construction of the line? Yes.
553. What is the land like on the north side of the proposed line? About one-fourth of it would be suitable for agriculture.
554. How far along the route will your descriptions apply? For about thirty miles.
555. Do you know anything of the country between Curlewis and Gilgandra? No.

MONDAY, 30 APRIL, 1900.

[The Committee met at the Court-house, Wellington, at 10'30 a.m.]

Present:—

WILLIAM THOMAS DICK, ESQ. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of railway from Wellington to Werris Creek.

John McLean, farmer and grazier, near Cobborah, sworn, and examined:—

- J. McLean.
30 April, 1900.
556. *Vice-Chairman.*] Are you living at Cobborah now? I am not interested in property there at the present time, but I lived there for about eleven years.
557. I understand that you have a good general knowledge of the country between Wellington and Murrumbidgee? Yes. From Wellington to the Talbragar I look upon the country as highly suitable for both agriculture and pastoral pursuits.
558. For what distance along the proposed route? About 30 miles.
559. And extending how far on each side of it? On the west my description would apply as far as Dubbo, and on the east—as far as my knowledge of the district extends—about 15 miles.
560. Is the country so good that it could be wholly devoted to agriculture, or will it be necessary for settlers on it to combine agriculture with grazing? The whole of that country is not adapted for agriculture.
561. How much of it is good agricultural land? I should think that about two-thirds of it would be fit for agriculture.
562. How many acres of agricultural land would be sufficient to maintain a man and his family decently? In my opinion 1,000 acres would be a nice holding for a man.
563. Would it be necessary for him to farm the whole of this 1,000 acres in order to maintain himself? No; he could farm one-half of it, and use the other half for grazing.
564. Is the greater part of the good agricultural land between Wellington and Cobborah now under cultivation? No; part of it is still Crown lands, though as good as the land that has been brought under cultivation.
565. Is any of the land on the Medway holding arable land? The land I am referring to comprises part of the Murrumbidgee holding and part of the Bodangora holding.
566. If the Dubbo-Coonamble line and the Wellington to Werris Creek line were both constructed, and the Murrumbidgee holding thrown open for settlement, which line would the traffic use? The Wellington-Werris Creek line. That line would command a large local traffic, and would make the distance to Sydney less than it would be by using the Dubbo to Coonamble line.
567. What effect would the construction of the proposed line have upon the country between Wellington and Cobborah? The tendency would be to cause land suitable for agriculture to be used for that purpose. It is difficult for people living 30 miles from a railway to go in for agriculture in competition with people living nearer the railway.
568. Where do the agriculturalists of Cobborah usually send their wheat and other produce? The people residing to the east of Cobborah send to Mudgee, a distance of 50 miles, and those residing to the west mostly send to Dubbo.
569. Has agriculture made fairly rapid progress during your residence in the district? It has been somewhat rapid since I went to live in the district; but it has been greatly retarded by the want of railway communication.
570. Do you think that a great deal more land would be brought under the plough if the proposed railway were constructed? I think that three times as much land will be put under cultivation within the next ten years if the proposed railway is constructed.
571. What is the average yield of wheat between Wellington and Cobborah? About 16 bushels to the acre, excluding last year's returns? I go by the police returns for the Cobborah district.
572. Do the farmers regard that as a fair yield? Yes, year in and year out.

573. If the proposed railway were constructed, would they at any time find a market on the northern or north-western lines? Yes. Last year stock was sent from the northern districts to the Cobborah district, and the firm to which I belong sold a very large quantity of straw to feed starving stock. If the railway had been constructed, that straw would have been sent to the district from which the stock came. I think that in dry seasons a considerable quantity of hay would be sent northward from the district you have been speaking of.

J. McLean.
30 April, 1900.

574. It has been stated that the proposed line should be constructed for national reasons;—have you any opinion to give on the subject? I think that is a very important consideration.

575. What national advantage would accrue from its construction? The line would serve the public who wish to travel from the southern to the northern railway system.

576. That would not bring much revenue to the railway? I think that the country along the route would be very much settled upon, and the line would serve a large territory.

577. The Railway Commissioners estimate a loss of about £18,000 per annum on the working of the proposed line;—do you think that the character of the country through which the line goes would justify us in recommending a proposal which would entail so large an annual loss? I think the deficiency has been estimated upon the present traffic; but the prospective traffic, if a line were constructed, should be much greater. I am of opinion that the line would be a paying one in the near future.

578. The Railway Commissioners say that if the line would develop new country and bring business on to the main lines, they would not mind an initial loss; but they see no prospect of such development? In my opinion the land which is suitable for agriculture would, if the proposed line were constructed, be used in that way. I admit that it is difficult to estimate what the traffic return would be.

579. Taking it for granted that the district we have been speaking of deserves railway communication, would it be best served by a line from Wellington going in the direction of Cobborah or by a line from some other point on the main line? I am of opinion that if the proposed railway started from Wellington it would go through country which would justify its construction. That country is not close either to Dubbo or to Mudgee, and is only served by the existing lines to a limited extent.

580. The Western line serves the country that you are speaking of for the first 15 miles from Wellington? Yes.

581. Would the remaining portion of the district be as well served by a line from Mudgee as by a line from Wellington? No.

582. It has been suggested that a line from Dubbo to Werris Creek would be better than a line from Wellington to Werris Creek;—what is your opinion upon that point? When you get about 10 miles away from Dubbo you come to an iron-bark range on the north side of the river—poor country, that will never be suitable for agriculture—and that country extends right up to Mundooran, and almost to Cobborah, although there it opens out into open box flats and iron-bark ridges. The country is much better on the southern side of the river.

583. The country north of Dubbo is inferior to that 10 miles north of Wellington? Yes; very much inferior.

584. What are the rates of carriage from Cobborah to Wellington and from Cobborah to Mudgee? I have paid £2 a ton for the carriage of wool to Mudgee and 6d. a bushel for wheat. From a point 12 miles west of Cobborah I have paid 4d. a bushel for the carriage of wheat to Dubbo.

585. Do you think that people within 10 or 15 miles of the proposed line would be willing to make any contribution towards meeting the estimated annual loss on it? I am not in a position to express an opinion upon the subject.

586. If you were a landholder along the route, would it pay you to contribute towards the reduction of the deficiency as much per annum as you now pay in land-tax? If I were a landholder in the district I should be prepared to give the Government what land was required for railway purposes.

587. But you would not guarantee to make good any part of the estimated annual loss? No; I have spoken to a few landholders on this subject, and they are mostly of the same opinion.

588. *Mr. Shepherd.*] If a man had 1,000 acres fit for cultivation, would it not pay him to put nearly the whole of it under crop, and then to alternately work and spell portions of it? That is a systematic way to farm; but where you have a large area under cultivation you also require a large area to graze the stock which are used in the work of the farm.

589. Is it not an advantage to occasionally spell farming land? Yes.

590. What crop do they grow in the district? Wheat, chiefly.

591. What price do farmers get for their wheat? Last season the price was 2s. 4d. a bushel; that is the lowest they have got.

592. If a farmer paid 4d. a bushel carriage, his return would be about 2s. a bushel, or something like 30s. per acre per annum? Yes.

593. What is the cost per acre of harvesting a crop? It varies considerably; it might cost one farmer 15s. an acre, while some pay more and others less.

594. Cannot you strike an average? About 15s. an acre.

595. Is Mudgee the nearest market to the district we are speaking of? It is the best railway terminus; it is nearer to Sydney than Wellington is. Our wool generally goes to Mudgee, and our wheat to Dubbo or Mudgee.

596. If the proposed railway were constructed, how far would your place be from a station? The place where I used to live would be about 3 miles from the proposed line.

597. Do you not think it would pay a man to make some contribution towards reducing the loss on a railway, if the construction of that railway saved him 47 miles of carriage? That may be so; but other people who would be benefited by the line, such as travellers from Melbourne to the northern line, would not be asked to pay anything in that way.

598. Is it usual to ringbark land which it is intended to clear? Yes.

599. How long is the timber left after it has been ringbarked before you commence to burn it off? About three years.

600. In the meantime how is the land used? For grazing purposes. Some people who have only a limited area proceed to clear the timber straight away.

601. *Mr. Watson.*] Do you know anything of the district from Cobborah on towards Werris Creek? I have travelled from Mundooran to Coolah.

602. Is the land through there as good as the land between Wellington and Cobborah? Part of it is. There is some very fine country towards Coolah.

Robert Patten, farmer and grazier, Comobella, near Wellington, sworn, and examined:—

R. Patten.
30 April, 1900.

603. *Vice-Chairman.*] Where is Comobella? It is 12 miles from Wellington, in the direction of Cobborah.
604. *Mr. McFarlane.*] Have you long resided in that district? I have known it for twenty years, and I have been here permanently for three years.
605. Are you engaged in farming pursuits? Yes.
606. Have you a fair knowledge of the country between Wellington and Werris Creek? I know the country for 15 miles from Wellington.
607. What is the general character of that country? It is all good agricultural land.
608. Is most of it under cultivation? It is largely under cultivation, but I should not like to say that most of it is under cultivation.
609. Is it your opinion that it is all fit for cultivation? Yes, with the exception of the tops of the ridges.
610. What crop is chiefly grown? Wheat.
611. It has been stated that the average yield of wheat in this district is from 16 to 18 bushels? My locality's yield would average about 17½ bushels.
612. Is the Crown land in the district similar in character to the land which has been alienated? Yes.
613. If it were thrown open for settlement, would it be taken up for the same purposes? I think so.
614. Is the country thickly timbered, or is it land that is easily cleared? It can be cleared fairly easily, though in some places the timber is heavy.
615. Is the produce grown in your district sent to Wellington to market? Mostly.
616. What rate of carriage is charged for wheat? About 1½d. a bushel.
617. If the railway were constructed would the wheat be sent by train? Yes; all of it.
618. Are there any tenant farmers in your district? Yes.
619. What rent do they pay for the best land? On an average 3s. to 4s. an acre, taking bush land and cleared land as it comes. Generally speaking, if the tenant makes any improvements the rental is not raised; but if the landlord makes improvements the rental is increased by 10 per cent. on the value of the improvements.
620. What is the improved value of the land itself? Between £5 and £6 an acre.
621. What is its unimproved value? Between £1 and 30s. an acre.
622. In arriving at the improved value of the land, do you take into consideration the cost of clearing, farming, and so on? Yes; and the cost of erecting farm houses, and constructing dams, roads, and fences.
623. Would the construction of the proposed railway materially increase the value of the land? It would increase the value of the land.
624. Would it substantially increase the value of the existing Crown lands? Undoubtedly.
625. If the Crown lands in the district were thrown open for settlement, would they be immediately taken up? I think so.
626. Do you consider the Crown lands sufficiently good for occupation? Yes.
627. What would be a sufficient area of such land for the maintenance of a man and his family? I think 500 acres would be required.
628. If you were cutting up land for settlement purposes, in what sized blocks would you subdivide it? I would subdivide it into not less than 500-acre blocks.
629. *Mr. Watson.*] When you say that the unimproved value of the land in the district varies from 20s. to 30s. an acre, do you refer to land near Wellington, or to the land at the further end of the district with which you are acquainted? I spoke of the land in my own locality.
630. What class of soil have you there? Chiefly red volcanic soil.
631. Is there a good depth of soil? Yes; except on the limestone outcrops.
632. How far are you from the nearest railway station? Eight miles.
633. The meaning of "unimproved value," according to the Taxation Acts, is the price which land would fetch in the open market after deducting the value of improvements;—if a man could get good volcanic soil within 8 miles of a railway for £1 or 30s. an acre, he would be lucky? Certainly he would; but he would not get land for that.
634. Then the land is worth more than £1 or 30s. unimproved? Yes, according to that definition of the word "unimproved." In my opinion, if facilities for transport were increased, the dairying industry would spring up. At the present time we cannot dairy because of the cost of carriage, and at present prices the wheat-growing industry is at a standstill.
635. Is the country well adapted for dairying? I think so.
636. What other industries would there be? There is a considerable outcrop of limestone, and I think that the burning of lime for agriculture and other purposes is an industry which might spring up. Then pig-raising would naturally follow dairying, the pigs being supported on the waste products from the dairy. With mixed farming, paddocks that were lying fallow could be used for the grazing of stock.

Thomas Quirk, farmer, grazier, and flour-mill owner, Gladstone, sworn, and examined:—

T. Quirk.
30 April, 1900.

637. *Mr. Watson.*] What is the extent of your holding? I have about 1,600 acres at Gladstone, and other land in another district.
638. Where do you get the wheat which you make into flour? Within 20 miles of Wellington. Most of our wheat comes from the north, from the direction of Spicer's Creek and Mitchell's Creek.
639. Is good wheat for milling purposes grown out towards Cobborah? Very good wheat. I am not acquainted with the country beyond the Talbragar; but I am perfectly acquainted with the country between Wellington and the Talbragar.
640. Where is your mill? At Wellington; the business is carried on by my partner. I went beyond the Talbragar once, and the country there seemed rather scrubby.
641. How do you regard the country between here and the Talbragar? It is splendid land for agriculture and for pastoral purposes. It is good land for fruit and vines.
642. Do you think that the proposed railway would have any appreciable effect upon that tract of country? It would benefit the people there, and would increase population. In my opinion the proposed railway would greatly assist in making the Blayney-Harden line profitable.

T. Quirk !
30 April, 1900.

643. Confining yourself to its local effects, do you think it would bring about a material increase in the population and production of the district you have spoken of? Yes.

644. Is the country between Wellington and the Talbragar now used to its full capacity? Not to one-third of its capacity.

645. What is the maximum distance which produce can be carted to a railway? I think that a farmer who has to go more than 10 miles to get to a railway station labours under very great difficulties.

646. Do you think that it will be necessary for this country to construct railway lines within 20 miles of each other? The time will come when that will be done. If a man can bring a load of wheat to market and get home the same day he does very well, but when he has to be away for perhaps three days he is farming under difficulties.

647. At the present time men are making a living by farming average land and carting the produce 20 miles to a railway station, do you think that prices will go down? I do not think so. I think that they are now as low as they can be.

648. Would the construction of the proposed railway help to concentrate trade at Wellington? Yes, very largely. The railway would be a very great boon both to the district of Wellington and to the Colony at large.

649. Do you grow any produce here which you could exchange with people living along the Northern railway? Yes. We grow lucerne here pretty extensively, and on the Talbragar they grow potatoes, turnips, and vegetables of all kinds. We also grow wheat and various cereals, and the proposed railway would open up a very large market for our produce in the north-west, and would help the people there by allowing them to send their stock here in times of drought. I have resided in the Wellington district for twenty-nine years, and I have never had a failure of crops during the whole time. My average return has been over 20 bushels to the acre.

650. Is that yield to be obtained only on the flat land like that on the banks of the Bell River? No; on all the wheat-growing land. There is some land in the district which the proposed railway would traverse which has alluvial soil to a depth of 80 feet. I was sinking a well at my place, and it was 80 feet before I came to the rock, going through beautiful soil the whole way. There is certainly no better agricultural district in the Colony. The quality of our wheat is excellent, and our losses of stock are comparatively nothing. The country is well watered, and possesses mineral wealth. The Bodangora mine is a very extensive property, and I am pleased to say that last week a reef was discovered on my land, about 6 miles from Wellington, which bids fair to be as good as the Bodangora reef. A few years ago some iron-stone was sent from the district to be assayed, and we received a report to the effect that it was superior to anything which had been submitted up to that time; but under present conditions it is of no commercial value. We have some of the best iron ore in the Colony, and we have also limestone and coal; while iron-bark suitable for sleepers grows in the district.

651. Where is the coal deposit? On Spicer's Creek.

652. Not very far from where the proposed railway crosses Spicer's Creek? I do not know the route of the proposed railway; but it is just where the road from Wellington to Cobborah crosses Spicer's Creek.

653. What is the quality of the coal? It is very good; but it is lighter in colour than the Lithgow coal.

654. What is the thickness of the seam? Between 6 feet and 7 feet. When I came to Wellington, twenty-nine years ago, agriculture was confined almost entirely to the alluvial land on the river banks, and the quality of the wheat grown was not very good; but since they commenced to cultivate the volcanic soil, the quality of the wheat has improved wonderfully. Twenty-nine years ago not more than about 20,000 bushels of wheat were grown within 20 miles of Wellington; but in 1898 the firm of which I am a member received into the mill 44,400 sacks, or 177,176 bushels of wheat, costing £31,634. In 1899 we received 91,226 sacks, or 381,075 bushels, at a cost of £45,000, and this year we have received 50,000 sacks, or 200,000 bushels, at a cost of £23,000. I estimate the yield of the district within 20 miles of Wellington at about 800,000 bushels for 1899, and for the present year about 880,000 bushels. If the proposed railway were constructed, the production of wheat would nearly double itself in four years. The land between Wellington and Cobborah is well suited for fruit and for vines. I have grown both with very satisfactory results. Dairying is carried on in several places, and is doing very well.

655. *Mr. Shepherd.*] How much of your 1,600 acres is under cultivation? About 300 acres.

656. And how much is fit for cultivation? About one-half.

657. How long have you held that land? About ten years.

658. Since you are within 7 miles of a railway, why have you not cultivated more largely? Because I am not a farmer by trade. I am a miller, and I carry on farming more as a hobby. I am away from home a great deal, travelling and supervising the mill business. There is probably no one in the district better qualified than I am to give an opinion upon its resources, because I know every corner of it, and I know how the people have been getting on here for the last twenty-nine years. I believe that the Wellington farmers are, as a rule, very well to do.

659. Are you acquainted with the country for any distance along the proposed line? Yes, for about 40 miles.

660. What is the character of it? It is good average agricultural land.

661. What proportion of it could be cultivated? About two-thirds. I had nearly 2,000 acres of land close to the route of the proposed line, about 1,920 acres of which could be cultivated; but not five acres have been cultivated because of the distance from a railway.

662. Are the railway rates to Sydney a great handicap to wheat production in the Wellington district? No; I look upon those rates as very fair. In my opinion the Railway Commissioners do what they can to encourage agriculture.

663. You think that it would pay the farmers to cultivate largely? I do.

664. What stock is carried in the district? Sheep, cattle, and horses.

665. What is the average weight of a fleece here? My sheep have yielded 7 lb. 2 oz. to the fleece.

666. Is the wool of a superior character? It is very good. I got £375 for the wool off 1,400 sheep.

John Perry, farmer and grazier, Walhallow, sworn and examined:—

667. *Mr. Shepherd.*] Are you acquainted with the country between Wellington and Werris Creek? J. Perry.
With the exception of a few miles, I think, I have been over the whole of it.

668. Will you describe the country in sections, keeping within 10 or 20 miles of the proposed line? 30 April, 1900.
From

J. Perry. From Wellington to Mitchell's Creek it is all splendid agricultural land. I have travelled through the farms on each side of the proposed line for a distance of about 50 miles, and I know that the land is some of the finest in the Colony. I have also been along the route of the proposed line as far as Cobborah.

30 April, 1900.

669. What is the country like between Wellington and Spicer's Creek? There is some very good land, and there is some poor land. Taking it altogether, the land is good, though it is not good pastoral land.

670. What is the land like from Spicer's Creek to Cobborah? It is fairly good agricultural land; but it is not good grazing land. The agricultural land is good in patches. The land on the hilltops is inferior.

671. How much of that land would be suitable for agriculture? About one-third, allowing for the hills and valleys. Of course, some of it is exceptionally good.

672. Then, on to Leadville, what is the land like? The flat country is rich agricultural land, and good land for pastoral purposes, while the ridges have a red loamy soil, than which you could not get better land for wheat.

673. Then the whole of that land is good either for agriculture or for pastoral purposes? Yes; I should think three-fourths of it would be good for agriculture.

674. Is it similar country from Leadville on to Coolah? Somewhat similar country. About Coolah there is some splendid agricultural land. The hilly country to the left of the line is not so good; but all the flats and the land along the Talbragar River are very good. The proposed line would tap Cockatoo corner, where there is some of the finest land in the Mudgee district. Mr. Bowman told me that what kept him from putting land under cultivation was the cost of carriage. I am travelling for the "Sunshine" harvester, and I have been to nearly every farm in that district.

675. From Coolah on to Bundella, what is the country like? It is good both for agriculture and for pastoral pursuits; there is both black soil and red loam. Some of the best wool, wool that has brought the highest price ever obtained for greasy wool, has come from that district.

676. What ratio does the agricultural and pastoral lands bear to the whole area? I do not know any bad land there, wherever it is possible to cultivate the land it is good for agriculture. Allowing for hills and stony ground, I should say that one-half of the land is fit for agriculture. Mr. McMaster, of Rockgedgiel, told me that if he could get the railway there he would put a couple of thousand acres under cultivation. He grows lucerne there.

677. The black soil is generally better than the red soil for lucerne? Black alluvial soil is very good for lucerne, but black soil which cracks in the hot weather allows the sun to get at the roots, and lucerne will not grow well on it.

678. Does the land continue good from Bundella on to Spring Ridge? Yes.

679. And from Spring Ridge to Werris Creek? That is nearly all black soil country.

680. So that there is very little barren country the whole way through? That is so. Even the scrub land, which used to be looked upon as absolutely useless, is good. On Spring Ridge they have very seldom missed a crop for the last seven years, and they hardly ever get less than 25 bushels to the acre, while they have got as much as 40 bushels to the acre. The land in the Colly Blue scrub used to be considered of no value, but I have stripped seven bags from an acre of wheat grown on that land.

681. Is most of the land along the route of the proposed line taken up? A great deal of it is. I was sub-reporter to the Department of Agriculture for a number of years, and four years ago my return of the cultivation for the district round Spring Ridge was 140 acres. Now there are 5,358 acres under cultivation in that district; but it is a great handicap to farming that we should have to pay from 1s. 9d. to 1s. 3d. a bag to send wheat from Spring Ridge to Quirindi. If the small holders there had railway communication, they would extend their cultivation. Mr. Binney there has 3,000 acres under cultivation, and he is putting about 5,000 acres under cultivation. The following return gives the area under cultivation in the various holdings in the district:—

Name of Landholder.	Acreage under cultivation.	Locality.	Name of Landholder.	Acreage under cultivation.	Locality.
Mr. Binney	3,500	Spring Ridge.	Mr. Mercer	40	Blackville.
Mr. Higgins	320	Kickerbill.	Mr. Foster	80	"
Mr. Lord	189	Spring Ridge.	Mr. Miller	90	Spring Ridge.
Mr. Darby.....	90	Colley Blue.	Mr. Barnes	40	"
Mr. Constable	60	"	Mr. Kingeton	30	"
Mr. Dyson.....	90	"	Mr. Smith	40	Merrigullah.
Mr. Doolan	300	Walhallow.	Mr. A. Doolan	80	Walhallow.
Mr. Della	40	Colley Blue.	Mr. Nellens	80	"
Mr. John Perry	160	Walhallow.	Mr. McLean	60	"
Mr. Joseph Perry	56	"	Mr. O'Neill	60	"
Mr. Busbie	60	Yarraman.			

All these holdings are within about 20 miles of the proposed line, and the people I have named would be compelled to use the railway. In that black soil country we cannot get along at all in wet weather.

682. Have you a return of the number of sheep held by the people living along the line? I can give you an approximate estimate of the number of sheep there. At Walhallow they have shorn as many as 150,000 sheep, though they only shear from 50,000 to 60,000 sheep there now. Mr. O'Neill has about 4,000 sheep; Mr. Leonard about 4,000; Mr. G. G. Binney, 4 D, 7,000 or 8,000; Mr. Charrington, 6,000; Mr. Campbell, 2,000; Mr. Roberts, 3,500; Trinkey, 50,000; Rockgedgiel, 50,000 to 60,000; Moredual, 12,000; Coomoo Coomoo, 30,000 to 40,000; Mr. Busbie, Yarraman, 6,000; Mr. Pengelly, Yarraman, 4,000; Mr. Wood, Yarraman, 5,000; Mr. Foster, Blackford, 3,000; Bomera, 30,000 to 40,000; Saltwater, 7,000; Oakley Creek, 30,000; Ulinda, 20,000; Binnia, 40,000; Ulamabri, 40,000; Urawilkie, 40,000; Goorianawa, from 40,000 to 50,000; and a number of small holdings carry between 12,000 and 15,000. The wool from all these sheep goes to Quirindi by team at the present time. There is also a lot of land on Bando Holding, which would be within the influence of the proposed railway.

683. Is it long since you were over that country? I was over some of it only six months ago.

684. Have you frequently been through the district which the proposed railway would traverse? I was over a great deal of the district twelve months ago, but I have known it for thirty-five or forty years.

685.

J. Perry.
30 April, 1900.

685. Have you been over the country through which the suggested line from Dubbo to Werris Creek would pass? I was through it two years ago. From Mooren it is poor sandy country with honeysuckle hills. The flats at the bends of the river are suitable for cultivation. Towards Binnia there is good soil, but a lot of the country is very poor.

686. Would a line from Dubbo to Werris Creek pass through superior land? I think so.

687. Are there many large cattle in the district through which the proposed line would pass? No. Most of the runs are carrying sheep. There are some cattle on "4 D" and Rockgedgiel holdings, but not a large number, and there are cattle in the vicinity of Coonabarabran.

688. How much arable land is there, on the average? At the other end of the proposed line, from Werris Creek to Bomera, nearly all the land could be cultivated.

689. What is the average yield there? Last season was the worst we have experienced; but, three years ago, it was quite a common thing to get 7, 8, 9, and 10 bags to the acre, and I have got nearly 11 bags to the acre. Taking bad seasons with good, we have averaged from 12 to 14 bushels to the acre. I stated my average yield to the police at 14 bushels. The average yield for the district during the last five years might safely be reckoned at not less than 12 bushels to the acre, and my own average would be more than that.

690. Do the farmers who are more than 20 miles from a railway station find themselves greatly handicapped by the cost of carriage? Yes. I am compelled to pay 3d. a bushel to get my wheat taken to Quirindi, and, if it rains, the carriers will not take it at all.

691. Have you spoken to many of the farmers about the prospects of the proposed railway? Yes, and they think that it would be their salvation.

692. Would they largely increase their cultivation if the proposed railway were made? Yes; because the railway would mean a saving to them of nearly 1s. 3d. to 1s. 9d. a bag.

693. What description of timber does the land between Wellington and Werris Creek carry? There is splendid timber all through—box, iron-bark, and pine.

694. Do you think there would be enough for railway purposes? Yes. They get piles out of the Trinkoy scrub for all the bridges around Quirindi.

695. Would the mining industry be assisted by the construction of the proposed railway? Not at the Werris Creek end of the line, because there is no mining in that part of the district; but at the Wellington end the railway might be of advantage to mining people.

696. Do you think that the estimated deficiency—£18,000 a year—upon the construction of the proposed railway is likely to be made up within a reasonable time? I do not know why the Commissioners have stated the probable revenue of the line at so low a figure as £8,586. With regard to compensation, I consider that any landholder whose land was taken for the construction of a railway would be amply compensated by the advantages which he would get from the railway, and the increased value of the remainder of the holding. The Coonabarabran people are now producing more than they consume, and they would have to use the railway. They have been paying 2s. 3d. and 2s. 6d. a bag to have their wheat carted into Quirindi.

697. In what direction is stock sent from the district through which the line would run to get feed in times of drought? To New England. One of the greatest troubles in connection with the moving of stock is that there is no water at Oakey Creek or along the stock route.

698. Would the construction of the proposed railway facilitate the removal of stock? Undoubtedly. Then, too, it would be a great advantage to have a connection between the Northern, and Western, and Southern railway systems. As I have already stated, the construction of the proposed railway would lead everyone along the line to go in more for agriculture. I myself would put in another 100 or 150 acres, and I have heard others say that they would do likewise. About Spring Ridge we can grow as good wheat as is grown anywhere, and I think that in the course of ten years our output of wheat will be as good as output of wool. The railway will give the people in this district the only chance they have of making a good living. We have already started to export wheat from New South Wales, and have sent away three shipments. The northern farmers wish to make Newcastle the port of export, and if the Government grant money for the erection of elevators it will give more encouragement to farming operations. The smallness of their holdings must compel many men to cultivate.

699. Do you think that the construction of the proposed line will bring a larger population into the district? Yes. At Spring Ridge there is an area of land sufficient for the establishment of a nice little village, and when the railway is made there will be a village there, and another at Dempsey's.

700. *Mr. Watson.*] You are one of the directors of the Farmers' and Settlers' Co-Operative Association? Yes.

701. You have, therefore, occasion to travel through the country considerably? Yes; and I have been over nearly the whole of the northern district.

702. Do you think that the proposed railway would create an interchange of commodities between the western and the northern districts. Yes. I have already known chaff to be sent from Maryvale, which is near Wellington, to Moree.

703. Was that an experiment? No; the people of Moree had to get chaff from somewhere.

704. Was a large quantity sent? Yes.

705. Why did not the Moree people get their chaff from the Hunter? The Hunter River people could not supply it just then.

706. Do you think there would be a fair amount of through traffic upon the proposed line? I think so. The Tamworth people, and all the farmers in that part of the country, with the exception of the Quirindi people, who would like the railway to start from Quirindi, are strongly in favour of the line. The Armidale and Glen Innes people have held meetings advocating its construction.

707. Do the people of those districts think the proposed railway will enable them to tap sources of supply around Wellington and at other places on the Western line? They have a magnificent potato-growing district in the north, and they often cannot get rid of their potatoes under present conditions; but they think the construction of the proposed railway would give them an outlet for their produce. Then, too, in times of drought the railway would be used for stock traffic.

708. They could not send potatoes to Wellington by way of Sydney in competition with the potato-growers of the other colonies? No.

709. During the last five years would the northern districts have drawn very largely upon the Wellington district

- J. Perry. district for fodder if a railway had been constructed? Yes; the Rockgedgiel people, the Coomoo Coomoo people, and other station-holders have been compelled to obtain fodder for their animals.
- 30 April, 1900. 710. Do you think that the people through whose land the line would pass would be prepared to contribute an amount equal to the amount they now pay in land-tax to make up some part of the annual deficiency estimated by the Railway Commissioners. A man having land within 5 miles of the line might pay the full tax, and a man within 10 miles but beyond 5 miles half the tax? Personally, I should be very pleased to make such a contribution, because it would pay me to do so by reason of the saving in freight which I could make, and I think, too, that the line would raise the value of my land 10s. an acre. Where men pay 1s. 9d. a bag freight and take four bags off an acre of land, they are now paying 7s. 6d. an acre. That charge is very much more than the land-tax, and would pretty well all be wiped out by the construction of the railway in proximity to their holdings.

Murdoch McLeod, miller, Wellington, sworn, and examined:—

- M. McLeod. 711. *Mr. McFarlane.*] Have you been in Wellington long? Eighteen months.
- 30 April, 1900. 712. How much wheat do you grind at your mill per annum? About 52,000 sacks, or about 220,000 bushels.
713. Where does your wheat come from? Within a radius of 20 miles of Wellington; but more particularly from the direction of Mitchell's Creek northwards, and Curra Creek to the west.
714. Is it good wheat? Splendid wheat. I am a partner of Mr. Quirk.
715. Is the wheat grown in this district equal to the general run of New South Wales wheat, so far as you know? I think it is superior to all other wheat that I have handled. For eleven years I was manager for Messrs. Brunton & Co., at Granville, and I suppose more wheat has gone through my hands than through those of almost any other man in the business in this colony.
716. Do you get much wheat from Spicer's Creek? Yes.
717. And from other localities along the proposed line? Yes. I have had wheat brought to the mill from a distance of 30 or 40 miles in the direction the proposed line will take.
718. Within 20 miles of Wellington where does the bulk of the wheat come from? About as much comes from Mitchell's Creek as from Curra Creek.
719. Have you had any experience of the cost of carriage? Generally speaking, the cost of carriage is very much against the farmers in the district.
720. What carriage have they to pay? The charges vary according to the distance; some of them have to pay as much as 4½d. a bushel. Last season a farmer brought in several loads of wheat by team from a place 45 miles away, a place equally distant from Parkes, Molong, and Wellington. I believe that there was a difference of ½d. or ¾d. a bushel in favour of the Wellington prices at that time.
721. How far from Wellington is Mitchell's Creek? Twelve miles.
722. What is the charge for carting wheat from Spicers' Creek? 1s. or 1s. 6d. a bag.
723. What has been the price of wheat during the last three months? From 2s. 1½d. to 2s. 4½d. in Wellington for fair to prime milling wheat.
724. Would the proposed line assist in settling population in the district through which it would pass? Undoubtedly.
725. Would people within 12 miles of Wellington use the proposed railway? Yes, because we should purchase wheat "on rail" at the nearest railway station. We are large buyers of wheat "on rail." Last year we sent over 50,000 sacks of wheat to Sydney.
726. How much wheat do you obtain from the farmers along the route of the proposed railway? Roughly, about 20,000 sacks last season, and there are other buyers in the district. The representatives of Mr. Crago and of Mr. Gillespie bought considerable quantities of wheat last year.
727. Did they get much of their wheat from the localities you have mentioned? Yes.
728. They buy in the same way as you do? Yes.
729. And presumably at the same price? Yes.
730. Do you send much flour into the district through which the proposed line would pass? Nearly all the people who bring wheat to the mill take away flour. Of course, those within the influence of the Mudgee line obtain their flour from Mudgee.
731. In the event of the construction of the proposed railway, the Commissioners would get the advantage, not only of the transport of the wheat, but also of the back loading of flour? Yes.
732. Would the people in the district get their supplies from Wellington? Yes, as the nearest market.
733. Did you notice any increase in the wheat-production last season over that of the season before? Yes, though it was not appreciable at our mill, because we have not bought so much for export and for other purposes recently, since the farmers are holding back on account of the low prices. I have been given to understand that there is an increase of from 25,000 to 30,000 sacks of wheat in the production of the district this year.
734. Do you export flour as well as wheat from Wellington? Yes; 50 per cent. of our output goes to Sydney.
735. In view of the very low price now obtainable for wheat, do you think it will pay farmers to grow it for export? I am afraid not. I think that under existing circumstances, and with a continuation of low prices, New South Wales will never become an exporter of wheat.
736. Will the cost of freight have anything to do with that? Yes. The railway rates are very fair, but the distances are very long.
737. People living on the main line will have a great advantage over people living between Wellington and Werris Creek? Where farmers were close to a railway it would not make much difference, because the difference in the railway rates would be very little; it costs no more to send wheat from Dubbo to Sydney than to send it from Wellington to Sydney.
738. Where farmers are at a distance from the railway is their wheat brought to Wellington direct by team, or to the nearest railway station? Either to Wellington or to the nearest railway station.
739. *Mr. Shepherd.*] Do you think it possible that, under more favourable auspices, New South Wales will become an exporter of wheat? Yes; and the construction of the proposed railway would make conditions more favourable for the farmers. The Wellington district is eminently suited for the storage of wheat in bulk, and if elevators were erected along the line, farmers would store it instead of rushing it all down to Sydney, and congesting the market. We are using last season's wheat now, and there is not a sign of the presence of weevil. At Sydney, on the other hand, wheat would not keep in bulk for three months.

Lachlan

Lachlan McAlister, farmer, Wellington, sworn, and examined :—

740. *Vice-Chairman.*] I understand that you can describe to the Committee the character of the country on the eastern side of the proposed railway? Yes. After you leave Wellington the land is good agricultural land, chiefly adapted for wheat-growing, until you get to Cobborah. Of course, there are interspersed small areas of scrubby land which is not occupied, but upon which there is good timber. After you leave Cobborah, there is good alluvial black soil along the Talbragar which is fit to grow anything. That country extends to Coolah. Back from the river the land is more suited for wheat-growing; but the river land is fit for lucerne, maize, and crops of that kind. I have seen very good crops of wheat grown there; but people will not put large areas under wheat in that part of the country, because of the difficulty in getting it to market. When you get to the Liverpool ranges the country is suited chiefly for grazing, until you get to Oakey Creek, 20 or 25 miles from Coolah. From Oakey Creek to Werris Creek it is mostly plain country, and good agricultural land right through.

L. McAlister.
30 April, 1900.

741. Do you know anything of the country on the western side of the proposed railway? I know a little of that country, though I do not know it as well as the country on the eastern side of the line. The black alluvial soil on the eastern side is quite different from the soil on the western side of the line, where the country is suited more for wheat-growing or for grazing.

742. What effect would the construction of the proposed railway have upon the development of the district through which it would pass? It would cause large areas of land to be put under crop, and it would increase settlement; the increase in the area under wheat would be something wonderful if railway facilities were given. At the present time road carriage is so high and the price of wheat so low that the farmers cannot attempt to grow wheat.

743. Do the people residing along the line complain of the long carriage? They say that if they had a railway they would put large areas under wheat. I asked them why they were not growing more wheat, and they told me that they were too far from the railway.

744. Is a great deal of land which is fit for agriculture now being used to depasture sheep simply because of its distance from a railway? Yes; most of it is being so used.

745. What interchange of products would there be between the northern and western districts if the proposed railway were constructed? I do not think there would be much interchange of products between Wellington and Werris Creek; but the people in each district would be interested in sending produce out west.

746. Do you think that the construction of the proposed railway would develop the district to such an extent that the estimated deficiency would cease after ten or fifteen years? I fully believe that it would. The increase of population in the district, with its consequent increase of traffic, and the traffic between Queensland and Victoria, would be certain to make the line pay.

747. The railway authorities seemed to think that there would not be much passenger traffic from Queensland to Victoria along the proposed line? I know that if I could save 100 or 200 miles in travelling I would try to do so.

748. Are good potatoes grown on the Talbragar? I have seen as good potatoes grown there as in the Hunter River and Shoalhaven districts.

749. In that case could not the Talbragar country supply Dubbo and the western districts with potatoes more easily than they could be supplied from the northern districts? Yes; I have seen splendid vegetables of all descriptions growing in that district, out as far as Coolah. I was there last November twelve months, during a very dry time.

750. Can you offer an opinion as to the respective merits of a connection with Dubbo and a connection with Wellington? There is no comparison between the country that a line would traverse from Dubbo to Murrungundi and the country between Wellington and Murrungundi; in one case you have a hungry sandstone country, and in the other strong alluvial soil.

Robert Porter, newspaper proprietor, and Secretary Railway League, Wellington, sworn, and examined :—

751. *Vice-Chairman.*] How long have you been a resident of Wellington? I have been a resident of Wellington for twenty-six years, and I have resided in the county forty-two years.

R. Porter.

752. I understand that you have prepared a statement? Yes. I should like first to refer to the opinion given on Saturday that only about 33 per cent. of the land through which the proposed line, Wellington to Werris Creek, runs has been alienated from the Crown. I think Mr. Gaden meant that the counties through which the line runs, as a whole, contained but about 35 per cent. of alienated land, though the line itself might run through lands the whole of which are purchased. For instance, take an extract from the Statistical Returns published by Mr. Coghlan, page 25, Part XI. The county of Napier, through which the line runs, is stated to contain 23·91 per cent. of alienated land in proportion to the total area. I presume Mr. Coghlan's statistics are correct. Another county, Pottinger, is stated to have 50·72 per cent. of alienated land. Another county, Lincoln, is put up at 18·67 per cent. There is another county, but add together the three percentages named and divide by three, the mean will be found to be only nearly 31 per cent., showing a very large area of Crown lands available for settlement in time. Those statistics, I think, dispose of opinion stated by Mr. Harper in answer to Question 118. And now, gentlemen, I wish to call attention to another matter which, in my opinion, would, to a very great extent, justify the construction of the line. I refer to the existence of coal between about the 22nd mile from Wellington and the 34th mile—I cannot give the exact distances. First, at Spicer's Creek, just where the road from Wellington crosses the creek, the Committee will notice the complete change to sandstone country. The creek is a bed of sand. Within sight of the road a shaft was sunk down on to a thick bed of coal. Speaking from memory only, I think that shaft was only 30 feet deep, and the seam of coal was stated to be 7 feet thick. I did not go down the shaft, but I was there when others measured it, and I was told it was 7 feet thick. A large quantity of coal was got out and sent away for trial, and a lease of the ground was applied for and granted. I produce a copy of the plan. The coal turned out to be of poor quality, but large orders could have been got for it to burn in furnaces, with a little wood in addition, if it could have been delivered at a low rate. The want of railway carriage rendered the mine useless, and it was abandoned. I produce an analysis by Mr. W. A. Dixon, registered analytical chemist. Mr. Dixon says the seam appears to be a lignite. I do not think it was;

30 April, 1900.

R. Porter. and Messrs. Mackenzie and Davis, also assayers, spurned the idea that it was a lignite, but said it was altogether too heavy, and was an earthy coal. It was, I am aware, altogether unfit for railway purposes, but large orders could have been obtained if it could have been delivered by rail. Twenty-four miles of road carriage killed it. Other assays were made, one of which was as under:—

Hydroscopic moisture.....	7.4
Volatile hydrocarbonates	38.41
Fixed carbon	42.75
Ash.....	11.00
	100.00

Sulphur, 2.08 per cent.; ash, grey colour; no coke.

On this subject I should like to read the following extract from a letter written by Mr. R. N. Williams, of Cobar, dated 18th October, 1888:—

I have no desire to make you believe that you have a first-class article and an article suitable for all purposes; but I have no hesitation in stating for your future guidance that it is useful for smelting purposes, and if used as indicated eventually the coal-fields will be heard of supplying the various mining centres of the Western district. If it were possible for you to deliver coal here for about 20s. per ton, I could now give you an order at that price for about 1,000 tons per month to start with; and as soon as the contemplated extensions are added to the company's smelting works double the quantity would be required.

I quote that extract to show the value of the coal. I believe that, unfortunately, a large quantity of the Cobar copper ore is now being sent to Lithgow to be smelted. I understand that the coal deposit that I speak of lies a mile or two to the east of the route of the proposed railway. I should also like to quote the following:—

Extract from a report upon Geological and Mineralogical Survey, by S. Stutchbury, 1 July, 1852.

THE Talbragar River, below the station, exhibits sandstone fit for building purposes similar to that at Dubbo, and would be easily quarried.

In the dry bed of the river picked up some slabs of coal, evidently brought down the stream. Barbigal is 18 miles from the confluence of the Talbragar with the Macquarie River, 14 miles through the bush. Tried for gold without success. Mitchell's Creek falls into the Talbragar about 1½ mile above Barbigal. Traced the coal first found loose at Barbigal to its site. Found it on the Talbragar River, 2½ miles above the station (Gillis's Murrinutgindigundi), and 3 miles above the junction of Spicer's Creek. The section exhibited in the bank of the river is the following:—Large rocks of coarse conglomerate sloping back to a height of 200 feet; fine-grained sandstone, 20 feet; loose, scaly, culmlike coal, 6 feet; hard fissile coal, resembling the splint coal of Lanarkshire, 5 feet to the water-line, probably more. The upper bed of coal would answer well for calcining metallic ores or burning lime; the lower bed is highly inflammable and useful for most purposes, greatly resembling the splint coal so much valued in Scotland for smelting iron. These beds are probably extensive and easily got at by sinking into, the angle of dip being very small, scarcely perceptible from the horizontal.

According to Mr. Stutchbury, who was one of the best geologists who ever visited New South Wales, we have, not far from the proposed line, coal that would run all the trains from Orange outwards, and to the Northern towns, at a cheaper rate than coal could be got from Lithgow or Maitland. If Mr. Stutchbury's report be true, an immense saving could be made by utilising the coal lying at our doors, and cheap carriage given to farmers on the line. Now, with regard to the national aspect of the proposed line, the Wellington Railway League are, of course, actuated to a certain extent by local motives; but on the other hand they are largely influenced by the idea of connecting the Northern districts with the Southern by the one missing link between Wellington and Werris Creek. Perhaps the idea has some sentiment about it. According to Mr. R. E. Jones' report, there would be a saving of 143 miles between Brisbane and Melbourne. The line would form the railway system of the colonies into one compact whole. I am told that many residents of Melbourne and Victoria generally have large interests in Queensland, and the line would be much used for the carriage of machinery and passengers. I will conclude by quoting from a letter from the Right Honorable Geo. J. Goschen, First Lord of the Admiralty, to the editor of *United Australia*. He says:—

It is very much to be desired that newly-federated Australia should be served with an organ which, rising above local and provincial considerations, will devote itself to what you designate as Commonwealth questions. I need scarcely say that I have watched the development of federation with the keenest interest.

Apart from the increased prosperity which I hope it will bring to Australia, it will facilitate its military and naval defence. As First Lord of the Admiralty, this side of the subject is naturally of much interest to me, and it will be a source of peculiar interest to me if in the near future the union of all the Australian colonies into one compact whole should be followed by improved arrangements for giving practical effect to their patriotic aspirations, to contribute by personal and other services to the defence of the Empire.—Yours faithfully, Geo. J. GOSCHEN.

I feel sure that if all the land lying between Wellington and Werris Creek were thrown open for selection to-morrow it would be applied for within a week.

753. Do you know the whole of that land? I know it as far as Cobborah. When you have forty or fifty applications for miserable mountainous country, I feel sure that that land would be applied for at once. Something has been said about potatoes. Both potatoes and onions, I am told, do well on the Talbragar, but potatoes are not grown in large quantities in the Wellington district because it is too hot for them, and they will not keep. The potatoes used here come mostly from Orange.

Walter Prideaux Pridham, auctioneer and stock and station agent, Wellington, sworn, and examined:—

- W. P. Pridham. 754. Mr. Watson.] How long have you been in Wellington? Twenty-two years.
755. Then you have had a good opportunity to make yourself acquainted with the value of the land in the district? Yes.
756. Do you know the district through which the proposed railway will pass? Yes; as far as Cobborah.
757. How would you describe that country? Generally it is good wheat land.
758. Would any large area of it be unfit for cultivation? More than 50 per cent. of the land in the neighbourhood of the proposed railway would be fit for cultivation. Near Wellington almost the whole of the land could be cultivated.
759. What would be the value of that land unimproved and without a railway? About 30s. an acre roughly.
760. Would the construction of the proposed railway make a great difference in its value? I think it makes a difference of £2 an acre to be within 5 miles of a railway station, and £1 an acre to be just beyond 5 miles from a railway.
761. Would land 10 or 15 miles back from the line be increased in value by its construction? I think the construction of the proposed line would considerably increase the value of such land. Land suitable for

for wheat-growing is worth £2 an acre more when it is brought within 5 miles of a railway station, and £1 an acre more when it is brought within 20 miles of a railway station.

762. The map shows a large area of country just north of Bomely to be untenanted; what sort of country is that? Scrubby country.

763. Is it rough country? I believe that the greater part of it is good country, although it is scrubby.

764. Why has it not been taken up;—it has been open for selection since 1884? It may be good wheat-growing country, but it is dog infested, and not good sheep country. If the proposed railway were made it would soon be taken up.

765. Do you think that the greater part of the district through which the line would pass is fit for agriculture? I think that every perch of it would be taken up if the line were made.

766. There is some untenanted Crown land at Cobrauraguy? That land is dog-infested too. The lessee of the adjoining land told me that the dogs there are very troublesome.

767. Is it country that would be suitable for agriculture? I believe that every acre of it would be suitable for agriculture.

768. How far is it from Wellington? Eighteen miles. There is no water there.

769. Could not water be conserved there? Yes; and a man who held the land in freehold would conserve water there, but a Crown lessee will not.

770. There is another block on the resumed area of Medway holding? That is all wheat land.

771. So far as you know the country adjacent to the route of the proposed line is pretty well all good land? Yes; and I am of opinion that the proposed railway would open up a splendid belt of country.

772. I suppose that the leases of the Crown land will, most of them, expire this year? Yes, and every block made available for settlement would be applied for, more especially if hopes of a railway are held out.

773. Is the land in the reserves similar to the surrounding country? You cannot generalise in regard to that land. Taking the country right through from Wellington to Cobborah it is wheat growing land, with very little ridgy country.

774. Do you know any country close to the existing line which is similar to that between Wellington and Cobborah? Yes, the Mitchell's Creek and Spicer's Creek country.

775. Is there similar country between Wellington and Dubbo, or Wellington and Orange? Yes; you will find similar land there. Between Wellington and Geurie there is similar land, and it has been increased in value by the construction of the main Western railway. Generally speaking the land away from the railway is worth from £1 10s. an acre, and, within 3 or 4 miles of the railway, £6 an acre.

776. There have been sales of unimproved land between Wellington and Cobborah at a much higher figure than 30s. an acre? Yes.

777. That would be land beyond the average in quality? It would be land within the influence of a town.

778. Do you think your valuation is a fair average one? Yes. Of course there is some land there which would not be worth 2s. 6d. an acre.

John Irving, auctioneer and land agent, Wellington, sworn and examined:—

779. *Mr. McFarlane.*] Have you resided in Wellington long? Yes.

780. How long have you been engaged in your present business? Over five years.

781. What does your business consist in? In the disposal of properties—chiefly town properties.

782. You are not engaged in the grain business? No, though I watch it very closely.

783. Have you a good knowledge of the produce trade? I have made it my study for the purpose of this inquiry.

784. Have you any statement to make to the Committee on the subject? My inquiries have been directed entirely towards the production of grain within 35 miles of Wellington.

785. Along the route of the proposed railway? Yes. The land already cultivated, being prepared for cultivation, and suitable for cultivation, commencing at a point 5 miles from Wellington, and going out 35 miles, amounts to 80,000 acres. That estimate was made a few days ago, and refers only to secured land. To 80,000 acres must be added about 60,000 acres—12,000 acres in the Bodangora holding, 3,000 Gillinghall holding, 30,000 acres in the Murrumbidgee holding, and 15,000 acres in the Murrungundy holding—all of which is suitable for agriculture, and will be thrown open for settlement during the present year. Of the 80,000 acres, between 30,000 and 40,000 acres are either under cultivation or cleared ready for cultivation, and I estimate that within four or five years after the construction of the proposed line, there would be 100,000 acres under wheat.

786. How far does the land you are speaking of extend on each side of the proposed railway? From 5 to 10 miles on one side, and to as much as 15 miles on the other.

787. Have you a knowledge of the country you refer to? I have a fair knowledge of portions of it. The information I have given you has been obtained from thoroughly reliable persons.

788. Is it your opinion that when the land now held under lease is thrown open it will be taken up? I think that every acre of it will be taken up.

789. Have you had experience in farming? Yes, in my earlier days, though not in this district.

790. Would you consider yourself a fair judge of agricultural and grazing country? Yes.

791. How does the wheat of this district compare with that in other wheat growing districts in which you have been? It is equal if not superior to the wheat grown in other districts in which I have been, and I have been in a great many, Inverell and New England amongst them.

792. What value would you place upon the land now under cultivation, say, 20 miles out of Wellington? From £2 10s. to £3 an acre for good land.

793. What rent would such land produce if leased to tenants? I have had no experience of leasing in this district. There is very little private leasing here.

794. What is the value of the unimproved land? £1 an acre; that is the average value.

795. I am asking you for present values? Yes.

796. In the event of railway construction, how much per acre would the value of land be increased? In a very short time the average increase would amount from 50 to 100 per cent.

797. Do you mean immediately along the route of the proposed railway, or extending some miles back from it? Within a reasonable distance for farming purposes—say 10 miles. Of course, the land in the immediate vicinity of the line would be increased in value more than land further away. 798.

W. P.
Fridham.

30 April, 1900.

J. Irving.

30 April, 1900.

J. Irving.
30 April, 1900. 798. Is the Crown land of the same character as the land already settled upon? What I have seen is very similar, and I have been favourably impressed with it, but, as I am not thoroughly acquainted with it, I should prefer not to give evidence in regard to it. The 100,000 acres which I estimate would be under wheat shortly after the construction of the line would produce an average yield of about 16 bushels to the acre, and a charge of 3d. per bushel freight on that yield would give a return of £5,000. Then there would be the revenue earned by the carriage of wool, stock, merchandise, and passengers. I went into the matter to satisfy myself that the line would be a reasonably profitable one. I think that within a reasonable time after its construction 3 acres of land would be under cultivation in the district for every acre that is being cultivated now.

Charles George Scott, storekeeper, Wellington, sworn, and examined:—

C. G. Scott.
30 April, 1900. 799. *Vice-Chairman.*] How long have you been carrying on business in Wellington? I have been here about eleven years.
800. Do you know the country between Wellington and Werris Creek? I know it for a distance of about 15 miles from Wellington.
801. I suppose you have business intercourse with the farmers within than distance of Wellington? Yes.
802. Would you say that they are generally prosperous? Undoubtedly.
803. Have you considered what effect the construction of the proposed railway would have upon trade and business in Wellington? We think that the construction of the proposed railway would almost double the wheat production of the district, because the country which the line would traverse is known to be good wheat-growing country.
804. Within the 15 miles that you know, is there much good agricultural land which is not now under cultivation? Well, some of the agricultural land has only been recently acquired by the present holders and has not been cleared; but it will be cleared very shortly. The cutting up of the Nanima holding settled a good many people on the land. That land has been cleared, and the acreage now under wheat within 10 miles along the route of the proposed line has been trebled within the last three years. We buy a good deal of wheat. During last season we sold about 250 bales of corn sacks, and each bale contained 250 sacks. A great deal of the wheat is still in the barns and has not been thrashed.
805. Were all the bags which you supplied sent to the district north of Wellington? No; but there is a good deal of wheat grown out in that direction. We buy a lot of wheat from Spicer's Creek and Mitchell's Creek.
806. Have you heard from any of the farmers along the proposed route that they are handicapped by their distance from a railway? Yes, and we know that it is so, because we frequently have to pay freights for them, and we have been charged as much as 4d. a bushel for road carriage, and I know that 6d. a bushel has been paid in some instances, which is more than the railway freight from Wellington to Sydney. The wheat grown here is, as a rule, very good, and if not the best in the Colony it is equal to anything grown elsewhere. The Wellington wheat got the first and second prizes at the Sydney Show this season.
807. What quality of flour does it make? Excellent flour. It is a hard wheat, and I have heard Mr. Brunton say that it is one of the best. Mr. Crago always buys a certain quantity of it for mixing. It is supposed to be very much harder than the northern wheat, and equal to the southern in that particular.
808. What is the value of the agricultural land within 10 and within 20 miles of Wellington? Within 5 miles of Wellington the land would be worth from £4 to £5 an acre; between 5 miles and 10 miles out it would be worth £3 an acre; and within from 10 miles to 20 miles of the town it would be worth £2 an acre.
809. What would be the effect of the construction of the proposed railway upon the Crown lands within those limits? It would increase the value of the Crown lands very much; it would make land which is now worth only £2 an acre equal in value to lands close to Wellington.
810. Have you had experience in land valuing? Yes, a little.
811. Do you think that landholders would be willing to pay, annually, an amount equal to what they pay in land tax to assist in making up any loss upon the proposed line? I cannot say, but I am sure that it would be a very beneficial thing to them to get their wheat carried for 1d. a bushel instead of 6d. a bushel.

Frederick James Rodda, farmer and commission agent, Wellington, sworn, and examined:—

F. J. Rodda.
30 April, 1900. 812. *Mr. Shepherd.*] Where are you farming? About 2 miles from Wellington, on the Macquarie River. I am a native of the district, and I know the first 100 miles of the country through which the proposed railway would pass very well. There is a very large tract of land between Wellington and a point 20 miles on the other side of the Castlereagh River which is admirably adapted for wheat growing, and is equal to any land around Wellington. Of course, there are ridges and portions of a big iron-bark scrub which in places encroach upon the land I am speaking of.
813. Can you show us in what way the traffic of the proposed railway can be increased to make up the estimated deficiency? There are about 100 miles of country all of which is suited for wheat-growing, and some of it is now under cultivation. Those who are now cultivating that land have to pay very high rates for the carriage of their produce to Wellington, Mudgee, Dubbo, or whatever railway station they send it to. Some of them pay as much as 2s. a bag for road carriage. If the proposed railway were constructed the carriage would be reduced to 3d. or 4d. a bag.
814. But it is estimated that there will be an annual deficiency of £18,000 in the working of the proposed line? It cannot be expected that all the land I am speaking of will be put under cultivation, and will produce wheat right away.
815. It has been suggested that people who will benefit by the construction of the proposed railway should guarantee the State against any loss on it;—do you think that is a fair thing? No, I do not.
816. You admit that the carriage which the farmers now pay would be reduced by more than one-half if the proposed railway were made? It would be reduced much more than that.
817. That being so, is it not only fair that the persons reaping an advantage from railway construction should guarantee the Government against loss? They might give a guarantee up to a certain extent.
818. Do you think they would guarantee an amount equal to what they now pay in land-tax? That would be right enough.

819.

819. As the traffic on the line increased the deficiency would decrease, and their contributions would be reduced? I think it would be a reasonable method of dealing if the guarantors knew exactly what they were undertaking, and had not to contribute more than they are at present paying for land carriage. F. J. Rodda.
30 April, 1900.
820. Have you had any conversation with the landowners in the district in regard to the railway? They seem to be of the opinion that, with a railway, the saving in cartage would be so great that the guarantee contribution would be purely nominal. At the same time, there is a large tract of country which is suitable for agriculture that lies so far from the route of the proposed line that it could not be farmed.
821. *Mr. Watson.*] At what distance from the railway line can a man afford to cultivate his land? At present prices a farmer has to go too far when he is more than 15 miles from a railway station. A man growing wheat must be able to take his produce to the railway station in a day and to get home the next. He should not be three days over the business. If a farmer had only 15 miles to go he could get back next day; but if he had 20 miles to go the journey would break into three days.
822. Is the good country that you have spoken of within 10 or 15 miles of the proposed railway? Yes; the proposed railway runs right through it. Part of the country through which the line would go is land which I would not take at a gift under present circumstances; but it would be good wheat-growing land if it were near a railway.
823. Would the proposed railway give an impetus to other industries besides farming? There is a large quantity of timber within easy distance of the route of the proposed line.
824. Is it difficult to supply Wellington with timber now? Yes, especially to get hardwood; but the proposed railway would run through a forest of iron-bark.
825. Is timber along the route of the proposed line suitable for railway purposes? I think so.
826. Is the country easy for railway construction? It is fairly easy.
827. Is it long since you were last over the country? I was through it about nine months ago. Of course, I did not follow the route of the proposed line; but I know its direction, and I travelled in its vicinity.
828. That country is now stocked with sheep? Yes, and, you may say, with native dogs in places.

Frederick Henry Kennard, Mayor of Wellington, sworn, and examined:—

829. *Mr. McFarlane.*] Have you resided long in Wellington? Thirty years.
830. What facts do you desire to bring before us in connection with our inquiry? I have some figures here in regard to the town of Wellington. Last year the ratable value of property in Wellington was £12,278, and this year it increased to £14,405. Property is gradually increasing in value in Wellington. During the last three years there has been a wonderful advance in the price of land here. F. H. Kennard.
30 April, 1900.
831. What is the reason for this increase in values? The way in which the land in the district is being taken up. The prospect of the construction of a line to Werris Creek has also stimulated people to obtain land in the district. All the farmers and settlers here are well to do. There are very few insolvencies in the district, and those who have become insolvent have been mostly strangers who were on their last legs when they came here. I do not think there has been an insolvency of a genuine Wellington resident during the last ten years.
832. Are the farmers generally tenants, or are they freeholders? They are generally freeholders, and a great many of the farmers are beginning to buy land in the town itself, and to build on it. There is not an empty house in Wellington, and eighty new buildings have been erected here during the last twelve months—buildings ranging from the substantial business premises of Messrs. Wise & Co. to small two-roomed houses.
833. What is the population of Wellington? About 3,000, and twenty years ago, when we formed the municipality, it was just over 1,400. I have been some distance along the route of the proposed railway, and out near Murrungundy. There is a mineral spring there which has been highly spoken of by Dr. Barker, the Health Officer here, and other doctors in the district. They say that the spring is of great benefit to people suffering from rheumatics, and there are two people ready to build a sanitarium there when the railway is made.
834. Is the spring close to the proposed line? It would be within 2 or 3 miles of the station if the proposed line were made.
835. Have you a good knowledge of the country through which the line would pass? Yes, for about 20 miles from Wellington; and I have been on the Werris Creek end, out towards Tambar Springs, and very nearly into Coolah.
836. Is the country, so far as you know it, good country, capable of carrying a considerable population? I think so.
837. Is what you have seen good agricultural country? Some of it is very good, though there is also some that is very bad.
838. Is the country which you do not consider good agricultural country suitable for grazing? Most of the country which I have seen would be good grazing country.
839. Is dairying carried on in this district to any extent? Not much.
840. What is the reason of that, seeing that it has made such rapid strides in other districts? People have told me that there are not the right sort of cows here.
841. Has dairying been attempted here? They had a butter factory here, but people said that they could do better with their milk than supply it to a butter factory, and that it was better to grow wheat than to bother with cows.
842. If the proposed railway is constructed will the country between Wellington and Werris Creek be used for dairying? Some of it will be.
843. It has been said that that country is first-class wheat-growing land, do you endorse that opinion? I know that there is some very good wheat land within about 25 miles of Wellington. I think that if it is worth while to make railways like the Berrigan and Finley lines a line from Wellington to Murrungundy would pay. It would stimulate wheat-growing, and the district through which it passed would become almost a granary.
844. Do you think Wellington will be the centre of a large wheat-growing district? Yes.
845. Is much Crown land available for settlement within 30 miles of Wellington? There is a good deal of land on the Murrumbidgee Holding which will shortly be thrown open. 846.

- F. H. Kennard.
30 April, 1900.
- S46. Do you think that that land will be taken up when it has been thrown open? I am sure it will. I have heard several say that they are going to try for it.
- S47. Have you any idea of the value of the land outside of Wellington farming land? If you want any land within 7 or 10 miles of Wellington you have to pay from £4 10s. to £5 an acre for it.
- S48. Is that improved land? Yes, land that has been cleared. There is some land on the Nanima Estate for which I was asked £6 an acre in its unimproved condition. That land was covered with trees, though there was a fence around it. The proposed line would give a direct route from Brisbane to Melbourne, because the Western and Southern lines are already connected. I brought that point under the attention of the late Mr. Eddy, and he said it was a good one.

TUESDAY, 1 MAY, 1900.

[The Committee met at the Court-house, Wellington, at 10'30 a.m.]

Present:—

WILLIAM THOMAS DICK, ESQ. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Charles Hampden Barton, Manager of the Wellington Branch of the Commercial Banking Company of Sydney, sworn, and examined:—

- C. H. Barton.
1 May, 1900.
- S49. *Vice-Chairman.*] I understand that you are the owner of Towri run, about 7 miles from Wellington, through which the proposed railway would pass? Yes. I look upon the proposal before the Committee as a national work. A connection between the Western and Northern lines must be made sooner or later for strategical reasons, even if the line had to pass through barren country, while it is of national importance that our railway systems should be connected with each other by the most direct and convenient routes. Just as the Blue Mountains had to be crossed in order to reach Bathurst and the rich agricultural and pastoral land beyond, so the country between the Western and the Northern lines, whatever its character, must be crossed in order to make a connection between the two lines to complete our railway system. The intervening country is, however, of such a character that I believe a connecting line would eventually pay much better than is anticipated.
- S50. Admitting that there is some ground for urging the construction of the line to facilitate military operations and the better working of our railways, do you think that the time for its construction has yet arrived, seeing that the Railway Commissioners estimate an annual loss of £18,000 upon the working of this line? I do; and I doubt the figures of the Railway Commissioners. I believe that the traffic on the proposed line, when it is worked in with the traffic on the existing lines, will be found to pay very much better than is anticipated.
- S51. The Railway officials were asked what advantage the construction of the proposed line would be to them—whether it would be a convenience in working the traffic, or would result in the gaining of revenue; and their answer was that, except at times when they had a large quantity of rolling stock locked up in a place where it was not required, a cross-country connection would be of no advantage to them? Undoubtedly the proposed railway would gain a good deal of extra traffic. I do not think that the Railway Commissioners have allowed for the extra carriage which would come from increased tillage and the larger population which the proposed railway would cause to settle in the district which it would serve. I do not think they are quite aware how much traffic a large farm gives to a railway. I feel sure that the Government gets more than £1,000 per annum from my property in freight. A large farm gives much more traffic to a railway than the biggest pastoral holding.
- S52. You have 7,000 acres under cultivation? I have 7,000 acres altogether, but only 4,000 or 5,000 acres under cultivation.
- S53. In what way do you think the Commissioners' estimate of revenue would be exceeded? A great deal of agricultural land in the district through which the proposed line would pass is still in the hands of the Government; but when it is thrown open, and a railway is made, it will be taken up and used. Then, too, with a railway, the people who are now cultivating will increase their cultivation.
- S54. Are you acquainted with the country along the route of the proposed line? Only as far as Cobborah.
- S55. Between here and Cobborah, would the construction of a railway be followed by any increase in population and traffic? I have not the slightest doubt of it.
- S56. Are the holdings between Wellington and Cobborah large holdings? They are not large for station properties, but they would be large for farms.
- S57. Would the construction of the proposed railway induce settlers to go in for cultivation rather than for the raising of sheep? I think it is necessary to do something in that way to make a place pay. Where people cultivate, they can get better results from sheep than can be obtained without cultivation.
- S58. Do you think that mixed farming will come about? Yes, and then more sheep will be carried than are carried at the present time.
- S59. Even if a change were made from grazing to mixed farming, how would the railway traffic be increased thereby? Even a small farm will give more traffic to a railway than a large pastoral property. Five hundred acres under cultivation would give more traffic to a railway than 10,000 acres used for grazing. A man who is grazing sheep on 10,000 acres would require only himself and two boundary-riders to work the place, whereas with a farm he would require ten or twelve men. Then, for farming operations, a man requires machinery, bags, and all sorts of requisites, and has large quantities of produce to send away.
- S60. But agricultural produce is carried by the railways at a lower rate than that at which wool is carried? I do not suppose produce pays quite as well as wool, but it keeps a large staff employed, and the trains full instead of half empty.
- S61. If the proposed railway were constructed, would there be an interchange of products between this district and districts west of it, and the districts on the Northern and North-western lines? The country on the Northern and North-western lines is very similar to the country out west, in that it is subject to drought.

drought and requires large supplies of fodder; so that if the proposed railway were constructed we should have twice as large a market for our produce, because the northern and north-western markets as well as the western markets would be open to us. C. H. Barton.
1 May, 1900.

862. Would you draw any of the products of the northern and north-western country to this district? The tendency would be for stock to come from the north to the south, and there might be a saving by sending wool over the proposed line. I do not think there is much agricultural country north of the Hunter valley.

863. *Mr. Watson.*] Do you think that the population of Brisbane and Melbourne is sufficiently large to provide a fair number of passengers for a direct through line? The question is a difficult one to answer, but I believe that there would in time be a very great increase in the passenger traffic. The fact that people would be able to visit Orange and similar places on their journey might bring them this way. The proposed line would give opportunities for an interchange of commodities such as we can hardly conceive at the present time. I believe that there would be a great deal of traffic between the western and the northern lines. For a long time past I have been supplying large quantities of chaff to Narrabri and Moree. I sent it to Wright, Heaton, & Co., and to Scott, Wilson, & Co. I have a brother in the north-western district, but I did not send any to him. In 1899 I got nearly £1,000 from Wright, Heaton, & Co. for chaff sent to Moree, and nearly £300 from Scott, Wilson, & Co. I have received nearly £100 from Scott, Wilson, & Co. this year.

864. Is it likely that others besides yourself send chaff in that direction? I do not know if other people send chaff in that way so far. My chaff was sent there in a time of drought, but I do not know why the order came to me. They may go on getting chaff from me, but it will depend upon the seasons they have.

865. The presumption is that you were able to supply chaff more cheaply than the people of the Hunter district could supply it? They paid me the full market price for it, and asked for no reduction. We sold 100 or 150 tons at a time. If the proposed railway were made we should probably supply a great deal more, and people living along that line would be in a still better position to supply it? The line would open up a very big trade for Cobbyrah, for instance.

866. A few extra miles do not make much difference in long railway haulage? I do not know how the Commissioners arrange their rates, but from Wellington to Moree, by way of Sydney, is a tremendous distance. No doubt it is a presumptuous thing to set one's opinion against that of a railway expert, but I believe that the returns of the proposed line have been under-estimated, in view of the probability of a large increase in the trade of the district. The Commissioners' estimate might be correct for a year or two after the line was opened, but it would not be much longer than that before the traffic commenced to increase. I think I am right in saying that there would be an increase of 50 per cent. almost immediately.

867. *Mr. Shepherd.*] Have you reason to believe that the landholders along the route would be willing to give to the Government whatever land was required for railway purposes? I think it is possible that they would. No doubt if they were approached they would make some concession. For my own part the existing line suits me very well, though the construction of the proposed line would be an advantage to me, and I should, therefore, fall in with other landholders in giving what land was required.

868. It has been suggested that those who benefit by the construction of the new railways should promise to make good part of any estimated loss by paying an amount equal to what they pay in land tax? The construction of the proposed line would benefit not only the people in the district but all the people in New South Wales, and also people in Brisbane, and in Melbourne, and therefore I do not know why the people of the district should bear the whole expense. I would rather give my land than consent to an arrangement like that.

869. Landholders within easy reach of the proposed railway would effect large savings in the carriage of their produce? I consider that landholders more than 10 miles out from Wellington would be fools if they did not give what land was required for the line, if by doing so they would get the railway any sooner; but I do not think they should be asked to subsidise the line as if they were the only people benefited by it. They have to pay their share of the general taxation.

870. As the traffic increased their contributions would decrease? That is all very well, but by the same argument it may be shown that in a very short time there would be no loss on the line, and therefore no tax upon the general ratepayers.

871. For about 10 miles at each end of the proposed line the country is already served by the existing railway? I do not know that you can cut off as much as 10 miles. The Orange farmers compete with us for the western trade, and they would also compete with us for the northern trade, so that they, too, would furnish traffic to the proposed line.

872. Would you use the proposed line? Sometimes. Some of my land is closer to the line than other parts are. The proposed railway would gain traffic not only from Wellington, but also from Orange, Blayney, and Bathurst.

873. Are the landowners along the route in fairly good circumstances? I think they can be considered fairly prosperous men. The quantity of chaff I sent to Moree was about 500 tons.

William Patrick Mitchell, stock and station agent, sworn, and examined:—

874. *Vice-Chairman.*] Will you make a statement to the Committee of your views in regard to the proposed line? During the drought, two years ago, as agent here, I had charge of a good many thousands of sheep, horses, and cattle. The horses were sent from Bourke, and nearly all the stock was depastured in the country to be traversed by the proposed line—along Spicer's Creek and out Comabella way. I had 4,000 sheep which came from Dubbo, paddocked for some months, on 1,280 acres. People continually bring stock from in and around Dubbo to Wellington. I also had stock from Forbes, Coonamble, Walgett, Dubbo, Bourke, Narraminy, Trangie, and Cobar; so that the Wellington district was nearly crowded out by starving stock. Most of that stock is brought here by road, but I believe that if there had been direct railway communication with the Narrabri district, a lot of the sheep which died in that district would have been sent here and saved. This was the only district which had good grass during the dry season. W. P. Mitchell.
1 May, 1900.

875. Is it the practice to understock in this district? They do not overstock here; they stock just up to the carrying capacity of the land. At a place to which I sent 137 horses for Cobb & Co., of Bourke, the land was carrying nearly a sheep to the acre as well as cattle, but there was abundance of grass, and the horses went away fat. The place I am referring to is held by Messrs. Martin Bros., Bodangora. 1 am

W. P.
Mitchell.
1 May, 1900.

am not quite sure that they were running a sheep to the acre all the time, but I know that they sheared a sheep to the acre. In one case a gentleman from the Walgett district bought 2,000 acres of land here, and a certain area under annual lease, for £2 10s. an acre, and was thus able to save his stock. The land carried over a sheep to the acre, and the sheep are fat now.

876. What was the character of the land which he bought? About 1,200 acres were fit for cultivation. It was not all ringbarked when he bought it, but he ringbarked some of it afterwards. I made an offer of £2 15s. an acre on behalf of a Forbes buyer for improved and partially improved land along the route of the proposed line, but the holders wanted £4 an acre. That was a block of 6,000 acres of secured land about 14 miles from Wellington. I have been engaged in lending out money for a Sydney firm, and in nearly every instance their own valuator has valued the land on which it is being advanced—partially improved land—at £4 an acre. I consider that any land within 15 miles of Wellington, which is well improved, is worth £5 or £6 an acre. Of course that valuation does not apply to river flats.

877. What would you call "well improved" land? Land which has been cleared, fit for the plough, and has been fenced. Last season a good deal of the wheat about here was bitten by the frosts, and farmers, thinking that it would not mature, cut a good deal of it for hay. That hay is now practically useless to them, because they have so far to haul it that it would not pay to export; whereas, if the proposed railway were made, they could send it away by train. I believe that a great many of the people along the route of the proposed line from Wellington to beyond Cobbarah would be only too happy to give what land was required for railway purposes.

878. Do you hear serious complaints from the farmers about the handicap which they now suffer? Yes, often.

879. Does their distance from a railway prevent them from extending their agricultural operations? Yes. If the proposed railway were made, the traffic on it would often increase the traffic on the main trunk lines as well, because a great deal of produce would be sent right through to the metropolis.

880. How would you compare the land between Dubbo and Murrungundy with the land between Wellington and Murrungundy? I do not think that it is as good; it is more sandy, and, according to experts, does not grow as good wheat. The Wellington wheat was awarded first prize at the Chicago exhibition, the reason being given that it contained more phosphorus than any other wheat. The Wellington soil contains more phosphorus than any other soil in New South Wales. I have already had a visit from a man who represents five intending applicants to inquire about the throwing open of the Murrumbidgee leasehold area. This gentleman believes that between twenty and thirty farmers will come from Numurka, in Victoria, to ballot for the land. Two or three blocks were balloted for the other day for homestead selections. The largest block was between 400 and 600 acres, and there were seventy-three applicants.

881. How much land of average quality will maintain a man and his family in decent comfort? I think that with good land, such as that along the route of the proposed line, towards Spicer's Creek, a man can live on 640 acres; but 1,000 acres or 1,250 acres would make a decent block, and would enable a farmer to combine sheep-raising with wheat-growing, and then if one failed he could fall back on the other.

882. How is the country timbered? It is pretty heavily timbered; chiefly with white box, but with pine in places.

883. What does it cost to clear it? I should say that you could get green timber cleared for between 30s. and £2 an acre.

884. Do the farmers ringbark the land first? If they can afford to wait, they ringbark first, and then burn off the timber when it is dead.

885. You say that improved land is worth £5 to £6 an acre within 15 miles of Wellington? Yes.

886. In its unimproved state, would land be worth from £3 to £4 an acre? Good agricultural land is worth £2 10s. and £3 an acre unimproved. Those prices have been given for land here.

James Bonnor, general merchant, Orange, sworn, and examined:—

J. Bonnor. 887. *Mr. McFarlane.*] I understand that you have resided at Orange for a number of years? For twenty-five years.

1 May, 1900. 888. How would the construction of the proposed railway affect Orange? For many years past the Orange farmers have been in the habit of supplying produce to districts similarly situated to Werris Creek. For instance, we have supplied large quantities of chaff, potatoes, and oats, to places along the western line as far as Bourke; and also to Cobar, to Condobolin, to Hay, to Gerodgery, and, in some years, to Albury. Last year we sent produce to Morce and Narrabri, and we have also sent it to Newcastle. The closer the centres of supply and demand are brought together the better it is for both producers and consumers. At the present time a great many stock die for want of food; but, if the squatters could obtain fodder more cheaply, the losses in stock would be much less than they are. These losses of stock are a very serious thing for the colony, and we have just gone through a season in which some millions of sheep have been lost.

889. Would the proposed railway give you facilities for sending produce to districts to which you do not send it now? Yes; it is not only in bad seasons that we supply produce to the places I have mentioned; we also supply it, more or less, in good seasons. It is always going forward.

890. Would the proposed railway be used by you to forward produce? The proposed railway would bring centres like the district between Coonamble and Dubbo, and Dubbo and Werris Creek, into touch with districts like that between Dubbo, Wellington, and Orange, and would thus create three times the traffic. It would enable the squatter who wanted supplies of fodder for his stock to obtain it at the cheapest rate; it would enable people living in warm parts of the country to obtain all kinds of English fruits, such as cherries and apples, which are grown in Orange, and also potatoes, butter, and produce of that kind, more cheaply than they can get them now; and it would also enable people to bring their families into the cooler districts during the heat of summer. At the present time, people rent furnished houses in Orange for the summer, and still more would come if the proposed railway were made.

891. Do you think the districts on the North-western line would require much produce? I have been twenty-five years in business in Orange, and we have been supplying those districts ever since the North-western railway was opened. The railway journey from Orange to Narrabri by way of Sydney and Newcastle is almost prohibitory, but if there were a line *via* Walgett and Werris Creek the distance would be very much reduced. The proposed line would increase the passenger traffic, the stock traffic, and the produce

produce traffic. It would increase the passenger traffic, not only by bringing people from the hot districts to the cooler districts, but also in giving a more direct route from Melbourne and the Southern line to the northern parts of the Colony, and to Queensland. Then, too, the line would decentralise business. At the present time nearly every town in New South Wales depends on Sydney for its trade; one town can hardly trade with another. But if Glen Innes, Narrabri, Mudgee, and the Western line were all connected, it would tend towards decentralisation, and give facilities for an interchange of products.

J. Bonnor.
1 May, 1900

892. Would the proposed railway be used to send supplies from Orange, Dubbo, and Wellington to the north-western districts? It is bound to do so.

893. Would there be any substantial traffic within a reasonable period? I should think so. Every buyer will go to the nearest market, in order to save trainage, whereas, now, people sometimes say that it costs too much to buy produce, and therefore let their stock die. If the proposed railway were made, they would buy produce and save their stock.

894. Have you received orders recently for chaff for any of the northern towns? Yes, last year.

895. What quantity of chaff did you send away? Last year about 1,000 tons of chaff were sent from Orange to the Northern lines.

896. To Narrabri and Moree? To places all along from Newcastle to Narrabri and Moree.

897. Would you use the proposed line for sending produce to other districts? Orange, Bathurst, Carcoar, Wellington, and Dubbo are likely to become in time large manufacturing centres, and the proposed railway would put large sheep and cattle districts into easy communication with these towns. One-third of all the potatoes grown in New South Wales is grown in the Orange district, and the production is increasing.

898. Do they not grow potatoes in parts of the north-western district? They grow them in Glen Innes. At the present time it is almost impossible to supply potatoes to Coonamble. Mudgee is not much of a potato-growing district, and beyond Orange, to the west, it is too hot for potatoes. The production of potatoes in the Orange district is increasing every year, and it will increase more and more as the demand increases.

899. Would the proposed railway be used for the carriage of potatoes? Yes; and also to send away fruit, chaff, and produce generally. We can grow grain of all kinds, except maize. Oats, wheat, peas, and crops of that kind grow well.

900. Do you receive much wheat from Wellington? A fair quantity. The millers at Orange need the dry wheat from these districts to mix with the local wheat, which is of a tougher nature.

901. Have you any knowledge of the country along the route of the proposed line? No.

902. You consider it a matter of some importance to Orange to have the line constructed? I do not look upon it as an outlet for Orange so much as a national matter.

903. But you think that it would benefit Orange? Yes; it would give an outlet for Orange produce, and would enable us to draw supplies of beef and mutton from other districts. Coonamble is a good district, and can very often supply good stock when stock in other districts are poor because of a drought. Loop-lines, such as that proposed, are necessary for the convenience of the travelling public, and for military purposes, and, in view of the speedy consummation of federation, should be constructed.

904. But only the most urgent of these lines can be carried out at once? That is so.

905. *Mr. Watson.*] From Orange to Moree *via* Sydney is 605 miles, and *via* Wellington and Werris Creek it would be 375 miles,—the charge per ton for chaff, in 6-ton trucks, would be 13s. 10d. for the 605 miles, and 10s. 10d. for 375 miles;—do you think that a saving of 3s. per ton in freight would materially affect the produce traffic between the two districts? The Government make great concessions on produce such as chaff; but the charge on produce other than chaff from Sydney to Bourke is 35s. per ton. This would leave a much greater margin than appears in the carrying of chaff, and would tend to decentralise the trade.

906. There is not the same distinction drawn between the "up" and "down" journey in respect to produce such as chaff as there is in respect to other produce? No. I think Mr. Combes was Secretary for Public Works when these concessions were first made, and the produce trade has grown rapidly ever since. After concessions were made we began to send produce to places to which we had no idea of sending before, because the rates were prohibitory. The Colony must be opened up for trade, and, as our rivers are not navigable, we must have railways. I am satisfied that the construction of the proposed line will create a considerable amount of traffic.

James Stuart Leeds, stock and station agent, Orange, sworn, and examined:—

907. *Mr. Watson.*] Have you a statement to make to the Committee? I have always been of the opinion that a line should be constructed from Werris Creek to the Great Western line. As federation is now very close, with the abolition of the stock tax in Victoria, such a line would greatly assist northern stock-owners, by giving them an opportunity to use the Melbourne market as well as the Sydney market. At the present time they have only the Sydney market, but the removal of the Victorian border duties will give them a market in Melbourne, and the proposed line, together with the Blayney-Harden line, would assist them in getting there. In my opinion, the construction of the proposed line would improve the prospects of the Blayney-Harden line, which is now worked at a heavy loss.

J. S. Leeds.
1 May, 1900

908. Mr. Harper told us that, prior to the imposition of the Victorian stock tax, the greater part of fat cattle travelling towards Melbourne came from the Queensland border, west and north, and went through Bourke, and he seemed to be of the opinion that if the tax were removed the traffic would go that way again? If the proposed railway were constructed it would be of advantage to stockowners in the northern part of this Colony, and also to the Queensland stockowners. A great number of stockowners have not used the Melbourne market, because they have been unable to get there.

909. If there were no border duties, would stockowners in the northern part of New South Wales be able to compete with stockowners in southern Queensland? I see no reason why a man who had fat stock in the northern district should not use the Melbourne market as well as the man who had fat stock at Bourke. A Queensland stockowner has to travel his stock many hundreds of miles by road before he can put them on to the train at all, and that wastes the stock; whereas if the proposed railway were constructed a stockowner in the northern parts of this Colony could put his beasts almost directly into the train, and land them in Melbourne in better and finer condition than the Queensland stock. In this way he would get a better profit from his stock than the Queensland owner would get.

- J. S. Leeds. 910. Is the New South Wales country as good for fattening big stock as the Queensland country is? Most decidedly. From Tamworth right away to Moree, and further, it is all rich fattening country; but at present the stockowners have only the Sydney market to go to.
- 1 May, 1900. 911. Is much fattening done in New England? Yes; at the present time the Sydney market has to depend largely upon the stock from the highlands.
912. You think that there would be a considerable through traffic in large cattle? Both in sheep and in large cattle.
913. It has been urged in favour of the proposed line that it would be of advantage in enabling stock to be removed from drought-stricken districts to places where they could get pasture? Certainly it would.
914. In what direction would the movement of stock be—from the North and North-western line towards Wellington and the Western line? The stock would be sent wherever there was grass and water.
915. Which districts are safer for stock—the western or the northern districts;—where is the rainfall most likely to be seasonable? Starving stock has to be sent to the highlands on the Northern, Western, and Southern lines.
916. In that case I do not see why starving stock should come towards Wellington from the northern districts? Stock has been trucked from Riverina to Bathurst for grass. Some stock which were trucked from Burrabogie to Bathurst are there still. Stock could not have been sent from the Southern line to the Western line had it not been for the Blayney to Harden connection. Only the other day it was said that the Blayney-Harden line would have paid had it not been for the Victorian stock tax.
917. Is it likely that if the proposed railway were constructed stock in dry seasons would be sent from the Moree and Narrabri districts towards the Western line? I think so; just as stock has been sent on to the Western line from Riverina.
918. Why would they not be sent on to the New England table-land? No doubt a great many would be sent there.
919. The proposed line would give them another outlet? That is so. When the Victorian stock tax is removed the live-stock traffic to Melbourne must add materially to the revenue of the proposed railway.

George Hawke, farmer, Orange, sworn, and examined:—

- G. Hawke. 920. *Vice-Chairman.*] I understand that you have had some experience of milling? I was for eighteen years the manager of a mill at Millthorpe. I was the first to conceive the idea of erecting a mill there, and I built the mill.
- 1 May, 1900. 921. *Mr. Shepherd.*] Have you been engaged in farming at all? Yes; I have a farm on which one of my sons is living. It is within 6 miles of Orange, and is under my management. I was asked to give evidence before the Committee in regard to the probability of produce from the Orange district being sent into the Moree district over the proposed line. About Orange we grow potatoes, which cannot be grown in the Moree district, and no doubt if we could send them there at a reasonable cost a large trade would spring up. There would also probably be a considerable trade in fodder.
922. Are you acquainted with the country in the vicinity of the proposed railway? I was through part of it many years ago, but I have only a superficial knowledge of it now.
923. Do you think it would be better to connect the Northern line with Dubbo rather than with Wellington? It seems to me that if there are no engineering difficulties in the way it would be better to make the connection at Wellington.
924. Do you know anything of the agricultural capacity of the land through which the line will pass? To my recollection the soil is generally rich, but when I went through the district agriculture was not thought of, and the country was being used purely for pastoral purposes.
925. It is estimated that there will be a deficiency of £18,000 per annum on the working of the proposed line;—can you tell us how that deficiency would be decreased? My experience of railways is that when a railway is first made although the traffic may be little the place quickly grows. I remember when bullock-drays brought everything to Bathurst and to Orange; but I do not know how many drays would be required to deal with the traffic now.
926. The Western line was pushed out into entirely new country, but the proposed railway is merely a connection between existing lines? Yes; but it would go through a great deal of country which is not served by them.
927. Have you reason to believe that the proposed line would give any great impetus to farming? We believe that we are on the eve of federation, and Orange is talked of as a likely place for the federal capital. If Orange became the federal capital the proposed line would bring Brisbane, and places to the north, much nearer to us than they are now, and I imagine that the passenger traffic would be very heavy.
928. Do you think that the estimated deficiency would be got rid of within a reasonable time? I think that the undertaking is so large that a loss of £18,000 should not be looked upon as a very formidable thing. Plenty of industries have been started and have been kept going for eight or ten years before making a profit, but eventually they came to pay.

Joseph Aarons, farmer and grazier, Wellington, sworn, and examined:—

- J. Aarons. 929. *Mr. Shepherd.*] Have you resided long in the district? I have resided in Wellington since 1854, and I have been in the district since 1844.
- 1 May, 1900. 930. You have been largely engaged in farming and grazing pursuits, I understand? Yes, very largely.
931. Have you a fair knowledge of the country through which the proposed line would pass? I know every mile of country from Wellington right up into Queensland, as far as the Darling Downs.
932. Will you describe for us the country between Wellington and Werris Creek within 20 miles on each side of the proposed line? I think that at least nine-tenths of that country is fit for agriculture; in fact, the whole of the land through which that line will pass is fit for a mixed agricultural and pastoral occupation.
933. What would be the character of the one-tenth that is not fit for agriculture? It would be good, sound pastoral country.
934. Is there no barren country? No.

935. What prospect is there of the proposed line being self-supporting within a reasonable time? I have every reason to believe, not only that it would be self-supporting, but that it would exceed the most sanguine expectations. I have seen far inferior country settled upon and cultivated. The existing hunger for land in these districts satisfies me that as fast as the railway is made population will settle on the land through which it passes. I used for many years to supply my stations at Nanima and down the river with stock from Northern Queensland. J. Aarons,
1 May, 1900.
936. Would the construction of the proposed railway largely develop the mining industry here? Yes. There is a belt of copper-bearing country which goes from Copper Hill at Molong as far as Bolaro. The proposed railway would be close to the copper deposits about Bolaro.
937. Is that country being prospected? It is being worked, and, with a railway, a good many mines would be opened up and a large population settled on the land.
938. Is the timber along the route suitable for a railway and for mining purposes? Yes, and there is any quantity of it.
939. Timber of what description? Box, iron-bark, stringy-bark, and gum on the flats. It is all good agricultural land, and, no matter what the seasons, will always give a fair average crop. I have been cultivating since 1851.
940. Does it seem to be the general impression that the proposed railway, if made, would be a success? Yes. As soon as land is thrown open in this district people come from all parts of Australia to take it up.
941. Do you think that the owners of land along the route would be prepared to give the Government as much as will be required for railway purposes? In my opinion, they would. The proposed railway would open up a trade for which the Wellington people have been yearning for years. The Railway Commissioners seem to have ignored the stock traffic from the Queensland side which the proposed railway would serve. I have brought cattle from Queensland in thousands, and have gone through the country myself to buy them. The stock traffic will be much greater than some people anticipate.
942. You are talking of fat stock? Fat stock and store stock. At the present time they have to take a great deal of stock to Bourke, but a good deal of store stock comes this way, and it is good country all the way through.
943. Is this district ever so short of feed that stock must be sent elsewhere for pasture? In one or two extremely dry seasons we have been a little short, but there have been no losses here to compare with those of other districts. People send stock to this district for both the Northern and the Western districts.
944. There is generally an abundance of pasture here? Yes.
945. Do you think that the construction of the proposed railway would encourage people to send stock here from the Northern districts in bad seasons? Yes.
946. The proposed line would derive a considerable amount of traffic from that source? Yes; and I have no hesitation in saying that it would return interest on the cost of construction within a very short time. I have had so many years' experience in bringing stock to the district that I know that that traffic will be very large.
947. Is it difficult to get stock here now, because of the roundabout way in which it has to come? Yes. A great deal of the stock would have to go round Bourke way.
948. What is the country like between Dubbo and the nearest point on the proposed line? It is sour country—scrubby, iron-bark, granite country—there is no comparison between it and the country from Wellington out. The moment that the land through which the proposed railway would run is thrown open for selection it will be jumped at. Scores of people have asked me when such and such a run is to be thrown open. If the proposed railway were made, fat stock from Northern Queensland would have a better chance of getting to the Melbourne market than they have by going round through Bourke, because they would be saved hundreds of miles of travelling. Then, too, a large trade in produce would open up between Wellington and Werris Creek. Last week I got a note from a firm in Tamworth—Messrs. Garvan and Cousins—inquiring what I could supply 100 tons of lucerne chaff at.
949. *Mr. Watson.*] You have not done business with them? No, because my supply of lucerne has been disposed of. If the proposed railway were constructed, the settlement along it would create a great deal of traffic.

John Perry, farmer and grazier, Walhallow, sworn, and further examined:—

950. *Mr. Watson.*] I understand that yesterday you omitted to mention one or two points which you think would be of importance? Yes. Yesterday I made no reference to the revenue which would probably be derived from the fat-stock traffic on the proposed railway. J. Perry.
1 May, 1900.
951. Do you think that that would be considerable? It would be a very large item.
952. Would you truck from Spring Ridge towards Newcastle? Yes.
953. For how far back along the proposed railway would there be a disposition to truck towards the Northern line? For fully 70 miles; from as far back as Oakey Creek, I should think.
954. Do you think that most of the station-owners there use Newcastle as their place of export and general depôt? Yes. The construction of the proposed railway would also enable the Coonabarabran people to export their produce, if they were growing more than they could consume.
955. How far would they be from the proposed railway? About 30 miles. Some of them would be nearer to it than that.
956. The Coonabarabran district is said to be a very good one? They can grow as good wheat and fruit there as is grown in the Colony. There is an enormous area of land there which is fit for cultivation. The Government are now throwing open a lot of land within 20 miles of the proposed railway which is as fine as any land that I have seen.
957. One of the witnesses yesterday expressed the opinion that with wheat at the present prevailing prices New South Wales would not become a large wheat-exporting country;—do you agree with that? I do not. We have already loaded three ships with wheat for the London market, and we find that by shipping direct to London we can get better prices than we can get in the Sydney market. We can land wheat in London for about 10½d. a bushel, so that at 29s. 4½d. a quarter the farmer receives 2s. 10d. a bushel net profit. By making Newcastle the port of export—and we are prepared to send 5,000 bags from there—there will be a saving of 1d. a bushel to the farmers; and if the proposed railway were made the people living along it would be in a better position for exporting wheat than the people at Wellington, because they would be nearer Newcastle. 958.

J. Perry. 958. Do you think that we can produce wheat so cheaply as to be able to compete in the English market with wheat grown in other parts of the world? The only serious competitor that we shall have is the Argentine; we can produce wheat as cheaply as they can grow it in the United States.

1 May, 1900.

959. What has it cost you to sow and to harvest your wheat crops? Using modern four-furrow ploughs, and cultivating ordinarily good land that has been ploughed at least once before, I have known 34 acres to be ploughed in a week. Taking any land, I average that with four-furrow disc ploughs a man can plough 18 acres a week at a cost of 2s. 6d. an acre; the harrowing can be done for less than a shilling an acre, and the harvesting, with combined harvesters, does not cost 6d. an acre. If we pay a man 30s. a week and find him in food, and another man £1 a week and find him in food, to sew bags, the harvesting does not come to more than 2s. Then there is 2s. an acre for seed. I only use half a bushel of wheat to the acre, and that would cost about 1s. 4d. For oil and sundries I allow 1s. an acre. Taking those figures, I estimate that we can grow wheat for about 8s. 6d. an acre—for something between 8s. and 10s.

960. At that cost, and knowing the price of land, do you think that it will pay people to grow wheat for 2s. a bushel? Yes; at from 2s. 6d. upwards, if the wheat is handled by means of elevators. There is a direct saving to the farmer in lessening the cost of handling of wheat. If South Australia, with an average yield of 6 and 7 bushels to the acre, can export 4,000,000 bushels of wheat, we in New South Wales, who have better land and a better rainfall, can do at least as well. We can, and we are exporting wheat. Those with whom I am connected are about to load a fourth shipment. Two gentlemen have sent us as much as 3,150 bags—1,650 bags from Currabubula, and 1,500 bags from Manilla. Mr. Binney is growing wheat 30 miles away from Quirindi, and is increasing his acreage. I have heard that he has paid as much as 1s. 3d. a bag for cartage, but I myself have had to pay 1s. 9d. a bag to send wheat 36 miles. 6,565 bags of wheat were taken by the "Vortigen," and the freight, insurance, and loading, and unloading charges came to 10½d. a bushel, which will leave the growers about 2s. 8d. a bushel net. The English co-operative society which is selling for us only charges ½ per cent. commission, whereas in the ordinary way of business perhaps 2½ per cent. would be charged. When I was here yesterday I forgot to mention the mining that is done round Leadville and Stringybark. Stringybark is within 20 miles of Cobborah.

961. *Mr. Shepherd.*] How much seed do you sow per acre? Sowing 26 lb. of seed and 1 cwt. of Thomas' phosphate, I have harvested 6 bags to the acre.

962. What does the ploughing cost per acre? It does not cost me more than 2s. 6d. an acre. Mr. York, with a "Sunshine Harvester," in my district, took off nearly 800 bags of wheat in fourteen days with his own and his brother's labour, and I, with my two sons, have taken 304 bags off 136 acres. I employed two men for two days to cart the bags, and it cost me 4s. 6d. for oil, &c., besides.

WEDNESDAY, 2 MAY, 1900.

[The Committee met at the Municipal Council Chambers, Dubbo, at 11 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDSAT CRAWFORD SHEPHERD, | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

James Andrew Ryan, Mayor of Dubbo, sworn, and examined:—

J. A. Ryan. 963. *Vice-Chairman.*] How long have you resided in the district? I have been a resident of the district for thirty-four years.

2 May, 1900. 964. What are your views in regard to the proposed construction of a railway from Wellington to Werris Creek? My opinion is, that the interests of the country would be better served by the construction of a line from Dubbo to Werris Creek.

965. What are your reasons for that opinion? I believe, in the first place, that there would be more stock traffic on a line coming into Dubbo, especially in view of a probable connection between the Western and the Southern lines, commencing somewhere near Dubbo. I think that such a connection will be made in the future, and that a cross-country line such as that would be largely used to convey stock to Victoria. I believe that the stock traffic from the northern parts of this Colony will be very large in time to come. The railway would also be of use in times of drought in removing stock from the western districts to higher country, such as the proposed line would give access to. The land between Dubbo and Murrungundy is good agricultural country, and I believe that if it were given railway communication it would carry a large farming population.

966. You do not regard the proposal before the Committee as complete in itself, but as part of a further connection between the Western and the Southern lines? Yes. Such a connection would make the proposed railway more profitable.

967. Are you personally acquainted with the country between Dubbo and Werris Creek? I know the country between Dubbo and Murrungundy, but I do not know much of the country beyond that. A line from Dubbo to Murrungundy would pay better than a line from Wellington to Murrungundy, and would serve more people. There is good country between Wellington and Murrungundy; but a line going from point to point would cross the creeks at right angles; whereas a line from Dubbo would follow the directions of the creeks, and would thus be easier of access to the farmers settled along them.

968. What is the proportion of good agricultural land between Dubbo and Murrungundy within from 10 to 20 miles on each side of the route of the proposed line? The best land would be on the southern side of the Talbragar.

969. On the southern side of the proposed line? Yes; on the northern side there is a good deal of iron-bark country.

970. Are there any other reasons why you prefer a connection with Dubbo to a connection with Wellington? I believe that a connection with Dubbo would serve the traffic better in years to come, and would also open up more country.

971.

971 It is estimated that the construction of the proposed railway will involve an annual loss of £18,000; do you think that the character of the country to be served by it justifies the incurring of such a loss? The line is not one which I would advocate as a paying commercial concern at the present time. In years to come, when the population of the district is bigger, and there is more traffic between the main trunk lines, the proposed railway would pay.

J. A. Ryan.
2 May, 1900.

972 Would the line be used for the carriage of starving stock? Yes; it would be used for the removal of stock from the western country to the Mountains, and their transport back again after the breaking up of the drought.

973. Mr. Harper tells us that the drift of that traffic is from the North-west to the South-east, at right angles to the general direction of the proposed line? The movements of stock depend upon the rainfall. Sometimes a good rainfall in one part of the Colony creates enough food to support perishing stock from many other districts. The New England country, for instance, might get a good rainfall, while we did not, and in that case the proposed railway would serve us for the transport of our stock to New England.

974. Would there be any interchange of products between the Western and the North-western lines? The proposed railway would be used for the carriage of wheat and chaff, but the traffic would not be very great.

975. Would produce grown at Dubbo and along the Western line be exchanged for the products grown in the Northern and North-western districts? The interchange would not be very great. But the line would be of great service to people in its vicinity. It would be of more use for that purpose than in opening-up commercial intercourse between the districts on the Western and the Northern lines.

976. A good deal has been said about the national aspect of this proposal; have you any opinion to offer upon that point? That is the strongest claim which the proposal has upon us in Dubbo. It would help to give communication from one part of the Colony to another, and in that way it would be useful for all time.

977. What would you call a national advantage? The proposed line would improve the communication between various parts of the Colony, and, when federation comes, it will be very desirable to have the Colony intersected by railways at different points.

978. Is there much Crown land available for settlement between Dubbo and Murrungundy? I could not say; but there are some leasehold areas still to be thrown open.

979. What is the average yield of the land within 10 miles of Dubbo, along the proposed route? From 20 to 30 bushels to the acre. The land along the valley of the Talbragar is considered superior wheat-growing land.

980. *Mr. Watson.*] You say that on the Northern side of line from Dubbo to Murrungundy it is poor land? A good deal of that land is covered with iron-bark.

981. Would there be much settlement upon that land? No; that country would be used only for timber.

982. A considerable quantity of timber comes from there now? Yes.

983. It is claimed by those who advocate the line from Wellington to Werris Creek that from Wellington to Murrungundy there is a large area of agricultural land on both sides of the proposed railway which would be served by it? The land on Mitchell's Creek and Spicer's Creek is good agricultural land; but the line from Wellington to Murrungundy would cross those creeks at right angles. On the other hand, a great many settlers would benefit by a railway going up the Talbragar.

984. Would it not be better to have good country on both sides of the line than on only one side of it? I would put the timber traffic against any other traffic as a feeder to the line. I think that the timber would equal in value any agricultural production.

985. Does the cutting of timber give employment to as many people as agriculture gives employment to? I think so. The iron-bark forests here have supported a large number of people for the last twenty or thirty years.

986. Would a line from Dubbo to Murrungundy give access to more timber than a line from Wellington to Murrungundy? Decidedly.

987. Has not a great deal of the best iron-bark between Dubbo and Murrungundy been felled? A good deal of it has been felled, but there must be a good deal of timber still there. When the timber getters have a long way to draw the timber they only fell the best trees.

988. Can it be correctly said that the best of what remains of the iron-bark between Dubbo and Murrungundy is north of Murrungundy? No. A lot of the best timber is within a few miles of Dubbo.

989. It has been stated that the iron-bark forests from Murrungundy towards Murrungundy are practically untouched? The further you go from Dubbo the more timber there is.

990. That being so, a line from Wellington to Murrungundy would tap almost the virgin forest? Yes. We expect that a great deal of timber will continue to go to Cobar for many years to come, and it would be more convenient to send that timber through Dubbo than through Wellington.

991. What is the particular demand for timber at Cobar? It is required for mining purposes generally—supports, surface works, and so on.

992. Do they prefer iron-bark for those purposes? Yes, if they can get it, but the road carriage has stood in the way of the timber trade.

993. It has been suggested that a better cross-country line would be one from Curlewis to Gilgandra;—do you know the country between those points? No; but I think that later on such a connection will be justifiable. Such a line would not pay just now any more than a line from Dubbo or Wellington to Werris Creek would pay; but it would pay in the future.

994. A line from Curlewis to Gilgandra would save some 50 miles of construction, although it would not give such a direct connection with the Northern line? If the proposed connection is to be considered in the light of an intercolonial line, I think it would be desirable to take it from Werris Creek to Dubbo.

995. *Mr. Shepherd.*] Are you well acquainted with the country between Dubbo and Murrungundy? I have travelled over it a good many times.

996. What sort of country is it? The soil is loamy, some of it light and some strong, but all good wheat land. Some of the land along the Talbragar is very rich, and will be good land for orchards in time to come. It would also suit vines. You could grow wheat right up to the tops of the hills. It is all open box country.

997. Do you consider it fit for either agricultural or pastoral pursuits the whole way through? Yes.

998. Are you acquainted with the country from Wellington to Murrungundy? I have never travelled through it, but I believe that it is good agricultural country.

John

John Miller, station manager, Murrungundy, sworn, and examined :—

- J. Miller.
2 May, 1900.
999. *Mr. Watson.* I understand that you know the route of the proposed railway from Wellington to Murrungundy, and the alternative route from Dubbo to Murrungundy? Yes.
1000. In view of all the circumstances of the case, which way do you think the line should be taken? I would follow the Dubbo to Murrungundy route. The land on both sides of that route is good wheat-growing land. Of course, there may be a patch here or there, of a mile or so in extent, covered with iron-bark and black pine, but even that ground, if it were cleared, would grow wheat.
1001. How would you describe the country between Wellington and Murrungundy? In my opinion, having regard to the agricultural capabilities of the soil, I think that the country on one route is on a par with that on the other.
1002. Is there not a good deal of iron-bark country on the northern side of the Dubbo to Murrungundy route? I do not think so.
1003. Roughly speaking, the Dubbo to Murrungundy route keeps to the south of the Talbragar River? Yes, until somewhere about the junction of Booni Creek. After it crosses the Talbragar there are 10 or 12 miles of rough country, but, further on again, much better country is opened up. According to my recollection of the route, I should not think there are more than 4 miles of what I should call bad country—stony ridges, with iron-bark on them—between Dubbo and Murrungundy.
1004. Does the line leave the Talbragar before it reaches Murrungundy? No.
1005. How would you describe the country on the northern side of the Talbragar, going 10 or 15 miles back? I should call it box country, with apple-tree flats, interspersed with black pine. About 2 miles out of Murrungundy it runs through iron-bark and black pine.
1006. I understand that for 21 miles out from Dubbo the country is good? Yes.
1007. After that you find iron-bark country on the northern side of the Talbragar? Yes.
1008. Is that country uniform, or is some of it better than other parts of it? It is interspersed with box flats, which would be used for agriculture if a railway were made there.
1009. The iron-bark country seems to run for a good distance north and west of the proposed line;—how would you compare that tract of country with the country through which the line from Wellington to Murrungundy would pass? There is more agricultural land, on the whole, from Wellington to Murrungundy, though there are bad spots on that route, just as there are on the northern side of the Dubbo to Murrungundy route.
1010. But on which route would there be the greater area of good land? I think on the Dubbo route.
1011. Is there any considerable tract of bad country close to Wellington? The country is all broken up on that route. There is not a run of good land; the good land is crossed here and there by patches of bad land.
1012. How much bad land is there—one-half? Speaking roughly, I should say that fully one-third of the land might be classed as broken, or bad country.
1013. Do you think that there is a larger area of broken and rough country on the Wellington route than on the Dubbo route? Yes.
1014. Does the broken country between Wellington and Murrungundy contain any valuable timber? White pine grows there, and that is valuable timber; but the trees are very scattered. The iron-bark has been pretty well cut out; but no doubt the young timber which is growing up will be valuable in time.
1015. Has the good timber north of the Talbragar, towards Murrungundy, been cut out? Yes; the best of it has been cut out.
1016. Would we be right in assuming that the best timber to be got now lies northerly from Murrungundy, towards Mundooran? Yes.
1017. So that either the Wellington or the Dubbo route would tap the good timber country equally well? Yes.
1018. Why do you recommend the Dubbo route in preference to the Wellington route? Taking a straight line from Wellington to Murrungundy, the distance is about 33 or 36 miles, so that settlers half-way would be within 15 miles of a railway station, supposing the Dubbo to Murrungundy route were taken. If, however, the Wellington-Murrungundy route were followed, the settlers between Dubbo and Murrungundy would be left without railway communication. If a line is taken from Dubbo through Murrungundy to Werris Creek, it will mean that in the future, where there is an acre of cultivation now, there will be 100. The cost of carriage kills a farmer when he is 28 or 30 miles from a railway.
1019. How far are you from the railway now? Twenty-nine miles.
1020. Have you any cultivation? Yes; we have just finished clearing 640 acres, and we have 4,000 acres which would be put under crop if we could send our produce away. Most of my neighbours who are now cultivating would put in much larger crops if they could get railway communication.
1021. What is the area of the Murrungundy holding? There are 17,000 acres under lease, and about 45,000 acres altogether, including the purchased land.
1022. When does the lease expire? On the 1st August.
1023. Is it likely that the land will be taken up? No doubt some of it will be taken up. There is bad land on the north side of the Talbragar; but there are good box flats through it.
1024. Is most of the Murrungundy leasehold on the northern side of the river? No; it is mostly on the southern side of the river.
1025. Has your resumed area been taken up? Yes; on the river frontage.
1026. Is any of the resumed area on the southern side of the river? No; the resumed area is all on the northern side of the river.
1027. That land is not so good as the land on the southern side of the river? No.
1028. Do you think there is any likelihood of what remains of the resumed area being taken up? I do not think there is any chance of it. It includes the iron-bark scrub which I have spoken of.
1029. Do you think that any of it would be taken up if railway communication were given to that part of the district? No; I do not think anyone would touch it. There is not a sufficient area of good land to make up for the bad land.
1030. On the resumed area you get into the heart of the iron-bark country? Yes; it is all big stony hills right back until you get to the fall to the Castlereagh. Land will be taken up on the Murrungundy leasehold and also on the Ballymore holding as soon as the leases fall in.
1031. On the northern side of the river? On the southern side of the river, and a small area on the northern side.
- 1032.

1032. Do you think that the construction of the proposed railway is justified by the character of the country through which it would pass, and the likelihood of creating settlement and increasing production? I consider that a line from Dubbo to Werris Creek would give more convenience to settlers, and would go through better country than a line from Wellington to Werris Creek, and that, therefore, there would be more traffic on a line from Dubbo than on a line from Wellington.

J. Miller.
2 May, 1900.

1033. Putting aside rival routes, do you think that the construction of any railway is justifiable? I do; because I think the construction of the line would create settlement and increase production.

1034. To a sufficient extent to give a chance of the line paying? Yes.

1035. Would the owners of Murrungundy be willing to give to the Government so much of their land as would be required for railway purposes? My employers have authorised me to give the land required for a line from Dubbo to Werris Creek.

1036. Would a line from Dubbo afford you greater facilities for getting away produce than a line from Wellington? Not if we intended to send our produce to Sydney; but from Dubbo there is a prospect of getting a line to Parkes, thence south, and such a line would give us an outlet to the southern markets, and would help us greatly in dealing with stock.

1037. Is it not likely that the export of wheat to London will increase each year? I expect that when the railway is made the production of wheat will increase.

1038. Will it not be necessary to find a market for our wheat out of the Colony? Yes; we should have to do that, and we have to do it now to some extent. The more country we have under wheat the more stock we shall carry; and therefore the more wheat we have to send away the more fat stock we shall have. If I were an owner of poor stock in the Western district, I should prefer to see the line made from Dubbo to Murrungundy rather than from Wellington, because of the saving in distance in travelling stock along it from the Western line.

1039. If you are going to produce wheat and wool it must be of advantage to you to have the shortest route to Sydney, and the line from Wellington would give you a shorter route than the line from Dubbo? Either line would suit us for the conveyance of produce. In my opinion, the balance lies in favour of the Dubbo route.

William Henry Baker, station manager, Barbigal, sworn, and examined:—

1040. *Mr. Shepherd.*] Will you describe the country along the route of the proposed line from Dubbo to Murrungundy? For about 20 miles it is good country, and then it becomes a little rough, with stony iron-bark ridges. After the line leaves Murrungundy it strikes into good country again—country with patches of apple-trees. The ridges are iron-bark, but there are good apple-tree and box flats.

W. H. Baker.
2 May, 1900.

1041. I understand that there are about 10 miles of indifferent country? Not so much; only about 6 miles.

1042. What is the country like from Wellington to Murrungundy? Some of it is very good.

1043. Is it not all good country? No; some of it is rough. On the whole it is a trifle better than the country between Dubbo and Murrungundy.

1044. Have you been along the whole route as far as Werris Creek? No; I have not been much further than Mundooran—about 50 miles.

1045. What benefits do you think would be obtained from the construction of the proposed line? I think that a line from Dubbo would be a cheaper line to make than one from Wellington. For one thing, it would be nearer good timber; then, too, the line from Wellington to Murrungundy goes through a good deal of hilly country.

1046. What great benefit would be derived by connecting Werris Creek with the Western line? The connecting line would open up the country through which it passed. At the present time the cost of road carriage prevents the people along the Talbragar from going into farming; but every man along the route would go into farming if the line were made.

1047. Do you think that the traffic would return anything like £27,000 a year, which is the estimated annual cost of the line, exclusive of land and compensation? One would have to be acquainted with the country right through to be able to give an opinion on that subject. What I have seen of the country beyond Mundooran is good; but I do not know the country all the way through to Werris Creek. I have heard that there is some intention of making a connection between the Southern and Western lines, junctioning with the Southern line at Parkes or Forbes. If it is intended to make that connection, it would be better to connect Werris Creek with Dubbo than to connect it with Wellington. I do not see how you could take a line from Wellington to the Southern line, because of the mountains at the back of Wellington.

1048. How do you account for the fact that there are thousands of acres of magnificent land between Wellington and Dubbo which are not being cultivated? That land is not open for selection; but nearly all the land that has been thrown open for selection between Wellington and Dubbo is now being farmed; the holders are farming every bit of it they can.

1049. What is the cost of clearing land in this district—land with green timber on it? From £1 to 30s. an acre, extra heavy from £2 to £2 10s. The timber consists chiefly of box and pine, both good wood to burn off.

1050. That would have to be pretty open country? They can clear fairly heavily timbered country for 30s. an acre.

1051. How long is timber left after it has been ringbarked before it is cleared? A good many people do not ringbark their timber at all; they clear it straight away. The dead timber costs from 10s. to 15s. an acre to clear, if extra thick from £1 to £1 5s.

1052. How is the land in the district chiefly used—for farming, or to graze sheep and cattle? Both for farming and for grazing. Barbigal has 500 acres under cultivation.

1053. What stock is carried? Both sheep and cattle.

1054. As a rule, do the farmers appear to be prosperous and satisfied with their returns? They are doing the best they can, but it is impossible for them to get their produce away because of the cost of road carriage. I have 250 tons of hay which I cannot do anything with.

1055. What does it cost you to produce a crop from the time you commence to plough until you have the grain in your barn? £1 an acre.

1056. Do you use modern machinery for cultivating and harvesting your crop. Yes.

Edwin

Edwin Henry Utley, ex-Mayor of Dubbo, sworn, and examined :—

- E. H. Utley. 1057. *Mr. McFarlane.*] How long have you been residing in the Dubbo district? About twenty-five years.
- 2 May, 1900. 1058. How far does your knowledge of the country along the route of the proposed line from Dubbo to Werris Creek extend? From Dubbo to the road down the Castlereagh to Mudgee.
1059. Do you know the country between Wellington and Murrungundy? Yes.
1060. How would you describe it? A great deal of it is fair agricultural land, though a good percentage is hilly, stony country.
1061. Would there be much inferior country? I should say a good deal.
1062. How does the country between Dubbo and Murrungundy compare with the country between Wellington and Murrungundy? The country on each route is similar, but the Dubbo to Murrungundy route would pass through flatter land than the other.
1063. Would the land between Dubbo and Murrungundy carry a larger population than the country between Wellington and Murrungundy? I think so. It is carrying a larger population at the present time. There is more population between Dubbo and Murrungundy than in any other part of the district.
1064. What class of settlement? Chiefly farmers. The country between Wellington and Murrungundy is rougher, more hilly, and more stony than that between Dubbo and Murrungundy.
1065. But as far as the quality of the land generally is concerned, how do the two districts compare? I think the land between Dubbo and Murrungundy is superior to that between Wellington and Murrungundy. There is not a great deal of difference in either the soil or the timber, but, if anything, the land between Dubbo and Murrungundy is flatter than the land on the other route, and it is more easily worked. A higher percentage of that land than of the land between Wellington and Murrungundy is fit for agriculture.
1066. Is a large area of Crown land available for settlement between Dubbo and Murrungundy? There must be a great deal of land there which is still held under pastoral lease.
1067. If the proposed railway were constructed from Dubbo to Werris Creek, would that land be settled upon? Yes.
1068. Is it sufficiently good land to carry a fair population? Yes. Every bit of it would be taken up to-morrow if it were thrown open.
1069. Do you think that the proposed line would be a paying one? I think it is very hard to say definitely whether a line will or will not pay, but I am of the opinion that light lines of railway will open up the country and encourage population.
1070. Where do those who are settled at Murrungundy do their business—at Dubbo or at Wellington? They all come to Dubbo. At times they may take their wheat to Gulgong.
1071. Which town do they generally use as their market town;—where do they mostly send their produce from? From Dubbo.
1072. Have you a good knowledge of the timber trade in the district? Yes.
1073. Where do you get your supplies of timber? From the country due north from Dubbo.
1074. What sort of timber is there? Iron-bark and pine. The pine is used for house building, and the ironbark for mining purposes and for public works. At the present time I am supplying the Railway Department with the sawn planking required for the Byrock-Browarrina line.
1075. Then the whole of the timber is not used locally? No; I send timber to places both east and west of Dubbo.
1076. In what locality is the best timber found? The timber on the eastern side of the Talbragar is not much good; but that on the western side, and between Dubbo and Gilgandra, and Dubbo and Cobborah, is splendid timber.
1077. Is there much timber between Dubbo and Murrungundy? You would tap the forest all along that route. Timber comes in now from that part of the country.
1078. Is the timber obtained between Dubbo and Murrungundy, or beyond Murrungundy? It lies on the west side of the Talbragar.
1079. How far from the route of the proposed line? A mile in some places, and a few miles in others.
1080. How far is the best timber from Dubbo? To get into the best timber we have to go back nearly 30 miles.
1081. How far would that be from Murrungundy? Scarcely any distance.
1082. So that the best iron-bark could be reached by either a line from Wellington, or a line from Dubbo to Murrungundy? Yes.
1083. If a railway were constructed, would the timber come by train? Yes.
1084. Would the train rates be less than is charged for road carriage? Yes.
1085. What is grown by the agriculturists between Dubbo and Murrungundy? They grow almost everything in the fodder line; they grow wheat, and they grow a large quantity of potatoes.
1086. What is the average yield of wheat per acre? I have known crops to yield as much as 40 bushels of wheat to the acre; but the average yield would be from 20 to 25 bushels to the acre. It is a fine sample of wheat.
1087. Is the land there specially adapted for wheat-growing? Yes.
1088. In the event of the construction of the proposed line, would there be much interchange of produce between the Northern and North-western districts, and the Western district? I think so.
1089. What products would be exchanged? A good deal of stock would be shifted backwards and forwards along the line, especially in dry times. When we were suffering from drought we could send our sheep northwards, and when the people up north were suffering from drought they could send their stock down here.
1090. Has stock ever been sent here in times of drought from the Northern and North-western districts? Last summer we sent hundreds of tons of chaff to Narrabri by way of Sydney. I think one man alone sent 500 tons. I should think that a railway from Werris Creek to Dubbo would be of great benefit to the Colony at large. The line would be practically a straight one, and would keep along the western slope, which contains the richest land. I do not think it is judicious to take a railway through hilly country when you can keep away from the hills, and at the same time go through rich land.
1091. You prefer the Dubbo route to the Wellington route? Yes.
1092. Would a line from Wellington to Murrungundy pass through hilly country? Yes, and some of it

is mountainous country, whereas from Dubbo to Murrungundy there are no mountains. There would be a great many engineering difficulties in the way of getting a line out of Wellington. The Macquarie River would have to be crossed, and a range of mountains would have to be got over, whereas a line could be taken out from Dubbo without any difficulty at all. Then, from near Dubbo a line could be taken to the main Southern line, though I think that such a line should branch off at Narramine.

1093. Putting aside the question of rival routes, do you think that the construction of any line is justifiable? Yes. I have always been of the opinion that the country has been kept back through not being opened up sufficiently.

1094. In the event of the Dubbo route not being recommended, would you consider the Wellington to Werris Creek line justifiable, and *vice versa*? Yes. In my opinion our railways have not been pushed ahead enough. We should have spent money on railways in preference to many other public works.

William Webb Baird, farmer and grazier, Cootba, sworn, and examined:—

1095. *Vice-Chairman.*] How much of the country along the route of the proposed line from Dubbo to Werris Creek do you know? I have been through that country; but I do not know it very well after you pass Merrygoen.

1096. Will you describe the country as far as you know it, taking that on the southern side of the proposed line first? From Dubbo to Murrungundy the proposed line would run up the valley of the Talbragar, which is very good agricultural country, and well settled. The land on the southern side of the route is a great deal better than that on the northern side; but there are fairly good patches of land on the northern side. The land on the southern side is all good agricultural land.

1097. Is there much good agricultural land between the dividing ridge north of the Talbragar and the Talbragar itself? I should not say so.

1098. What is the general character of that country? Iron-bark, with flats in between. There are good patches of agriculture; but I should not like to say exactly how much good land there is.

1099. In general terms you do not consider the land on the northern side good agricultural country? No.

1100. What is the land like from Murrungundy to Merrygoen? Near Merrygoen the line is crossed by an iron-bark ridge, which begins north of Brocklehurst. Along the valley of the Talbragar there is good land between Brocklehurst and Murrungundy; but further north the country is pretty rough. It is fairly good grazing country after it has been ringbarked; but without ringbarking it is no good. A good deal of it has been ringbarked. From Merrygoen to Binnia, about 26 miles, the country is such as I think would be cultivated if there were railway communication. If it were my country I should cultivate it if I could get my produce away. At present that district is handicapped by its distance from market. I have a property 3 miles from Dubbo, and another 9 miles from Dubbo, and, while I do well with agriculture on the one, I cannot do so well on the other, because of the extra cost of haulage.

1101. How does the country between Wellington and Murrungundy compare with that between Dubbo and Murrungundy? For the first 12 miles I do not think there is much difference; but when you get at that distance from Wellington you get into some pretty rough country, between Mitchell's and Spicer's Creeks. Then there is a rough patch after crossing Spicer's Creek, between Spicer's Creek and the Talbragar. Five or 6 miles out from Murrungundy you get on to a good patch again.

1102. How would you compare the country generally on the two routes? I think that if anything the country on the Dubbo route has the advantage.

1103. Do the people along the route of the proposed line complain of the hardships to which they are now subjected by their distance from market? It is the general complaint that the payment of road carriage kills farming operations.

1104. Do you know anybody holding a large area of good agricultural land who is at the present time absolutely prevented from cultivating it because of the cost of carriage? I cannot say that I do; but my brother told me only yesterday of a man who, although last year he cultivated 900 acres, was not going to put an acre under cultivation this year, because he does not think it worth while to do so. That man lives 9 or 10 miles from Dubbo.

1105. How near to a railway must a man be to make agriculture pay? The man that I speak of has a lot of sheep, and he believes that there is more in sheep-raising than in farming. Sheep at present are very valuable.

1106. If the proposed railway were made, would the landholders along it go in exclusively for agriculture, or would they combine agriculture with grazing? They would combine the two industries.

1107. What leads you to that opinion? It is my own experience that it pays best to combine farming with grazing. When you wish to spell your cultivation paddocks you can run stock on them, and plough up new land.

1108. If you were told to cut up the land into blocks of a sufficient size to attract population to the district we are speaking of, what size would you make them, say, 10 miles back from the main line? I think that if a man liked to work he could make a good deal more than decent wages on a 640-acre block.

1109. Would he be able to use his land for mixed farming? Yes; he could cultivate 200 or 250 acres and run sheep on the rest. He might, perhaps, carry a sheep and a half to the acre.

1110. Is the district between here and Werris Creek a district to which stock are likely to be sent in times of drought? The New England district is one which rarely suffers from drought; and, three or four years ago, when we had a terribly bad winter here, I lost 4,400 out of 5,500 sheep, because I could not get my stock away.

1111. Was there no district towards the east to which you could send them? There was no grass north, south, east, or west to which I could get them.

1112. Was there no grass about Orange at that time? No. If I had sent my stock there the cold would have killed them. Starving sheep from this district cannot stand the winter climate in the Orange district.

1113. It is fairly cold in the New England district in winter? I do not think it is as cold as in the Orange district.

1114. Do you think that if the proposed railway were constructed you would be likely to find a market for the products of this district on the Northern and Western lines? No doubt if they had a big drought round

- W. W. Baird. round about Moree we could, but otherwise we could not. A great deal of chaff went from here to Narrabri by way of Sydney two or three years ago.
- 2 May, 1900. 1115. That was during a period of exceptional drought? Yes. A line from Dubbo to the main Southern line, *via* Parkes, would give a direct cross-country connection which would give us access to a southern market.
1116. Are you shut out from the southern markets now? I cannot say that we are, because we can use the Blayney-Harden line; but we have to go a long way round.
1117. Does the railway travelling affect the condition of stock much? Stock lose in condition during every four hours that they spend in a railway truck. From the time an animal is put into a truck until he is taken out again he is losing condition. If a line were made from Werris Creek, through Dubbo, to Parkes, you would save a bridge over the Macquarie, and would go through fertile, unalienated land. A grade of 1 in 70 could be obtained all the way from Dubbo to Parkes, and very little would have to be paid for compensation.

Craven Hyde Fitzhardinge, solicitor, Dubbo, sworn, and examined:—

- C. H. Fitzhardinge.
2 May, 1900.
1118. *Vice-Chairman.*] How long have you been in Dubbo? I have been practising here for thirty years.
1119. *Mr. Shepherd.*] What are the advantages which you think would be derived from the construction of the proposed railway? I think that a connection between the Northern and the Western lines would be of great advantage in assisting the people in the arid west to remove their stock in periods of drought, which come almost annually, to the more-favoured New England district; and it would enable the people in the Northern districts to send their produce to a good market out west. The line would be very easily constructed, and it would open up a large area of country for settlement.
1120. Do you think it likely that it would become self-supporting within a reasonable time? I think so. It is astonishing to see how much traffic there is on the Western line, both in goods and passengers; and I have no hesitation in saying that within a few years a cross-country line to Werris Creek from Dubbo or from Wellington would be self-supporting.
1121. Have you a personal knowledge of the country through which such a line would pass? I have been from Dubbo through Murrungundy, Cobborah, Merrygoen, Binnaway, and Warkton, to Coonabarabran. I know the country thoroughly from Dubbo to Cobborah, on both sides of the route of the proposed line, and also from Murrungundy to Wellington.
1122. What are the opinions of the residents of the district in regard to this proposal? The farmers out about Cobborah are all anxiously waiting for railway communication. Although they grow wheat, they only strip it for grain, and lose all the straw; but if they could afford to send chaff away it would pay them to grow for hay as well as for grain, and they would put larger areas under cultivation.
1123. Is that the general opinion? Yes; they would increase their cultivation if they had a railway within 10 miles.
1124. Would the people through whose land the line would pass be willing to give the Government whatever land was required for the railway? I think that 10 miles out from Dubbo they would, where the line did not touch small holdings. On the Dubbo-Coonamble line there are one or two cases of great hardship caused by the line going through small holdings. I knew one such holding that was cut in two, and it would be very hard to expect the holder in such a case to give his land to the Government without compensation.
1125. Do you think the people living along the line would be prepared to contribute something to a fund to guarantee its success? I do not think a guarantee would be given by the people between Dubbo and Cobborah, because most of the land is held by small holders. I think, however, that the farmers and the squatters, who are more liberal in these matters, would be prepared to give such a guarantee. The small farmers should not be expected to give a guarantee.
1126. If such contributions were levied, they would decrease year by year as the railway began to pay? Of course, if a tax were made, the people would have to pay it, but they do not like the land tax. The farmers would help the railway by creating traffic for it.
1127. Could you describe the country through which the line would pass? As far as Murrungundy there is good agricultural land on the south side of the Talbragar, and also for 2 miles on the north side, except for occasional ridges. A large quantity of wheat comes into Dubbo year after year from that land.
1128. Do you think that the railway should start from Dubbo, or should it start from Wellington? From Dubbo. By bringing the railway from Dubbo you would save so much haulage to the people living further west who would use the line to get to the New England tableland, and you would also have a shorter line, and one that would go through the best country. In my opinion the line should junction with the Coonamble line just beyond the Talbragar, to save the expense of another bridge over that river.
1129. What is the country like between Dubbo and Murrungundy? It is excellent agricultural land, except on the ridges. From Wellington to Murrungundy the land is not so good. About to where the Mitchell's Creek gold-mine is the country is very poor, and east of the road from Murrungundy to Wellington it is inferior country. I held an improvement lease on Spicer's Creek, but I had to abandon it, because the land was so inferior.
1130. In your opinion, the land is better between Dubbo and Murrungundy than between Wellington and Murrungundy? Yes, for settlement; though there is more mineral country on the Wellington route. North of the Talbragar there are large iron-bark forests, and where the iron-bark is cleared off the land is very good for wheat-growing. The land on the Coonamble line, which people at one time fought shy of because of the iron-bark on it, has now been taken up, and produces good wheat crops. It is sandy land, with a clay bottom. Nearly all the teams which bring in iron-bark sleepers—between 20,000 and 30,000 sleepers have been brought in from the Coonamble line during the last two months—come in along the Coonamble-road, showing that the timber grows in places to the north of Dubbo and not to the north-east. A line from Wellington to Murrungundy would not tap the iron-bark scrub from which the timber is now being drawn so well as a line from Dubbo to Murrungundy.
1131. *Mr. Watson.*] But do not the iron-bark forests run from Murrungundy northwards nearly to Munderoran? Yes; but not to Merrygoen. No doubt the Wellington line would tap the forest at one point only, and the supply of timber there would soon be exhausted. The proposed railway is generally termed

a national line, because it will be a main connecting line, and if it comes to Dubbo it would probably be continued from Dubbo to the Southern line. I have a slight knowledge of the country from Dubbo towards Parkes, and I know that an excellent line can be obtained there, a junction being made on the other side of the Macquarie River. On the other hand, if the line from Werris Creek were brought to Wellington it would be a difficult matter to take it out of Wellington towards Parkes. If the line goes to Wellington it will have to stop there.

C. H.
Fitzhardinge.
2 May, 1900.

Roderick Baylis MacKenzie, Acting District Surveyor, Dubbo, sworn, and examined:—

1132. *Mr. Watson.*] Have you been stationed long in this district? Nearly fifteen years.

1133. Does the Dubbo district extend down towards Wellington? It extends in that direction as far as a point between Geurie and Maryvale—10 miles from Wellington.

R. B.
MacKenzie.
2 May, 1900.

1134. How far north-east does the Border go from there? It meets a circle which is drawn at a radius of 10 miles from Wellington.

1135. Is any large part of the land along the route of the proposed railway from Wellington to Murrungundy within your district? My district goes as far as Muntooran.

1136. Then you have a pretty fair knowledge of the country from Wellington to Murrungundy and from Dubbo to Murrungundy? Yes.

1137. Can you offer an opinion as to the character of the land through which a line from Wellington to Murrungundy would pass? It is partly farming land and partly pastoral land. There is some very rich land, and some very poor land. The country between Dubbo and Murrungundy and between Wellington and Murrungundy is similar.

1138. Is the proportion of good and bad land similar? Yes.

1139. It has been stated that the land between Wellington and Murrungundy is practically all fit for the plough;—do you agree with that statement? No.

1140. How far would your general description of the land apply—to all the land within the coloured portions of the map between the main line and Murrungundy? No; the land between the Castlereagh and the Talbragar is chiefly very poor.

1141. Is the land somewhat similar on each side of the proposed Wellington route until you get out towards the Talbragar? Yes.

1142. From the Talbragar northwards the line would go through some Crown land? Yes.

1143. Can you say whether the leased land there, or any large portion of it, is suitable for agriculture? The leasehold area of Bodangora Holding is very suitable for agriculture. Northerly from the Talbragar is poor country.

1144. I understand that that lease expires shortly? It will expire on the 10th or the 30th July next.

1145. Is it probable that that land will be made available for settlement then? Yes; in areas of about 700 acres on Bodangora.

1146. How far is the greater part of that land from Wellington or Geurie? It is 13 or 14 miles from Wellington.

1147. Is it uniformly good agricultural land, or is it broken? It is broken; part of it is stony.

1148. Would a block of 700 acres include some stony country? Yes. We have divided it for homestead selections, and the 700-acre blocks include good land and stony land.

1149. You would not make the blocks quite so large if the land were all good agricultural land? No. The land that we are speaking of is a little nearer to Geurie than to Wellington.

1150. A little further north there are some reserves and some other pastoral leases;—how would you describe that land? The land on the Murrumbidgee Holding, and through Elong Elong, Spicer's Creek, Narran, and across to Medway, is all mixed country.

1151. There is rather a large reserve a little to the north-west of Bodangora? That is a forest reserve.

1152. Is it still being kept, and likely to be kept, as a forest reserve? Yes.

1153. And, presumptively, it is not good agricultural land? No; it is sandy country. All that part of the district is very patchy.

1154. Would 700 acres be a fair area for the maintenance of a family? No. The 700-acre blocks that we were speaking of comprise some of the best land.

1155. Along the route of the proposed line from Bodangora, northwards to a point between Cobborah and Muntooran, what area would be necessary to maintain a family? All the selectors there are inclined to increase their holdings up to 2,560 acres. Out towards Cobborah and Spicer's Creek the country is better.

1156. What I want to know is what population would the country carry if the proposed railway were constructed? I think that if the proposed railway were constructed from 300 to 500 acres would be sufficient for a holding.

1157. That would not be iron-bark country? Yes; where good land can be put in with inferior land.

1158. How would you describe the land between Dubbo and Murrungundy? For the first 9 miles on the southern side of the proposed railway route it is good agricultural land, and the land on the northern side is partly good, though it runs out into iron-bark country; it is good agricultural country down to the Talbragar River. On the south side of the route, after you get out about 3 miles, there is a little fringe of good country right up to the 9 miles limit; but that country also runs back into iron-bark forests. From there to Murrungundy, on the northern side of the Talbragar, the country varies from light sandy country to good red-soil country. On the northern side of the Talbragar, from nothing to about 3 miles from the river, you get into iron-bark forests right on to the Castlereagh. The good flats narrow down towards Murrungundy.

1159. Would the good country be as much as 3 miles wide at Murrungundy? No, because the bad country comes in closer to the river there.

1160. What about the country on the southern side of the route? That is about half and half; half good red-soil country and half poor sandy country running back towards the Wellington to Werris Creek line. It is patchy all through.

1161. Just as the Wellington end is patchy? Yes; in this district.

1162. Assuming the traffic area of a railway to extend about 15 miles on each side of the line, would you be likely to get more traffic from a line from Wellington to Murrungundy than from a line from Dubbo to Murrungundy? I think that there would be more traffic on the Wellington line, because the Coonamble line would take a lot of traffic that would otherwise go to a line from Dubbo to Murrungundy. 1163.

- R. B. MacKenzie.
2 May, 1900.
1163. Do you think there is a possibility of the country between the Talbragar and the Castlereagh being settled—the iron-bark country? Yes. A large part of that country is in the Murrumbidgee Holding, and is being designed for settlement now.
1164. If it were found that in that iron-bark country there is a fair area of flat land suitable for agriculture it would make a difference to the traffic? Yes.
1165. Do you think, from your knowledge of that country, that there is likely to be much settlement on it? I do not think that settlement will be successful there for some considerable time. The land is more likely to be kept for forestry purposes, or to be let in big grazing, improvement, or scrub leases.
1166. Is there a considerable area of country there with a very light sandy soil? Yes.
1167. That would not be of any value for agriculture? No. There are patches of it which would be suitable for orchards.
1168. Is the climate suitable? Yes; the rainfall is good.
1169. Is the country fairly good from Murrungundy to Cobborah? Yes; there is some very good country along there, especially near Cobborah.
1170. Is much Crown land likely to be made available for settlement between Murrungundy and Cobborah? No; there are only one or two areas which would be opened up there.
1171. Does the good land between Murrungundy and Cobborah extend north and south of the proposed route for any considerable distance? The good land extends further to the south than to the north. It extends east right to the limit of the district; to the north it goes a little beyond the Talbragar River.
1172. There you again strike the iron-bark forest which runs towards Mundooran? Yes; between the Talbragar and the Castlereagh there is a good deal of land within forest reserves.
1173. Would the timber in those reserves be equally accessible from a line from Wellington to Murrungundy as from a line from Dubbo to Murrungundy? The timber would be very much nearer to the Dubbo line than to the Wellington line.
1174. For some distance from Dubbo the good timber must be nearly cut out? A good deal of it has been cut out. The further you go the better the timber gets.
1175. At what distance from Dubbo would you reach the best part of the forests? About 12 or 14 miles out. They bring in timber from all directions.
1176. Beyond Murrungundy, in the direction of Mundooran, it must be pretty well virgin forest, and that timber would be equally accessible from either route? Yes. The Coonamble line would serve one part of the forest and the proposed line the other.
1177. Can you offer any opinion as to the character of the country between Dubbo and Peak Hill? Between Dubbo and Tomingley, a distance of 32 miles, the country is very poor.
1178. Would that description apply to the country on both sides of a line from Dubbo, *viz* Peak Hill, to Parkes or Forbes? Yes. Fifteen miles from Dubbo you get into better country on the western side.
1179. What is the country like from Tomingley to Peak Hill? You get good country then.
1180. What is the country like between Narramine and Peak Hill? It is very good country.
1181. Is most of it suitable for agriculture? Yes. Between Dubbo and Tomingley you are on the edge of the bad country, but out west the country is good.
1182. Is the country between Narramine and Tomingley at present held under pastoral occupation? No; a good deal of it is settled on now.
1183. Is there any large leasehold area there? There is Bulgandramine. Then Haddon-Rigg will shortly be open. The rest of the country into Narramine has all been selected.
1184. With a view to serving a settled district and increasing production, would you favour a line from Narramine towards Tomingley? Yes. There are few engineering difficulties in the way of constructing such a line.

With reference to the Committee's inquiries this afternoon, regarding a comparison of traffic between a contemplated line from Wellington to Murrungundy, and one from Dubbo to Murrungundy, I estimate that such a comparison favours the Wellington-Murrungundy route by two to one.

Richard McGee, railway station-master, Dubbo, sworn, and examined:—

- R. McGee.
2 May, 1900.
1185. *Mr. McFarlane.*] Have you been long in Dubbo? Nearly five years.
1186. Do you get much produce from the country through which a line from the Western line to Werris Creek would pass? Not much. We get the Talbragar traffic and the Murrungundy traffic.
1187. Do you get the traffic from towards Cobborah? We get some Cobborah traffic.
1188. Does it amount to much in the aggregate? Not to very much. We get the whole of the Murrungundy traffic, and the traffic from the country between Murrungundy and Cobborah; but we do not get the whole of the Cobborah traffic, because some of it goes to Wellington and some to Mudgee.
1189. Where is all this produce generally sent? Usually to Sydney. It consists chiefly of wool, skins, hides, and tallow.
1190. No farm produce? Very little, except some wheat. The wheat all goes to Sydney, or towards Sydney.
1191. Has much produce been sent from Dubbo to the North-western line? Not during the past year, I think; but a year or two ago a considerable quantity of produce was sent from Dubbo to Narrabri, and out Moree way.
1192. Can you say how much? I think about 100 tons. The matter was referred to during the Committee's investigation of the Coonamble railway proposal. It is only in seasons of drought that there will be traffic of that kind.
1193. What is the volume of traffic done at Dubbo station? For the year ending 31st December, 1899, the tonnage inwards received at Dubbo was 12,119 tons 13 cwt. 3 qrs.; and outwards, 21,038 tons 4 cwt. 3 qrs.
1194. Was there much stock traffic? Last year there was a falling off in the stock traffic. We received 455 horses, 3,247 cattle, 1 calf, 25,800 sheep, and 41 pigs; and we sent away 754 horses, 2,177 cattle, 184 calves, 124,454 sheep, and 64 pigs.
1195. Has there been any marked increase in the traffic during the last five years? There has been a very decided increase each year. The wool traffic from the district beyond Coonamble fell off for a time; but the Dubbo district has hardly been affected by the drought.
- 1196.

1196. Has the traffic in farm produce increased? Yes, considerably.
1197. Are stock brought to Dubbo in times of drought? Over 20,000 sheep which were received here came here for feed. They came from Cannonbar, Girilambone, and other places out west.
1198. Has stock ever been sent here by rail, because of scarcity of feed in the district? Not since I have been here.

R. McGee.
2 May, 1900.

William Mortimer Beckles Dayrell, manager, Dubbo Flour-milling Company, sworn, and examined:—

1199. *Mr. Shepherd.*] Can you give the Committee any information as to the extent of the farming operations along the route of the proposed line? During the last five months we have received between 20,000 and 25,000 bushels of wheat from the country between Dubbo and Murrungundy, and I believe that there must be between 400 and 500 tons of wheat still there. A good deal of the wheat goes back to the farmers in the shape of grist.
1200. Is much wheat grown beyond Murrungundy? We do not get much wheat beyond Murrungundy. The wheat grown beyond Murrungundy goes either to Mudgee or to Gulgong; we cannot depend upon getting it.
1201. Do you get any wheat from the district lying between Wellington and Murrungundy? We buy wheat along the line towards Wellington as far as Geurie.
1202. What is the yield of wheat in this district? About 17 or 18 bushels in that part of the country of which I am speaking. They are fortunate in getting storms up that way.
1203. Which would be the better route for a railway, from Dubbo to Werris Creek, or from Wellington to Werris Creek? I would not venture to pass an opinion upon the subject, because I do not know the country between Wellington and Werris Creek. If the line were brought to Wellington, it would make another junction, of course.
1204. I suppose some of the farmers, from whom you get wheat, have to bring it at least 30 miles by road? Yes; those who cart from Murrungundy.
1205. Do they complain about the distance? I have not heard any complaint. Sometimes it happens that it is cheaper to send the wheat into Mudgee. The rates of carriage depend a good deal upon the state of the roads.
1206. Would the farmers in that district be likely to increase their cultivation if the proposed railway were made? They appear to be doing that now.
1207. Can you give us some account of the progress of this district? Ten years ago there was not sufficient wheat grown in the district to keep a mill running six weeks, but now we have a surplus.
1208. Has the progress of the district been regular? Yes, and rapid. There is sufficient wheat grown around Murrungundy to keep the mill going without drawing upon the Narramine wheat.
1209. What is the price of wheat delivered at the mill? It started at 2s. 2d., and went up to 2s. 3½d. and 2s. 4d. this season. The average price would be about 2s. 3d., which is very low.
1210. Do the farmers consider it a remunerative price? No; the small holders complain of the price.
1211. Is the price of wheat likely to rise or to fall? I see no hope of the price of wheat improving; but as wool is now at a good price, no doubt many holders will run sheep instead of growing wheat.
1212. Is New South Wales likely to become an exporter of wheat? New South Wales already exports wheat.
1213. Will the exportation of wheat from the Colony have any effect upon the price? If the producers could pool their wheat and export a large quantity, so as to "bear" the market a bit, they might succeed in getting more for it. If they exported their surplus early in the season, so as to make wheat a bit scarce, they might improve the local market.
1214. I suppose wheat is the chief crop grown here? A few oats are grown in the district, but none to speak of.
1215. Are potatoes grown to any extent? Some very fine potatoes have been grown round about Ballymore at times, but you could not call this a potato-growing district.
1216. Is fruit grown here to any extent? Yes, nearly every kind of fruit.
1217. If the proposed railway were constructed would the fruit-growing industry progress? It seems to me that orchardists are all beginning to complain that it does not pay to grow fruit, so that there does not seem to be much hope of fruit traffic.
1218. Is the flour produced here of first-class quality? Yes; we send flour to the principal bakers in Sydney.
1219. *Vice-Chairman.*] If the proposed railway were constructed, would you expect to find a market for your flour out on the Northern and North-western lines? I think we should be able to send a good deal along there.
1220. Can you make a comparison between the wheat grown in this district and that grown in the northern districts? The northern wheat is softer than ours, and would do better with harder wheat mixed with it.
1221. Would the construction of the proposed railway greatly stimulate the production of wheat in the district between Dubbo and Werris Creek. It should do so, because it would enable the farmers to get their produce to market more quickly.
1222. How long have you been in the district? I came here in 1866.

W. M. B.
Dayrell.
2 May, 1900.

James Charles Tibbits, farmer, Myton Fields, sworn, and examined:—

1223. *Vice-Chairman.*] How far is your holding from Dubbo? About 4 miles.
1224. Have you a pretty good knowledge of the country which would be served by the proposed railway? I have been over nearly every inch of it.
1225. Will you give us a general description of the country which would be served by the proposed railway—country within 15 miles of the route? Between Dubbo and Cobborah there are very rich flats, some of which are wide and some narrow. Then a rough ridge comes in, and lessens the area of good country; but beyond that ridge, towards the north, you come upon good country again, though the land is densely covered with iron-bark and scrub. My sons have taken up land on Ranter's Creek, 15 miles north of Mundooran. They have improved it by ringbarking, and it is astonishing to see what ground which

J. C. Tibbits.
2 May, 1900.

J. C. Tibbits. which used to be considered worthless will grow when cultivated. Last year the wheat failed on all the rich Macquarie River flats, but in the iron-bark country the frosts did not touch it at all. I saw wheat standing 3 feet high in a paddock in which I counted thirty-one stumps and trees ringbarked, but to all appearances would have returned five bags to the acre.

2 May, 1900.

1226. What yield of wheat was obtained? The man growing that wheat cut it for hay; but the yield would have been very good. Except on the gritty, iron-bark country, which will not grow anything, the soil is very good.

1227. What would be the cost of clearing iron-bark country per acre? I cannot tell you; but nine out of ten trees are hollow, and burn well when [they are old and dead. There can be no doubt about the fertility of the iron-bark country. It is the greatest mistake in the world to suppose that it is barren. You will see fruit growing there that will astonish you. I saw a peach-tree, which was growing within 7 feet of an iron-bark stump, 3 feet across; and I never saw anything like the fruit that it produced.

1228. Do you think that the cost of clearing that land will prevent it from being brought into cultivation for some years? Yes.

1229. Until all the available box flats and other better land has been brought into use? Yes.

1230. But you think that the iron-bark country should not be looked upon as hopeless from an agricultural point of view? That is what I wish to convey. In my opinion there are several reasons why a line to Werris Creek should start from Dubbo instead of from Wellington. In the first place, I think the passenger traffic would be greater from Dubbo. Two Circuit Courts and two Courts of Quarter Sessions are held in Dubbo, and the Land Board has its head office in Dubbo. Then in the Talbragar district there is a deposit of coal 6 feet thick, and mineral waters which should prove a fortune to the district. The water is similar to that obtained at Baden and other water-places in Germany and England. Leamington, in Warwickshire, which I remember as a small village, is to-day a city because of its mineral springs; and why should not Dubbo become a city for the same reason?

1231. How far are the springs from here? Only 24 miles.

1232. How far away are the coal-measures that you speak of? They are in the same 40 or 50-acre block. Then there is shale there, too; and they have tapped artesian mineral water there. In my opinion the connecting line should be taken from some place further north than Werris Creek, and should join the Dubbo-Coonamble line about Gilgandra.

1233. Why do you think that that would be a better connection? It would be a shorter connection. Coonabarabran is away from the line at the present time, and it would be served by the line that I speak of.

1234. Is the country between Curlewis and Gilgandra better than that between Werris Creek and Dubbo? I do not say that it is better country; but it is as good, and a line from Curlewis to Gilgandra would tap iron-bark forests which have never been touched yet. East of Ranter's Creek there are miles of iron-bark forest, which has never been touched. If the people residing in the western district were compelled to send their stock to New England it would not pay them to travel 30 miles extra to get to the junction at Wellington; and besides there are no trucking conveniences at Wellington for large numbers of sheep, while there are such conveniences at Dubbo. People sending stock from out west to the Northern line would save 40 miles of transport by going through Dubbo to Werris Creek instead of through Wellington. Then, if we wanted to send forage from Dubbo to the Northern line, it would be very hard for us to have to send it an extra 40 miles. The Dubbo district can produce whatever the Wellington district can produce, and it is nonsense to talk about the competition of Orange.

James Heane, stock and station agent, Dubbo, sworn, and examined:—

J. Heane. 1235. *Mr. Watson.*] Have you formed any opinion upon the question into which the Committee is inquiring—the making of a connection from the Western line to the Northern line? I have thought more upon the question of making a connection between the Western line and the Southern line. By leaving the Western line at Narramine and going south you would escape the rough country which you would have to go through if you took a line south from Wellington.

2 May, 1900.

1236. What is the necessity for making a line towards Peak Hill from the Western line? The whole of the country between Narramine and Peak Hill has been taken up in small areas, or will be so taken up directly it is available for selection, and such a line would serve that country. I think, too, that the connection is one which should be made for intercolonial reasons. I know that you can get shale on the Talbragar. I held a run there for some years, and you could pick up the shale and light it with a match. Coal is also to be obtained there, and mineral waters.

1237. Would that country be served by a line from Wellington? I think it would be better served by a line from Dubbo.

1238. How far from Dubbo are the coal and shale deposits? It is about 22 miles to where they sank the shaft on the Ballymore Hill. That place is within about three-quarters of a mile of the mineral spring, which has been running for fifteen years. They send the water down to Sydney.

1239. Mr. Harper is of opinion that the Queensland fat cattle which might under Federation be sent to Melbourne would take the old road through Bourke, rather than come on to the Northern line, and then through from Werris Creek to Dubbo or Wellington? I think they would go to Bourke and then come down by train to Narramine if a railway were constructed from there across to the Southern line. Fat cattle would not come on to the Northern line from Queensland, because most of the Queensland cattle come from places beyond the Warrégo River, and could not get on to the Northern line.

1240. Then we could not expect much cattle traffic on the Werris Creek, Dubbo, or Wellington line? I should think not.

1241. Is the rainfall about the same in the districts at each end of the proposed line, or is it good in one and bad in the other? I have been trying for the last thirty-five years to determine in what month we may expect rain. When I reckoned up the rainfall for every month during twenty-five years I found that seven months of each year received a little above the average and five a little below it. If the seasons are good to the north the stock goes that way, and if they are bad there and good here the stock comes this way.

1242. I understand that last year a great number of the stock came to this district for agistment? Yes.

1243. Did most of them come by rail? Yes; a great many of them came by rail, and a great many of those which came from the direction of Bourke were driven. A good many of the sheep started to travel here by road, but when they became too weak to travel they were sent on by rail. At the present time sheep are travelling out to the West Bogan for grass. The railway rates are too high to allow people to use the trains if they can possibly send their stock by road.

1244.

1244. I understand that the rates for starving stock are so low that they hardly pay the cost of haulage? They give half rates for short journeys, but those half rates are equal to the full rates to Sydney. If it costs 4½d. to send a sheep from Nyngan to Sydney, it would cost the same to send one from Bourke to Nyngan.* J. Heane.
2 May, 1900.

1245. Are we to understand that it does not pay to send starving stock short distances by rail? Not if they can be travelled.

1246. Would you call the distance from Bourke to Dubbo short? No. The longer the distance the nearer the cost of train carriage comes to the cost of droving.

1247. Would there be much stock traffic on the proposed line, or would it be only a stand-by in the worst seasons? It would be a stand-by in the worst times, so far as the starving stock traffic is concerned.

1248. Do you think that with federation New England stock-breeders will compete with Queensland stock-breeders in the Melbourne market? No. I have known fat stock to be brought from the country you speak of to Dubbo for sale in very dry years; but I think there is no probability of its being taken to Melbourne. I think that in the future they are more likely to take stock to Sydney dead than alive.

1249. You do not think the traffic would assume its former dimensions? No. In the olden times I have seen 100,000 sheep between Murrungundy and Obley, all coming from Queensland.

1250. Is the proposed line likely to open up country which is fit for agricultural development? I do not know the country about Werris Creek; but, as far as Cassilis or Coolah, you have a stretch of country which it would be of great advantage to open up. If there were a railway, there would be an enormous quantity of grain exported from the district between Dubbo and Coolah. There are patches of iron-bark country where the ridges run through that district, but between the ridges there is good agricultural ground. A person driving along the road, say, at Beni, might think that he was passing through very poor land; but just near there is Jones' Creek, where you can get 10 or 12 miles of agricultural land, and it is so in other places in the district.

1251. There is good country on the Castlereagh, near Munderoran? Yes; there is very good country above Munderoran.

1252. The proposed line would go within 30 miles of Coonabarabran? I have never been there, but I know that it is a farming district, and that they have had a mill there for some thirty years past, so that they must grow a considerable quantity of wheat.

1253. The flour from that mill would not be sent to the railway? No. A railway going down the Talbragar will open up a large area of iron-bark country, and the line from Dubbo to Coonamble will go past similar country. The timber out there is, at the present time, too far away to be brought into Dubbo. If a line is taken from Wellington to Murrungundy the difficulty of getting across the Talbragar will prevent teamsters from bringing timber to it.

Charles Cadell, stock and station agent, Dubbo, sworn, and examined:—

1254. *Mr. McFarlane.*] How long have you resided at Dubbo? During the last ten years.

1255. Have you a knowledge of the country through which the proposed railway would pass? Yes, as far as Coolah. C. Cadell.
2 May, 1900.

1256. How would you class that country? It is good agricultural country. There is timbered country there too. It is good sheep country. When you get further out the country becomes better. You get then on to rich black-soil country.

1257. Does this district compare favourably with other districts to which railways have been constructed? Yes.

1258. It has been stated that stock frequently come from the western districts to Dubbo for feed? Stock have been railed to Dubbo from the west. People here have a lot of country which they generally lease for the use of starving stock in time of drought. Messrs. Tobin and Sons, who have a station up Coonamble way, must have had 40,000 sheep in this neighbourhood last season.

1259. Can you tell us what places starving stock come from to the Dubbo district? This year a lot of stock came from the Lachlan, out Forbes way. A good deal of that stock has been paddocked up Cobborah way. They came by road. Then stock came here from Bourke by rail. They were trucked to the railway siding nearest to the place to which they were going. Two years ago from 50,000 to 100,000 sheep passed through Dubbo to stock up the country out Narrabri way.

1260. Does stock always come to Dubbo? Yes, nearly every year. A large number of stock has been sent out Cobborah way.

1261. I suppose the number of stock coming here depends on the severity of the drought elsewhere? Yes. Out Bourke way there are very few stock now left.

1262. Have stock been sent from Dubbo to other districts for feed? Yes, small lots have been shifted.

1263. In what direction did they go? They went out Cobborah way, and out Munderoran way. They were fortunate in having grass so close at hand.

1264. The north-west district, between Moree and Walgett, suffers severely from droughts? Yes.

1265. If the proposed railway were constructed, would the people there use it to send their starving stock towards this district? I think so. I think, too, that there would be a good deal of stock traffic towards New England. The New England people buy a lot of sheep out this way.

1266. If the proposed railway were constructed, would the Narrabri people bring their stock this way by train, or would they drive them here? If the roads were good they would drive them; but if the roads were bad they would send them by train.

1267. Which do you prefer, a line from Wellington or a line from Dubbo to Werris Creek? I think that if a connection is to be made from the Western to the Southern line, the Werris Creek line should come to Dubbo. The country between Wellington and Murrungundy is very similar to that between Dubbo and Murrungundy. I should like to mention that forage has been sent from the Dubbo district to Narrabri. During the last drought a lot of forage was sent from here.

1268. Is that traffic likely to continue? It all depends upon the seasons.

1269. Has fodder been sent from this district in more than one year. The people in this district have not been farming on a big scale till the last few years.

1270. You have not had much surplus produce before? That is so.

THURSDAY,

* NOTE (on revision):—Live Stock Rates, Bourke to Sydney, are 4½d. per truck per mile, for short distances 8d. per truck per mile; thus bringing half rate to about the same price as fat stock.

THURSDAY, 3 MAY, 1900.

[The Committee met at the Municipal Council Chambers, Dubbo, at 10.30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD, | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Jacob Matthews, Mayor of Peak Hill, sworn, and examined:—

J. Matthews. 1271. *Vice-Chairman.*] How far is Peak Hill from Dubbo? 44 miles.

3 May, 1900. 1272. You have come here prepared to give evidence on the Wellington to Werris Creek railway proposal in its bearing upon the future connection of the Western and Southern line? Yes. I think that a line from Wellington to Werris Creek would be too much to the east to suit Peak Hill; but if a line were taken from Werris Creek to Dubbo, and another line from Narramine through Tomingley and Peak Hill to Parkes or Forbes, they would open up a very large belt of splendid country, and would serve the interests of the Colony at large. The country between Narramine and Peak Hill is perfectly level, except for two little hills which the road crosses, and which could be got round by going a quarter of a mile off the road. Even if you went right over them with the railway you would not need a cutting more than 8 feet deep. From Peak Hill to Parkes a line on which a grade of 1 in 100 could be obtained has been surveyed. By constructing a railway through that country you would open up some of the very best wheat producing land in the Colony. There is no bad country between Peak Hill and Parkes, and a plough could be put into 90 per cent of the land there. There are no stones except for 2 or 3 acres on a hill here and there. The Harvey Ranges would be from 8 to 12 miles from the proposed line, except at Mingelow, where they come in to within about 7 miles. For 80 miles westward from the foot of the Harvey Ranges it is all splendid country, and south from them there is good country for a distance of 150 or 200 miles. A line such as I spoke of would connect that country with the Western line and with the Southern line, and would give us an outlet for our produce both towards Bourke and towards Condobolin. Mr. McDonnell Stuart, the Railway Engineer, was in Peak Hill on the 24th October, 1898, and he reported favourably on the scheme. The area under cultivation at that time was 15,300 acres, and the estimated increase for the following year was 5,800 acres. All this country is newly settled country, and hardly any of it has been selected more than fourteen years; but when people found that it was good wheat-growing land they rapidly increased their cultivation area there. The number of sheep in the district at that time was 193,300, and the quantity of the storekeepers' supplies imported about 500 tons.

1273. To what area of country do those figures refer? To country within 10 miles of the proposed line between Parkes and Narramine. The area of the holdings there now is 530,702 acres. That area is held under conditional lease, conditional purchase, homestead selection, annual lease, and other leases from the Crown, and, with the exception of eight to ten holdings, lies within 10 miles of the route which a line from Parkes to Narramine would follow. The area now under cultivation is 22,992 acres, which more than bears out Mr. Stuart's estimated increase. The number of the holdings in the district is 170, and the number of sheep carried 263,742.

1274. *Mr. Watson.*] You have not included township allotments as holdings? No; the holdings comprise farms and stations. The first township you come to from Narramine is Tomingley, with a population of about 150. Then you come to McPhail, a prosperous mining centre, with a population of about 400. Then comes Peak Hill, with a population of about 1,000; Mingelow, with a population of 30 or 40; and Briertown, with a population of 150 or 200. At Mingelow there is a gap through the mountains called the Greening Gap. From Mingelow to the Gap there is a main road, and as at that place the mountains are narrow the distance across them is only 3 or 4 miles. Once you get through the gap, about 12 miles out from Mingelow, you come on to the flat country again. There is a sort of horse-shoe basin due east from Mingelow. This basin is surrounded by mountains, and contains, I should think, 30,000 acres, all of which are held by about thirty settlers. The basin that I spoke of is on Bolderodgery holding. From the centre of the horse-shoe to Mingelow is 20 miles; to Parkes, 30 miles; to Wellington, 40 miles; and to Molong, 35 miles. At this point I should like to read the following letter from the Under-Secretary for Public Works, dated Sydney, 24th April, 1900, and addressed to the Honorable Member for Condobolin:—

Sir,

With further reference to the request of the Peak Hill Railway League to be furnished with estimates of cost of the proposed railway extensions, Parkes to Dubbo and Parkes to Narramine *via* Peak Hill, I have the honor, by direction of Mr. Secretary O'Sullivan, to inform you that there has been no survey of the length (24½ miles), which would have to be substituted for the northern end of the Parkes-Dubbo line in order that the junction should be at Narramine; but it has been explored, and is roughly estimated to be 11½ miles shorter than the Dubbo connection.

The estimate of the Parkes-Dubbo line, if brought up to date, would amount to about £253,000.

A very rough estimate, founded on an exploration only, as regards the 21½ miles at the northern end, gives about £212,900 as the approximate cost of the Parkes-Narramine line.

1275. *Vice-Chairman.*] In your opinion, if it should be necessary to make a connection between the Western line and the Parkes line, it could be made more easily and more cheaply from Narramine than from Dubbo? Yes; because by that route you would save over £44,000, and from Dubbo to Tomingley is 11½ miles longer than from Nyngan to Tomingley. Then, too, whereas from Dubbo you have to go through hilly country, from Narramine the country is perfectly level.

1276. Which of the two connections with Tomingley would open up the best country? One from Narramine. The country between Dubbo and Tomingley is stringy-bark and iron-bark country, and is not good; whereas the country from Narramine to Tomingley is all good. Our yield of wheat last year was about 12 bushels to the acre; but a great deal of the wheat was cut for hay, because we had heavy frosts late in the season, which injured the early crops. The early wheat was very heavy, and went, I think, fully 25 cwt. to the acre, but late wheat did not do so well, though it averaged 12 bushels to the acre. Of course

course we have had droughts in our district, but we never had stock die from starvation in our immediate vicinity, and last year every available paddock was taken up by people from down the river. I think there were 150,000 sheep and a number of horses in paddocks there all the winter, and there are some there even now. J. Matthews.
3 May, 1900.

1277. Will you describe the mining centres between Dubbo and Parkes? There is no mining done till you get to Tomingley, whether you start from Naramine or from Dubbo; but at Tomingley there are a couple of gold-mines which employ 150 or 200 people. Then you go on to McPhail, where there is a mine employing about 400 people—a big mine which belongs to a very large syndicate. Further on, at Peak Hill, mining operations have been considerably retarded because of the refractory nature of the ores, but during the last two or three months the promoters have had a water-jacket constructed at a cost of about £4,000, and they have also secured the services of Mr. Taylor, the Government Mineralogist. The water-jacket was started more than a fortnight ago, and it has been used ever since without a hitch. The directors of the mine told me the other day that there was no doubt about the success of this treatment. With the water-jacket they now put through 18 tons in twenty-four hours, but they hope to be able to put through 25 tons in twenty-four hours. They now use 2 tons of coke a day, or over 700 tons a year. All that coke is now carted from Forbes.

1278. If the treatment of refractory ores which you speak of proves a success, will it be followed at other mines in the district? Yes.

1279. Is there a good body of refractory ore there? They think so. They have 1,500 tons at grass, and I have never heard of there being a shortage. There must be a good supply of ore or Mr. Taylor would not have given up his Government position to take the management of the mine. If the water-jacket is enlarged, they will use 1,000 tons of coke a year at Peak Hill for it alone. The total output at the Proprietary mine has been about 20,000 oz., and during the last two or three years their operations have been practically stopped because of the refractory nature of their ore. A cyanide company bought 3,000 tons of tailings, which they are treating. At Alectown there are no reefs, I understand, but there are alluvial workings.

1280. Are we to understand that you would sooner see a railway made from Dubbo to Werris Creek than from Wellington to Werris Creek, because you are afraid that if the line were taken from Wellington it might prevent the construction of a line from Narramine towards the Southern line? Yes.

1281. If the proposed line were made from Dubbo to Werris Creek, would you find a market for your produce on the North and North-western lines? I think our market lies out in the direction of Wilcannia, Bourke, Walgett, and Brewarrina. Up Morce way we get into a district which is served by the New England country.

1282. Would a line from Narramine to the Southern line stand on its own merits apart from its value as a connecting line, because of the land which it would open up for settlement? I think so. Whenever a block of land in the district becomes available for settlement there are from 100 to 300 applicants for it.

1283. Would a connection between Curlewis and Gilgandra suit you as well as a connection between Dubbo and Werris Creek? Yes, and a great deal of railway construction would be saved by making that line.

John Dight Mackay, pastoralist, Bulgandramine, sworn, and examined:—

1284. *Mr. Watson.*] Have you been over any of the country between Wellington and Werris Creek? No; though I have been up the Talbragar from Dubbo to Cobborah. J. D.
Mackay.
3 May, 1900.

1285. The feeling of the people down your way is in favour of the Dubbo-Werris Creek line, because it would improve the chances of a connection from Narramine to Parkes? Yes; and because it would give us a shorter route to the Northern district.

1286. What advantage would you gain by being able to get easily from Dubbo to the Northern line? During the last two years a large quantity of fodder has been carried by train from this district to Narrabri, and a large number of stock, chiefly from the Coonamble district and the country beyond have come into this district for grass.

1287. Then you anticipate that if the line were made from Dubbo to Werris Creek the people down your way would be able to use it to send fodder to the Northern districts? Yes.

1288. There would be a demand for fodder only in times of drought, I presume? Yes.

1289. You would not expect a regular and permanent trade in fodder? There is always a considerable amount of stock traffic between this district and the district further north. The bulk of our store stock goes towards the Liverpool Plains to be fattened, and it seems to me that in the near future stock will be able to travel only by rail, because the stock routes are being very much curtailed, and have deteriorated very much by the traffic along them, and by the burrs which grow on them. Reasonable railway rates would be cheaper and more satisfactory to stockowners than droving.

1290. Do you think that railway rates will ever be low enough to allow you to truck store stock? I see no reason why not.

1291. At present the rates are very high, unless it be for starving stock? They seem to us unduly and unreasonably high.

1292. What do you think it would pay a man to give for railway carriage for 1,000 sheep for a distance of over 150 miles? Unless sheep are travelling immediately after shearing I am satisfied that it would be profitable to train them even at the present rates, because the depreciation on the stock routes is so great. The stock routes are utterly unimproved, and are always depreciating, so that the wool gets covered with mud and burrs. I am sure that the depreciation of the sheep is equal to 1s. an animal at present prices for mutton and wool, where stock travel over 200 miles. One reason why the railway is not used so much as it might be is the shocking treatment which stock receive in the trains. They are shunted and knocked about in such a manner that where they are at all weak the losses are too large to make it profitable to send them by train, but, in my opinion, the training of store sheep is increasing.

1293. I suppose that as settlement advances, the size of the stock routes will be lessened? Apparently so; they seem to be curtailing them in many places now.

1294. Are there any other things which would make the proposed line valuable? The facilities which it would give for the carriage of stock and of fodder are the two main reasons, so far as local interests are concerned, for the construction of the line; but another advantage its construction would have is that it would shorten the route from Brisbane to Melbourne and Adelaide.

J. D. Mackay. 1295. Do you not think that, to construct the line for that purpose, would be to go a good deal in advance of requirements? Probably it would. In speaking in favour of the line, I have looked upon the proposal merely as it affects this district.

3 May, 1900.

1296. Do you agree with Mr. Matthews in what he said about the land lying south of Narramine? Yes; all that district is very good. I might mention that the statistics which he gave you did not include any land within 12 miles of Narramine or 10 miles of Parkes.

1297. Your station is one of the few leasehold areas on the route of a line from Narramine to Parkes? Yes. There are three such holdings.

1298. Is the land comprising your leasehold area suitable for settlement? Yes.

1299. I understand that the lease will shortly expire? My lease expires in 1903. I recently redivided, and there was a great rush for the land, there being 100 applications for most of the blocks. That land has been settled within the last eighteen months.

1300. What is the land on the leaseholds of the other runs like? It is excellent land.

1301. Do those leases fall in this year? One of them falls in in August, 1900, but I am not sure when the other falls in.

1302. But it cannot be very long before both leases expire? No. There is one leasehold area not included in the statistics which have been given to you which falls in next July. That land has been already surveyed, and lies within 12 miles of Narramine.

1303. I understand that the greater part of the land along the line that you have suggested is already settled upon? Yes; a great deal of it only recently. Much of it has been taken up in comparatively small areas, and it is necessary that the holders should cultivate.

1304. Would you say that a connection between Narramine and Parkes is justified by reason of the quality of the land through which it would pass, apart from other considerations? Yes. The average rainfall at my station, taking the records since 1882, has been between 21 and 22 inches; in 1888 it was below 12 inches; but in no other year has it been below 16 inches.

1305. You have come here to-day because you wish the Committee to keep in view, when considering the question of connecting the Western and Northern lines, the great probability of the construction of a line from Parkes to Narramine? Yes. A line from Parkes to Narramine would be a paying one, and would require no costly works. Between Narramine and Peak Hill only five small culverts would be required.

1306. Such a line would serve a number of centres of population? Yes. The population of Tomingley and its neighbourhood is about 1,100. It is a mining centre which has been profitably worked for fifteen or sixteen years, and last year about 1,000 oz. of gold were sent away from there. Then the McPhail Mining Company pays £1,800 a month in wages, and the year before last it paid a dividend upon an enormous capital. Everything points to prosperity in the district.

1307. In suggesting a connection from Narramine to Parkes, have you had in view the probable extension of the line from Forbes towards the Great Southern line? Yes; I would also like to mention that there has been an agitation for a line from the Bogan Gates to Trangie, but it seems to me that a more serviceable connection would be a line from Narramine to Parkes, and a branch line could then be taken out from Peak Hill in a westerly direction.

1308. West from Peak Hill, how far would the agricultural land extend? Certainly as far as a line joining Nyngan with Condobolin.

1309. That would be between 50 and 60 miles? Yes; the country continues about the same as you go west, but the rainfall decreases.

1310. When you get out towards Gilgunnia you get into purely pastoral country? Yes.

1311. In that class of country you cannot afford to have your railways too close together? No; a branch line going west from Peak Hill would tap a lot of excellent farming country which lies within 30 or 40 miles of Peak Hill.

Thomas Bridle, farmer and grazier, Peak Hill, sworn, and examined:—

T. Bridle.
3 May, 1900.

1312. *Mr. Shepherd.* I understand that you advocate the construction of a line from Narramine to Parkes? Yes.

1313. In preference to a line from Wellington to Werris Creek? Yes; a line from Wellington to Werris Creek would be of little use to us, even as a connection with the Northern line, because of the long distance which we should have to travel in order to get to it. I consider that the country between Narramine and Parkes is better country, both because of its agriculture and because of its mining possibilities, than the country which the proposed line would serve, and it is also country through which a much more easily and cheaply constructed line than the proposed line could be taken. I am well acquainted with the country from Narramine right through to Tumut. I came here a little over fourteen years ago, and took up land 12 or 14 miles west of Peak Hill. I considered then that the land would be especially good for wheat-growing and for grapes, and I have never had any cause to complain of it. Although we have passed through prolonged droughts, there has never been a total failure of the crops. There has been partial failures, but I have never had a bit of land which I could not mow or cut. You can make 95 per cent. of the land between Narramine and Parkes, and extending 20 or 30 miles to the west, a wheat paddock. To the east the good land is limited by the Harvey Ranges. There are a good many small selectors in the district, and as they do not hold sufficiently large areas to be able to live by grazing alone, they must be provided with road or with railway communication. Of course, the better country is, from an agricultural point of view, the softer the ground, and the worse the roads. I live between 38 and 40 miles from Parkes, and I find that I cannot increase my cultivation, because in a moist season the road gets cut up so badly that the price of carriage takes away all my profits. At the present time wheat is worth about 5s. per cwt., and wool about £5 per cwt., so that the result will be that unless good roads be provided the wheat-growing industry must be destroyed. As the Condobolin line only cost about £2,100 a mile, I see no reason why a similar line should not be constructed through the country I speak of. I think that it would be a better speculation to make a railway than to make a road, and the settlers in the district have been promised assistance. Close to the Harvey Ranges there is a belt of mineral country which the railway would serve. Of course, if you kept in close to the ranges you would have comparatively little agricultural land on the eastern side of the line, but by keeping more to the west you could have 15 miles of good country on each side of the line, country that would produce from a ton and a half to 2 tons of hay per acre. My area under crop last year was 470 acres. I cut 55 acres

T. Bridle.
3 May, 1900.

acres for hay, and I got 100 tons of hay. Then I stripped 415 acres, and got 1,626 bags of wheat. Those were my results in a dry season. I have been paying 1s. 6d. a bag to have my wheat carried away, and although I have never refused the offer of a teamster, there are three or four loads still to be taken away. If the season had been a wet one I could not have had my grain taken away at a price which would pay me, and I should have had to give up farming. I have a man cultivating on the halves system with me. He got an unemployed ticket to come up here, and has a wife and two children. He is a man well worth supporting, and is doing well just now; but if I had to stop growing wheat he would have to go back to Sydney. The district is so good that a line through it must eventually pay. Mr. Stuart, in his report, gives a fair account of the country, and he admits that the line would pay from the start. When I took up my land fourteen years ago I had two men at £1 a week, and 10s. a week for victuals, working for three weeks in a garden of 2 acres, and then the land was not properly grubbed, and it cost another 30s. a week to finish it. Where the timber is dead, however, I can get it grubbed out for very little. A great many people out there would put a large area under wheat if they could get it away.

1314. How far are you from the railway now? Half of my land is within 38 or 40 miles of Parkes. I have obtained as much as 7 and 8 bags of wheat to the acre, and my son has obtained as much as 8 bags to the acre on his land. A man who is living within 31 miles of the railway has 2,500 bags of wheat which he will not be able to get drawn away this year, and if next summer turned out wet he would have to discontinue cultivating, and live by sheep-farming, and so would I. Last year I paid £400 for machinery, and I may clear that amount this year; but if the seasons are good the roads will be so cut up that I shall not be able to get my wheat away. I have no doubt that a line through that country would pay, because where people have good land they can bear to be taxed; whereas if you tax people on poor country too heavily you will tax them off the land altogether. The Government should be able to make any line pay in good country, either by extending the betterment principle or by imposing taxation.

1315. What is the quality of the wheat grown in the district you are speaking of? It is the best wheat in the Colony. I have obtained 2s. 9d. a bushel for some of my wheat in Sydney this year, and the rest of it is on its way to England. I was one of the first shippers with the Co-operative Company, and my wheat was classed by an expert as of "A" quality.

1316. You have not found out yet whether it pays to send wheat to England? No. Last year I sold my wheat locally, and I did not get paid at all.

1317. In your opinion is it more profitable to use land for agriculture than to depasture sheep? I think that agriculture should pay at least twice as well as pastoral pursuits, and 1 acre of farm land will furnish as much traffic to a railway as 20 acres of land under sheep. I can get my farming done on the halves system, and if I get 4 bags of wheat to the acre, and 8s. per bag, I make 16s. an acre that way, which is a great deal more than one can make with stock.

1318. Would not four bags to the acre be a pretty heavy yield? Yes.

1319. What is the average size of the holdings in your district? Some of them are very small, while a great many people have holdings of between 2,000 and 3,000 acres. The conditional purchases run up to 2,560 acres, while holdings of another class average from 800 to 1,000 acres. These men must either have railway communication or must leave the district, because they have not enough land to maintain themselves by keeping stock, and they cannot grow wheat profitably because of the heavy cost of road carriage.

1320. A man could not make a living on 40 acres? No, unless he had his land planted with vines.

1321. What do you consider a fair area for the maintenance of a man and his family? I should be sorry to have less than 2,560 acres; but with agriculture, and having a good outlet for his produce, a man might do with much less. With hard work and care a man might make a living on 200 or 300 acres; but, if through misfortune he got into the hands of the storekeepers or bankers, he would be ruined. Without a railway the small holders must mortgage their property, and then the land will all drift into the hands of large holders. At the present time there is a good class of men on the land, and they will work well if the Government gives them a railway.

1322. Is it usual amongst the farmers in that district to grow their own vegetables, potatoes, and fruit? For the last three or four years there has been a drought, and vegetables could not be grown without irrigation.

1323. I suppose they all keep a few pigs and poultry? Yes.

1324. So that living is very cheap with them? Yes; it does not cost them much to live.

1325. Do farmers there seem prosperous and contented on the whole? Yes.

1326. But they feel the handicap of their distance from a market? Yes, and it is becoming worse every year, because as traffic increases the roads become worse.

1327. At what distance from a railway station will farming pay? Within 12 or 15 miles. A man ought to be able to get to the station in a day, so that he can send in his produce on a day's notice.

1328. Would the country you describe be within 15 miles of a railway from Parkes to Narramine? On the eastern side of the line it would be within 7 or 8 miles.

1329. What proportion of the land in the district that you have been speaking of is fit for agriculture? I think that 95 per cent. of the land on the western side of the line would be good for agriculture, and for 8 miles on the eastern side of the line 80 per cent. is good land. Further to the east the country is barren and useless.

1330. Do you feel satisfied that, in the event of railway construction there, the increase in population would be very large? Yes. A railway would promote agricultural settlement, and would also assist the mining industry. If the Peak Hill Proprietary have discovered the proper way of treating their refractory ores immense quantities of coke, coal, limestone, and ironstone will have to be conveyed there, and the railway would very much lessen the cost of carriage. I own 1,500 shares in an adjoining mine, and I have no doubt of their value. There are five small towns on the route of the line. I have been connected with mining for over forty years, and although I have seen scores of mining towns almost deserted, these towns have become populated again. The connection with the Northern line would be of great assistance to the district, and would be of national importance, because under present circumstances the blowing up of a bridge or two between Sydney and Newcastle would completely disconnect the northern system from the other railway systems of the Colony. These connecting lines are of value, too, in allowing an interchange of products between the various parts of the Colony; and it is better that our people should supply themselves in this way than that they should obtain supplies from other parts of the world. Eventually the proposed line would be a paying line, and would be of great advantage to people in the country.

Robert

Robert George Dulhunty, Inspector of Stock, Dubbo, sworn, and examined:—

R. G.
Dulhunty.
3 May, 1900.

1331. *Mr. McFarlane.*] How long have you occupied your present position? Twenty-two years. I have been in the district for fifty years, so that I know it thoroughly. In round numbers, there are 1,600,000 sheep in the Dubbo district this year.

1332. Compared with other districts, do you consider it a good grazing district? Yes; it is a very good district.

1333. I understand that it is never very severely affected by droughts? Sometimes we have droughts; but they are never very severe. I have also charge of the Canonbar district. When you get beyond Nevertire you get into country in which the stock suffer. That district has recently lost 60 per cent. of its stock through drought, whereas the stock in our district have increased.

1334. Has it ever been necessary to send stock from this district to other districts for grass? Yes.

1335. In what direction do they go? Most of them go in the direction of New England.

1336. We have been told that the surplus stock is sent from here to the Liverpool Plains to be fattened? Yes; but of late years we have not had very much surplus stock to send to the Liverpool Plains, because what we have had have been sent into the Canonbar district. We have sent a lot of stock to Goulburn, Yass, and places in that direction to be fattened.

1337. I understand that starving stock has been sent to this district in times of drought? Yes; last year we had something like 2,000,000 stock in the district, which had come chiefly from the Bourke, Coonamble, and Walgett districts.

1338. Do many sheep come here from the north-west districts? A large number of sheep are coming from the north-west districts now into the Cobar district, where there is grass.

1339. How do they come? By train where they can. Very large numbers came by train last year.

1340. What distance would people drive sheep rather than send them by train? It depends very much on the season. When the season is very dry people cannot drive their sheep at all.

1341. In an ordinary season what distance would sheep be driven? Fat stock would travel on foot nearly as far as Dubbo in a good season, and take the train there. The travelling stock reserves and roads into Dubbo are very fair; but beyond Dubbo, and between Dubbo and Sydney, Bathurst or Mudgee, there are only lanes, and the sheep cannot travel.

1342. Do you think that the proposed Wellington to Werris Creek line would be largely used for the conveyance of stock from the north and the north-west? I think that it would.

William Handover, produce merchant and timber contractor, Dubbo, sworn, and examined:—

W.
Handover.
3 May, 1900.

1343. *Vice-Chairman.*] I understand that you are personally acquainted with the iron-bark forests in this district? Yes. The most suitable timber for railway purposes that we get in Dubbo is the iron-bark.

1344. Has most of the good timber near Dubbo been cut out? No.

1345. At what distance from Dubbo is there still a considerable quantity of iron-bark available? Within a radius of from 10 to 25 miles.

1346. Is that a long distance to draw iron-bark for sleepers? No; it is only a fair distance.

1347. Is there any large area of iron-bark forests from that point along the proposed line? There is good timber from Dubbo right away to Gulargambone, a distance of 75 miles. At the present time we are supplying sleepers for the Brewarrina line. We have supplied about 147,000 sleepers, all of which have been cut within 25 miles of Dubbo.

1348. *Mr. Watson.*] If good iron-bark can be obtained within 12 or 25 miles of Dubbo, why do sleeper-getters go further out? There are a large number of teams plying between Dubbo and Coonamble, and they take timber as back loading rather than return empty. Teams have brought timber from the other side of Gilgandra, a distance of 45 miles, at the same rate as other teams have brought timber 23 miles.

1349. Is there much iron-bark from Murrungundy due north to Mundooran? There is about the same quantity of iron-bark there as there is in the country north from Dubbo.

1350. Where does the best timber grow? The belt of timber runs due north to a point 12 or 13 miles north of Tooraweenah, and in some places it may run 10 miles to the east.

1351. At Murrungundy a railway would tap the ironbark country? Yes.

1352. Would not a line from Wellington to Werris Creek, *via* Murrungundy, and a line from Dubbo to Coonamble, serve that iron-bark country very well? Yes; but it would be better served by a line to Werris Creek from Dubbo than from Wellington. Within the last twelve months Mr. Ewers and myself have supplied something like 250,000 iron-bark sleepers and about 500,000 feet of girder stuff to the Government. All that timber was obtained within 25 miles of Dubbo, and we are still getting sleepers here for the Dubbo-Coonamble line. There is sufficient timber on the Dubbo-Coonamble line to last for the next thirty years. We have some 40,000 sleepers already cut for the first section of that line, and the total number of sleepers required will be something like 260,000.

SATURDAY, 5 MAY, 1900.

[The Committee met at the "Commercial Hotel," Cobborah, at 9 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |

ROBERT HENRY LEVIEN, Esq.

JOHN CHRISTIAN WATSON, Esq. |

JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

George Paterson, farmer, Bonny Plain, near Cobborah, sworn, and examined:—

G. Paterson.
5 May, 1900.

1353. *Vice-Chairman.*] How far are you from Cobborah? 7 miles, on the road to Leadville.

1354. What is the country like from Murrungundy to Cobborah, and from Cobborah to Dunedoo? Most of the country between Murrungundy and Dunedoo would be a farming district if it were given railway communication.

1355.

1355. Is the country equally good on each side of the river? From Cobborah to Dunedoo there is very little difference; but from Cobborah to Murrungundy the country is not so good on the northern side of the river as it is on the southern side. G. Paterson.
5 May, 1900.
1356. Is there not a good deal of cultivation between Murrungundy and Cobborah on both sides of the river? Yes, and it is increasing every year.
1357. Is there still a considerable area of land fit for agriculture, and within 15 miles of the proposed railway route, which has not yet been brought under the plough? Yes.
1358. What is the reason of that? The want of railway facilities for getting produce away.
1359. What does it cost to cart produce to a railway station now? It costs about 6d. a bushel to send wheat to Mudgee, which is our nearest railway station.
1360. Is that charge regarded as a serious handicap? It is the cost of road carriage which has kept the district back, from the time it was first settled.
1361. Are you acquainted with the land within 10 miles of Wellington? Only along the road. I know that it is a great wheat district.
1362. How far is Cobborah from the route of the proposed line? About 6 or 8 miles from the nearest point.
1363. Then it would be well within the influence of that line? Yes.
1364. Do you know anything about the country beyond Dunedoo, towards Coolah? No doubt it is splendid farming and pastoral land. Going that way you go through the great Pine Ridge property, which is beautiful country.
1365. Is the land along the route of the proposed line suitable only for agriculture, or would it be used better for mixed farming? On the frontage on both sides of the river from Cobborah to Coolah the land could all be used for agriculture if it were required. There are places 10 miles across where the land could be used for agriculture.
1366. Can the Talbragar valley be described as a highly fertile district for 10 miles on each side of the river? There is no doubt about it. The land is very good from here to Coolah.
1367. What yield of wheat is obtained in the district? If we do not get 20 bushels to the acre we consider the crop a partial failure.
1368. How long have you been here? Twenty years.
1369. Are there any holdings which have been under crop for the greater part of that time? Yes.
1370. What would be the average yield? I have not kept a record; but anything under 30 bushels is not considered a good crop. I think I should not be over-estimating the average yield if I put it at 15 bushels to the acre.
1371. How long have you been cultivating? I have been cultivating one of my paddocks for fifteen years, and I have got as much as eight bags, and as little as three bags, from an acre on that paddock. We expect 20 or 25 bushels from an acre for a fair crop.
1372. Are there any large leaseholds shortly to fall in to the Government which may be made available for close settlement? There are 10,000 acres on the Tucklin and Bolaro Holdings which will be thrown open shortly, and I suppose 8,000 acres of that land are fit for cultivation.
1373. How many acres of the Talbragar land would maintain a man and his family in decent comfort, year in and year out? Well, I have been living for the last twenty-three years on what I make out of 300 acres.
1374. Have you been satisfied? One has to cut one's coat according to one's cloth; but 300 acres are not enough.
1375. Would 640 acres be enough? Yes, a man could make a living on 640 acres; but if he wished to keep a few sheep or cattle, and to have a bit of spare ground, it would require 1,000 acres to make him contented.
1376. Will the district grow other crops besides those you have mentioned? No doubt about it if we had the rain. The ground is strong enough to grow anything, and we have occasionally grown very good crops of maize, getting as much as 70 bushels to the acre. During the last five or six years the seasons have been unusually dry in this district.
1377. What other advantages would accrue to the district by the construction of the proposed line? As a connecting line it would be useful in many ways; it would be useful for moving stock from place to place in time of drought, and for moving troops across the country in time of war.
1378. Do you expect to find any market for your produce in the northern and north-western parts of the Colony? Not in the New England district, but the proposed line would enable us to send produce into districts like the Bourke, Cobar, and Coonamble districts. To take produce to Mudgee is like taking coal to Newcastle, and to take it by road to Coonamble costs so much that there is no profit in doing so. Last year we had to cut our wheat for hay because the grain was no good.
1379. Does your distance from a railway station prevent you from sending away small consignments of fat stock? Yes; that has been a loss to us.
1380. Do you think that with a railway small consignments would frequently be sent from the district? Yes, and the stock would be delivered in Sydney in good condition. The 50 miles of road between here and Mudgee are chiefly metalled, so that sheep whose feet are soft after coming off cultivation paddocks can hardly travel over the distance.
1381. Is this district considered a good fattening district? Yes.
1382. Are sheep ever sent to this district from elsewhere during drougthy years? Yes. With regard to the fattening qualities of the district, I might mention that two years ago I sold a small lot of sheep to a butcher in Gulgong, and when I went in a fortnight afterwards I saw one of them, an aged ewe, which weighed 108 lbs., a 2-year old wether, 90 lbs., and a lamb, ten months old, 58 lb. The heaviest sheep which I have killed myself weighed 105 lbs. I keep Lincolns chiefly.

Thomas Paterson Yeo, farmer and grazier, Elong Elong, near Murrungundy, sworn, and examined:—

1383. *Mr. Watson.*] How far is your place from Cobborah? 12 miles. It lies in the direction of Dubbo.
1384. What effect would the construction of the proposed line have upon the production of the district round Elong Elong? If the proposed railway were constructed more of the land would be used for agriculture. T. P. Yeo.
5 May, 1900.

- T. P. Yeo.
5 May, 1900.
1385. Is there more land available for agriculture than is now being cultivated? Yes.
1386. For how many miles would the agricultural land extend across the route of the proposed railway from Elong Elong? On the southern side it would extend 10 miles, and on the northern side not so far, because you get out into iron-bark country there.
1387. Several routes have been suggested to serve this district—a line from Wellington to Werris Creek, a line from Dubbo to Werris Creek, and an extension of the line from Mudgee;—which, in your opinion, would best serve the district? A line from Wellington to Werris Creek and an extension of the Mudgee line.
1388. That would be two lines;—if you were going to make a line to Cobborah, from what point on the existing line would you start? From Wellington.
1389. Why is that? I am not acquainted with the land between Cobborah and Mudgee.
1390. Is it good country from Cobborah to Wellington? It is good agricultural country.
1391. Do you know the country out towards Coolah or north towards Binnaway? No; I am not acquainted with it at all.
1392. Do you corroborate what Mr. Paterson has said about the productiveness of this district? Yes.
1393. Does much stock come through here going towards Werris Creek or the Liverpool Plains? Yes; a lot of stock passes through this way.
1394. In which direction does the stock route run? There is a stock route from here to Mudgee.
1395. That is the way that fat stock would travel? Yes.
1396. Have you seen store stock going to the Liverpool Plains? Yes; I have seen them coming up the river from Dubbo.
1397. *Vice-Chairman.*] Do you think that it would be better, in the interests of the district, to have a connection with Wellington than one with Mudgee? I am not in a position to say which would be the better route.

Francis Scheibel, senior-constable, Cobborah, sworn, and examined:—

- F. Scheibel.
5 May, 1900.
1398. *Mr. Shepherd.*] I understand that you are prepared to furnish certain returns to the Committee? Yes; I have the crop and population returns, which were collected in January last.
1399. What are the boundaries of the district to which your figures apply? From Cobborah, the boundary of the district runs along the Talbragar as far as Murrungundy, a distance of 18 miles. It then follows Spicer's Creek as far as the Wellington-road, a distance of 30 miles, and comes back on to Sandy Creek, a distance of about 20 miles. Then it goes along Sandy Creek to the Talbragar, a distance of 30 miles. It also runs out from Cobborah towards Gulgong, a distance of 19 miles; on to Redbank, 12 miles, and across to Tucklin, a distance of 1½ miles. The area of cultivation in this district last year was 6,805 acres, of which 5,263 acres were under wheat. The yield of wheat was 53,192 bushels. The area of Crown lands under lease was 158,167 acres, and the area of freehold property, 48,190 acres.
1400. What is the population of the district? Nine hundred and fifty.
1401. Are the people here chiefly engaged in agriculture, or do they combine agriculture with grazing? They go in for mixed farming.
1402. Are they generally pretty well contented? They are fairly well contented, though they say that they would have more land under cultivation if they could get their produce away.
1403. How far have they to cart their produce generally? Mudgee, the nearest railway station, is 47 miles from Cobborah.
1404. Do they consider that distance too great a handicap? Yes.
1405. What would be about the average yield in this district? I have not been here sufficiently long to be able to say, but the people here consider it to be from 15 to 18 bushels to the acre.
1406. I suppose wheat is the principal crop grown? Yes.
1407. Is it generally grown for grain or for hay? Most of it is grown for grain.
1408. *Mr. Levien.*] Does much stock come through this district, going towards Werris Creek, from Dubbo or Wellington? A great many stock travel through here, but they are mostly going on to Luo to be trucked.
1409. What about store stock? A number of store stock travel out from Dubbo through this district.

James Bell, farmer and grazier, Narran, near Cobborah, sworn, and examined:—

- J. Bell.
5 May, 1900.
1410. *Mr. McFarlane.*] Are you an old resident of this locality? I have been here about eleven years.
1411. Would the proposed railway serve the interests of this district? Yes.
1412. Do you think it would be largely used? Yes; very largely used.
1413. Which route would you prefer—that from Wellington or that from Dubbo? So far as the residents of the district are concerned, one route would do as well as the other; but, whereas a line from Dubbo along the Talbragar would run in the same direction as the present Western line, and pass through 20 miles of country which is already served by that line, the line from Wellington would go at right angles to the Western line.
1414. How far is your property from the route of the proposed line? About 4 miles.
1415. Has much land been taken up between Cobborah and Wellington? Pretty well all the land has been taken up between those two places. On my holding people have taken up land 5 miles back from the river. The holdings are continuous from there to Wellington.
1416. Do you endorse the evidence that has been given by other witnesses this morning? Yes.
1417. Have you any information which you would like to give to the Committee? I should like to say that north of the Talbragar there is agricultural land on the eastern side of the proposed route, but, on the western side, there is a large forest reserve and about 50 miles of iron-bark country, the timber on which would be suitable for railway purposes. Teamsters have come 70 and 80 miles to get timber from that forest, which speaks well for its merits.
1418. That timber could be used in the construction of the proposed line? I think so. At the present time this district is labouring under considerable hardships. It is costing us now 7d. a bushel to take wheat to Mudgee, and 5d. a bushel to take it to Dubbo. As the price is only 2s 3d. a bushel, by the time we have paid railway charges and cartage there is very little left. Our present situation prevents us from growing anything but wheat, and we cannot get any market for our hay.

1419. How would a connection with the Mudgee line suit the requirements of the district? I think that the residents of the immediate district would prefer a connection with Mudgee. My place is on the boundary line between Mudgee and Dubbo. J. Bell.
5 May, 1900.
1420. Do you think the connection with Mudgee would be more desirable than the connection with Wellington or with Dubbo? I think it would, in the interests of the district.
1421. Which line would give the best return to the country—a line from Mudgee, a line from Wellington, or a line from Dubbo? I think that the proposed line from Wellington to Werris Creek would be the best, and would produce most revenue. Several questions have been asked about the stock traffic through this district to the Liverpool Plains. The graziers on the Liverpool Plains draw most of their stock from Dubbo, Bourke, and the western districts, and most of that stock comes through this district. I have known as many as 10,000 sheep to come through my run in one week.
1422. Does much travelling stock go through this district in the direction of Wellington or Dubbo? In the season we have, I suppose, 100,000 sheep passing through the district, taking both store stock and starving stock into calculation.
1423. Do you refer to stock going in the direction of Wellington or Dubbo? No; to stock coming from the west. Stock comes here from the west and from the south-west.
1424. Would the proposed railway be used for the conveyance of starving stock, or would the rates be too high? No; I think the railway would be used.

Alexander Douglas, grazier, Bomely, near Murrungundy, sworn, and examined:—

1425. *Vice-Chairman.*] What is the size of your holding? I have about 8,000 acres of leased land. A. Douglas.
5 May, 1900.
1426. Is any part of your holding now under cultivation? Yes; about 40 acres.
1427. What is the carrying capacity of your run? There are about 5,000 acres improved, and the land carries about a sheep to 2 acres, taking it altogether.
1428. Do you find yourself handicapped by your distance from the railway station? Undoubtedly.
1429. How far are you from a railway station? 33 or 34 miles, and it costs me about 30s. a ton to send my wool there.
1430. Is the land which you hold suitable for agriculture? Part of it is, but it is not very good country; it is what I would call second-rate agricultural country.
1431. What yield have you obtained from the 40 acres that you are cultivating? Last year I got about 15 bushels to the acre.
1432. How far are you from the Talbragar? I have a frontage to the Talbragar, and the land on the frontage is fairly good; but off the river, going northwards, the country is only second-rate.
1433. The land runs back into inferior iron-bark country? Yes.
1434. What is the character of the land on the south side of the river? Between my place and Wellington it is the very best wheat-growing land.
1435. How much of the frontage land on the northern side of the river is good agricultural land? I have about 600 acres fairly good and about 50 acres really good.
1436. Is there not a fringe of good agricultural land on the northern side of the Talbragar? The poor country comes down pretty close to the river on the north side, but the country on the south side is good.
1437. Would the interests of this district be best served by a connection with Wellington, by a connection with Dubbo, or by a connection with Mudgee? A connection with Mudgee would give us a direct route to the Sydney market. If we could not get a connection with Mudgee a connection with Wellington would be preferable to a connection with Dubbo. I do not think the people here would take advantage of the line if it went to Dubbo, though where I am living it might be used.
1438. Why would the people here be disinclined to use a line coming out from Dubbo? Because of the extra haulage which they would have to pay. Farmers have told me that if the railway came from Dubbo they would continue to send their produce to Mudgee by team. A line from Wellington would go through better country than a line from Dubbo, and would obtain more traffic.

MONDAY, 7 MAY, 1900.

[The Committee met at the "Commercial Hotel," Coolah, at 9 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (Vice-Chairman).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	ROBERT HENRY LEVIEN, Esq.
JOHN CHRISTIAN WATSON, Esq.	JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Thomas Holden Richard Preston, first-class constable, Coolah, sworn, and examined:—

1439. *Vice-Chairman.*] Can you furnish the Committee with the crop and population returns for this district? Yes; with the returns which were taken in January of this year. T. H. R.
Preston.
7 May, 1900.
1440. To what district do your figures refer? The figures refer to the counties of Lincoln and Napier. The greater part of the district lies to the south of the proposed line, though the district extends also about 12 miles northward. The area under wheat in the county of Lincoln, in January last, was 478 acres, and the area cut for wheaten hay was 100 acres, while the total area under crops of all kinds was about 800 acres. In Napier, the total area under wheat grown for grain was 400 acres, and grown for hay 230 acres, and the total area under crops of all kinds about 900 acres; making a total cultivation in the two counties between 1,700 acres and 1,800 acres.
1441. Do those figures show an increase on the figures for the previous year? There was an increase of about 350 acres in the area under wheat. The greater part of the cultivation in the county of Lincoln lies close to Cobborah, and the greater part of the cultivation in the county of Napier is on the Castlereagh and up north. There is very little cultivation in Coolah itself. 1442.

- T. H. R. Preston.
7 May, 1900.
1442. What is the population of the district? About 700.
1443. Does that show an increase on previous years? Yes; there has been a considerable increase this year.
1444. What is the reason for that increase? I think it is because more land has been made available for settlement.
1445. And is more land to be thrown open for settlement this year? Yes; I believe that a good deal of land will be thrown open shortly. Land is being surveyed on both Queensborough and Gundare holdings—I think 17,000 acres on Gundare, and a large area on Queensborough.
1446. Does much travelling stock pass through Coolah from Dubbo? A good deal. Most of it is on its way to the meat-works near Muswellbrook.
1447. Where does that stock come from? The large stock generally comes from Queensland and from other places up north.
1448. *Mr. Levien.*] They do not touch Werris Creek at all? It is very seldom that anything comes from Werris Creek.
1449. Do they come from New England at all? Sometimes.
1450. Many? Not a great number. Most of the cattle come from Queensland.
1451. *Mr. Shepherd.*] Does your return of the population include women and children? Yes.

John William Swanston, station manager, Booyamuirra, sworn, and examined:—

- J. W. Swanston.
7 May, 1900.
1452. *Mr. Watson.*] What is the area of your holding? About 5,000 acres. I was managing the Queensborough holding for about three years.
1453. Have you any information with which you would like to furnish the Committee? I have been in this and the Leadville districts for about twelve years, and during the whole of that time I have been engaged in agricultural and pastoral pursuits. There is a large area of Crown land in this district, which will shortly be thrown open for settlement. I think the leasehold area of the Queensborough holding is equal to about 25,000 acres, and I think that the leasehold of the Botheroe holding also falls in next July. There is also some land on Gundare which will fall in shortly. The proposed line goes throughout Botheroe and Queensborough holdings.
1454. The nearest point on the proposed line will be about 17 miles from Coolah? Yes.
1455. For what purposes would the land which is thrown open for settlement be taken up? For pastoral purposes, I suppose, though a good deal of the land is suitable for agriculture. I do not think people can use it for agriculture without a railway.
1456. It is too far for a market? Yes.
1457. Are you engaged in agriculture in this district at all? Yes.
1458. For station purposes? Yes.
1459. There is no mill in the district? No.
1460. Flour has to be brought here from Mudgee? Yes, and from Coonabarabran and Gulgong.
1461. The principal industry here is sheep and cattle raising? Chiefly sheep-raising.
1462. Is the district suitable for cattle? A good deal of it is.
1463. If the proposed railway were constructed would the greater part of the district be within its influence? Yes; a considerable number of cattle are fattened on the Tongy holding, within 4 miles of Coolah, in a south-east direction.
1464. Would the district be within a reasonable distance of the proposed line for agricultural traffic? Yes; I think that agriculture would pay here if there were a railway, because the soil is well suited for grain. Three years ago, although the season was a dry one, I stripped 24½ bushels to the acre from 14 acres, and a good deal of the grain had already fallen to the ground.
1465. Would a large part of the land which is to be thrown open for settlement be suitable for agriculture? A great part of the land on Queensborough and Botheroe holdings would be suitable for agriculture. I cannot give you much information about the Gundare land.
1466. Do you usually have good seasons in this district? Yes; our average rainfall for the past ten years has been nearly 31 inches. Our record is as follows:—1890, 37·86; 1891, 31·57; 1892, 34·61; 1893, 35·55; 1894, 27·31; 1895, 24·68; 1896, 27·35; 1897, 19·93; 1898, 31·56; 1899, 19·99; 1900, 10·63 (to 1st May). Like many inland districts, Coolah has maintained a fair average; 1899, which was supposed to be a drougthy year, gave us nearly 20 inches.
1467. Does the rain generally come at times when it would be beneficial to wheat crops? Yes; but we are so far from market that last year we had to cut our wheat for hay, although it would have yielded between 30 and 40 bushels of grain to the acre.
1468. Have you any opinion to offer as to the probable development of agriculture if the proposed railway is constructed? I think that a good many landholders would go in for wheat-growing if there were a railway within a reasonable distance.
1469. Is there a large area of freehold or conditionally-purchased land in the district? Yes; a good part of the Coolah Valley is held in that way, though there is some Crown land on the Coolaburragundy Creek. A lot of the Gundare country is on that creek, and so is the land on the Coolah holding which was thrown open last year.
1470. In what areas was the land thrown open? It was thrown open in settlement areas of from 3,200 acres up to 4,000 acres.
1471. Was it designed for pastoral settlement? Yes; but the surveyor who is cutting up the Queensborough land tells me that on some of the flats it will be thrown open in small areas.
1472. But unless men can send their produce to market they will not be able to use small areas of land? No.
1473. Taking the district generally, would one-third of the land be fit for agriculture? I think more than one-third of it would be fit for agriculture, though, of course, some of it is ridgy country, which would not be suitable.
1474. Do you know anything of the movements of travelling stock through this district? In good seasons a good many stock travel through the district.
1475. Are they mostly fat stock making towards Newcastle and Aberdeen? A good many fat sheep go to Aberdeen; but the store cattle go to Muswellbrook, and down on to the Hunter, and store sheep go towards New England.
1476.

1476. It is not likely that stock would have to be sent from this district in times of drought? No.
1477. It is more likely that stock would be sent to the district? Yes.
1478. What is the rate of freight here? We get our wool sent down to Sydney by way of Mudgee for £4 16s. a ton, £2 of which is for road carriage to Mudgee.
1479. How much do you pay to bring stores up from Mudgee? In off seasons £2 a ton.
1480. Have you ever attempted to send wheat away? No. Other cereals, and lucerne, pumpkins, and potatoes, also do well in the district. With increased settlement and smaller holdings more sheep will be depastured in the district than we have now.
1481. How many sheep do you run to the acre? The good land will carry a sheep to the acre.
1482. How many sheep were there on the Queensborough holding? From 17,000 to 20,000.
1483. And how many acres would that holding comprise? About 50,000 acres. It has a lot of scrubby land there which is absolutely worthless, and which has recently been thrown open in scrub leases.
1484. Had that land been improved? No; I ringbarked it after I went there.
1485. Had you time to see the effect of the ringbarking? No.
1486. So that the run was unimproved when it was carrying 20,000 sheep? Yes. I think the previous owner ran from 17,000 to 20,000 sheep.
1487. If the land had been ringbarked and the suckers kept down, how many sheep would it have carried? From 25,000 to 28,000.
1488. *Mr. Shepherd.*] What sort of country is there on the other side of the proposed line from here? There is some good country there.
1489. Would it be equal to the land which you have described? Yes. The country round Coolah is hilly, whereas the country you refer to is level country.

J. W.
Swanston.
7 May, 1900.

Hugh McMaster Kennedy, station manager, Old Coolah, sworn, and examined:—

1490. *Mr. Shepherd.*] How far is your holding from Coolah? It is on the opposite side of the creek.
1491. What is the area of the station? 11,000 acres.
1492. Do you carry sheep or cattle? Both.
1493. How many sheep have you? 10,000.
1494. And what number of cattle? 250 at the present time.
1495. Do you find the country very suitable for fattening stock? Yes.
1496. About how many do you send to market yearly? About 6,000 sheep and about 200 head of cattle.
1497. Where do you generally send your stock to from here? We generally truck the sheep at Lue, and the cattle at Rylstone.
1498. How long have you been in the district? I have resided here ten years.
1499. Have you been any distance along the route of the proposed line? No.
1500. What advantages do you expect from the construction of the proposed line? I think that a good deal of country would be used for agriculture if the line were made. The squatters would lose a good deal of the land, which is not of much use for pastoral purposes, for agricultural purposes.
1501. Have you generally a good supply of grass here? Yes.
1502. So that, as a rule, you do not require to move your stock? That is so. We have had no losses during the last few years, though the seasons have been very dry.
1503. Would there be a sufficient quantity of grass here to attract stock from other districts in dry seasons, or is the country pretty well stocked? It is pretty well stocked.
1504. So that it would not be available for stock from other districts? I do not think it would.

H. McM.
Kennedy.
7 May, 1900.

Thomas Rogan, station overseer, Coolah, sworn, and examined:—

1505. *Mr. McFarlane.*] How long have you been here? Nearly twenty-six years.
1506. Have you a general knowledge of the district? Yes.
1507. How would you class the country—as agricultural or as pastoral country? A great deal of the land in the district is suitable for agriculture.
1508. There is not a very large area under cultivation at the present time? No.
1509. If the proposed railway were made, would the area under cultivation be materially enlarged? Yes; because farmers would be able to send their produce to market.
1510. How far is Coolah from the nearest railway station? Seventy miles. Mudgee is the nearest railway station.
1511. Is the produce that is grown here sent to Mudgee, or is it consumed locally? Anything grown down Leadville way may be sent to Mudgee, but nothing grown near Coolah goes to Mudgee.
1512. Which would suit the district best, the proposed line or a line from Mudgee coming within 17 miles of Coolah? If the line went out Cassilis way from Mudgee it would go through good country, though most of that country has been secured.
1513. Is there much trade between Coolah and Wellington? Not that I am aware of.
1514. Is there much between Coolah and Mudgee? Most of that traffic goes to Mudgee.
1515. Have you had much experience in agriculture? No; though I have seen 32 bushels of wheat taken off an acre of land there.
1516. Was that an exceptionally high yield? It was a big yield; but even of late years they have grown good crops on the Gundare holding, though they have had to cut them for hay.
1517. Is there much land which would give 32 bushels to the acre available for cultivation? If the railway came within 17 miles of Coolah, a lot of those who own land in the district would probably lease it in blocks of 80 or 100 acres for agricultural purposes. It costs 10d. a bushel now to send wheat from Coolah to Mudgee, and the price of wheat is only 2s. 3d. a bushel.
1518. *Vice-Chairman.*] Would a line which went towards Cassilis suit this district better than any other line? A line going towards Cassilis would go through country which has nearly all been secured; whereas on the route of the proposed line there is a lot of land yet to be taken up. On Gundare holding there are about 11,000 acres to be thrown open for settlement.
1519. *Mr. Levien.*] Does much stock travel between this district and New England, either way? I do not know much about the movements of travelling stock here, because I have been living off the road. No stock comes through Gundare.

T. Rogan.
7 May, 1900

- T. Regan. 1520. *Vice-Chairman.*] How many acres on the Gundare holding are to be thrown open? About 11,000 acres.
 7 May, 1900. 1521. Of the 11,000 acres, how much is suitable for agriculture? About 4,000 acres.
 1522. In what size blocks has it been surveyed? It was surveyed in blocks of 3,700 acres and upwards; but it will have to be re-surveyed, because adjoining selectors have disturbed the survey by taking up additional conditional purchases on the surveyed land.

Francis John Piper, grazier, Coolah, sworn, and examined:—

- F. J. Piper. 1523. *Mr. Levien.*] How far from Coolah do you live? About 4 miles.
 7 May, 1900. 1524. How long have you resided in the district? I have lived in Cassilis and in Coolah all my life.
 1525. What is the size of your present holding? I have a settlement lease comprising 3,818 acres.
 1526. Have you any land under cultivation? No. My land has only recently been taken up.
 1527. Do you know anything of the agricultural operations carried on in this district? Most of the land here is fit for agriculture—that is, the land on the river frontages.
 1528. What yield have you obtained in this district? As much as 40 bushels to the acre.
 1529. That was an exceptional crop? Yes.
 1530. What is an average yield? Twenty bushels to the acre.
 1531. What is the quality of wheat grown here? That depends upon the season; it is fair to good.
 1532. What have you done with the wheat which you have grown? I have sent it to Mudgee.
 1533. How far from Mudgee was it grown? At a place 50 miles from Mudgee.
 1534. How many acres were comprised in the area which you held there? 600 acres.
 1535. How many acres had you under cultivation? Thirty acres.
 1536. Have you seen much stock travelling between this district and the New England district? During the last six months I have seen about 15,000 sheep, mostly Queensland stock, going west. I think that a line from Mudgee would suit this district better than a line from Wellington to Werris Creek.
 1537. What does it cost to clear land for agricultural purposes here? About £2 an acre.
 1538. *Mr. Watson.*] If it were dead timber what would it cost? About £1 an acre.
 1539. *Mr. McFarlane.*] What do you mean by clearing—taking out the stumps and making the land fit for ploughing? Yes.
 1540. *Mr. Watson.*] Would a line from Mudgee to a point somewhere between Cobborah and Dunedoo be within a reasonable distance of Coolah for agricultural traffic? No.
 1541. How far would it be from here? About 26 miles.
 1542. Would that be too far? Yes.
 1543. How near would you require to have it to make it to of any value to you? A line to benefit the district should come within 12 miles of Coolah.
 1544. Would that be a reasonable distance? Yes.
 1545. What do you think of the district from an agricultural point of view? It is a very good district.
 1546. What proportion of the land is fit for agriculture? One-third.
 1547. *Vice-Chairman.*] How does the land about here compare with that about Cassilis? I think this land is as good as that.
 1548. Have you ever considered whether a line from Muswellbrook to Cassilis would suit the district? I think that a line from Muswellbrook would suit us.
 1549. Does any large number of stock go to Muswellbrook from this district? Yes. The Aberdeen works are close to Muswellbrook, and store stock also go to Muswellbrook sale-yards.

TUESDAY, 8 MAY, 1900.

[The Committee met at the "Exchange Hotel," Binnaway, at 10:15 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
 JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.
 JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

David Innes Watt, grazier, Ulinda, sworn, and examined:—

- D. I. Watt. 1550. *Vice-Chairman.*] How far is Ulinda from the nearest point on the proposed railway? About 3 miles. I am about 19 miles from Wellington.
 8 May, 1900. 1551. What is the size of your holding? 50,500 acres, including both freehold and leasehold.
 1552. How long have you resided here? I have owned country here for twenty years, but I first came to the district forty years ago.
 1553. What is the average carrying capacity of the land? About a sheep to 3 acres.
 1554. How much land in your holding would be available for agriculture if a line were constructed from Wellington to Werris Creek? About 8,000 acres.
 1555. How would you describe that land? It is red soil and chocolate soil.
 1556. What is your average rainfall? About 26 inches.
 1557. How are you situated with regard to the existing railways? We are about 100 miles from either the Northern, the Western, or the Mudgee lines.
 1558. Has the progress of the district been retarded by its distance from a railway? Yes; and especially the farming industry.
 1559. Do you think that if the proposed railway is constructed, there will be enough good land along the route to allow of a fairly large number of agriculturists being settled along it? I think so.
 1560. If you had a line within a few miles of your station, how many acres of land similar to the 8,000 acres that you say is fit for cultivation, would maintain an ordinary family in decent comfort? I should think about 1,000 acres.
 1561.

1561. Could a family be maintained on that area by agriculture alone, or would mixed farming be necessary? Mixed farming would be better. D. I. Watt.
1562. Would the country lend itself more to mixed farming than to pure agriculture? Yes. Besides Ulinda, I also hold Gowang, in the Warrumbungle Mountains, about 20 miles west of Binnaway, and Kerbin, and Yarragrin. These three stations comprise about 48,000 acres, taking both the leasehold and the freehold areas. 8 May, 1900.
1563. How would you describe that country? It is not well adapted for farming.
1564. What is its average capacity for stock? About a sheep to 2½ acres.
1565. Is it good fattening country? Yarragrin is good fattening country.
1566. Have you suffered much from the drought of late years? No; I have not suffered materially from drought since 1885.
1567. Has any large number of stock been sent to this district from drought-stricken districts? Yes; large numbers.
1568. How many? Approximately about 200,000 sheep. 75,000 sheep were sent here by one owner.
1569. Is it a usual thing to send sheep here when there are droughts in other parts of the country? People frequently send sheep, horses, and cattle here from other parts.
1570. During your residence in the district has it been necessary to send sheep away to other districts for feed? Yes, on one occasion.
1571. But, as a general rule, you have not suffered from the disastrous droughts which have afflicted other parts of the colony? That is so.
1572. When they have droughts in other parts of the colony is there generally sufficient grass in this district to depasture sheep from other districts? All the inferior country about here is rented in times of drought by stock-owners in other districts, who wish to save their stock.
1573. What market would you have for your products other than wool in the event of the construction of the proposed railway? If the railway were constructed I should be able to send grain to Sydney for export.
1574. What is the average size of a holding in this district? They run from 40 acres up to holdings the size of mine.
1575. *Mr. Shepherd.*] Are the holdings generally extensive? Yes.
1576. *Vice-Chairman.*] Have you ever tested the agricultural possibilities of your land? I have grown small crops.
1577. With what results? I have always got good crops of hay.
1578. What is an average yield? From a ton and a half to two tons to the acre.
1579. *Mr. Shepherd.*] Is that wheaten hay? Yes.
1580. *Vice-Chairman.*] A good many suggestions have been made for connecting this part of the country with our railway system;—would you care to offer an opinion upon the respective proposals? The line which would suit us best would be one from Mudgee through Mudooran to Coonabarabran.
1581. Would that open up a large area to population? Yes.
1582. Would it serve the district more conveniently than any other route? Speaking for this part of the district, I think that it would. The cost of carriage would be very much less.
1583. Would such a line tap the agricultural land better than the proposed line from Wellington to Werris Creek? Yes, within 25 or 30 miles of Binnaway.
1584. If that line were made would the district be fairly served as far as Coonabarabran? Yes.
1585. *Mr. Watson.*] How would a line *via* Redbank and Merrygoen suit? That line would suit this part of the country very well.
1586. *Vice-Chairman.*] If the proposed Wellington to Werris Creek line were constructed, would there be any large area of agricultural country more than 20 miles away from it? I think not.
1587. You think an extension from Mudgee would be the best in the interests of the district? Yes.
1588. Do you think that such a line would be the best in the interests of the colony generally? I could not say.
1589. *Mr. Shepherd.*] In your opinion, would the granting of a railway tend to the cultivation of a large area of land in the district? I think so. At the present time people cannot cultivate large areas here, because there is no outlet for their produce.
1590. Do you think that the land would be cultivated on the halves system, or would landholders cultivate their own land? I think that landholders would cultivate their own land, and that they would also engage in cultivation on the halves system.
1591. *Mr. Levien.*] Does much travelling-stock cross this part of the district to get to Werris Creek? No; the stock travels down by Cassilis and along that way.
1592. *Vice-Chairman.*] What is the general cost of carriage inwards and outwards from Ulinda? 2s. 9d. per cwt. to the nearest railway station, and 6s. a cwt. to Sydney. It costs me more now to take wool to the railway station than I had to pay forty years ago when I took it to Morpeth.
1593. Do you pay the same rates for inwards and outwards carriage? Yes.
1594. Has the progress of the district been retarded by the want of a railway? Yes.
1595. What is the financial condition of the landholders in this district? I think the district within a radius of 50 miles of Binnaway is financially one of the soundest in the Colony.
1596. Do you fatten any large stock here? I fatten about 10,000 sheep in the year, and shear about 50,000.
1597. Any cattle? No.
1598. Which is your principal market for fat stock? Aberdeen and Homebush.
1599. Would the construction of the proposed railway help you to get away large consignments of fat stock? It would assist me in selling small lots of stock as they were ready for sale.
1600. At present it does not pay you to send away small consignments? No; you must send the sheep away in flocks of from 1,000 to 1,500.
1601. With a railway a small holder would be able to send away small lots at frequent intervals? Yes.
1602. *Mr. Levien.*] I suppose it would be a great advantage to you if you could act immediately upon the receipt of a telegram from Sydney in the sending away of stock? Yes. At the present time, if we send away stock on the advice that the market is good, we get them in when prices are very low again.
1603. *Vice-Chairman.*] What yield of grain have you obtained in the district? I have never stripped any grain.

- D. I. Watt. 1604. Do you know anyone who has? Yes; in the neighbourhood of Binnaway they have got as many as 33 bushels of wheat to the acre.
- 8 May, 1900. 1605. *Mr. Watson.*] Do you know the country between Curlewis and Gilgandra? I know something of it. I think it would be very difficult country for a railway.
1606. It has been suggested that that would be a better route for a cross-country connecting line than the proposed route? I do not think that it would. I think the country is rougher and less suited for agriculture.
1607. Is there less population on it? Yes.
1608. Would a line from Mudgee have a better chance of paying than a line from Wellington to Werris Creek? I think so.
1609. Do you think it would be worth the while of the owners of land in this district to contribute to a fund to make up at least part of the estimated deficiency on the working of the line—say a sum equal to what they now contribute to the general revenue in land-tax? I do not think so.
1610. You do not think that the line will be of sufficient value to them to justify them in guaranteeing any part of a loss upon it? I do not think so. If we had railway communication, no doubt farming would be gone into largely, and the production of the country would be increased, so that I think in a very short time the line would pay.
1611. The evidence of the Railway Traffic Manager is that there would be a deficiency of £18,000 a year on the working of the line, without taking into account what would have to be paid for land and compensation? I think that when people begin to go in for agriculture here that deficiency will very soon be wiped off.
1612. Mr. Harper has told us that he has made allowance for an increase of traffic, and, even assuming that the increase would be greater than has been allowed for, there would still be a large deficiency. A contribution of 1d. per acre from the alienated land within a reasonable distance of the line would give about £5,000 a year, which would considerably reduce the deficiency? I think that a cross-country railway would make a great deal of revenue by conveying starving stock from one district to another. This district, considering its proximity to Sydney, is the worst served in respect to railway communication of any in the Colony. It takes us two days to drive to the railway at the present time.
1613. How long are the teams on the road? About six days.

Frank John Sheppard, grazier and farmer, Mooron, sworn, and examined:—

- F. J. Sheppard. 1614. *Mr. McFarlane.*] Have you resided long in this district? I have known it for twenty years.
- 8 May, 1900. 1615. Do you know the country between Wellington and Werris Creek? No; I can speak only of the country immediately around Binnaway. I do not know much of the country between Cobborah and Dubbo.
1616. Do you know the country between Cobborah and Werris Creek, in the locality of the proposed railway line? Yes.
1617. What is your opinion of that country? Some of it is the best country in New South Wales for either pastoral or agricultural pursuits.
1618. Is any large extent of it suitable for cultivation? Yes.
1619. Have you tried cultivation to any considerable extent yourself? I have cultivated as much as 200 acres.
1620. What have you grown? Wheat, corn, and lucerne.
1621. Were the results satisfactory? Yes; the year before last 100 acres of wheat averaged 18 bushels to the acre, and that was a bad year.
1622. Taking a number of years, would the yield exceed that? I have not had experience in cultivation for more than five years. The nearer you get towards Werris Creek from here the better the land gets; it is the most productive land in New South Wales.
1623. Do you endorse what was said by Mr. Watt in regard to the productiveness of the district? Yes.
1624. How far are you from a railway station? Eighty-four miles.
1625. To what station do you send your produce? To Mudgee—that is, my wool.
1626. There seems to be a difference of opinion as to what route a railway should take to serve this part of the country? To serve this part of the country alone I think that a line from Mudgee would be the best to construct; but I do not think such a line would be the best for the whole Colony.
1627. Are there parts of the district which would be so far away from a Mudgee extension that that line would not serve them? Yes. Out on the Coonabarabran side the people would be almost as far from a railway, if that line were made, as they are now. A cross-country line would serve a greater number of people.
1628. In the event of the Werris Creek line being constructed, do you think it should start from Wellington or from Dubbo? I cannot give you an opinion on the subject. If it were cheaper to send our goods *via* Wellington to Sydney I should like to see the line start from Wellington.
1629. A line from Wellington would give you a nearer route to Sydney? Yes.
1630. Would there be any traffic between this district and the western district? Yes.
1631. Then a line from Dubbo would give the shortest route to that traffic? Yes, by a few miles.
1632. Where would the bulk of the traffic go—towards Sydney or to the west? Towards Sydney.
1633. Why is the agricultural land in this district not under cultivation? Because of the lack of a railway.
1634. Would either a line from Mudgee, or the proposed railway from Wellington to Werris Creek, induce agriculture in this district? I think so.
1635. To any large extent? To a very great extent.
1636. If a railway were brought within a measurable distance of your property would you extend your agricultural operations? Yes.
1637. And have you reason to believe that others similarly situated would do the same? Yes.
1638. Do you think that that would cause a volume of traffic which would add materially to the railway returns? Yes.
1639. I understand that mixed farming is now carried on in the district to a considerable extent;—would that continue, or would the whole of the agricultural land in the district be used for agriculture? A good

F. J.
Sheppard.
8 May, 1900.

good deal of it would still be used for fattening stock on; but, with a railway, stock-breeders would be able to send away their fat stock in small lots, whereas now we can only send away large flocks at a time.

1640. At the present low price of wheat would it pay to grow for outside markets? I think so.

1641. What market do you supply now? The local market; but we cannot extend our area of cultivation, because the local market does not increase, and the carriage to Sydney under present conditions is too costly.

1642. What is the cost of carriage from your place to Mudgee? £3 a ton.

1643. Is there a fair percentage of agricultural land in this district? The agricultural land is fairly distributed through the district.

1644. Do you consider the land which is not suitable for cultivation good sheep country? Yes. I think that a railway ought to be constructed in this district, because it is a district which has been neglected for years. Although, in one way, the district is the most go-ahead district in the Colony, and everyone seems to be making money here, or doing much better than people in other parts of the country, we have been left completely out in the cold in the matter of railway communication.

1645. Do you prefer the Wellington-Werris Creek route to any other? I think so.

1646. Has there been any agitation on the part of the residents of this district for some recognition of their claim to railway communication? Yes. I think meetings have been held at Coonabarabran, at Cobborah, and at Mundooran.

1647. Which route do the people of the district advocate? Each place wants its own special route.

1648. But you think that the proposed line would serve the greatest number of people? Yes.

1649. Would it open up a larger area of country than any other line? I think so.

1650. *Mr. Shepherd.*] I suppose you will admit that there should be some probability of the line being self-supporting to justify its construction? No; I think that the Government ought to be prepared to do something for the people of the country in these matters.

1651. If a railway is constructed to one district, and there is no possibility of its being self-supporting, other districts must pay for it? A railway may not pay for the first two years; but it must pay afterwards.

1652. If the people of the district are confident that a railway will be self-supporting within a reasonable time, do you not think that they might make a contribution towards a fund to assist in getting rid of any deficiency? The people living in the district through which a railway passes are not the only people to benefit by its construction. The people in the metropolis gain by the construction of these railways.

1653. Do you not think it would be worth while, for the sake of obtaining a railway, to guarantee some part of any estimated deficiency? I do not think that the public should be called upon to do that. The Government should assist each part of the country.

1654. In contributing to a guarantee fund the landowners would not be paying more than they were paying before the railway was constructed? Let them depend upon the rates charged upon the railway. In this district we should be satisfied to pay even 6d. more than we pay now to get a railway, because of the convenience it would afford us.

1655. What return have you got in growing maize? I have got 35 bushels to the acre, and, in one year, when I irrigated from the Castlereagh River, 70 bushels. There are possibilities of irrigation on the Castlereagh.

1656. I suppose it does not pay you to send to the railway now? No; but if the proposed railway were made it would pay us to grow maize and wheat. There are a number of people in the district who have not large enough holdings to keep themselves going by raising stock; but if the railway were made they would put part of their land under crop, and do very well. Without a railway they find it pretty hard to make a living.

1657. *Mr. Watson.*] You now pay 11s. a ton to send wheat from Mudgee to Sydney, and from Binnaway to Sydney, *via* Mudgee, the rate would be 12s. 4d. per ton, so that your saving would be considerable; would it not, under those circumstances, pay you to contribute so much per acre to wipe off any estimated deficiency on the working of a railway? It might pay me to do so; but I do not think it would be fair to require me to do so.

1658. If you obtained 18 bushels of grain to the acre, and saved 3d. a bushel carriage, it would surely pay you to contribute 2d. or 3d. an acre towards making up a deficiency? It might; but I think that the Government should stand any estimated loss, without asking individual landholders to assist in making it up. Eventually, of course, the railway would pay.

1659. *Mr. McFarlane.*] Would you think it more satisfactory, instead of contributing so much per acre, to pay special rates to make up any deficiency? I think so. I might say that I am here to represent Mr. McMaster, of Binnia, and Mr. Duncan McMaster, of Binnia and Bundella. They are both in favour of a line from Wellington to Werris Creek.

Robert Beames, farmer and grazier, Binnaway, sworn, and examined:—

1660. *Mr. Watson.*] What is the extent of your holding? 3,390 acres.

1661. How many sheep do you carry? I have no sheep on my holding at present, but I usually carry from 1,000 to 1,500 sheep.

1662. Is that exclusive of the land which you use for cultivation? I have only a small area of land under cultivation—about 40 acres.

1663. Is the land you cultivate specially good land? It is a fair sample of the land on the river frontage. There is plenty of other good land on the river frontage which has not been cleared.

1664. What returns have you obtained from the 40 acres? I have had as much as 15 bushels to the acre.

1665. Your market for grain has always been Coonabarabran, I suppose? Yes.

1666. What price do you get for your wheat? This year I got 2s. 6d. a bushel. The price varies from 2s. 3d. to 2s. 6d. a bushel.

1667. Is the land back from the river as good for cultivation as the river frontage? The flats run back some distance on this side of the river; some of them are from $\frac{1}{2}$ mile to $\frac{3}{4}$ mile wide. On the other side of the river the ridges come in closer.

1668. Is the ridgy country only suitable for grazing? Yes.

1669.

R. Beames.
8 May, 1900.

- R. Beames.
8 May, 1900.
1669. It would run about a sheep to 3 acres? About that.
1670. What proportion of your holding is suitable for agriculture? About 600 acres.
1671. If you had a railway within 20 miles it would pay you to go in for cultivation more largely? Yes; and a larger area would be put under cultivation in the district generally.
1672. Would a much larger area be cultivated? Yes. Last year the farmers in Coonabarabran had to keep their wheat over because the local consumption was not very large, and they could not send it away.
1673. Has Coonamble been a market for this district? No; it has been served by Gulgong for a long time past.
1674. Do you know much of the country between Wellington and Werris Creek? I do not know Werris Creek; but I know Wellington and Dubbo. There is a lot of agricultural country coming out from Wellington; but a few miles on this side of Dubbo the land is scrubby.
1675. Do you think that the Wellington route is better than the Dubbo route? It would go through better farming country.
1676. How would you describe the country between Merrygoen and Binnaway? There is a lot of good agricultural country there.
1677. How would you class the country between the Talbragar and the Castlereagh? There is some very nice country there. A lot of it would be good for agriculture.
1678. What proportion of the land around Binnaway would be fit for agriculture? Perhaps a fourth.
1679. Do you consider the land between Binnaway and Weetalibah good agricultural land? Yes; there is a lot of good agricultural land there; but there is a lot of very bad country, too.
1680. Do you think a line from Mudgee towards Merrygoen would be a better line for the district than one from Wellington to Werris Creek? No; I think the Wellington to Werris Creek line would suit most people, and it would go through good country.
1681. Through better country than a line from Mudgee to Merrygoen would go through? I think so.
1682. Do you think it would be an advantage to be able to go *via* Werris Creek to Newcastle when sending wheat away? Yes.
1683. Do you think it would be worth your while to contribute anything towards making good any loss that there may be on the working on the line? No doubt the line would be a grand thing for the district; but I think it would be a difficult thing to get the people to contribute to it.
1684. The line would not be of much advantage to grazing land? A railway here would help both agricultural and pastoral operations, though, of course, it would help agriculture more than grazing.
1685. Do you grow for hay as well as for grain? Yes; I have been here twenty years, and I never yet saw a failure of crops on this river. You can always get either hay or grain. In one year the wheat was about 7 feet high, and I had oats 9 feet high. A man was a fortnight cutting 3 acres of oats, and I got 20 tons of hay off the land.

Samuel George Sheumack, farmer, Binnaway, sworn, and examined:—

- S. G.
Sheumack.
8 May, 1900.
1686. *Mr. Shepherd.*] How long have you been in the district? About thirteen years.
1687. What is the size of your holding? 540 acres.
1688. How much have you under cultivation? 100 acres.
1689. What crops are you growing? Wheat chiefly, and maize. I have also grown potatoes, pumpkins, melons, turnips, mangel wurzel, and other crops.
1690. Do you grow wheat for hay or for grain? Generally for grain.
1691. What yield of hay do you get? We have only lately taken up our place, and we have had nothing but a continuation of droughts since we have been there, so that we have not had heavy crops; but, with fair seasons, we shall get from 25 to 30 bushels to the acre. One gentleman a few miles from here got as much as 40 bushels to the acre.
1692. What yield of maize do you get? About 30 bushels is the most that we have got yet; but we have not had a good season.
1693. Have the potatoes also been a partial failure? Yes; lately.
1694. Do you consider the land highly suitable for the crops that you have mentioned? I do.
1695. What does it cost you to clear land for cultivation? About £2 an acre.
1696. Do you kill the timber on it first? We ringbark part of it first, but we have taken off part of the timber when green.
1697. When you ringbark how long do you wait before pulling down the timber? About twelve months.
1698. Then you grub it out and burn it? Yes.
1699. Does £2 an acre include the cost of ringbarking, grubbing, burning, and making the land fit for cultivation? Yes.
1700. Is this a good district for honey? There is no better district in the Colony, with a good season. If we had a railway we could send 20 or 30 tons of honey to the Sydney market every year.
1701. Does the eucalyptus produce good honey? Yes; the best honey.
1702. What kind of trees grow on the land? Yellow-box, white-box, iron-bark, and red-gum.
1703. Apple-trees? Yes; but they give the honey a bad flavour.
1704. Do you cultivate land to produce food for your bees? No; the bush-honey is the best.
1705. Is it your opinion that the opening of the proposed railway will encourage people to go in largely for farming? Yes.
1706. I understand that you have some brothers engaged in farming? Yes; there are six of us here.
1707. Have they holdings of their own? No. There are five of us waiting for land to be thrown open, and as soon as it is thrown open we shall take it up. If there were a railway thousands of acres would be taken up for farming. We are kept back by the want of a railway.
1708. Many of the holdings here are very large? Yes.
1709. Do you think that if there were a railway the large holders would engage in farming, either on the halves-system, or on their own account? I believe that they would; I am sure that Mr. Watt would.
1710. Which pays best, farming or grazing? I could not tell you; I have had no experience in grazing.
1711. Where do you find a market for your produce? Coonabarabran is our only market.
1712. How far away is that? Twenty-two miles.
1713. Have you a ready market there? No; and the buyers give us just what they like.
1714. Have you tried dairying? No.

MINUTES OF EVIDENCE--RAILWAY FROM WELLINGTON TO WERRIS CREEK.

1715. Do you think that the district would be suitable for dairying? Yes.
 1716. Have you tried fruit-growing? We have an orchard, but it is only young; we have not had fruit from it yet.
 1717. Do the trees promise well? Yes; they are doing very well, notwithstanding the continuance of droughts.
 1718. What trees have you? Pretty well all kinds.

S. G.
Sbaumack.
8 May, 1900.

Charles Naseby McWhirter, hotelkeeper, Binnaway, sworn, and examined:—

1719. *Vice-Chairman.*] How long have you been here? All my life.
 1720. Is the country around Binnaway fit for agriculture as well as for grazing? Yes.
 1721. How much of the land within 10 miles of Binnaway is fit for agriculture? Most of it.
 1722. Are the ridges good agricultural land? No; the ridges are a bit too stony.
 1723. Have you yourself had experience in farming? Yes; I have been engaged in farming operations all my life.
 1724. What area have you under cultivation? I started with a small area, and now I have about 200 acres under cultivation.
 1725. What do you usually sow? Mostly wheat.
 1726. What has been your yield? On an average the wheat crop yields about 20 bushels to the acre, but one crop which was burnt would have given 40 bushels.
 1727. How often have you had a total failure of crops? Never.
 1728. Have there been any partial failures? No; you can always get hay, even if there is no grain.
 1729. Is there any general demand for land in this district for agricultural purposes? No; all the land in the district is taken up.
 1730. If more land were thrown open, would it be taken up for agriculture, even with a railway? Yes; people are waiting for land.
 1731. Do you think that if a railway were constructed, large as well as small landholders would increase their cultivation areas? I think so, because a railway would give an outlet to their produce. At present we have only the local market.
 1732. Do you send any of your produce to Mudgee or to Wellington? No.
 1733. The rates of carriage are too heavy? Yes.
 1734. With a railway, how many acres could a man make a living on? In some places a man would want more land than he would want in other places. Along the river frontage a man could do well with 640 acres, if he farmed it.
 1735. Where do you get your supplies from? From Mudgee.
 1736. What rate of carriage do you pay? £3 a ton.
 1737. Which would serve the largest area of good land—the proposed line, a line from Mudgee, or a line from some other point? I think the proposed line.
 1738. Do you know the country from Curlewis to Gilgandra? I know some of it. Most of it is good land.
 1739. Which line would go through the greater area of good land—the proposed line, or a line from Curlewis to Gilgandra? The proposed line.
 1740. Has there been much traffic in stock from the Northern or North-western to the Western line? There used to be a good deal four or five years ago. Stock used to come this way from the direction of Wellington and Dubbo, and sometimes stock used to go from this district towards those places.
 1741. Does this district often receive starving stock from drought-stricken districts? Yes; during the last few years.
 1742. Do you know any other time when starving stock were sent here? Yes; between 1877 and 1879.
 1743. This district does not, as a rule, suffer from drought? No; it stands the dry weather well.
 1744. Is it sound sheep country? Yes; sheep do very well here.
 1745. Is it good country for fattening large stock? Yes. A few miles away from the river there is any quantity of good country.
 1746. Does anyone here go in for fattening big stock? Yes; about 10 miles west from here they go in for fattening big stock.

C. N.
McWhirter.
8 May, 1900.

WEDNESDAY, 9 MAY, 1900.

[The Committee met at the Court-house, Coonabarabran, at 10:30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD.
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Kenneth Murchison, journalist, and a member of the Local Land Board, Coonabarabran, sworn, and examined:—

1747. *Vice-Chairman.*] How long have you resided here? Twenty-seven years.
 1748. During that time, you have doubtless had opportunities of observing the growth and progress of Coonabarabran? Yes.
 1749. Will you outline to the Committee the general course of events as they have marked the development of the town since you came to reside here? There are other gentlemen present who have known Coonabarabran for a longer period than I have known it, but I have seen the beginning of its industrial development. When I first came here a great part of the western, and nearly all the north-western traffic, except that which went to Narrabri, came through Coonabarabran, and that is why I settled here. There was not much else to induce settlement of that kind, because the place was very small. Mr. Neilson, who is now the largest property owner in Coonabarabran, was at that time building the first mill; but now there

K.
Murchison.
9 May, 1900.

K.
Murchison.
9 May, 1900.

there are two mills in the town, a co-operative company having put up a second mill in 1892. The co-operative company's mill has since been burnt down, but we had faith enough in the district to rebuild it. When I first came to Coonabarabran, large numbers of teamsters camped here at night, coming from Walgett, Coonamble, and the north-western districts, and people will tell you that they have seen as many as thirty and forty teams here. We then regarded the town as likely to be on the permanent main route of traffic from the north-western district to Sydney and to Newcastle. The stock came through Coonabarabran to Mudgee and to Muswellbrook, *via* Coolah, and teamsters came through on their way to Muswellbrook also. At that time the Northern line had not left the Hunter Valley, and the Western line was somewhere about Wallerawang, while no decision had been come to with regard to the Mudgee line. Then the Northern line was pushed on, the North-Western line was made, and the Western line was taken to Bathurst, to Orange, to Wellington, and on to Bourke, and Coonabarabran was isolated. Ever since then there has been a struggle against unnatural conditions on the part of the men living here. We tried for years to get a line which we would still accept as a very good line, not only for ourselves, but for the others—a line from Muswellbrook, *via* Cassilis, to Walgett. Money was voted for that line, but the cost was found to be too great, and therefore we would not ask for it now. We consider, however, that a line from Wellington to Werris Creek, which is the proposal into which the Committee is inquiring, must, in the natural order of things, be constructed to connect the railway systems of the Colony and to bring the New England district into communication with the western district. We feel sure that the line will be constructed, and we considered that the next best thing for us and the country would be a branch line, leaving that line somewhere near Bomera, and going through Coonabarabran to Coonamble, and then on to Walgett, or whatever place was thought best. We considered that that line would be the cheapest to make, and would open up most country. Such a line would make Newcastle our nearest port, and would also enable us to send our produce to Sydney. It is most important that these wheat-growing districts should be able to get to the coast by the nearest possible routes, because those of us who look beyond the local aspect of this matter know that, even if we have to pay only as much for sending 500 miles as other people pay for sending only 300 miles, the taxpayers generally have to make up the loss. Ultimately we shall have to depend upon other countries for our market, but for a good while to come we shall have a good outlet in the Western and North-western districts. We send our flour out to Walgett and to Coonamble now, but the construction of the line from Dubbo to Coonamble will unfairly handicap us. We are not afraid to compete with any other district, but we cannot continue to compete with Dubbo if we and the other taxpayers of the country are called upon to subsidise a line from Dubbo to Coonamble.

1750. How has Coonabarabran progressed during the last fifteen years? Most of the progress made by the town has been made during the last fifteen years, but we have now arrived at a stage at which people are thinking of giving up their land. Mr. Proctor, who lives out towards Baradine, recently sold his place because he did not know what he could do with it, and there are others who are prepared to sell because of the difficulty of doing anything with the land without railway communication. If a railway were made the district would make more progress in the next three years than it has in the last fifteen or twenty years, during which time population has increased and land has been taken up in all directions. The new Land Act gave an impetus to settlement, so that country which would not have been looked at ten years ago is being rushed now, and the area under cultivation has been doubled or trebled, though it is not as large as might be expected, from the fact that we have two flour-mills here. These mills, however, are not employed half their time, because they cannot get a market for their flour. Mr. Finley, who is one of the chief farmers here, has tried to get rid of his farm because of the difficulty in selling his produce. Messrs. Binney, out towards Quirindi, bought a lot of his wheat for seed the year before last, because it was the best wheat obtainable; yet, although he grows such good wheat, he feels that he would be doing better by going in for large stock or sheep. He paid 2s. 6d. a bag for the carriage of that wheat, but, as a rule, he would have to pay 1s. a bushel for carriage. On the occasion to which I refer he must have sold nearly 50 tons of wheat. Last year he was trying to let his farm, and this year he wants to give up farming altogether. If, however, there were a railway, he would increase his cultivation area five or sixfold. He has enough good land, but, under existing conditions, he cannot use it profitably for agriculture. I would like to read to the Committee some evidence which I gave before the Sectional Committee which visited Coonamble. In 1897 the number of holdings of 1 acre and upwards in the district, was 366, and the area of alienated land 563,999 acres.

1751. Within what boundaries does that land lie? Within 20 miles on either side of a line from Bomera to Coonamble, through Coonabarabran.

1752. How far along that line do the holdings that you speak of extend? From Tambar Springs to Tooraweenah; from a point about 40 miles on the Werris Creek side of Coonabarabran, to a point about 35 miles on the Coonamble side. The area of Crown lands in occupation was 1,364,260 acres, and the total area under cultivation 4,502 acres, of which 2,029 acres were under wheat for hay, and 1,743 acres were stripped for grain, yielding 27,268 bushels; 730 acres were under maize, and yielded 8,841 bushels; and 24 acres were under other grain crops. 983 acres were cut for wheat, oats, and barley hay; 203 acres for lucerne hay; 60 acres for green food; 63 acres for potatoes; and 5 acres for sugar-cane. Then there were 53 acres under fruit, and 52 acres under other crops. The horses in the district numbered 4,986; the milch cows 1,083; and other cattle, including calves, 13,200; the sheep, including lambs, 891,265; and the swine, 658. The quantity of wool produced was 2,090 tons. Although the area under cultivation in this district is not large in comparison with that in other districts, it produces more than it requires for local consumption, because of the artificial isolation of the district to which I have already referred. The farmers who are at any distance from Coonabarabran have to take their wheat to Dubbo or to Quirindi, and they cannot afford to pay the high rates which are charged for road carriage. The soil and climate, however, are especially favourable to the growth of wheat and fruit. I know the Tumut country, and, indeed, pretty well all the country from here to Melbourne, and I know that there is no better fruit-growing district than the Coonabarabran district. There are large areas of splendid fruit-growing and wheat-growing land in this district; but between Coonabarabran and Narrabri there is a great deal of vacant land which is a nuisance to pastoralists, because of the dingoes which breed there. Large areas of Crown lands in the district were abandoned when the late Mr. Garrett arbitrarily raised the rents of the lessees, and that land has never been occupied since.

1753. What kinds of fruit grow in this district? Apples, peaches, plums, and stone fruits of all kinds. It is rather cool for oranges about Coonabarabran itself, because the immediate district is very high, and
you

K.
Murchison.
9 May, 1900.

you have to ascend whether you come from Gunnedah, Mudgee, or Coonamble. At Baradine and Coonamble, however, they grow oranges as good as any in the Colony.

1754. In what way would a line from Wellington to Werris Creek serve Coonabarabran and the surrounding country? It would serve us in a small degree by giving us better access to Newcastle than we have now.

1755. How far would you be from that line? About 30 miles. Ulinda would be about the nearest point.

1756. Would the producers of this district look upon that distance as a serious handicap; so serious that they would be compelled to ask for the construction of a branch line? I think they would be compelled to ask for the construction of a branch line from Bomera.

1757. Do you think that such a branch line should stop at Coonabarabran? It would suit us to have it stop there, and, as both Coonamble and Walgett seem likely to be provided for, we should not be justified in asking that it be taken further on? Coonamble, however, properly belongs to this district, and the traffic for that district should pass through Coonabarabran on its way to Newcastle.

1758. Do you think that the interests of this district, and of the districts north and south of it, would be better served by the proposed line, and a branch line to Coonabarabran, than by an extension of the railway from any other point on the existing line? I think so.

1759. Would the continuation of a line from Mudgee to Merrygoen serve this district as well? I do not think so, because it would cut us off from Newcastle and the Northern line.

1760. What market do you expect to find for your products on the Northern line? There is traffic of various kinds from one district to another. Stock from districts a little beyond us go up on the Northern line in times of drought.

1761. But what permanent market are you likely to find for your products on the Northern line? It is not a market for our products there that we look for so much as a connection right through to Queensland.

1762. What business would you do in Queensland? Well, transaction in stock would be large.

1763. The official evidence is that the stock traffic would be served by a line going further to the north-west? We want a connection with Newcastle and with the Northern line, not only for stock traffic, but for general commercial purposes.

1764. What other business do you expect there will be in addition to the stock traffic? The passenger traffic will be a large item. We have not had much communication with the north up to the present time, chiefly because it is too costly to get there.

1765. What this district wants is an outlet for its agricultural and pastoral products? Yes; and for our fruit.

1766. You would like to get your produce to the seaboard as cheaply as possible? Yes, and, if possible, we should like the option of going either to Newcastle or to Sydney.

1767. Will you describe to us in general terms the country within 10 miles of Coonabarabran? It is chiefly agricultural country, and is especially suitable for small holdings.

1768. Small pastoral holdings? Occupation by small farmers, who would combine agriculture with pastoral pursuits.

1769. What would you consider a small holding? From 300 up to 4,000 or 5,000 acres.

1770. Would you call anything under 5,000 acres a small holding? Yes.

1771. How much land within 20 miles of Coonabarabran is suitable for agriculture? I cannot say; but I daresay one-third.

1772. Could we take the land between Binnaway and Coonabarabran as typical of the country round Coonabarabran? No. There is more bad country between those places than in the district generally, except going towards Narrabri, where it is iron-bark forest country. The roads into Coonabarabran, as a rule, pass through pretty bad land.

1773. Would the country 20 miles out from Coonabarabran, along the Mundooran road, be typical of the country round Coonabarabran? No; the land for 15 miles alongside that road is much worse than the average country.

1774. What is the population of Coonabarabran? Something over 700.

1775. Are there any other industries in the town besides flour-milling? Yes; Mr. Neilson has a saw-mill in connection with his flour-mill, and there is another saw-mill in the town, and a third about 14 miles out.

1776. What is the average rainfall of the district? About 30 inches. The climate here is an important consideration; it accounts for our good wheat, our good fruit, and our good health.

1777. *Mr. Watson.*] What sort of land is the vacant land in the direction of Narrabri? A good deal of it is scrubby country, with iron-bark and box forests.

1778. Would not that country be suitable for either improvement or settlement leases? Yes, part of it would be.

1779. Has any attempt been made to have the land occupied in that way since the new Land Act was passed? All that is available has been taken up in settlement leases. The land has been offered on improvement leases, but I do not think any sensible man would take it under the conditions which have been attached to those leases; it would ruin him to do so.

1780. If the vacant land you speak of is suitable for pastoral purposes it seems strange that it should be vacant when it might be obtained on a fairly reasonable tenure? It is not very good for pastoral purposes, and a great deal of it is bad, though the bad land is generally well timbered with iron-bark. All through it, however, are areas which might be taken up in small holdings, and under favourable conditions would be cultivated. At present, however, that country is too far from a railway to make it profitable to grow wheat there. Pretty nearly all of it is patchy country. If the proposed line were made, this district would have the Newcastle market, and would be able to trade with the Hunter district. That trade we look upon as likely to be very considerable in the near future.

1781. What products would you exchange with the Hunter district? We would send agricultural products there. We anticipate that before many years have passed a large amount of manufacturing will be done there, and then the people living in the district will not produce enough for their own consumption.

1782. Are not the people living in the Hunter district exporters of agricultural produce? They do not grow much wheat down there.

Robert Neilson, storekeeper and miller, Coonabarabran, sworn, and examined:—

- R. Neilson.
9 May, 1900.
1783. *Mr. Shepherd.*] How long have you resided in the district? About twenty-six years.
1784. Have you travelled through the district much? Not very much.
1785. Are you acquainted with any part of the proposed line? I have been to Bomera, and I know the country between there and Coonabarabran. I know nothing of the Werris Creek country, except by hearsay. When I came here with Mr. Murchison, in 1872 or 1873, there were only two or three houses in Coonabarabran. I got 70 tons of goods up that year by way of Muswellbrook, and I paid 3s. 9d. per cwt. freight. Now, however, it costs me 3s. per cwt. to bring goods from Gunnedah, and the railway freight, which used to be 5s., is 6s., because of the extra mileage.
1786. What do you think of the agricultural capabilities of this district? I have been informed that the agricultural area of the district could be increased to 100,000 acres.
1787. In what direction could the additional cultivation be made? In the direction of Baradine and Goorianawa.
1788. How far from Coonabarabran? Twenty-eight miles.
1789. How far from the proposed railway? A little over 50 miles.
1790. Would not the distance from a railway be too great a handicap to permit of agriculture there? Well, at Burrowa a man built a mill, and it had to be closed because of the competition of the railway 20 miles away.
1791. Would the proposed railway benefit Coonabarabran? If the proposed line were made, we should hope for a branch line from it to Coonabarabran.
1792. Do you think that the estimated deficiency of £18,000 would be made up within a reasonable time? I think that we should be agreeably disappointed by the result of constructing the proposed line. The passenger traffic, north and south, would be considerable. Then, too, although the construction of a railway from Dubbo to Coonamble has been sanctioned, wool will continue to come towards Coonabarabran from within a short distance of Coonamble. Out as far as Calga the wool may go to Quirindi this year, although that wool has been looked upon as likely to provide traffic to the Dubbo-Coonamble line.
1793. What is the average yield of wheat in this district per acre? It depends upon the fertility of the soil and the energy of the tiller. If the tiller works properly he may get as much as forty bushels to the acre.
1794. Is wheat the only crop that is grown here, as a rule? Wheat and maize.
1795. What is the yield of maize? The crop which they are now pulling is poor, because of the terrible heat wave from which the whole Colony suffered. Maize grows well here, and is of good quality.
1796. What proportion of the land within 20 miles of Coonabarabran is fit for agriculture? Coonabarabran was placed, by the occupiers of the Ulimambri run, in some of the worst country near here. For 20 miles outside of it you will find as good land as there is in the Colony. Beyond Ulimambri, as far as Bomera, the country is very good indeed, and so it is, too, on the other side. Out towards Goorianawa and Baradine you will find good country.
1797. How far would the good country you speak of be from the proposed line? It would be within 50 miles of it, and some of it runs close up to the proposed line.
1798. Is this district largely used by starving stock in seasons of drought? Yes; it was perfectly inundated with stock last year. Every piece of ground that had grass on it at all was sought after by the people in the Walgett and other districts.
1799. The stock traffic would be a source of revenue to a railway? Yes; and the railway would be the means of saving valuable animals.
1800. From what districts do the stock come? From the Namoi and Walgett districts, and even from the Coonamble district. Mr. Keogh had to secure country for his stock, I believe.
1801. As a rule, you have a superabundance of grass in this district? Yes. It is the general opinion of the farmers of the district that the construction of the proposed line is to be advocated in anticipation of the further relief which would be afforded to us by a branch line from it to Coonabarabran. I was one of a deputation which waited upon the late Mr. John Sutherland, when he was Secretary for Public Works, and, in speaking of the rough country in the district, I pointed out that there was a lot of very valuable iron-bark upon it. Mr. Sutherland thereupon said that it would be a pity to destroy that timber before there was a market for it; but we cannot get a market for it until we get a railway. It will be a great advantage to the farmers to be able to save even a penny a bushel in the carriage of their wheat, while the rates of carriage for goods sent from the city here are not low.

Richard Johnstone Parker, manager of the Australian Joint Stock Bank, Coonabarabran, sworn, and examined:—

- R. J. Parker.
9 May, 1900.
1802. *Mr. Watson.*] Have you been stationed in Coonabarabran long? I have been here over twenty years.
1803. Are there any other banks here? No.
1804. Then you should have a pretty fair idea of the general condition of the district? Yes.
1805. What has been the financial condition of the district during the time that you have been here—has it been one of steady improvement? On the whole it has.
1806. Has this district been affected by the droughts which have injured other parts of the Colony? We have not been injured nearly as much as other districts.
1807. There are a considerable number of people with small holdings in this district? Yes.
1808. Do they get along fairly well? Yes, on the whole. The high price of wool last year helped all the settlers in this district very materially.
1809. If wool goes back to its former price will there still be a good outlook for the people about here? A fair outlook; but I have always strongly advocated mixed farming. Ever since I have been here I have done my best to encourage small men—and we are interested chiefly in the small settlers of the district—to go in for mixed farming. Those who have done that have done much better than those who have confined themselves to one kind of enterprise.
1810. Do the holdings, as a rule, contain a fair proportion of agricultural land? Yes.
1811. Which, in your opinion, would be the best route for a railway to serve this district? We are strongly persuaded that the construction of a line from Wellington or Dubbo to Werris Creek would suit us best, because it would give us hope of a branch line on to Coonabarabran.

1812. The proposed line, which leaves Coonabarabran 30 miles from it, will hardly develop the country to the north, out towards Baradine? It would certainly not help this district as much as we need help. R. J. Parker.
9 May, 1900.
1813. Therefore a branch line would be required? Yes.
1814. Is there any prospect of such a line paying? It is hard to say that there is, if the Dubbo to Coonamble line is to be carried out; but even if that line is constructed, a good deal of the heavy traffic from that district will still come this way in good seasons.
1815. You could hardly expect a branch line going out towards Tooraweenah to pay after the Coonamble line was made? A branch line from the proposed line through Coonabarabran towards Walgett would answer all purposes. Such a line would go through a large extent of country which is at present very sparsely populated, though it is land which might be cut up into comparatively small holdings.
1816. Is the land between Coonabarabran and Baradine similar to that between Binnaway and Coonabarabran? Part of the way it is, but as you get further out it is much better. Going north, after you get out 5 miles in the direction of Baradine, you begin to descend, and then you get on to very much better country. Unless something is done to relieve the producers of this district, the district will go back. We have two mills here, and I do not think that they find it easy to get rid of the production of the district now. We cannot send it away to the larger centres of population, and, therefore, unless some new outlet is provided in the north-west, I am afraid that farming will receive a considerable check. The district is specially suitable for small holdings, on which a man might run, say, 1,000 sheep, and cultivate 400 or 500 acres. That class of settlement would be of advantage to the whole country.
1817. Is a fair proportion of the land in the district suitable for agriculture? Yes, a good proportion. With the exception of some of the country to the north-west, which has been spoken of as forest country, a good deal of the land yet to be thrown open is superior country.
1818. Yesterday we seemed to pass through a considerable area of country which is unsuitable for wheat-growing:—is that country similar to the district generally? No; the land which is yet to be thrown open contains, I believe, a considerable portion of agricultural land.
1819. You refer to Crown land? Yes.

William Nash, grazier, Gorah, sworn, and examined:—

1820. *Mr. McFarlane.*] How far do you live from Coonabarabran? About 17 miles, in the direction of Coonamble. W. Nash.
9 May, 1900.
1821. Have you resided long in this locality? About thirty years.
1822. Have you had any experience in farming? I was reared on a farm, and I have been farming ever since; we farm about 50 acres at the present time.
1823. What is the character of the land in the locality in which you reside? We have a large area of splendid land which is especially suitable for wheat.
1824. What area do you hold? 28,000 acres.
1825. Freehold and leasehold combined? Yes.
1826. Is there much agriculture in your neighbourhood? Yes; we are out on the Bugaldi Creek.
1827. How far are you from the nearest railway station? We are about 127 miles from Mudgee. Gunnedah is nearer, but the road there is not so good.
1828. I presume that there is not more land under cultivation, because of the difficulty in getting produce to market? Yes. I have 900 bushels of wheat in my woolshed now, and there is no possibility of doing anything with it, while other farmers are similarly situated.
1829. Have they in the past depended solely upon the local market? Yes; upon the Coonabarabran and Coonamble market.
1830. Is that market over-supplied now? Yes, it has been over-supplied for the last two years. The small farmers prospered very well for five or six years; but since we have over-produced there has always been a large quantity of grain which cannot be got rid of. From my place down the creek and towards Baradine there must be at least 60,000 acres of beautiful wheat land. I consider that that land is superior to the land between Gunnedah and Tamworth.
1831. There is very good land about Tamworth? Yes, it is a better district than this; but in that district you see the Peel River Company's bullocks feeding on the flood flats while farmers are ploughing up the gravelly ridges.
1832. What would you consider a fair yield of wheat in your district? I believe that the farmers out there have got an average yield of from 15 to 16 bushels; but we have had heavier crops.
1833. How would you compare the country between Coonabarabran and Binnaway with the country which we have just described? The flats between Coonabarabran and Binnaway are very narrow, so that you could only put small areas of agricultural land into a farm. The country that I have described is more suitable for farming.
1834. Would the ridgy country between Coonabarabran and Binnaway be suitable for agriculture? No.
1835. Where is the best land within 20 or 25 miles of Coonabarabran? I do not think you could get more suitable land for farming than that towards Baradine.
1836. Where is the worst land? Out towards Narrabri.
1837. Is the land in this district suited to maize? No; my experience is that there is not a sufficient rainfall for maize. The trouble is that though at present there are a good many small holders in the district, and within a few months their number will be increased, because there is a large area of country out towards Baradine which will have to be taken up, the local market is already too small to support them, and the construction of the Coonamble line will deprive us of the Coonamble market.
1838. With equal facilities would the farmers here be able to compete with those around Dubbo? I think so.
1839. Generally speaking, how would you class the country between Werris Creek and Wellington or Dubbo? I think it is a fair average country. There is some very good land all the way down the Castlereagh.
1840. Would the construction of the proposed line be of any material benefit to the Coonabarabran district? The line would be rather far off; it would not be of much advantage to the district. Anything beyond 20 miles is a long way to carry produce at the present low prices.
- 1841.

- W. Nash, 1841. Would you consider a branch line to Coonabarabran necessary to serve the farmers in the district? They must be given some assistance, or otherwise they will cease to grow crops. This district cannot prosper without a railway.
- 9 May, 1900. 1842. Would a branch line to Coonabarabran be of material benefit to it? Most certainly.
1843. Would it serve the farmers out where you live, 17 miles from Coonabarabran? We should be in a better position if the line were constructed than we are in now.
1844. Is there any large area of Crown lands in your neighbourhood suitable for cultivation? Yes.
1845. What would you describe as a small holding? From 100 to 300 acres.
1846. Would that be sufficient to maintain a man and his family? It is not sufficient; but a great many people are trying to make a living on such areas.
1847. If proper facilities were given would it be sufficient? Most certainly it would.
1848. There are some leasehold areas in the district which are shortly to be thrown open to settlement? Yes.
1849. What is the country like? A great part of it is very good. The Bugaldi country and the country around Baradine, which is not grazing country, is chocolate soil country. The owners of the runs have been buying up the black-soil plains; but they have not bought up the red-soil country; so that there is now a large area of it to be thrown open for settlement.
1850. Do you consider it good wheat-growing country? Yes.
1851. What percentage of the land in the district would be suitable for wheat-growing? At the very least there are over 30,000 acres suitable for wheat-growing. From the time you pass Yermin, down the Baradine Creek, to Wangan, and from Baradine to Terrididgerie, the country is good.
1852. Where do you generally do business? In Coonabarabran, in Mudgee, or in Sydney. Our chief business is done in Sydney.
1853. Where does your wool go? It mostly goes to Mudgee.
1854. Have you any knowledge of the timber here? We have large forests of pine and iron-bark out towards Narrabri. You get into very good timber 7 miles from Coonabarabran.
1855. Is this timber being cut at the present time? Yes; on the Narrabri side. The forest reserve runs right through from Narrabri to near Gorah. I do not refer to that as suitable farming country, although there are patches of good country along the creeks.
1856. Have you been connected with farming in other districts than this? I have had a farm at Hampden, and I have travelled a good deal.
1857. How would you compare this district with other districts? The good land to which I have referred is equal to anything that I know of in other districts for wheat-growing, oats, and barley; but we have not a sufficient rainfall to grow maize. For thirty years I never saw the wheat crop fail, and 1877 was the only year in which we had to cut our wheat for hay.

Frederick George Failes, M.R.C.S.Eng., Coonabarabran, sworn, and examined:—

- F. G. Failes, 1858. *Vice-Chairman.* Will you kindly supplement, as far as you can, the evidence which has been given before the Committee this morning? A great deal has been said about the necessity for making a branch line from the proposed line; but I should like to say something about the country beyond Coonabarabran, out Baradine way. We claim that this district takes in all the country which supplies wheat to the flour-mills here—that is, the country out towards Tooraweenah and the country out to Baradine. I am not prepared to agree with the statement that a line stopping at Coonabarabran would serve these outlying parts of the district. Coonabarabran is situated in the heart of the bad part of the district, and to bring a line here would not, I think, be satisfactory to the outlying country. I look upon Baradine as the centre of the best wheat-growing land in the district. Out there there are very large areas of land which are now uncultivated, but which could be used to grow wheat. If wheat were grown there, and a railway were made only to Coonabarabran, the produce would have to be drawn 30 miles to get to a railway station, and for 16 miles it would have to come through very hilly country. I believe that New South Wales is likely to become a large exporter of wheat, but I do not think that the Baradine farmers could grow wheat and draw it 30 miles to a railway station, and then sell it in competition with other growers near the coast.
- 9 May, 1900. 1859. What alternative do you suggest? I think that any branch line to Coonabarabran should be continued on as far as Baradine, or at least over the ridges. I should like to point out to the Committee that the farmers have not experimented with the poor country round Coonabarabran, so that what can be done with it remains to be seen. As a hobby I have tried what I could do with 8 acres near the hospital which the Committee have allowed me to cultivate. Of course, I pay no rent for the land, but I have been able to clear it, pale it, and grow hay upon it at a profit.
1860. What is the character of the land? It is land upon which gum, stringy-bark, apple, and other inferior timbers were growing.
1861. Is it ridgy land or flat land? It is rising ground.
1862. What crops have you got? The last two or three years have been exceptionally bad, hot summers. I have grown no wheat on the land, although wheat-growing is the staple industry of this district. This year I could have had a very fair crop of corn, but, owing to the dryness of the summer, it did not germinate till too late, and I have had to cut it to feed the cows. I have had no crop from which I could tell you the yield of corn. I am certain that this ground can hardly be beaten for growing potatoes. I have grown "Early Rose" and other potatoes, and I know that potatoes of a better quality cannot be grown, though the yield is not heavy. I was advised, too, by the late Mr. Thompson, of the Agricultural Department, that the land I spoke of would be very good for fruit. It is a red, sandy loam. Roughly speaking, there are 1,000,000 acres of scrubby forest country between Coonabarabran and Narrabri, and it has been asked, why has it not been taken up? To that question my reply is that the conditions under which it has been offered have not been such as would allow anyone to take it up, though I am certain that a large area of it is quite as good as the land which I have been cultivating, and, with easy conditions, people could afford to clear the best of it. The cost of clearing and fencing large areas of this country would be proportionately less than I had to pay for a small area. I think those who take up this country should have practically no rent to pay for a number of years, and should not be compelled to forfeit the land when it became valuable.

1863. *Mr. Watson.*] Cannot people take the land up in improvement or settlement leases at very low rentals? The condition has been imposed that one-fourth, one-fifth, or one-sixth, should be cleared, and kept cleared, and people cannot afford to clear so much. It is bad enough to have to clear a large area of ground; but to keep it clear is still more difficult, because to do that it is necessary to keep it under cultivation for a number of years, since only in that way can you eradicate the red-gum scrub. If the public who wish to take up land were allowed to offer suggestions as to the way in which they should be permitted to take it up things would be better. It would pay the Government handsomely to let people have land such as I am speaking of, for a number of years for nothing, simply to get rid of the vermin which now live on it.

F. G. Failes,
M.R.C.S. Eng.
9 May, 1900.

1864. *Vice-Chairman.*] What would be a suitable area for a holding in the country you speak of? Five thousand or 10,000 acres. Such a block would include areas suitable for cultivation.

1865. Are artificial grasses grown in this district? Very little. Farming is in a most backward state here. I know that, because I come from Norfolk, one of the best agricultural districts in England. It only requires the stimulus of a good market, however, to bring about improvements. I believe that at the present time there is not such a thing as a drill in the district.

1866. There is an area of untenanted country shown on the map to exist within 15 miles north of Coonabarabran? That is all scrubby country.

1867. Is the country similar right on to Narrabri? I believe that it is.

1868. What is the character of the country going east towards Bomera? Between Coonabarabran and Bomera there is a lot of splendid agricultural land. There are 200,000 acres of Crown lands to be thrown open shortly, and that land is incomparably superior for agricultural purposes to the greater part of that which is now available for agriculture.

1869. Where is the land you speak of situated? Round about Bomera and Trinkey.

1870. Did you use any manure in the 8 acres which you cultivated for the hospital? Not so far, because I have only taken two crops off the land. There are large ironbark forests in most of the scrubby unused country near Coonabarabran, and the timber there is very good. I believe that Coonabarabran would be a great trucking place for stock, if the railway came here, and that stock from Queensland and from the Walgett district would come here to be trucked, though, if a line is taken from Narrabri to Walgett, that will cut off some of that traffic.

1871. If there were a railway to Coonabarabran would the settlers be able to send away small consignments of sheep frequently? Undoubtedly. It would pay small settlers well to fatten small lots of stock to send away; and I believe that, with cultivation, the poor country will be better adapted for that sort of farming than for any other. If the poor sandy ground is laid down in suitable grasses I believe that it can be used in that way.

1872. Has any land been thrown open in the district lately? Not much land has been thrown open lately, but what land has been available has been taken up at once.

1873. Could you offer any opinion upon the probability of an exchange of commodities between this district and those along the proposed line? We have always looked for our main market out towards Walgett and the North-west; but I do not see how it would be possible for us to send produce round by Werris Creek to those places in competition with growers who are more favourably situated.

1874. Was fodder sent from this district out to Walgett, or in that direction, during the last drought? I am sure that the Baradine people sent fodder out that way.

1875. How far is Baradine from here? Twenty-seven or 28 miles by road.

1876. Do you agree with other witnesses that the best connection you can get will be by a branch line from the proposed line? I do not quite fall in with the suggestion that a branch line should be brought into Coonabarabran alone. I think that such a line should be extended on to Baradine.

1877. You do not consider that a branch line from some other point on the existing line, say Mudgee or Muswellbrook, would be better? We have had our minds diverted from the Muswellbrook proposal because of the improbability of getting it, but for years I thought that that would be the best line to construct. I wish to emphasise the fact that I do not think it is everything to have a railway brought to one's doors. As a matter of fact, I believe that the best line we could get would be a line from Coonabarabran to Walgett, without any other connection, so that we could send all our produce out west. Coonabarabran is the most inland place in New South Wales which has an altitude of 2,000 feet, and for that reason I consider that our future traffic should be with the west. As a sanatorium for the people out west I believe that Coonabarabran would be second to none in the Colony, and we could grow fruit and other produce for them.

1878. Has fruit been tried to any extent in this district? Our last Police Magistrate, Mr. Edwards, had a most successful orchard. His successor tried canning the fruit, but he did not make a success of it, because of the distance it had to be sent away. One could not wish for better results than can be obtained from growing grapes here.

1879. Is any mining done within 20 miles of Coonabarabran? I do not think anything of importance has been done in mining. A very poor quality of coal has been discovered in the district, and it might improve at a lower depth.

George Edgar Wright, road superintendent, Coonabarabran, sworn, and examined:—

1880. *Mr. Watson.*] How long have you been here? Nearly seven years.

1881. What is the general trend of the traffic in this district? Until last year practically the whole of the traffic went to Mudgee, and thence to Sydney; but last year an enterprising firm of forwarding agents in Quirindi (Messrs. Dawson and Rogers) offered certain inducements which took about 250 tons of wool to Quirindi. Some of that wool was shipped at Newcastle for Sydney, and some for Melbourne. A considerable quantity of back traffic also came that way.

G. E. Wright.
9 May, 1900.

1882. Did the firm you speak of offer lower rates than had been charged before? Yes; they carried the wool more cheaply than it could have been carried into Mudgee.

1883. And the same with the back loading? Yes.

1884. Is that alternation of route likely to be permanent, or does it depend upon the seasons? It depends upon the seasons. During good seasons teamsters can go to Quirindi more easily than to Mudgee, because, although the road to Mudgee is a better road, it is fenced to such an extent that there is very little feed upon it, whereas the animals can get grass on the Quirindi road. Then, too, the Quirindi road is softer than the Mudgee road, and saves shoeing.

1885.

- G. E. Wright. 1885. Would the Quirindi road be available in a drooping season? Not without a considerable expenditure of money.
- 9 May, 1900. 1886. Do you think that the roads will be improved in a few years? Not at the ordinary rate of expenditure. We have done very little work between Coonabarabran and Bomera, a distance of 40 miles; we only spend £250 upon that road. Between Coonabarabran and Mundooran we spend nearly £1,000 a year, and from Mundooran to Mudgee there is a main road nearly the whole way.
1887. I understand that efforts have been made to obtain larger votes for the Quirindi road? Yes, last year.
1888. Unsuccessfully? Yes.
1889. On the ground that the traffic did not warrant an increase of expenditure? Yes.
1890. Which is the shortest road from Coonabarabran to Mudgee, that *via* Mundooran? No, *via* Merrygoen. Most of the traffic goes *via* Merrygoen when the river is down, which is nearly always; but when the river is up, the traffic goes through Mundooran, to take advantage of the bridge there.
1891. Coonabarabran is the centre of a number of districts? Yes; for the Baradine country, and for Borah for land work, though their wool goes to Gunnedah.
1892. What freights are charged for road carriage to Coonabarabran? Sometimes the charge is as low as 2s. a cwt., but at the present time it is 3s. or 3s. 3d. In the wool season the rates are lower than at other times, because of the back loading.
1893. That would apply either to the Mudgee or to the Quirindi road? Yes.
1894. Would the construction of the Dubbo-Coonamble line have any great effect on the trend of traffic from Coonabarabran, supposing that no other line is constructed? It should have. The Urawilkie wool went to Quirindi last year. That place is 60 miles from here, and before that they sent their wool to Mudgee. As, however, they are within 30 miles of Coonamble, they will send their wool to the Coonamble line when that line is completed. The Baradine traffic will, I think, come this way, and the Tooraweenah traffic will go to Mudgee, although Tooraweenah is within 35 miles of Gilgandra. The light traffic in this district and the passenger traffic goes to Gunnedah—the only heavy traffic that way being a van, which plies fortnightly.
1895. If a line were constructed from Wellington to Werris Creek, going through Merrygoen, and a little south of Binnaway, would it or the Coonamble line get the Tooraweenah traffic? The Werris Creek line, because of the saving in trackage. Such a line would take almost the whole of the traffic in this district.
1896. What is the distance from Mudgee to Coonabarabran? One hundred and ten miles by way of Gulgong and Merrygoen.
1897. And from Quirindi, *via* Bomera, to Coonabarabran? About 100 miles.
1898. And from Werris Creek? A little less.
1899. How far is it from Coonabarabran to Gunnedah? Sixty-five miles.
1900. Is the road there worse than other roads? It is not a very bad road, but it is a road that people will not use.
1901. How far south does your district extend? To Merrygoen.
1902. How far does it go in the direction of Coolah? To Coolah and on to Cassilis.
1903. What money do you spend on those roads? £450 on the road to Coolah, and £75 on the road to Cassilis.
1904. What do you spend on the road to Quirindi? £250 on the 40 miles between here and Bomera. A road will have to be made between Coonabarabran and Tambar Springs for the convenience of the settlement which we expect will take place there; but, so far, the traffic has not been sufficient to warrant an expenditure. There are between 200 and 250 miles of scrubby country between Coonabarabran and Narrabri which is now held under annual lease; but in times of drought that country is rushed by starving stock, and, at the present time, there must be 20,000 sheep depasturing on it. For close settlement that country is quite out of the question, and the timber there is not very good.
1905. Do you mean that the timber is not good immediately around Coonabarabran? Yes. We have great difficulty in getting a 30-foot stick. We are building a bridge now, and the timber-getters will have to go out 10 or 15 miles to get a 35-foot stick. They may get it nearer, but there is really no good timber within 20 miles of Coonabarabran.
1906. The good timber grows out towards Narrabri? Yes; there is really good timber out in that direction.

Alexander Deans, butcher, Coonabarabran, sworn, and examined:—

- A. Deans. 1907. *Mr. McFarlane.*] Have you long been a resident of this district? Thirty-three years.
- 9 May, 1900. 1908. Do you consider it good country for pastoral purposes? No, not generally.
1909. Is it good fattening country? No.
1910. Is it country which will carry stock for breeding purposes? Yes, it is very good breeding country for either sheep or cattle.
1911. Is it profitable country on which to keep sheep? Parts of it are; but a great deal of it is not of much use.
1912. In which direction does the bad country lie? North, towards Narrabri.
1913. How would you compare the country between Binnaway and Coonabarabran with the surrounding district? It is better than the land out towards Narrabri; but it is inferior to the land west and east of Coonabarabran.
1914. Do you buy fat stock to any large extent? Yes; but I buy very few in this district.
1915. Where do you get your fat stock? Chiefly in the Coonamble district.
1916. Both sheep and cattle? I often get stock from the country to the east of Coonabarabran, about 8 miles from here.
1917. Would the heavily-timbered country carry stock if it were ringbarked and cleared? The more you ringbarked the country to the north the quicker the suckers grow; but, east and south, in the box country, ringbarking makes a great deal of difference.
1918. Taking a belt 30 or 40 miles wide, how would the country between Werris Creek and Wellington compare with the country in the neighbourhood of Coonabarabran? It is about the same as the country to the east, though there are a few patches that are not so good. From Ulimabri to a point 8 miles east from Coonabarabran there is no better land.
- 1919.

1919. Would that land carry a fair population if it were given railway facilities? Yes; every 600 or 700 acres would support a family.
1920. If used for agricultural and grazing? If used for agriculture.
1921. What crops would the land be most suitable for, wheat or maize? Wheat.
1922. If the proposed railway from Werris Creek to Wellington were constructed, would it be of any practical benefit to Coonabarabran? Yes, it would do it a great deal of good.
1923. Would it be sufficiently near to Coonabarabran to enable the people here to take advantage of it? I think so.
1924. It has been stated to-day that it would not be of material advantage to Coonabarabran unless a branch line were constructed to the town? It is my opinion that a branch line should be made to Coonabarabran from some point on the proposed line.
1925. What is the country like between Curlewis and Gilgandra? It is fair country. From Curlewis to Tambar Springs the country is good. From Tambar Springs to the range at Blantyre or Fancy Ground there is fair country, and from the range to Binnaway the country is inferior. Then from Binnaway, for a distance of 20 miles south-west, the country is good. That brings you to Bearbong, and from there to Gilgandra it is medium, iron-bark country.
1926. Which would suit Coonabarabran better, the proposed line or line from Curlewis to Gilgandra? The proposed line.
1927. The distance from Coonabarabran to the Curlewis-Gilgandra line would be only 18 miles? Yes; but that line would take us further up on the Northern line than Werris Creek, and much further west than Wellington.
1928. Do stock travel to this district in seasons of drought? Yes; a great number come here.
1929. Where do the surplus stock go from this district? They go west and north-west to the Coonamble and Walgett districts as stores.
1930. Are they bought up by the people there, or are they sent there to get a bigger market? The people of those districts come here and buy them, and take them away. People also come here for stock from the New England district.
1931. If the proposed railway were constructed, would the stock be sent by train from this district to any part of the New England district? In time of drought it would be easiest to use the line. During the last drought stock going from this district to New England were compelled to go very nearly to Coolah, and then back through Tambar Springs, and in towards Quirindi, to get there, there being no water on the Gunnedah-road. I think it would have been much better for them if they had been able to use the railway.
1932. Do the stock going in that direction number a great many? I think so.
1933. Where would most stock go to, to the New England district, or to the north-west district? I think to the New England district. I know that thousands of sheep have been brought down Coonamble way, and have come through this way to New England.
1934. Do the stock in this district suffer much in times of drought? No.
1935. The district is well watered and well grassed? Yes.
1936. Do stock come to this district from other districts where there is not sufficient grass? Last year every available acre was taken up.
1937. Did sheep come here from other districts then? Yes; they came here from the Walgett district; some of the witnesses have stated that we cannot get rid of our surplus wheat; but I find that the local market will take all the pigs that I can raise, though it is too far to drive pigs to the railway station. If there were a railway close at hand, the farmers could get rid of their surplus wheat very easily by raising pigs.
1938. Would that be profitable? I am certain that it would.
1939. Would it be as profitable as sending wheat direct to market? More profitable, I think. I notice that in Sydney a pig about 8 months old seems to fetch as big a price as anything else of the same age, and an animal of that age does not require very much wheat. I sell a good many pigs to the farmers here, and I find that suckers taken away about Christmas time weigh from 150 lb. to 2 cwt. at 8 months of age, and I know that they get nothing but pumpkins and wheat. It seems to me that the profit on pork would be greater than that on anything else, even sheep-breeding.
1940. Do you do much business through Mudgee? No.
1941. It has been suggested that a line from Mudgee to this district would meet the requirements of Coonabarabran? Such a line would serve us as far as the Sydney market is concerned.
1942. How would it serve the country generally as compared with either the proposed line, or a line from Curlewis to Gilgandra? I think that the proposed line should be made, because that would suit all parties. It would suit the Cobborah country, the Westalibah country, the Oakey Creek country, and the Tambar Springs country.

John Henderson, grazier, Ullman, sworn, and examined:—

1943. *Mr. Shepherd.*] What is the size of your holding? 75,000 acres, all told.
1944. How far is that from here? My country comes within 15 miles of Coonabarabran.
1945. In what direction does it lie? East, along the Quirindi-road.
1946. What stock are you running? Sheep, principally, and a few cattle as well.
1947. What number of sheep have you? Nearly 28,000 at the present time.
1948. And what number of cattle? Two hundred.
1949. Are you cultivating any of your land? Only for hay, for winter feed for my working horses; but if the railway were made I should cultivate more. I should endeavour in that event to cultivate on the share system.
1950. How much of your holding is suitable for agriculture? Fully a half.
1951. *Mr. Watson.*] Do you mean of half your secured land, or half of the 75,000 acres? Half of the secured land.
1952. *Mr. Shepherd.*] How much of the land is secured? 23,000 acres.
1953. What has been return per acre from the land that you have cultivated? I have never cultivated wheat for grain; but I have got about 1½ tons of hay to the acre. I also grow a little lucerne.
1954. How does the lucerne grow? It grows very well; I cut it three times during the last two seasons, and they were as dry as any I have experienced in the district.

J. Henderson.
9 May, 1900.

- J. Henderson. 1955. I suppose the land on which you grow lucerne is pretty flat? Yes. I am trying to grow it on a ridge now, but I do not know how it will succeed there.
- 9, May, 1900. 1956. Have you a river or a permanent creek? There is a small creek, and there are a few permanent water-holes in it.
1957. Is the flat upon which you are growing lucerne much above the creek? No; only a few feet above it. Part of the land may be subject to floods, though I have never seen it flooded.
1958. How long have you occupied your run? Nearly twelve years.
1959. What weight of wool do you get per fleece? From $5\frac{1}{2}$ to $7\frac{1}{4}$ lb.
1960. What kind of sheep do you run? Merinoes principally, and we have a few crossbreds.
1961. Are you able to send any large number of fat sheep to market? I have not been sending many in the past; I have to look forward to cultivating and to improving before doing much of that sort of thing.
1962. Do you consider the run fully stocked? It is fairly stocked at the present time, considering the seasons. The surplus stock is disposed of as store stock, as a rule.
1963. Which is your nearest railway station? Quirindi.
1964. How far are you from there? Seventy miles. We sometimes dispose of small lots of fat stock; but it is not worth sending away a small lot.
1965. It would pay you to send away small lots if you had a railway within easy distance? Yes.
1966. In what way would the proposed railway benefit you if it were constructed? By helping me to get rid of my sheep and my wool, and to take away farm produce. I was a heavy sufferer last year by not being able to get my wheat away in time.
1967. How far would you be from the proposed line? It touches my land on one side; but the homestead would be about 15 miles away from the line.
1968. Is yours heavily-timbered land? The timber is not very heavy; but there is a good deal of it.
1969. What description of timber is there? Box, iron-bark, apple, and a little pine.
1970. Have you a fairly good rainfall? Yes; during the twelve years that I lived there the lowest rainfall was $12\frac{1}{4}$ inches, and last year we got only 14.66 inches. The average, however, is somewhere between 24 and 26 inches.
1971. Is the timber on the run valuable? There is a little good pine; but I do not think the iron-bark is very good.
1972. We could not reckon upon the timber being of much value to the railway? Not to any extent.
1973. Have starving stock been depastured upon your holding in dry seasons? No; but I have not had to reduce my stock in such seasons.
1974. I suppose you can run about a sheep to 2 acres? Yes; though I consider that the freehold land will carry more, because it has nearly all been ringbarked.
1975. Has not the leased land been improved? Not to the same extent. For one thing, there is hardly any water on it.
1976. Its carrying capacity would be increased if you had it improved? Yes.
1977. What do you consider the difference between improved and unimproved country? Improved country will carry twice as many stock as unimproved country, and probably a little more. Of course, there is timber that only gets worse if you ringbark it.
1978. When does your lease expire? It is practically up now.
1979. Do you think that the land, when it becomes available for selection, will be readily taken up? Yes; if a railway is made, and in any case if it is thrown open in fair-sized areas.
1980. In what way would the proposed railway benefit you? It would benefit the country all along the route, and there would be more farming done, more labour employed, and more money spent in the district if it were made.
1981. What is the general opinion of the people in the district as to the probability of the proposed railway becoming self-supporting within a reasonable time? I think the general opinion is that the railway would be self-supporting before it had been running many years, because of the extent to which it would develop the district.
1982. Are you confident that it would pay within a few years? I think that it would; though, of course, if the price of wheat became so low that farmers did not care to grow it, that would tell against the railway.
1983. Do you think that settlers who would be benefited by the construction of the line would be willing to contribute towards a fund to make up part of any deficiency? I do not think they would contribute enough to make up £18,000 a year.
1984. If you saved half of what it now costs you to send produce away, could you not afford to make such a contribution? I think that personally I should be agreeable to contribute; but I cannot say what the people generally think about it.
1985. The contributions would be reduced as the traffic increased and the line became self-supporting? Yes; I do not think it would be unfair.
1986. You would gain by the saving in rates? Yes; and by prompt delivery.
1987. Have you tried fruit-growing on your holding? Only on a small scale; but the district is a splendid one for fruit. The poorest land will grow fruit, and I know land on which trees which have not been attended to for the last twelve years are producing good crops.
1988. *Mr. Watson.*] A tax of 1d. per acre on the alienated land through which the line passes would produce about £5,000 per annum;—do you think that that would be too large a contribution to ask towards making good any deficiency? I do not think it would; but I doubt if my neighbours would take the same view of it, though some arrangement of the kind would be fair enough.

Nelson John Proctor, grazier, Coonabarabran, sworn, and examined:—

- N. J. Proctor. 1889. *Vice-Chairman.*] I understand that you know the country between here and Baradine, and round about Baradine;—will you kindly describe that country? For the first 8 miles from Coonabarabran the country is poor and mountainous, with rocky hills and steep gorges. Then it begins to improve.
- May, 1900. 1990. Do you get on to low land then? Yes; you are going down hill for 4 miles after rising 4 miles from Coonabarabran. You are descending until you get to the Yarrenden Creek.
1991. Does the good country continue from there on to Baradine? Yes; though there are patches of inferior country to the right of the road. 1992.

1992. And what is the country like around Baradine, to the north-west and the east? It is all flat country. N. J. Proctor.

1993. Is it suitable for agriculture? It is more suitable for agriculture than for anything else.

9 May, 1900.

1994. Can you compare it with the country in any other part of the western district? I have been through the Narramine district, which is a large farming district, and I think that the country I am describing is very similar to that. Some of it is very superior country, but some of it, which is scrubby, is not suitable for grazing.

1995. Is the rainfall there as good as that in the Narramine district? I think it is better. During the six years that I have been living there the average has been a little over 20 inches.

1996. Have agricultural operations there been retarded by reason of the distance from a railway? Yes.

1997. I suppose there has been some agriculture? There are some 500 acres now under cultivation within 15 miles of Baradine, and the average yield is from 16 to 20 bushels to the acre. Last year was an exceptionally bad year, and the yield was not then so high. A late frost blighted the wheat when it was fairly grown.

1998. Would the construction of the proposed railway stimulate agriculture in the Baradine district? Very little, unless there is a branch line.

1999. How far do you think the branch line should extend? Right out to Baradine; you get into good country there, and there would be about 10,000 acres of land available for cultivation.

2000. Do you think there is a sufficiently large area of good land around Baradine to justify the construction of a branch line? I think so, with the pastoral assistance which would be given to such a line.

2001. How far is Baradine from Coonamble? Forty-four miles.

2002. It would be 55 miles from the proposed line? Yes.

2003. To which line would the traffic go? I think that agriculture will die out in the district altogether unless a railway is brought nearer to it. The present market for the district is Coonamble, Walgett, and Pilliga; but when the railway goes to Coonamble we shall be unable to compete with the Narramine farmers.

2004. If a branch line were taken as far as Coonabarabran, what would be the position of the Baradine people? Much better.

2005. They would have a minimum distance of 27 miles to draw their produce then? Yes.

2006. Would a line from Curlewis to Gilgandra have any more effect upon the Baradine district than the proposed line would have? It would not suit the district so well, because it would make our railway haulage greater.

2007. Would an extension from some point on the existing line serve Coonabarabran and Baradine better? Not better than a branch line from the proposed railway. At Baradine they are just tapping one of the finest iron-bark forests in New South Wales.

2008. Does the forest extend right up to Narrabri? Yes. The timber reserve runs right into the township of Baradine. The people on the other side of Baradine have a market for their hay and chaff on the Namoi; but when the Narrabri-Walgett, and the Dubbo-Coonamble lines are made they will have no outlet at all.

2009. They will then be in the same position as Coonabarabran? In a worse position.

2010. What are the general rates of carriage inwards and outwards from Baradine? As a rule, it costs us from 4s. to 4s. 6d. per cwt. to bring goods from Mudgee or Quirindi, while for our wool we pay from £3 10s. to £3 12s. 6d. a ton.

2011. Is the country out in that district good pastoral country? Some of it is very good.

2012. What is the average capacity of the land now held under pastoral occupation? The only station property near there is Goorianawa, which is good plain country. The town of Baradine is practically on the resumed area of Goorianawa.

2013. Are there many small settlers in the district? Yes.

2014. What is the average size of their holdings? As a rule, 2,560 acres. Some of their holdings carry a sheep to the acre, and did so during the whole of the last drought. The country which is suitable for agriculture is not pastoral country.

2015. What would be a fair size for an agricultural holding? With a railway, I think a man would do very well on 2,560 acres, if he combined agriculture and grazing.

Edmund May-Steers, Inspector of Stock, Coonabarabran, sworn, and examined:—

2016. *Mr. Watson.*] How long have you been here? Ten years.

E. May-Steers.

2017. Have you held your present position all the time? Yes.

2018. Is the district a sound stock district? Yes.

9 May, 1900.

2019. Is it suitable for fattening, or chiefly for carrying stores? Chiefly for carrying stores.

2020. And for breeding? Yes.

2021. What are the boundaries of your district? From Baradine to Gulargambone; thence to the junction of the Merrygoen Creek; from there to Leadville, and on to Coolah; and then across the mountains to the Tamarang Range; and thence on to Mullaley, and back to Baradine.

2022. Then the district extends out about 45 miles in every direction from Coonabarabran? Yes, on the average. On the 31st December, 1899, there were 840,000 sheep, and 18,000 large cattle in the district.

2023. I suppose part of the district suffered from drought during the last few years? It has suffered very slightly.

2024. I suppose they have suffered out towards Gulargambone? The drought has been bad there, but not so bad as in other places. There have been no losses of stock through the drought.

2025. How did stock round about Coonabarabran fare during the recent dry seasons? This year is the worst year they have had since I have been in the district.

2026. Have there been any large losses this year? I do not think there have been any losses yet; but there is a possibility of loss if the rain does not soon come.

2027. Generally speaking, this district has escaped the drought which has affected other districts? Yes; and when they have had droughts in other parts, sheep have come here for agistment.

2028. What has been the trend of the stock traffic through the district;—has it been towards New England? Yes; store stock have gone in that direction. The back country people send their stock through

- E. May-Steers. through here for grass to New England; and the New England people come to this district to buy sheep to stock up with.
9. May, 1900. 2029. Where is the store stock mostly fattened—in New England, or on the Liverpool Plains? On the Liverpool Plains.
2030. Would the proposed line be used to any extent for cross-country traffic? Not to a great extent. The country through which it passes is practically always good, and owners will not truck store sheep if they can travel them.
2031. Does much fat stock go through the district, on its way to Muswellbrook or the Northern line? Yes. It goes chiefly to Aberdeen or to Flemington.
2032. Where does it come from? From the Pilliga, Walgett, and Coonamble districts.
2033. That stock would not use the proposed line to any extent? No.
2034. It would be much better for the holders in the north-western district, if they wished to use the railway, to drive in towards Narrabri? Yes.
2035. They would not drive half way and truck the rest? No. Some of the stock-owners in the Narrabri district drive right through to Mudgee and Rylstone in good seasons to truck to Flemington.
2036. Towards Werris Creek the line would probably be used for the conveyance of fat stock? The people close to the line would use it.
2037. Where does the fattening country commence, going towards Werris Creek? It starts about Rockgedgiel.
2038. Then it is likely that the 50 miles of line at the Werris Creek end would be used for the conveyance of fat stock? I believe so, though I do not know that part of the country well.
2039. Would a line from Curlewis to Gilgandra be more largely used for stock traffic than a line from Wellington to Werris Creek? Only in bad seasons.
2040. It might be used, then, for moving starving stock? Yes.
2041. Otherwise you do not think there would be much difference? No; I think that the people who fatten stock would cross that line to go on to Mudgee.
2042. It has been suggested that the Mudgee line might be extended out towards Merrygoen;—do you think that such a line will attract more fat stock? Not to any large extent: not so much as if the line were taken right out to Coonabarabran.
2043. Why should people truck stock at Coonabarabran rather than at Narrabri—that is, stock coming from the north-west? I think the distance would be less from Narrabri. Then, too, drovers could hold back their stock at Coonabarabran and keep it on the Crown lands, trucking it when they liked.

John Taylor, farmer and carrier, sworn, and examined:—

- J. Taylor. 2014. *Mr. Shepherd.*] How far is your place from Coonabarabran? Three miles.
- 9 May, 1900. 2045. What is the extent of it? I have purchased 45 acres; but I also hold land for grazing purposes under annual lease.
2046. How much land have you under annual lease? 640 acres.
2047. How long have you been residing here? Since 1859.
2048. I suppose that as a carrier you have a thorough knowledge of the country? A pretty good knowledge. We bought our present place in April, 1860. There was no farming then; but people grew a little wheat for their own use, and ground it themselves. Afterwards we began to take our wheat to Mudgee, and to bring back the flour.
2049. Where is your principal market now? My principal market is at Coonabarabran.
2050. Are you acquainted with the country between Wellington and Werris Creek? With part of it; but I do not know the route right through from one end to the other.
2051. Will you describe the country so far as you know it, within 15 miles of the proposed line? From Werris Creek coming this way the country is good for the first 50 miles; good grazing and good agricultural country.
2052. On both sides of the line? Yes, most of it.
2053. Is it good for agriculture chiefly? Some of it is good for agriculture, and some for grazing.
2054. Roughly speaking, what would the proportions be? About one-third would be fit for agriculture, and the rest would be good grazing country.
2055. What is the character of the next 40 miles of country? About a fourth of it would be fit for agriculture. Some of it is very good land; but other parts are only second or third class land. The balance varies from good or fair pastoral country to poor country.
2056. The first 50 miles are better than the next 40? Yes. Then on towards Wellington the land improves.
2057. What proportion of it is fit for cultivation? About half.
2058. Have you done any farming yourself? I have been farming for nearly thirty years.
2059. All about this neighbourhood? Yes, in this neighbourhood.
2060. What has been the result? With the exception of one season I have always got a crop. That was in 1877.
2061. What is your average yield? From 16 to 20 bushels to the acre. Last year the average yield was about 18 bushels.
2062. Have you always grown wheat? I have grown oats and corn. I have obtained as many as 50 bushels of corn to the acre.
2063. And how much hay? As many as 2 tons to the acre; but that was an exceptionally good crop. An average crop is about a ton to the acre.
2064. In what way would the district benefit by the construction of the proposed line? The country out from Coonabarabran would not benefit by the construction of the proposed line unless a branch line were brought to Coonabarabran itself. The town is situated in the most barren part of the district, and the best land lies to the east and west of it, while there is good land to the south, and some to the north, which, if the produce could be sent away, could be brought into use. The country to the north is very sandy; but there are many patches of 300 or 400 acres which would grow wheat, corn, and other crops.
2065. The cost of carting produce to the railway station now prevents people from farming? Yes, that and the low price combined. I have wheat at the present time which I am using and selling for horse-feed.
- 2066.

2066. What is the freight to the nearest market? I think it would cost about 1s. a bushel to send wheat to the railway. The only way in which our farmers can make anything is by taking flour out west; but there are so many of them doing that now that they have a job in getting buyers.
2067. Is the land sufficiently good to enable you to compete successfully with growers in other districts? Yes; if we had railway facilities.
2068. What is the cost of road-carriage on goods per ton? From Gunnedah, about 3s. a cwt.; and from Mudgee, from 3s. 6d. to 4s. a cwt.; but I think it is cheapest to bring things through Quirindi, because of the saving in railway freight.
2069. Do the people in the district seem inclined to go in for cultivation? A great many of them would go in partly for cultivation and partly for crops if there were a railway. Those who carry sheep and farm a little do better than those who only farm, because they are able to use their poorer land, which otherwise they could not use for grazing.
2070. What would be a sufficiently large holding for a mixed farm? I think nothing less than about 640 acres; that would be a small holding.
2071. A good hardworking man could make a fair living on that area? Yes; if he had facilities for getting rid of his produce.
2072. At what distance from a railway could a man farm successfully? At not more than 20 miles.
2073. That would take him two days to deliver his produce? Yes; a day in and a day out.
2074. As a rule do the small settlers live entirely on their holdings, or do they exist by taking contracts? Those who have very small holdings take contracts, and when they cannot get any work to do they use their time in improving their land. I have only 45 acres, and I manage to make a living, but it is chiefly by working elsewhere.
2075. Are the settlers pretty prosperous where they are near a railway? Settlers near a railway are more comfortable than those further off, because they can turn their produce into ready money without loss of time. When we grow hay or wheat we have often to keep it six months before we can turn it into money.
2076. Do the settlers in this district live pretty comfortably? Yes; where they keep cows. I favour the proposed route more than any other, because I hope that at some time we may get a branch line from it to Coonabarabran. The Curlewis-Gilgandra line would not serve the country at all. At Werris Creek you are right on the Northern line; but at Curlewis you are a long way from it.
2077. Would the proposed line be largely used for moving starving stock in bad seasons? Yes; but we may not have bad seasons for a long time. I think, however, that the proposed line would get a good share of the stock traffic whether the seasons were good or bad; and there might be a good deal of timber traffic.
2078. Is there a good supply of timber? Yes; out to the north and north-west.

J. Taylor.
9 May, 1900.

Thomas Deans, farmer and grazier, Coonabarabran, sworn, and examined:—

2079. *Mr. McFarlane.*] I understand that you are an old resident of the district? I settled here in 1863.
2080. Have you been residing here ever since? Yes; within 25 miles of the town.
2081. Have you a good general knowledge of the district and its capabilities? I have a fair knowledge of it.
2082. Have you had any experience of other districts? I lived near Hartley for seven years.
2083. Is the land in this district good agricultural land? Some of it is very good, though some of it is inferior. In places you might get 400 or 500 acres of good land, and in other places only 30 or 40 acres.
2084. Where it is not suitable for agriculture, it is suitable for grazing? Yes.
2085. In all cases? Yes.
2086. Do you endorse what has been said about the proportion of grazing and agricultural land? Yes; I endorse what evidence I have heard.
2087. Do you think that the construction of the proposed railway will benefit this part of the district? I consider that it would benefit a great deal of it. I have had a good deal of experience in bringing goods into the district during the last five or six years, and I prefer to bring them from Quirindi.
2088. Do you think that the proposed line would be better than a line from Curlewis to Gilgandra? Yes.
2089. If a line were constructed from Wellington to Werris Creek or Dubbo, would it induce a number of people to settle in the district? I think so; though I do not know much about the land between Cobbarah and Wellington.
2090. Do you know the Werris Creek country? Yes; it is very good country.
2091. Do you think the Coonabarabran district would be too far from the proposed line to allow farmers to make use of it? I do not think so.
2092. In what direction is your holding from Coonabarabran? It is 8 miles from the town, in an easterly direction.
2093. Do you think that you could farm profitably if the proposed railway were constructed? Yes; and I would send my produce, stock, and wool to the railway.
2094. Do you grow wheat? I grow all sorts of things, including peas and pumpkins.
2095. Do you think various crops could be successfully grown in the district generally? I think so; and they might be used for fattening stock. Pumpkins, for instance, might be used in that way.
2096. Have you found farming profitable? Yes.
2097. Do you grow much wheat? I have about 70 acres under wheat.
2098. What is your average yield per acre? In a fair average season, from 18 to 20 bushels to the acre. I have received as much as 30 bushels to the acre, and my lowest yield has been 15 bushels.
2099. *Mr. Shepherd.*] What vegetables do you grow? Peas and pumpkins; and I also grow corn, wheat, barley, and potatoes. I grow pumpkins for my milking cows.
2100. Have you grown turnips? No; I cannot grow them.
2101. What has been the average yield of your various crops? I have had from 15 to 20 bushels of peas to the acre, and, in good seasons, from 15 to 20 tons of pumpkins to the acre, while in other seasons I have not got a ton.
2102. Do you grow fruit? I have some fruit-trees, but they are not in a good position, they are down on the banks of the river, and the frost kills the fruit.

T. Deans.
9 May, 1900.

- T. Deans. 2103. *Vice-Chairman.*] What are the general rates of freight on your store goods? I pay £4 16s. 9d. a ton to bring goods from Sydney to my place. Of that amount £2 is paid to the teamster, 2s. 6d. is commission, and the balance is steamer freight from Sydney to Morpeth, and rail from there to Quirindi.
- 9 May, 1900. 2104. By what other route do you get goods? I also get goods from Mudgee. The road carriage from Mudgee would cost £3. I have got a few things from Gunnedah, but that road is too expensive.
2105. Are the rates dearer now? Yes. I have to pay £3 now to bring things from Quirindi, whereas I used only to pay £2. As a rule, the Mudgee carriers have to feed their animals, while the Quirindi carriers can depend upon the grass and kurrajong trees along the road.

THURSDAY, 10 MAY, 1900.

[The Committee met at Mr. McMaster's residence, "Morven," at 8 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVYEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

James Mair Alison, grazier, Oakey Creek, made an affirmation, and was examined:—

- J. M. Alison. 2106. *Vice-Chairman.*] How is Oakey Creek situated with respect to the proposed railway? It is about 75 miles from Werris Creek and 102 miles from Dubbo.
- 10 May, 1900. 2107. What is the extent of your holding? Between 30,000 acres and 40,000 acres.
2108. Would much of the land on Oakey Creek be suitable for agriculture if there were a railway near to it? No; we have had a great deal of trouble in growing enough hay to feed our own horses.
2109. What has the trouble been due to? To the want of rain at the proper season.
2110. As a rule rain does not fall at such times as would render agriculture profitable in the district around Oakey Creek? In the little paddock which we have, we only get a good crop of hay about once in three years.
2111. What is the country like to the east and to the west of your holdings? The country between here and Merrygoen is bad—mostly iron-bark scrub. It is very bad pastoral country.
2112. Do you think it has any agricultural possibilities? I do not think the sandy country is good for anything. It cannot last long without manure. From here to Mundooran the country is very bad.
2113. Would the construction of the proposed line confer much benefit upon the pastoralists along the route by giving them a more speedy and certain means of conveyance? The wool that goes from Weetalibah goes straight to Mudgee now by road, and, of course, the proposed railway would take it away more quickly, but I do not think it would take it away more cheaply. From here to Mudgee is 90 miles, and from Mudgee to Sydney is 190 miles. From here to Dubbo, however, is 100 miles, and from Dubbo to Sydney is nearly 300 miles, a much greater distance; so that I think no one could afford to send round by way of Dubbo.
2114. One reason which has been urged in support of the line is that "it would afford facilities for speedier intercommunication between the Northern, Southern, and Western main trunk lines, and will, therefore, tend to create increased traffic;"—what products are likely to be interchanged between the North and North-western and the Western and Southern lines, if the proposed railway be constructed? I do not see how there can be any interchange at all.
2115. The distance to Sydney from Morven, *via* Mudgee, is 280 miles, and *via* Wellington 328 miles, a difference of 40 miles in favour of the Mudgee route? Yes, and there would be another 40 miles in favour of the Mudgee route on the way back.
2116. It has been urged that the proposed railway might be used for the transport of starving stock to the New England country? When the proposed line was first mooted Sir John Robertson had the idea that the starving stock on the Macquarie could be sent to New England and Liverpool Plains country, which at that time was all cattle country; but now the New England country has all been fenced in, and has been drained, and what land is not used by the stockowners there is taken up by the large flocks of starving sheep which come from the Moree district. Country which formerly used to produce foot-rot has been so much improved by drainage that it is now often overstocked, so that last year hundreds of sheep died round about Moree, because they could not be received in the New England country, and the Moree district is nearer to New England than this district.
2117. Would many consignments of fat stock be sent along the proposed line to Sydney? I do not think so. You could not take stock around by Dubbo and Wellington to Sydney, because it would be too expensive. The stock from this district would all go to Mudgee.
2118. They carry fat stock from Bourke to Sydney? Sometimes; but at Bourke they have no choice in the matter, though they find the carriage very expensive. Fat stock come to Bourke from Queensland.
2119. As a rule, where are fat stock sent from this district? Very often to Quirindi; but I think that most of them go to Mudgee.
2120. You do not think that the construction of the proposed line would alter the trend of the traffic? I am sure that it would not.
2121. Apart from its military value, am I right in concluding that you see little or no advantage in the construction of the proposed line? I cannot see that it would do any good. The country will have to pay for it, and there will be no traffic on it.
2122. It has been suggested in connection with this and other lines that the landholders of this district should make an annual contribution towards the reduction of any loss on working. Could you afford to make such a contribution? I should not like to make any promise on the subject.
2123. Could a landholder afford to pay as much as he now pays in land-tax for such a purpose? I should not like to pay another land-tax, and I do not think other landholders would.
2124. Can you suggest any other line which would serve this district better than that proposed? I think that a line out from Mudgee would be the best.
- 2125.

2125. For what reason would you urge the construction of that line? For every reason.
2126. Would it open up better country? It would go through good country. There is no better farming country in the Colony than that between Mudgee and Redbank.
2127. Do you think that such a line would serve the country better than the proposed line? Yes; except that the proposed line might be of advantage for military purposes, though, I think, that a line from Muswellbrook through Cassilis, and Redbank to Mudgee, would do as well for the transport of troops, and such a line would bring us closer to Sydney.
2128. *Mr. Watson.*] If a line were constructed from Mudgee to Redbank, where could it be taken afterwards, if it were thought advisable to extend it? It could be taken straight out. There is a loss of £18,000 or £20,000 a year on the Mudgee line now; but if that line were taken on to Coonamble the loss would disappear.
2129. A line has been sanctioned from Dubbo to Coonamble: that being so, which would be the best direction to extend the Mudgee line from Redbank? Through Redbank, and then on in a direction which would keep Coonabarabran about 30 miles to the east.
2130. Is not the country west of Coonabarabran rather rough? It is good healthy country, and farmers would do well there with 2,000 acres or 3,000 acres, and by keeping a few sheep.
2131. But would not the line be an expensive one to make after it got past Merrygoen? What does it matter what the expense is, if you have produce to carry on it.
2132. However, in the meantime, you suggest that a line should be taken from Mudgee as far as Redbank? Yes; that would go through the best of the country.
2133. *Mr. Shepherd.*] What sort of country is there along the route of the proposed line? There is a very narrow strip of good country between Wellington and Cobborah; but, after that, the country which the proposed line will go through is as bad as it can be.
2134. What would be the width of the strip of good country that you speak of? That strip of country is not very wide. In the olden times they always kept out of the bad country. From Wellington to Cobborah is nice farming country; but the good country is very narrow.
2135. From Cobborah coming this way what is the country like? There are a good many good patches going through Mundooran; but generally the country is not good. There is not much agricultural country there.
2136. What would be the carrying capacity of most of the land so far as you know it? It is not very great. Besides, that country is grass-seed country, and you cannot lamb good sheep on it.
2137. Do you think that if the proposed railway were constructed people would be encouraged to settle on the land as agriculturists? I think that if you took a railway anywhere some people would settle upon the land through which it went; but the question always arises: Is there not better land to go through.
2138. Do you think that the construction of a railway would increase the traffic of the district to such an extent as to wipe out a deficiency of £18,000 a year? I do not.
2139. You do not think it is desirable to construct the proposed line? I do not. Where is the passenger traffic to come from. There is no population in the district. I think that before a line is constructed there should be a population to be served by it; and I am sure that if the proposed line is made it will be a national loss. In Melbourne they have seen the folly of constructing lines that will not pay.
2140. *Vice-Chairman.*] With regard to the stock traffic from other districts to New England, what has been the history of that traffic, so far as this district has been concerned? We have had to remove our sheep only once in thirty years. The stock which has been taken to New England in such numbers was taken there to stock up the country after it had been depleted by a drought. They were sent there by Mr. Green and other people from districts to the south of us, and some 200,000 sheep went there. That was about three years ago. Of course, small flocks of sheep have gone to the district at other times through this district.
2141. Could a considerable number of sheep have passed through this district without your knowledge? I do not think so. The New England holders have often to buy sheep. In some parts of New England they cannot lamb sheep, and they have to come and buy our store wethers. They take two or three fleeces off the sheep that they buy, and then they send them away to be fattened; but that traffic is not considerable. We buy their store wethers to fatten down here.
2142. Would that traffic increase with the construction of the proposed railway? The construction of the proposed railway would not alter it a bit. It hurts sheep more to send them 100 miles by train than to drive them that distance, unless, of course, the season is very dry.

John McMaster, grazier, Binnia, sworn, and examined:—

2143. *Mr. McFarlane.*] Have you a good general knowledge of the district through which the proposed line would pass? I know the country in the immediate vicinity of Morven and on towards the Northern line; but I do not know the country towards Wellington.
2144. How would you class the land within 20 miles of the proposed line? From here on to Werris Creek there is a great deal of good agricultural land.
2145. Is the balance of the land suitable for pastoral purposes? Yes.
2146. Is the pastoral industry a profitable one in this district? Yes.
2147. Is the country good fattening country? Yes; it is both good fattening country and good wool-growing country.
2148. Is it suitable for both cattle and sheep? Yes.
2149. Is much of the land between here and Werris Creek occupied by agriculturists? Yes, a fair quantity.
2150. Principally at the Werris Creek end? Yes, and I think that the area under cultivation is being extended.
2151. Is there much land in the leasehold areas which are shortly to be thrown open for selection suitable for agriculture, but uncultivated? So far as I know there is not a great deal.
2152. Would the construction of the proposed railway tend to increase the area of cultivation in the district? I think so.

J. M. Alison.
10 May, 1900.

J. McMaster.
10 May, 1900.

- J. McMaster. 2153. Which would serve the district better, the proposed line, or a line from Mudgee? The proposed line. It would be a national line, connecting our Northern and Western railway systems.
- 10 May, 1900. 2154. Would it benefit the district as much as a line from Mudgee would? I do not think it would benefit it quite as well, though I do not think there is much difference between them in that respect. A line from Mudgee would be more beneficial, as being a more direct line to Sydney.
2155. Would the proposed line suit the traffic from this district to the north-west districts and to New England better than any other? Most decidedly.
2156. Is there any considerable stock traffic between New England and the north-western districts and the district lying between Werris Creek and the Western line? A few years ago over 200,000 sheep passed Binnia within the space of a fortnight or three weeks on their way to New England to grass.
2157. If the proposed railway were constructed would it be used for the conveyance of stock? I think so. There would be times when the stock would be compelled to travel by rail. The stock that I refer to were hardly able to travel, and I think that if there had been a railway they would have taken it.
2158. Would you send stock by railway if you were near to it? Yes. If I had a lot of valuable stock, which I wanted to send somewhere to grass, I should certainly truck them there.
2159. Do you send away many fat stock? Yes, a good many.
2160. Where is your market for fat stock? Homebush.
2161. Where do you truck them from? The sheep that we send from the Liverpool Plains we truck from Quirindi, and sheep coming from holdings nearer this way we truck at Mudgee or Luc.
2162. If the proposed line were constructed, would you truck at the nearest railway station, or would you continue to drive to Quirindi and Mudgee? There are times when we should use the line, but at other times we might not. It is all a question of expense. At the present time we have only to send stock 50 miles to get them to Quirindi, whereas, if we used the proposed line, we should have to send them a long way round.
2163. How far is your homestead from the route of the proposed railway? I suppose not more than 6 or 7 miles. We should only have to send our stock a few miles from Bundella to get to the line station, so that in all probability we should use the railway there.
2164. Would people living along the route use the proposed railway, or would they drive their stock and their sheep to Mudgee? I think they would use the line.
2165. What crops is this district chiefly suited for? Wheat and corn.
2166. How would the agricultural area in this district compare with the wheat-growing land which you have seen in other districts? A great part of it would not be as good as the land in other districts.
2167. If the proposed railway were constructed would it open up for settlement a large area which is not now settled upon? No doubt it would in time increase settlement.
2168. *Vice-Chairman.*] Have you any agricultural land on your holding? Yes, a small area. I have only grown crops for my own use.
2169. What yield do you usually get? During the last few years the yield has been very small; but in some seasons we have had a good yield.
2170. Year in and year out, what sort of crops do you get? I have never grown wheat for grain.
2171. What is a fair average return for hay? I have obtained 2 tons to the acre.
2172. What is the rainfall on your land? From 24 to 25 inches.
2173. If the proposed railway were constructed, would you start agricultural operations on a larger scale? In all probability I should.
2174. Would you lease any land on the halves system? I should be inclined to lease land on the halves system.
2175. Where is Binnia? Binnia is about 4 miles from Oakey Creek, and within a few miles of the proposed line. It is 75 or 78 miles from Werris Creek. Another property in which I am interested is Bundella, which is 25 miles nearer Werris Creek than Binnia. My father has also a property near Coolah.
2176. What is the average carrying capacity of your Binnia property? About 40,000 acres there carry from 25,000 to 30,000 sheep.
2177. That is, taking the bad and good land together? Yes.
2178. Is yours fair average country? I should say that it would be better than the average.
2179. Is that because it has been improved, or because the land is better? I think that the land itself is better than the average.
2180. *Mr. Watson.*] Do you think it would pay freeholders along the route to make a contribution towards reducing any deficiency upon the working of the railway? I do not think so. I should not be prepared to make such a contribution.
2181. Do you not think that the railway would be worth a penny per acre per annum to you? I should not like to promise to pay anything. Agriculture is a thing which can very soon be overdone.
2182. It seems pretty evident that New South Wales growers will soon have to take the prices paid for wheat in the markets of the world; do you think that they can grow wheat at those prices and pay 10s. or 11s. a ton to send it to Newcastle or Sydney? I could not say.
2183. Is this as good wheat country as, say, the Narrandera country? I could not say; but I dare say that part of the land in this district is equally good. I should think there would be plenty of agricultural land in the district.

FRIDAY, 11 MAY, 1900.

[The Committee met at "The Flags" Hotel, Bomera, at 12.30 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDEBAY CRAWFORD SHEPHERD.
JOHN CHRISTIAN WATSON, Esq.ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Donald McGillivray, station manager, Bomera, sworn, and examined:—

2184. *Vice-Chairman.*] How far is Bomera from the route of the proposed line? The route passes through the run, and the homestead would be about 5 miles from the nearest point on it.
2185. What is the area of Bomera holding? I supervise 150,000 acres.
2186. In one holding? Yes.
2187. What is the average carrying capacity of the run? The secured land, which comprises an area of 36,000 acres, carries about a sheep to the acre, and the leased land, of which there is about 115,000 acres, carries, I suppose, 3,500 cattle, which are equal to about 27,000 sheep.
2188. Is that part of the run devoted to cattle? Yes; we do not carry sheep on that land.
2189. How much of the whole run, taking secured and leased land together, is suitable for agriculture? I consider that there is 20,000 acres of good land fit for wheat-growing.
2190. Is any of the leased land fit for agriculture? Of the leased land on the Blandtyre, I suppose, 25,000 acres are fit for wheat.
2191. What is the difference between the leased land and the secured land? There is very little difference. Taking it on the whole, I think the leased land is quite as good as the secured land—that is, the 25,000 acres on the Blandtyre.
2192. Have you tested any part of the agricultural land on the secured area? Merely for growing hay.
2193. What was the average yield which you got? I have been here three years, and during that time I have cultivated about 18 acres for station purposes, and have obtained about 3 tons of hay to the acre. Those years have been bad years.
2194. What is the average rainfall at Bomera? During the last three years it has been about 23 inches. Before that it was greater.
2195. How far is Bomera from the nearest railway station? It is 51 miles from Gunnedah and 62 from Quirindi.
2196. What is the average freight to and from Quirindi? Two shillings per cwt. At the present time they want 3s. 6d. per cwt., because of the drought.
2197. Is that the charge for both inward and outward traffic? That is what they want for bringing things out; I have not had anything sent in.
2198. What is the country between here and Werris Creek like? It is suitable for both agricultural and pastoral pursuits. The black soil country is not so reliable for wheat as the box country, but a great part of it is very suitable for cultivation, and there are large farms on it. One gentleman has 6,000 acres under cultivation close to the route of the proposed line.
2199. Where is that? On "4 D" holding.
2200. Would the country between Bomera and Werris Creek support close settlement if there were a railway? Yes.
2201. How many acres of it would support a family in decent comfort? 400 acres, if the land were cultivated.
2202. Would it be necessary to devote the land exclusively to agriculture, or would it be better for a settler to go in for mixed farming? Mixed farming would be safer.
2203. How many acres would be sufficient if a man went in for mixed farming? I should think about 640 acres.
2204. How much Crown land is there available within 20 miles of the proposed railway? The 25,000 acres on the Blandtyre, to which I have already referred, has been surveyed, and the land is now waiting to be balloted for. The 115,000 acres of Crown land in the Bomera holding is all within 25 miles of the route of the proposed line.
2205. Is it a fact that the greater part of the best land along the route of the proposed line has been secured and is now in the hands of private owners? A great deal of the land has been secured.
2206. Do you think that if the proposed line were constructed the owners of land in the district would go in for agriculture, either by themselves, or on the halves system? We are prepared to offer 20,000 acres of our secured land for cultivation on the halves system. The people who own Bomera also own Kentucky, in Riverina, and they have had as much as 15,000 acres under cultivation there. If the proposed line is made I shall have instructions to work in that way.
2207. Is the share system being practised in this district? Yes, to some extent; but I cannot tell you how much. In Riverina we take a bag to the acre, and the farmers only have the land while it is under crop; at other times we have it for sheep.
2208. *Mr. Watson.*] Is a bag an acre all you get for your share? Yes; but the farmers pay for clearing the land.
2209. *Vice-Chairman.*] What market would you expect for your produce if you went in for agricultural pursuits? The general colonial market and the world's market.
2210. You do not look for a market out towards Moree and Walgett? I should not expect to send a great deal out there, though a little might go there.
2211. It has been urged that the proposed line would form a connecting link between the Northern, the North-Western, and the Western railway systems;—would you find a market in those districts? No doubt. We grow lucerne here splendidly, and we should find a market for it in the Bourke district and in the northern districts. The proposed line would also be used for the transport of sheep backwards and forwards. During the first two years that I was here 325,000 sheep passed through Bomera, travelling for grass.

D.
McGillivray.
11 May, 1900.

D
McGillivray.
11 May, 1900.

2212. Where did they come from? From Narrabri and that district. Some were going towards Mudgee while other lots were going towards New England.
2213. Is that traffic likely to be permanent, or was it only the result of the drought? It was the result of the drought.
2214. If the proposed railway were constructed, would it be used by stock travelling for grass? I am sure that it would. A flock of 12,000 sheep which passed this place took four days to go 10 miles, and men were skinning the sheep that could not travel all the way along the road. That sort of thing has happened even this year.
2215. *Mr. Shepherd.*] Is not the case you refer to an isolated one? Yes; that happened because of the drought. The sheep were splendid sheep, but they were in a very bad way.
2216. *Vice-Chairman.*] For what purposes would lucerne be bought in the western district? To feed sheep. They often have to feed their sheep out there.
2217. I suppose they would only feed valuable stud sheep? They sometimes feed paddock sheep, too.
2218. How long would it pay to feed ordinary sheep? We are well aware that it does not pay to feed them, but I am afraid to say how many months the sheep have been fed at Canonbar, though at very large expense.
2219. Is it not a fact that the feeding of sheep in times of drought has proved so unprofitable that it is not likely to be again indulged in, except to save valuable stud sheep? I do not know. I have not had to feed sheep here, though we have had to feed them on Kentucky.
2220. Do you know the country from Bomera towards Wellington, on the route of the proposed line? I know the country between Bomera and Coolah. That country is very like the country here.
2221. Do you think there would be much agricultural produce sent from that district if there were a railway? I am sure of it. The production of the district would be increased tenfold if there were a railway. The Commissioners' estimate of revenue seems to me an absurdly low one. If there were 15,000 acres under crop in the district, and only a very low yield were obtained, at the rates that we have to pay for carriage now the railway revenue would be something like £20,000. At the present time it costs us 1s. 2d. a bushel to send wheat from here to Quirindi.
2222. All that the railway would get for haulage for that distance would be about $\frac{1}{2}$ d. a bushel? If we could get our grain carried for that price, we should be able to cultivate.
2223. You are of opinion that, even if the railway does not pay, there will be a considerable increase of settlement in this part of the country after it has been made? Yes; the 25,000 acres already referred to would mostly be put under cultivation. We should lose our 115,000 acres of leased land; but then we could make much more use of the 36,000 acres of secured land.
2224. Do you think that, in order to obtain a railway, the landholders in this district would be prepared to contribute towards making good any deficiency in revenue as much as they now pay in land-tax, the contributions to be reduced as the deficiency disappeared? I should think so. I should advise it, and I could pretty safely promise that my principals would agree to it.
2225. Do you think that the land required for a railway could be obtained from the landholders free of cost? I am of opinion that it could. I think that they would all give their land; I am sure that the Government would get our land.
2226. *Mr. McFarlane.*] Do you send your fat stock to the Sydney market? Yes; I send them to Quirindi and truck them there; but the stock route is so bad at the present time that I cannot send my fat stock away at all.
2227. How long does it take to travel sheep to Quirindi? It takes us three weeks to get sheep from here to the saleyards at Homebush.
2228. If the proposed railway were constructed, would you use the nearest railway station to send your fat stock from it? Yes; it would never pay to drive sheep past the railway.
2229. Would other owners truck their fat stock at the nearest station? Yes; everyone would. There is a man in the Narrabri district who travels some of his fat stock; but I do not think it ever pays.
2230. Do you send much fat stock away. I sent nearly 8,000 fat stock away one year. That was a fairly good season, although we only got 17.6 inches of rain.
2231. Do many other stock-owners send fat stock away? The proposed line will be nearer to Bando holding than Gunnedah is,—and they have sent 63,000 fat sheep from that station in one season alone. No one who had fat stock would travel there, where they could take the train.
2232. *Vice-Chairman.*] Which would suit this district best,—a connection with Dubbo, or a connection with Wellington? I do not see that it would make much difference to the district; but from what I know of the country, a connection with Wellington would be more advantageous to the Colony at large. For one thing, it would give a straighter route to Melbourne.
2233. *Mr. Shepherd.*] On what terms would you offer your 25,000 acres if you went in for the share system? I think on the consideration we received a bag an acre.
2234. What facilities do you afford men for settling on the land;—in some places seed is provided? My principals provide seed. If a man is very poor, and has horses and labour but not sufficient money to buy wheat for feed, they supply him with wheat, and get it back when the crop comes up.
2235. Would a bag an acre be taken in full satisfaction of the landlord's claim? Yes; but the tenants would have to clear the land. We lend them money if they find it necessary to employ labour to assist in clearing it.
2236. What interest is charged on that money? 5 per cent.
2237. For how many years is the land leased? For four years. During the last year, when the farmer is putting in his wheat, we also provide lucerne seed for him to sow.
2238. But when the fourth crop is taken off the farmer has to give up the land? Yes.
2239. Do you think that in four years a man would recoup himself for the expense of clearing the land? Yes.
2240. What is about the average cost of clearing land? It would take about 5s. an acre for average country.
2241. *Mr. Watson.*] That is when the timber is dead? Yes; the timber has all been rung years ago.
2242. *Vice-Chairman.*] I understand that you know a great deal about Australian country;—how would you describe the Bando country? The Bando country is the best in Australia for fattening stock quickly. It will fatten more stock in a year than any other country will.
2243. Is it good country for breeding purposes? Yes; it is wonderfully good country for breeding stock, but it is not so good for wool.
- 2244.

2244. What is the average weight of a fleece there? About 8½ lb.; but the country is full of trefoil burrs. I should also like to mention that this is one of the best timber districts that I know away from the rivers. Wonderfully good iron-bark and pine grow here, and if the railway were constructed, a great deal of timber would be sent away by it. Then, too, we have some of the best building stone in the Colony—a beautiful white sandstone—and it is easily got. D.
McGillivray.
11 May, 1900.

2245. Is it liable to fret? No; we have chimneys of it that were built in 1863 still standing.

Charles John Smith, grazier and farmer, Tambar Springs, sworn, and examined:—

2246. *Mr. McFarlane.*] Have you resided in this district long? Since 1853. C. J. Smith.

2247. Have you been engaged in farming pursuits? I have been farming ever since I came here, and I was brought up on a farm. 11 May, 1900.

2248. What results have you had from your farming? I have never grown wheat until the last three seasons, though I have grown corn and hay for my own use.

2249. How many acres have you had under wheat? About 42 acres last year.

2250. What was the average yield? Between 16 and 17 bushels to the acre last year, and 22 bushels the year before.

2251. Where is your market? Quirindi.

2252. Do you send any wheat to Sydney? I have not done so yet.

2253. What distance is your property from this place? About 15 miles.

2254. What is the nature of the country in your locality? The soil is alluvial.

2255. Is a large part of it adapted for agriculture? All the land on the creek where I am living is better suited for agriculture than for anything else.

2256. What does it cost to carry grain to Quirindi? The usual charge is 2s. a bag; but I employ my own teams.

2257. What yield of corn have you obtained? I have not taken any note of it.

2258. Has corn been successful? Not during the last twelve months; but the year before I had a very good crop. Last season was the worst I ever experienced.

2259. What is the country like between here and Werris Creek, along the route of the proposed line? There is a lot of agricultural country there.

2260. Is it land that could be cultivated and settled upon if the railway were constructed? Yes, and if it were thrown open for settlement. What keeps us back is the fact that we have no means of getting our produce away.

2261. Are many of the people in this district engaged in agriculture? There are a few where I am living, but they only cultivate on a small scale. I am only cultivating on a small scale; but if there were a railway I should go in largely for agriculture.

2262. Do you think that would be profitable? It is the only thing for us to do, I think.

2263. If the proposed railway were constructed, would the people here use it for sending their produce away? Yes; it would be cheaper to use the railway than to send away produce by carts or in waggons.

2264. What is the area of your holding? 1,300 acres.

2265. How much of your land would be suitable for agriculture? 800 acres.

2266. Is your land similar in character to the adjoining land? Yes. A number of people would cultivate all their land; but I do not believe in the alluvial black-soil country for agriculture, although I have several hundred acres of it. It is not as good as the timbered country.

2267. What trees grow on the timbered country? Apple and box.

2268. If the proposed railway were constructed, would the owners of the land through which it passed give that land to the Government free of cost? I do not see why they should not.

2269. Would the landholders here be willing to make a contribution of a penny per acre to make good the estimated deficiency of £18,000 per annum on the working expenses of the railway? We are pretty heavily taxed now; we pay £2 an acre for all our land, besides the taxation. At the same time, I should not be against making such a contribution, to be sure of obtaining the benefits which the construction of a railway would give me.

2270. What is your experience of the fattening qualities of this district? Where I am the country is as good as you will find in the Colony.

2271. Do the stock fatten rapidly upon it? Yes.

2272. Both cattle and sheep? Yes.

2273. Have you had any knowledge of farming in other districts? Yes; at Wallabadah, 25 miles from Murrurundi.

2274. How would this land compare with that for agricultural and pastoral purposes? It is about the same. I have known paddocks to be under wheat here for thirty years, and to give as good crops now as they did at first.

2275. What is the black-soil country in this district best adapted for? For grazing.

2276. Is it better grazing country than the other country in the district? Yes; but in dry weather it cracks and opens up, so that it is not good for agriculture.

2277. How many stock have you? Very few at present, because I have had no grass for five years. I generally have 100 head of cattle, 400 or 500 head of sheep, 30 or 40 horses, and some milkers.

2278. Where is your market for fat stock? Maitland.

2279. How do you get them there? I drive them to Quirindi, and then truck them.

2280. If the railway were constructed would you use it? Yes; I should not drive my sheep a bit further than was necessary.

2281. Would others situated similarly to you do the same? I think so. If they did not they would lose money.

2282. Is the agricultural land you have spoken of heavily timbered? Yes; but my land has been ring-barked for a number of years, and most of the trees have fallen down.

2283. How much would it cost per acre to clear green timber in this district? I have had no experience of clearing green timber.

2284. What does it cost to clear timber that has been ringbarked? If it were not too thick, 5s. an acre ought to do it.

Frederick John Turner, farmer, grazier, and storekeeper, Tambar Springs, sworn, and examined :—

- F. J. Turner. 2285. *Mr. Watson.*] Have you attempted any cultivation? Yes; I have grown wheat, and grain, and
 11 May, 1900. corn.
2286. With what result? I put in an acre of wheat, and I got 67 bushels off it.
2287. What yield of corn have you had? 82½ bushels to the acre from 4 acres. I only cultivated the land to make a comparison between it and the Wollambi country.
2288. What year was it that you got your large yield of wheat? In 1879.
2289. Was that a good season? Yes.
2290. Have you grown hay since? Yes.
2291. What has been your yield? About 3 tons to the acre during the last four or five years. Of course, we have had droughts here.
2292. Do you think that you would do better than that with a fair season? Yes.
2293. What is the area of your holding? I have a family selection of about 1,200 acres.
2294. How much of your land is as good as that from which you got the large yields which you have mentioned? 1,000 acres; it is all agricultural land.
2295. Was the land which you cropped situated on the banks of a creek, or was it specially good? There was nothing specially good about it; it is about 2 miles from the creek and about 2 miles from the mountains.
2296. How do you regard the country generally round Bomera and Tambar Springs from an agricultural point of view? Bomera is nearly all agricultural country, and so is the Tambar Springs country, whereas the Bando country is all grazing country.
2297. Has much of the resumed area of the Tambar Springs holding been taken up? Yes; all that has been available. There were 1,100 and 1,200 applicants for the blocks last January.
2298. What was the area of those blocks? From 450 to 1,100 acres was the size of homestead selection blocks, while the settlement lease blocks measured about 3,000 acres.
2299. Was it thought that a man could make a living by agriculture on 450 acres? Yes.
2300. How far from a railway is this land? A man taking up that land would be 63 or 64 miles from Quirindi.
2301. Do you think that a man could make a living on 450 acres at that distance from a railway? No. Without a railway those people will have to throw up their land. They are Adelaide people, and people from other parts of the Colony, who did not inspect the land before they took it up.
2302. *Mr. Levien.*] Were the successful balloters Adelaide people? They were all strangers to me.
2303. *Mr. Watson.*] If the proposed railway were constructed, would people be able to make a living on 450 acres in this district? Yes.
2304. What proportion of land in this district is suitable for agriculture? About two-thirds.
2305. Is the rainfall here suitable for wheat-growing? Yes.
2306. Does it fall at the right period of the year for wheat? Yes; it never fails. Last year was the worst we have had; but even then the rain came at the right time, and this year the season has been favourable so far.
2307. It has been suggested that if the railway were constructed, some of the large landholders would lease land to agriculturists on the share system;—would many be anxious to take that land? Yes; it would pay people to take it.
2308. Did you hear Mr. McGillivray's evidence? Yes.
2309. Do you think that the terms which he mentioned would be reasonable here? They are not as good as we have here at the present time, where the landholder clears the land, and finds the seed for the first year, taking one-third of the produce as his share for five, ten, or fifteen years, as agreed upon.
2310. I suppose those conditions would suit people, inasmuch as it would not be necessary for them to find capital to clear the land? Yes. It would suit small holders better to take up land under those conditions than to take up land for themselves. Of the twenty who have taken up land on Bando, near my holding, there are fifteen who will not be able to stay there, because they will not have enough capital; whereas if the land were cleared for them, and they were provided with seed for the first year, they would be all right.
2311. Was the timber on the land they took up dead? Yes.
2312. What would it cost a man, using bullocks, to drag down trees and to clear that land? From 5s. to 12s. 6d. an acre for dead timber, and about 20s. for green timber; but there is very little green timber.
2313. You think that most men have not enough capital to be able to pay for the clearing of any considerable area? Yes.
2314. But if they can run a few sheep on the land at first, they will eventually be able to clear it? Yes.
2315. You regard this as a good agricultural district? Yes; it is more fitted for agriculture than for grazing. It is only the plain country that I consider fit for grazing proper. I was farming in the Wollombi district for many years, and all I got was from 7 to 11 bushels to the acre; whereas here I got 67 bushels in my first crop, while a neighbour got 48 bushels; but there is no market for the grain. I might mention that I get up about 75 tons of goods a year for my store.
2316. What do you pay for freight between Quirindi and your place? Three shillings a hundred weight.
2317. Are the rates lower in the wool season? I do not know; I only started last December; but I do not think they are lower then. Perhaps they would vary from 2s. 6d. to 3s.
2318. Do you think landholders here would be willing to contribute something towards making good any deficiency on the working of the line? The station-holders have told me that they would give what land was required for a railway free of cost.
2319. Do you think people could afford to pay as much as they now pay in land tax to help to make good any deficiency in working? I am sure that they could.

James Nicholas O'Rourke, farmer and grazier, Tambar Springs, sworn, and examined :—

- J. N. 2320. *Mr. Shepherd.*] What is the extent of your holding? With my brothers, I hold about 3,000 acres.
 O'Rourke. 2321. How long have you been in the district? About thirty years.
2322. How much land have you under cultivation? Pretty well 40 acres between us. 2323.
- 11 May, 1900.

2323. Is your land conditionally purchased land? Most of it.
2324. What crops are you growing? Wheat and corn.
2325. What yields do you get? The wheat crop is equal to about 19 bushels to the acre, and the maize crop to about 30 bushels; but I have not been growing very long, and the last few years have been very dry.
2326. What crops would you be likely to get in a good season? Forty bushels or more of wheat and about the same quantity of maize.
2327. How much of your land is suitable for agriculture? Nearly all of it.
2328. What is about the average size of the holdings in the district? The small holdings range from 450 acres up to 2,000 acres.
2329. Would there be a large increase in agriculture if a railway were constructed? Yes; I think that a lot of the recent settlers here will not be able to continue to hold their land if they do not get a railway.
2330. Where do you send your wheat? To Tamworth.
2331. How many miles is that? About 100 miles. I truck it from Gunnedah or Curlewis, and the road carriage costs me about 2s. a bag.
2332. What is the usual method of clearing land here? Principally by burning off and digging out the roots with pick and shovel.
2333. What is the cost of clearing per acre? I think land can be cleared for the plough at a cost of 10s. an acre, if the timber has been dead for a considerable time.
2334. I suppose, where the timber is heavier, it costs a little more? Yes.
2335. What effect would the opening of the proposed railway have upon the district generally? A very good effect; it would assist the small holders to go in for agriculture. They cannot make a living unless they cultivate their land, and at the present time there is no market for their produce.
2336. Do many holders in this district combine farming with grazing? Yes, and the number is likely to increase.
2337. Do you carry any stock? Yes.
2338. If there were a railway would you occasionally send small consignments to market? Yes. It does not pay to send a small flock by road, especially in dry weather.
2339. What is the smallest number that it would pay to send by road? Two hundred, and you would not be able to take them far if they were fat stock.
2340. Is it usual for farmers to join together to make up a sufficiently large flock to send away? Yes; they sometimes send away 100 or 150 each to make up a load.
2341. Would the proposed railway assist any other industry besides farming and grazing? I think that a great deal of timber would be cut in this district, and sent away by the railway. The line would run through splendid timber country; country with beautiful pine and iron-bark upon it.
2342. Have you tried fruit-growing at all? Yes, and I have got very good results with any sort of a season.
2343. What kinds of fruit have you grown? All kinds. Grapes grow splendidly.
2344. Do you send your fruit to the Tamworth market? No; we only grow for our own use, or to sell about the district.
2345. Are there any saw-mills in the district? We have one at Tambar Springs.
2346. Where do they get a market for their timber? Principally round about the district. There is a great demand for timber; but it is hard to get it away, because of the cost of carriage.
2347. Do many stock travel through the district in dry seasons? Yes; both sheep and cattle.
2348. Which direction do they go? They are either making towards New England, or they are going towards Dubbo and other places to be sold.
2349. Is there land in this district to which stock can be sent in dry seasons? Yes. Bando is a splendid fattening country.
2350. It is not heavily stocked country? Not at the present time.
2351. How would a railway be supported in this district? By the produce traffic and the stock traffic. Owners will not drive their stock if they can send them away by train.
2352. Do you feel satisfied that within a reasonable period of time the estimated deficiency of £18,000 would be made up? I think so.
2353. Do you feel sure that the district would largely benefit by the construction of a railway? Yes.
2354. And the traffic upon it would largely increase within a short time after its construction? Yes.

J. N.
O'Rourke.
11 May, 1900.

[The Committee met at the "Bundella Hotel," Bundella, at 8 p.m.]

Hugh McMaster, grazier, Rocksgediel, sworn, and examined:—

2355. *Mr. McFarlane.*] How long have you resided in this district? About forty years.
2356. What is the area of your holding? I have 30,000 acres of freehold, and about 25,000 acres of leasehold.
2357. Do you confine yourself to grazing? Yes.
2358. Do you not cultivate any land? Only for station purposes.
2359. What is the carrying capacity of your land? We have 32,000 sheep on the land now, and we have had as many as 70,000 sheep on it. On the average the run carries about 45,000 sheep.
2360. What is the carrying capacity of the improved land? A sheep to about an acre and a half.
2361. And of the unimproved land? A sheep to about 4 acres.
2362. Is the leasehold area thickly timbered? Yes; the freehold land is mostly plain country, and the leasehold land is mostly ridges or sandy country.
2363. How far is your station from Bundella? Six miles.
2364. What is your opinion of the country between Binnaway and Werris Creek, and within 25 or 20 miles of the route of the proposed line? After you pass Oakey Creek, going towards Werris Creek, you go through some of the best grazing country in Australia.

H. McMaster.
11 May, 1900.

- H. McMaster. 2365. Can you tell us how much of the land would be suitable for agriculture? I have had very little experience of agriculture; but in a fairly good season very nearly the whole of the land would be suitable for agriculture. In a dry season a great deal of the land would not grow crops well.
- 11 May, 1900. 2366. I understand that the land is better adapted for wheat than for any other crop? Yes.
2367. How much of your freehold land would be suitable for wheat? I think about two-thirds.
2368. How does your land compare with the land generally between Binnaway and Werris Creek? The land on the Binnaway side is better for agricultural purposes than the land on this side. It is red-soil country, which, I think, is the most suitable country for agriculture.
2369. Do you run cattle? I have only a few on my holding.
2370. Do you send many fat sheep to market? We have sent as many as 12,000 in a year, and we have sent as few as 10,000.
2371. Where do you send them? To Quirindi, and thence by train to Homebush.
2372. Do you find any difficulty in driving stock to Quirindi? At the present time we could not get them there at all if our neighbours did not allow us to water them at their wells.
2373. Are the other graziers in the district similarly situated? I think that all between here and Quirindi are similarly situated, except those who have only to go through their own land to get to the railway station.
2374. Are there many small graziers in the district? A good number.
2375. Do they fatten sheep for the Sydney market? Some of them do.
2376. Do they send their sheep in small lots? Yes.
2377. Is it a drawback to have to do that? Yes; it costs more in proportion to drive a small lot than to drive a large lot.
2378. If the proposed railway were constructed, would you consign your sheep from the nearest station in preference to driving them to Quirindi? Yes.
2379. Would others similarly situated do the same? Yes; I do not think anyone would do otherwise.
2380. I understand that there are large areas of leased land in the district which will shortly be thrown open to settlement;—if railway communication were given would people take up that land? Yes; I think it would be taken up for wheat-growing. At the present time land in this district can only be used for grazing.
2381. How much land would be required in this district to maintain a family wholly by grazing? I do not think a man could make a decent living by grazing on less than 1,000 acres.
2382. Given railway facilities? Yes.
2383. How much land would it take to maintain a family if they went in for growing wheat? From what I have heard I think 40 or 50 acres would be enough. A man near Quirindi told me that he made nearly £400 on 40 acres of land upon which he grew wheat.
2384. Do you think that any considerable area of the purchased land in this district would be used for agriculture if the proposed railway were made? Yes; if wheat-growing would pay better than grazing.
2385. Do many stock travel to this district from other districts, or to other districts from this district? A great deal depends upon the seasons. Last year a great number of stock came by train to Quirindi from the Moree district, and then crossed the Range into the Cassilis district.
2386. How many stock came that way? I think there must have been 50,000.
2387. Is that an annual return? No; but I think it has occurred twice during the last five years. On one occasion sheep from the Riverina district passed through here, and, on another occasion sheep from the Moree or Walgett district came through here and went south.
2388. Does store cattle travel between this and other districts? Yes. This is a fattening district, and store sheep come here from other districts.
2389. It has been suggested that the Mudgee line might be extended so as to serve the district lying between the Western and Northern lines? Such an extension would not serve this part of the district, because it would not come near enough to it. It might suit the people living down towards Cobborah, but we should still use the Northern line.
2390. If the proposed railway were made, from what distances would people bring wool and agricultural produce to it? From 20 to 30 miles; but it would depend upon their distance from the Northern line.
2391. Could people carry wheat a distance of 20 or 30 miles to get to a railway station, and then compete successfully with growers in other parts of the country? People so situated would be at a disadvantage; but I think they could grow wheat profitably.
2392. Do you think landowners in this district would give the land required for the construction of a railway free of cost? I could not say. Of course, it would be a small item to people who were really in favour of the railway. I am only a part owner, and I cannot speak for the firm, but I do not think we should be prepared to give more than the strip required for the lines. I do not think we would give land for station purposes.
2393. Would you be prepared to make a contribution to decrease the estimated deficiency upon the working of the railway? I do not think it would pay us to agree to anything like that.
2394. Would the landholders of the district be willing to pay a sum equal to the land tax, which would return about £5,000 a year if contributed by the land within the influence of the railway, with a view to decreasing any deficiency? I cannot speak for others, but, personally, I would not agree to it.
2395. Which line would be the more suitable to construct—a line from Wellington or a line from Dubbo to Werris Creek? I should think that a line from Wellington would go through better country than a line from Dubbo; but if it were proposed to connect the Southern and the Western lines by a line going south from Dubbo, it might be well to connect Werris Creek with Dubbo.
2396. Which route would suit this district the better? As things stand to-day, the Wellington route.
2397. Which route would serve the larger number of people? I think the Wellington route.
2398. There would be more business with Sydney than with places out west? Yes.
2399. Is there much trade between this district and Dubbo? I do not think so.
2400. Is there much trade between this district and the North-western district? Yes.
2401. Have many stock transactions taken place between this district and the New England district? Yes. People are always buying stock in the New England district and bringing them here, or buying stock here and taking them to New England.
2402. Do you think that if the proposed railway were constructed new traffic would spring up to such an extent

extent that in a few years the line would be a paying concern? I think that it would be a paying line. H. McMaster.
I do not think that there would be the loss which the Commissioners estimate. A lot of produce would be sent into this district from New England in dry seasons, and from districts further to the south, out towards Walgett. 11 May, 1900.

2403. Do you think there would be much traffic between the Western district and the North-western district if the proposed line were constructed? I think there would.

2404. What would that traffic consist of? Stock and produce. I do not think people would go all the way round by Sydney if they could get a shorter route across country.

Thomas James Finley, junr., Bundella, sworn, and examined:—

2405. *Mr. Watson.*] What is the area of your holding? My father has about 25,000 acres of secured land and about 15,000 acres of Crown land. T. J. Finley, junr.

2406. How long have you been here? Twelve years.

2407. Have you been grazing all that time? Yes.

2408. Do you think that the proposed line should be constructed? Yes.

2409. What would be the effect of the construction of the proposed line? It would increase the production of the district and prevent the loss of stock. Nearly all the districts in the Colony suffer from drought at times, and generally at such times the best districts suffer most, because owners there wait so long for rain that when their stock are starved out they find that they have been too late in applying for country elsewhere, or that the roads are too bare for their sheep to travel.

2410. Would the proposed line be largely used for the carriage of store stock? Yes. Last year I heard of sheep being trucked from the Riverina to Narrabri by way of Sydney, and I believe that a great deal more trucking of stock would be done if sheep were not kept so long in the trucks. If the proposed line were made it would bring the Riverina district much nearer to the Narrabri district than it is now.

2411. In which direction would stock mostly move in this district—towards New England, or from the North-western district towards the Western line? I think that it would move mostly towards New England, that being a district which suffers less from drought than other districts do, though at times the movement would be the other way. As a rule, produce would come down to this district from the New England district, and stock would go from here to the New England district.

2412. It has been stated that during the last drought stock from the North-western district could not be taken in the New England district? That might have been an exceptional case; but I do not think it would generally happen.

2413. Do you think that there is usually sufficient country in New England to afford relief to a large number of sheep? Yes.

2414. It has been found that the mountainous country adjacent to the Riverina is very early secured in times of drought, by a comparatively small number of men, and that others who come afterwards are unable to get country there? The small number of men represent a great number of sheep.

2415. Still there has not been room for all the sheep that people wish to send there? The recent drought has been wider-spreading than droughts usually are; but, as a rule, the mountainous district of the Colony would relieve a great many sheep.

2416. What effect would the proposed railway have upon the fat stock traffic of the district? It would be a very great help to it.

2417. Do fat stock lose in condition by being driven to Quirindi? Yes; they lose on the average a lb. a day, and in certain seasons of the year their wool gets covered with burrs.

2418. Does that reduce the value of the fleece? Yes.

2419. If the proposed line were constructed people could send away small consignments of fat stock at frequent intervals? Yes; and, if there were a railway, people would be more inclined to grow lucerne to feed their sheep with. If, however, you fatten your sheep now in that way, they waste so much in being driven to the railway that you gain nothing; whereas if you could truck the sheep direct from your paddock it would be profitable.

2420. If lucerne were grown could more sheep be fattened than are fattened now? Yes.

2421. If the proposed railway were constructed, would pastoralists still send their fat stock to the Northern line? I do not think so; I should not. It has been tried with both cattle and sheep in good seasons, and the conclusion that has been come to is that it pays best to use the railway.

2422. Have you had any experience in agriculture? Only in growing for home consumption.

2423. What has been the result of agricultural operations here? Wheat is pretty well always a success, but oats do not do so well.

2424. Is the comparative failure of oats due to the want of something in the soil, or to the want of rainfall? To the want of rainfall.

2425. How much of your 25,000 acres would be suitable for cultivation? About three-fifths.

2426. And how much of your leasehold area? About one-fifth.

2427. If the proposed railway were constructed would you be inclined to put your land under crop, either on the share system or under some other system? Yes, if it would pay me to do so; but this year sheep have paid better than wheat. If wool was only 6d. a pound and sheep 1s., we should go in for cultivation.

2428. Under normal conditions it is usually assumed that with a suitable rainfall, good land, and a railway, agriculture pays better than sheep-raising;—would you be inclined to go in for agriculture? Yes.

2429. Would other landholders in the district do the same? I have not spoken to them on the subject; I dare say they would.

2430. What proportion of land fit for agriculture is there between here and Werris Creek within 20 miles of the route of the proposed line? I think three-fourths of the land would be fit for wheat-growing; it is all country similar to that through which the Committee have been travelling during the last few miles.

2431. Does similar land extend north and south to any distance? Not so much to the south. From Colly Blue on, the land is pretty well all the same, north and south.

2432. How far is Colly Blue from Werris Creek? A short 40 miles.

2433. Do you think the line should come from Wellington or from Dubbo? I am strongly in favour of Wellington as the junction. 2434.

- T. J. Finley, junr.
11 May, 1900.
2434. Is that because it would give a shorter route, or because it would give you a connection with the Southern line? Because it would give us a better connection with the Southern line than we should have if the junction were at Dubbo.
2435. It has been suggested that the Dubbo connection would be valuable in giving more direct access to the Western district;—do you think that that advantage is as great as the advantage of being connected by the shortest distance with Sydney and the Southern line? I think that the connection with Sydney and the Southern line is the more valuable of the two to us.
2436. Do you think that it would be worth the while of landowners in this district to make a contribution of so much an acre towards reducing any deficiency upon the working of the railway? I should be willing to give the land required for the construction of the line.
2437. Would you be willing to contribute, say, a penny an acre to making up any deficiency? The question is, would the Government credit the proposed line with all the traffic that belonged to it. Quirindi is our trucking station now, and I am afraid that the proposed line would not get credit for the increase of traffic on the main line which its construction would occasion.
2438. Have some of the settlers here only recently gone upon their land? Yes. There has been a considerable increase in settlement during the last two or three years.
2439. Without railway communication these settlers would have to depend upon grazing? Yes.
2440. They are too far from the main line to be able to grow produce? Yes. It is 50 miles from here to the railway, and some of the settlers are still farther away.

Thomas Davidson, farmer, Merrigala, sworn, and examined:—

- T. Davidson.
11 May, 1900.
2441. *Vice-Chairman.*] How far is your place from Bundella? Ten miles.
2442. How far would you be from the proposed railway? About 2 miles.
2443. How long have you been residing here? Twenty years.
2444. Have you had any experience as a farmer? Not very much, though I have grown small crops during the last few years.
2445. What is the size of your holding? 300 acres.
2446. Do you occupy plain country or rising country? Part of my land is plain country and part of it rising ground.
2447. How much of it is adapted for agriculture? About two-thirds.
2448. What agricultural operations have you carried on there? I have had 16 acres under hay.
2449. What yield have you got? From 30 cwt. to 2 tons an acre.
2450. How long have you been growing there? About six years.
2451. Were those fairly good years, or rather bad years? Rather bad years; I have not had a good year yet.
2452. What crop would you expect to get in a fairly good season? I think I should get from 2 to 2½ tons to the acre.
2453. What market have you for your produce now? I sell to people passing to and from Tambar Springs.
2454. If you had a railway, would you have sufficient agricultural land to make a living upon it? Yes.
2455. Have you ever sent produce to the existing lines? No.
2456. Why? I have never had enough to do that, and it would not pay to send hay so far. I have never grown grain.
2457. What would be the rate of carriage from your place to Quirindi? £2 10s. a ton.
2458. If the proposed railway were constructed, what change would you make in your operations? I would grow as much as I could.
2459. Would you grow for hay or for grain? For both, I think; whichever would pay.
2460. How many acres of fairly good land would be sufficient to maintain a family in this district? About 500 acres, if the man who took it up got a good start.
2461. Could a man maintain a family on that area by agriculture alone, or would he have to go in for mixed farming? He would do all the better to go in for mixed farming.
2462. Do you run any sheep? Yes, a few.
2463. Would it pay you to put all your land under agriculture if there were a railway? If there were a railway I should put pretty well all of it under agriculture.
2464. We have had various opinions as to the capacities of black soil for wheat-growing? I believe that the sandy ground is better.
2465. Do you mean red sandy land? No; it is raw sand where I am cultivating.
2466. What timber grows on that land? Gum and pine.
2467. Do you find the soil better for wheat than the black soil? Yes.
2468. Have you tried the black soil for any crop? Only for hay.
2469. What was the result of the trial? The result was not as good as I get from the sandy soil; but it was a payable result.
2470. Do you run any cattle? Only a couple of cows.
2471. Do you think that with railway communication the district would be adapted for dairying? I think so.
2472. How would you describe the district from a stock-carrying point of view? It will carry a sheep to the acre.
2473. Is it good fattening country? The plain country is; but the bush country is not so good.
2474. Is it a good breeding district? Yes.
2475. What is a fair average clip in this district? From 6 to 6½ lb.
2476. Would you describe the country as well watered? Where I am it is well watered. I have a little well, 11 feet deep, and there is always plenty of water there. You can get water anywhere on the plains at a depth of from 20 to 25 feet.
2477. If the leased lands in the district were thrown open to settlement would they be easily taken up? I think so.
2478. In spite of the distance from a railway? Yes; there would be any amount of applicants.

2479. If a railway were made, would your neighbours go in for agriculture more extensively? Yes.
2480. Would the construction of a railway encourage close settlement in this district? Yes. I believe that if we had a railway plenty of land would be made available for settlement.
2481. Are your neighbours at present prevented from sending small consignments of fat stock to market by reason of the expense? They have some trouble sometimes; but I do not know much about the stock traffic.
2482. What is the rainfall in your part of the country? About 30 inches.
2483. As a rule, does the rain fall at the right season for wheat? Yes. I have never had any trouble in getting a crop of hay, though I could do with more rain than I have had. My crop averaged from 1½ ton to 2 tons an acre last year.
2484. Do you think that without a railway you will be prevented from extending your agricultural operations? Yes; because it is of no advantage for me to put in more than I could use myself, or sell on the road.
2485. Are the other farmers in your neighbourhood in the same plight? Yes.
2486. If you cultivated a couple of hundred acres, what market would you expect to get—the Sydney market or a market to the north and north-west? We should have to go to Sydney, I think.
2487. Do you think that you would find any market for hay out Moree and Walgett way? We might, at times.
2488. There would be no permanent market there? There would be no permanent demand; they would not want fodder in a good season.

T. Davidson.
11 May, 1900.

Robert Thomas Slack Smith, station manager, Merrigala Holding, sworn, and examined:—

2489. *Mr. McFarlane.*] How far is your run from Bundella? Twelve miles.
2490. Do you endorse the statements which have been made by the several witnesses to-night with regard to the disability under which the farmers and graziers in this district labour for the want of a railway? Yes.
2491. Have you suffered in the same way yourself? Yes.
2492. What is the size of the holding that you manage? There are 2,200 acres of purchased land and about 1,400 acres of leased land in it.
2493. Is it all grazing land? We use it all for grazing, except 12 acres, which we cultivate for our own use.
2494. Is the land suitable for agriculture? The greater part of it could be used for agriculture. There are over 2,000 acres of plain country, and the rest of the land could be used for wheat-growing.
2495. Do you mean 2,000 out of the 2,200 acres of purchased land? Yes.
2496. Have you been long in the district? All my life.
2497. How far are you from a railway station? We are 55 miles from Quirindi.
2498. Do you send fat stock to market? Yes, to Quirindi.
2499. Is this good fattening country? Yes. The 2,000 acres of plain country comprise very good fattening land.
2500. Do you agree with previous witnesses in the statement that most of the land in this district is suitable for agriculture? I think that it is, so far as I know it.
2501. Would the construction of the proposed line cause additional settlement within 20 miles of it? I think so. If the line were made, land, which otherwise would not be taken up, would be taken up for small holdings.
2502. Would large holders be prepared to lease their land on the share system? I fancy that a number of them would be inclined to do so. Most of the graziers in the district are now suffering from the want of a railway, and the small men more than the large men, because a small flock of sheep costs proportionately more to drive than a large flock, and cuts up more on the road. When a small flock of sheep leaves a paddock the animals fret, and will not feed until they reach their destination. The loss sustained in driving them to Quirindi is considerable.
2503. Is it only in dry seasons that there is a loss? I think that there is always a loss when you are travelling with small lots of sheep.
2504. If the proposed railway were constructed would you and others similarly situated use it for sending your stock to market? Yes.

R. T. S.
Smith.
11 May, 1900.

Edward Hayden, farmer, "The Plantation," sworn, and examined:—

2505. *Mr. Watson.*] Your holding is close to the proposed railway line? The proposed line goes right through it.
2506. What area have you? My father and I together hold 920 acres.
2507. Do you cultivate any of it? About 20 acres.
2508. Have you been long on it? About twenty-eight years.
2509. Is most of your land suitable for cultivation? Yes; the whole of it.
2510. Do you substantiate what has been said by other witnesses with regard to the desirability of a railway in this district? Yes.
2511. Would you cultivate a larger area if the proposed railway were constructed? Yes I think that I should cultivate the whole of my land.
2512. Do you think that agriculture would pay you better than grazing? Yes.
2513. What results have you obtained from your cultivation? The best crop we had went 60 bushels to the acre.
2514. What was your worst crop? About 20 bushels to the acre. We have not grown any grain during the dry seasons; we have cut our wheat for hay.
2515. What yield of hay have you had? From 30 cwt. to 3 tons.
2516. What has the hay crop been during the dry seasons? From 30 cwt. to 2 tons. A man can always get a fair crop of hay.
2517. Have you cultivated any land other than that on your own holding? I have about 2 acres in the township which I have cultivated.

E. Hayden.
11 May, 1900.

- E. Hayden. 2518. With what result? I never weighed the crop; but I should think it was equal to about 2 tons to the acre.
- 11 May, 1900. 2519. What is the character of your land? It is all plain country.
2520. Do you consider it well suited for cultivation? Yes, in fair seasons.
2521. Are there many other selectors near you? No; very few.
2522. Are there many small holders in the district? Yes, a good many.
2523. Is their land generally suitable for cultivation? Most of it is.
2524. Would they go in for cultivation if there were a railway? I think so.
2525. Would you be willing to give what land was required for railway purposes? I do not think so.
2526. How much of your land would the railway take? About a mile.
2527. That would be about 12 acres;—could you not afford to give that area of land? I do not think so. I have only a small holding.
2528. It is estimated that there will be a loss of £18,000 a year upon the working of the proposed line;—do you think that the country should incur that loss? I think that the loss would not be so great if this district were opened up by a railway.

Richard John Stevenson, grazier, Brennan's Gap, sworn, and examined:—

- R. J. Stevenson. 2529. *Vice-Chairman.*] How far from Bundella do you live? Twelve miles, and I should be the same distance from the proposed line.
- 11 May, 1900. 2530. How long have you been residing in the district? Six months.
2531. Have you had any previous experience as a farmer? Very little.
2532. What is the size of your holding? 1,445 acres.
2533. How do you use it? For grazing.
2534. What is its carrying capacity? A sheep to 2 or 3 acres when it is improved.
2535. Is much of it fit for agriculture? No; very little.
2536. If the proposed line were constructed, would you be induced to go in for agriculture? Not to a great extent.
2537. How many acres would you cultivate? Not more than 20.
2538. What is the character of the country at Brennan's Gap;—it is mainly ridgy country, I suppose? Yes.
2539. What class of timber grows there? Box and kurrajong.
2540. What benefits do you anticipate from the construction of the proposed line? If there were a railway I could send stock and produce away more easily.
2541. It would also assist you in getting up supplies? Yes.

Boyd Peter Sievers, grazier, Brennan's Gap, sworn, and examined:—

- B. P. Sievers. 2542. *Vice-Chairman.*] What is the area of your holding? I have no holding; my son has 720 acres at Brennan's Gap.
- 11 May, 1900. 2543. What is the character of his land? It is very fair land—land upon which box and kurrajong grow. About 200 acres of it could be cleared and cultivated.
2544. Have you had experience as a farmer? I was brought up on a farm in the Old Country.
2545. If there were a railway close at hand, would your son be induced to cultivate that 200 acres? Yes.
2546. At what distance from a railway can a man grow wheat and other grain profitably? It will not pay a man to farm who is over 25 miles from a railway station.
2547. How many settlers are there at Brennan's Gap? There are nine of us there, and our properties adjoin.
2548. What is the average size of the holdings there? 640 acres is the area of the smallest, and 2,400 acres is the area of the largest. There are more than 10,000 acres in the nine holdings.
2549. Has that land been recently taken up? It has been taken up since the Land Act of 1895 was passed.
2550. Was it taken up with a view to agriculture or with a view to grazing? The railway route has been surveyed for twenty years, and we all hope that the line will be constructed some day.
2551. If the railway is not constructed, what will be the position of those settlers? We shall have to struggle on without it; but if the railway is made we shall get ahead of things a bit.
2552. The construction of a railway would make a substantial change in your prospects? Yes.
2553. Without a railway they are not too good? That is so.
2554. Is much cultivation being done out there now? No. I had a little crop of swede turnips, which yielded at the rate of 30 tons to the acre, and I have cultivated a bit of a garden.
2555. On what soil were the turnips grown? On very deep black soil.
2556. Do you think the black soil would be profitable to grow wheat on, year in and year out? There is a difference between black soils. There is one kind of black soil in the box country, and another kind of black soil on the plains. In the box country a certain amount of chocolate soil is mixed with the black, and there is a great depth of soil.
2557. What else have you grown? Onions and cabbages, and I have had large crops. I am clearing some land now.
2558. Can we form any general conclusions as to the capacity of the land in the district from the results you have obtained on the plot you have cultivated, or was that plot a selected area? There was nothing particular about the plot I selected.
2559. Have the other holdings at Brennan's Gap as much good soil as there is on your son's holding? There is one holding there of 790 acres, of which you could cultivate 50 or 60 acres if there were a railway. Another man, for whom I was asked to speak, holds 640 acres, and would be able to cultivate from 60 to 80 acres. If a railway be not made we cannot afford to grow more than we require for our own use. Of course, we produce a little wool.
2560. Is there a larger area of good land within 20 miles of the route of the proposed line from Bundella to Werris Creek than there is at Brennan's Gap? Yes; there is considerably more arable land along the route of the proposed line. Brennan's Gap is the worst part of Rockgedgiel, except for wool-growing.
- 2561.

2561. If the land now held under lease were thrown open, and a railway were made to the district, would a considerable agricultural population be attracted here? All the land that is thrown open will be snapped up. B. P. Sievers.
11 May, 1900.
2562. Has most of the good land here been alienated? I think there is a good deal of arable land still held under lease. That land would be cultivated if it were thrown open for selection, and if there were a railway.
2563. If some of the large landholders in the district offered good agricultural land for lease on the condition that they would pay for clearing it, and would provide seed for the first crop, taking as their share of the profit one-third of the produce, would you be prepared to take it up, supposing there were a railway? I should be prepared to pay a bag an acre for such land; that would be equal to about 10s. an acre. We can run a sheep to the acre when fully stocked. 100 sheep produce about two bales of wool, so that they would give a certain amount of traffic to the railway.
2564. Do you corroborate what has been said by other witnesses as to the expense and difficulty of sending away small consignments of fat stock? I have had no experience in the matter.
2565. Would you be prepared to pay as much as you now pay in land tax to get rid of any deficiency upon the working of a railway? I should. I think that if we went in for wheat-growing we should get an average return of 30 bushels to the acre. I have seen a sandy piece of ground, not far from here, produce 28 bushels to the acre, after having been cropped for seventeen years without manure. There were 8 acres in that piece.

Richard Curtis, farmer and grazier, Brennan's Gap, sworn, and examined:—

2566. *Mr. McFarlane.*] Have you resided long at Brennan's Gap? About two years. R. Curtis.
11 May, 1900.
2567. How many acres of land do you hold? 2,400 acres.
2568. The Brennan's Gap country has been described as rather poor;—is that your opinion of it? It is good grazing country. If it is ringbarked it will carry about a sheep to the acre.
2569. How would you class it as agricultural country? I think it is good agricultural country.
2570. How much of your area is suitable for wheat-growing or for cultivation? Eighty or 100 acres.
2571. Is your land a fair sample of the land in the district? I think so.
2572. Is agriculture carried on in the district to any extent now? No.
2573. What is the reason of that? They are nearly all new settlers there; and, besides, there is no market for produce grown there.
2574. If the proposed railway were constructed would all the available land be used for agriculture? I think so.
2575. Do you corroborate the statements of previous witnesses from Brennan's Gap in regard to the disabilities under which you are labouring? Yes.
2576. Are you in favour of the construction of the proposed railway? Yes.
2577. How far are you from the surveyed route? About 12 miles.
2578. Would you use the line to send produce to market? Yes.
2579. You would not continue to carry your produce to Quirindi? No.
2580. *Mr. Watson.*] What is the character of the holdings up your way? They are all conditional purchases and conditional leases.
2581. What kind of timber grows at Brennan's Gap? The timber is pretty nearly all box and kurrajong; but there are a few stringybarks.
2582. Is there any iron-bark on the higher land? No.
2583. Do you think the timber there will be of value? The stringy-bark is valuable timber.
2584. Is there enough timber there to provide traffic for a railway? I think so. Some of it would be rather hard to get out; but there is plenty of it.

John Ewbank, grazier and storekeeper, Bundella, sworn, and examined:—

2585. *Vice-Chairman.*] Will you make a statement of your views with regard to the question before the Committee? I wish to inform the Committee that there is splendid timber—stringy-bark and blue gum—on the main range. I suppose there are trees there having lengths of 60 and 100 feet as straight as a gun-barrel. Hundreds of thousands of feet of sawn timber could be got from those forests, and the timber trade would be a great source of traffic for the railway. Then, too, the soil is excellent; it will grow anything. The country that I am speaking of is about 15 miles from here, on the top of the main range—straight up Bundella Creek. J. Ewbank.
11 May, 1900.
2586. Is it easy of access? I think so; at any rate, it could be made easy of access.
2587. Is there any iron-bark there? No.
2588. Is there a considerable area of the country you speak of? A great area; enough to build a colony.
2589. Has the timber ever been tapped? No. I have been here for twenty-seven years, and when I wanted some slabs to build a store I was informed that I could be supplied with slabs 2 feet and 3 feet wide, and as smooth as if they had been sawn.
2590. What kind of timber was that? Stringy-bark.
2591. Is not stringy-bark a bad timber to place in exposed positions? It does for rails and palings; but it does not make good posts, because it does not stand well in the ground. It also makes good shingles. The land at the place I speak of is quite flat for many miles, and generally has water on it, though I have been told that there is no water there this season.

SATURDAY, 12 MAY, 1900.

[The Committee met at new "Colly Blue Hotel," Colly Blue, at 12 o'clock noon.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
JOHN CHRISTIAN WATSON, Esq.ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Thomas Woore Frederick Busby, grazier, Colly Blue, sworn, and examined:—

- T. W. F. Busby.
12 May, 1900.
2592. *Vice-Chairman.*] How far do you live from Colly Blue? Twelve miles.
2593. And how far from the nearest point on the route of the proposed railway? About 16 miles.
2594. What is the size of your holding? 17,000 acres. Two of us hold 11,000 acres of freehold, 3,000 acres of conditional purchase land, and 4,000 acres of conditional lease land.
2595. What is the average carrying capacity of your run? I bought a place with 18,000 sheep on it, and I have been running 15,000 or 16,000 on the average for the last eight years.
2596. Is there much difference between the carrying capacity of the freehold land and that of the leased land? Not when it is improved.
2597. But under original conditions? The improved land is equally good, whether it is on the leasehold area or on the freehold area.
2598. How would you describe your country? I have both ridges and plain country.
2599. What is the principal timber? Box and apple.
2600. How much of your land is suitable for agriculture? 9,000 or 10,000 acres.
2601. Is it black soil? Black loam on the creek flats and plains.
2602. Have you ever gone in for agriculture? Yes; I have 200 acres under cultivation now. I have had three crops of wheat, with an average yield of 25 bushels to the acre.
2603. Have you cut any wheat for hay? Yes.
2604. How much hay did you get? From 2 to 3 tons to the acre.
2605. Have the seasons during which you have been cultivating been favourable to agriculture? One year was, but the other two were not. Last year we got a good crop, but at most of the places around here they had to cut their wheat for hay. In a favourable season, I think we should get from 40 to 60 bushels of wheat to the acre.
2606. What market have you found for your agricultural produce? Hitherto it has all gone into Quirindi.
2607. How far is that from your property? Forty miles from the farm.
2608. What is the carriage to Quirindi? I pay 1s. 6d. a cwt. for my ordinary loading, but I think the cost of carrying wheat is higher.
2609. Are the rates of carriage a severe tax upon agriculture in this district? Yes.
2610. Do you speak on behalf of any of your brother pastoralists? Yes; on behalf of five or six of them.
2611. Has their experience been similar to yours? Yes; so far as agriculture is concerned.
2612. If a railway were constructed, would you farm a large part of your 9,000 acres? Yes; although without a railway we cannot afford to farm it.
2613. Would you cultivate yourself, or would you let our your land on the share system? I should probably do both. What I have done so far has been done on the share system.
2614. Has there been a steady increase in the area of land put under cultivation here, or is there a disinclination to increase the cultivated area without railway communication? Within the last five or six years everyone has cultivated a certain area, and the extent of cultivation is increasing every year.
2615. Do you know much of the movements of stock between the Northern and North-western lines and the Western line? Fully 100,000 sheep must have passed through the lane here last year, on the way to New England.
2616. Where did they come from? I do not know; they were on their way to New England for grass.
2617. Is that traffic usual, or was it due to abnormal seasons? It was due to the drought.
2618. Is there much loss of condition in travelling fat stock to a railway? It cuts them up a good bit. They have to go long stages without water from here.
2619. I suppose it does not pay to drive any but fairly large consignments of stock to the railway? The smaller the flock the greater the cost per head of sending it in.
2620. If the proposed railway were constructed, would small settlers frequently send away small consignments of stock to the Sydney market? I am sure they would.
2621. It would not pay them to do so at the present time? It would not.
2622. What is your rainfall here in average seasons? The average rainfall is about 27 inches.
2623. Is that a suitable rainfall for agricultural pursuits? Yes.
2624. It is estimated that there would be a deficiency of £18,000 upon the working of the proposed line, and it has been suggested that the land-owners who would be benefited by its construction should make some contribution to reduce the loss;—could you afford to contribute annually for that purpose, until the railway became a paying one, as much as you now pay in land tax? Perhaps, as a purely business matter, it might pay me to contribute; but, as a taxpayer, I would protest against such an arrangement.
2625. If, without making such a contribution, you could not get a railway, would it pay you and your neighbours to make the contribution? I think that possibly some might agree to contribute, but others would not. From a business point of view it might pay me to contribute, but I could not speak with certainty until I had looked into the matter.
2626. Have you been authorised to speak for others in respect to giving what land is required for railway purposes? I have heard some people say that they would give their land.
2627. You do not think there would be much difficulty in getting that concession? I do not think there would be much trouble about it.

2628. How would you describe the country between Colly Blue and Werris Creek? It is a succession of plains and ridges. T. W. F. Busby.
2629. What proportion of it, within 20 miles of the route of the proposed line, is suitable for agriculture? There is very little which is not. Some of the open plain country might be a bit too hard, but there is some of the best agricultural land in Australia on these plains. 12 May, 1900.
2630. Is it good fattening country? Yes; this is the finest fattening district in the Colony.
2631. What is the average weight of a fleece here? Good flocks will cut $7\frac{1}{2}$ or 8 lb. to the fleece.
2632. Do you fatten stock in this district for the Sydney market? Yes; there is more fattening than anything else done here.
2633. Is there much timber that would be valuable for railway construction or for other purposes close to the route of the proposed line? Yes.
2634. What timbers grow here? Iron-bark and pine. The red-soil country, after the timber has been taken off, grows very good wheat.
2635. Is it the practice in this district to stock up to the full capacity of the land? Yes; on freehold land.
2636. If the proposed railway were constructed, would the district become settled with a large permanent population? I think so. I and my family have been living within 50 miles of Colly Blue for the last seventy years, and I think that this is the safest and richest district in the Colony, and I have been in Riverina and in other districts.
2637. The experience of the share system in other parts of the Colony is that after the land has been under crop four or five years the owners use it for grazing again;—do you think that that would be done here? No; unless the land were being worked out and required improving. All wheat land requires a rest now and again; but I do not think there would be more than an ordinary rest given to it.
2638. You think that agriculture would be a permanent thing in the district? Yes.
2639. *Mr. Shepherd.*] On what terms do you carry on the share system? So far, I have merely stipulated that the land should be cleared. I have fenced it, and I have given the man who cleared the land the right to the crop. Now I have another man on different terms. He is to have a bit of it, and he has to get it ready for a crop next year.
2640. How long did you lease the land? For two years.
2641. After that time, had the tenant to give it up? Yes. Now another man has it, on slightly different terms. He has to sow and plough the land for me next year, while he will probably get some more ready for himself. I have really not enough land ready.
2642. Will it pay a man to crop land for two years only? It will pay the expense of clearing the land. I have been told that the terms I have given him are too easy.
2643. Does he find the necessary tools? Yes; I merely give him the land. Of course I have to run his horses.
2644. Was the land ringbarked before he took it over? What he took over was covered with green timber.
2645. How much an acre did it cost him to clear it? I could have had it cleared for about 15s. an acre.
2646. When does the rain fall here? Our best rains come between January and April. Then we get good spring rains in September. As a rule, we get wet winters. I should like to add that as the leased land is thrown open for selection every acre of it will be taken up. Land is becoming very valuable here. I own a property for which £3 an acre was offered, although the land had not been cleared, and there was about 11s. an acre owing to the Government on it.
2647. What was the character of that country? Some of it was plain country, and some of it red soil ridges, timbered with box and apple trees.

Alexander Pyke, farmer, Yarraman, sworn, and examined:—

2648. *Mr. McFarlane.*] Have you resided long in this district? Twenty-five years. A. Pyke.
2649. Have you a good general knowledge of its agricultural and pastoral possibilities? Yes. 12 May, 1900.
2650. What is the country like along the route of the proposed railway line, so far as you know it? It is good agricultural country, and good fattening country.
2651. How far is Yarraman from here? Twelve miles.
2652. Where do you get your supplies from? From Quirindi.
2653. How far is Quirindi from Yarraman? Thirty-five miles.
2654. How many tons of goods do you have sent up in a year? Yarraman, Blackville, and Coomoo Coomoo comprise a district which would be an important feeder to the proposed line. There are forty families in that district. I receive between 110 and 130 tons of goods per annum, and there are about 300 tons of goods received in that district altogether.
2655. What is the rate of carriage? I have paid as much as 3s. a cwt.; but 1s. 6d. is the present rate.
2656. How far is Yarraman from the route of the proposed line? It is within 12 miles of it.
2657. How does this district compare with other districts that you know? I should say that it is one of the best agricultural and pastoral districts in the Colony. It is one large plain from Colly Blue to Yarraman, and from here to Blackville, though there are occasional ridges.
2658. If the proposed railway were constructed, would you use it for bringing up goods? Yes.
2659. Would others in the district also use it? Undoubtedly. Only a short time back there was not an acre of land under cultivation in this district; but this year there will be more than 1,000 acres under cultivation in the district that I have spoken of; and if the proposed railway were made thousands of acres would be cultivated.
2660. Is there much land here available for cultivation? Not much Government land; but there are thousands of acres of secured land which the holders would be glad to lease.
2661. Is much cultivation done by these holders at present? The largest area under cultivation this year would be about 120 acres; hitherto the largest area has been about 70 acres.
2662. If the proposed railway were constructed, would the land which is suitable for agriculture be cultivated? I am sure that it would.
2663. To what distance from the route of the proposed line? Up Yarraman way it would be cultivated to a distance of 18 or 20 miles.

2664.

- A. Pyke.
12 May, 1900.
2664. Do you think that the large holders would lease out land for agriculture? Yes. At the present time Mr. Forester is cutting up his land for that purpose. He has 4,000 acres, and all of it, except about 300 acres, is fit for cultivation. In our small district there is a population of 300 persons at the present time, and at shearing time there are nearly 1,000 persons within a radius of 18 miles.
2665. If a railway were made, would the settlement increase? Yes; because where one person is employed now fifty persons would be employed then.
2666. Do many fat cattle and sheep go from this district to the Sydney market? Yes; a very large number in good seasons.
2667. If the proposed railway were constructed, would the stock be sent by train? The stock from our district would go by train, and so would stock from the district further out.
2668. Do you think that if the railway were constructed it would pay within a reasonable time? I think that the Government never undertook the construction of a better or more payable line.
2669. Do you think that the Railway Commissioners' estimate for traffic is too low? Yes; but the estimated loss is a very small one. Some account must be taken of the loss to the Colony through so many thousands of acres of good land lying vacant. I am prepared to erect a flour mill directly the construction of the line is assured. At the present time we have to pay from 5d. to 6d. a bushel to send grain to Quirindi; so that the local growers at Quirindi can send their produce to Sydney for much less than we have to pay. Notwithstanding that, however, we are extending our area of cultivation every year, and the extent of cultivated ground would be largely increased if we had a railway.

Francis Lord, farmer, Spring Ridge, sworn, and examined:—

- F. Lord.
12 May, 1900.
2670. *Mr. Shepherd.*] How far do you live from here? About 5 miles, in the direction of Werris Creek.
2671. What is the extent of your holding? 1,465 acres.
2672. How many acres have you under cultivation? About 200.
2673. Is all that under wheat? Yes.
2674. What is your average yield? About 12 bushels to the acre.
2675. How long have you resided in the district? Three years.
2676. Have you been growing during average seasons? No; during bad seasons.
2677. Would your yield be larger in a better season? Yes.
2678. Where do you find a market for your produce? I generally sell my wheat in Quirindi.
2679. How far away from your place is that? Thirty-seven miles.
2680. What does it cost you to send produce there? Last year it cost me 2s. a bag; this year I paid 1s. 9d. a bag.
2681. Do you consider those rates a handicap? A very great handicap. I admit that they are below the ordinary current rates for carriage, but, together with the low price of wheat, they make a big hole in our profits.
2682. How much of this land is freehold? It is all conditional purchase and conditional lease land.
2683. Would you be induced to cultivate a larger area if the proposed railway were constructed? I have been increasing my area every year for the last four years. I started with 35 acres, and this year I have 200 acres. If a railway were made I should be inclined to cultivate every available acre.
2684. Are your prospects sufficiently encouraging to lead you to go on increasing your area? Certainly.
2685. Are you in favour of the construction of the proposed line? Yes.
2686. Are your neighbours of the opinion that it would be of great benefit to the district? They all agree in that.
2687. How many landholders are there within 20 miles of your holding? I cannot say; but the whole of the land is occupied, so that if I wanted more land I do not think I could get it.
2688. Do you know if those who are engaged in agriculture under the share system are satisfied with their results? No. Mr. Binney carries on the share system on his holding, and those who are working with him seem to be fairly well satisfied; but I do not know what results they have obtained.
2689. Is land which is offered on the share system generally taken up freely? "4 D" is the only holding in the district on which land has been offered in that way, and it appears to me that nearly all the available land has been taken up.
2690. You think that the traffic which would be created by the construction of a railway would, within a reasonable time get rid of a deficiency of £18,000? Judging by the expansion of traffic which has occurred during the three years that I have been here I think that the deficiency would be soon made up.
2691. Would landholders be willing to give their land for railway purposes? I understand that the holders of Breeza were willing to give what land was required. Whether they are still ready to do so I cannot say.
2692. If you could save £50 a year by the construction of the railway, would you be willing to pay something towards getting rid of any deficiency? Personally, I should be glad to do anything in that way, because a railway is the only thing that will do us any good.
2693. Do you think that the principle is a fair one? I do not object to the principle.
2694. I suppose you run stock on your land? I have a few cattle, but no sheep at the present time; I am merely farming. I have been in other parts of New South Wales, and I think that the resources of this district are very great; but no encouragement is given for their development, nor is their development possible without railway communication. The line of demarcation between the agricultural and the pastoral interest is not so clear in this district as in others, because we are beginning to see that the black soil—which at one time was considered purely pastoral land—is good agricultural land. That has been proved by my own experience and that of others, though I admit that at the present time we do not exactly understand how to till the black soil to the full advantage. I have no doubt, however, that by observing and experimenting we shall eventually ascertain how to get the best results, and there is an enormous area of black soil country. No doubt this is a splendid wheat-growing country, and I think corn, barley, and other cereals could be produced here. Then, too, the railway would probably cause dairying to be gone in for in the district; but at present it is impossible for dairying to be carried on here, because there

is no way of getting rid of the produce. To get our wheat from Quirindi to Sydney costs us less than to send it from our homesteads to Quirindi, and at the present low price of wheat the cost of road carriage is a heavy handicap to growers.

F. Lord.
12 May, 1900.

2695. What has been your experience of the result of railway construction in other districts? When a railway terminus is made, a forced activity is created in the district, and it is often said that directly the line goes beyond a town that town is done for; but if the resources of the district are good, the town will not go back. If railways were never to be made because the terminal town would be injured by their extension, we should never have a railway outside the metropolitan area.

Francis Wilson Darby, grazier and farmer, Coolanbilla, sworn, and examined:—

2696. *Mr. Watson.*] What area of land do you hold? Nearly 3,000 acres.

F. W. Darby.
12 May, 1900.

2697. Do you cultivate any portion of your land? About 150 acres.

2698. How far are you from the nearest market? My place is 35 miles from Quirindi.

2699. What yield of wheat do you get? My average last year was about 20 bushels to the acre.

2700. Was last year an average season? No; it was a bad season.

2701. What would be your average yield for a number of years? From 25 to 30 bushels to the acre.

2702. What effect would the construction of the proposed line have upon the land immediately in your vicinity? If the railway were made, I and my neighbours would put a larger area under wheat, because we should have better access to market, and would be able to send away our produce at a profitable rate.

2703. Is a large proportion of your land suitable for agriculture? I could take 1,000 acres for agriculture without interfering with my grazing.

2704. Would you keep some of your land for grazing, even though it might be suitable for agriculture? Yes; I should not put it all under cultivation.

2705. Have your neighbours the same proportion of good land as you yourself? Some of my neighbours would have a greater proportion of agricultural land.

2706. What is the country like between your place and Werris Creek? It is plain country.

2707. Is the plain country suitable for agriculture, or do you prefer the rising ground? There is some of it which I would not care about taking. Some of the soil in the plain country is brown ground, and better for wheat than the black soil. There are large areas of rising country along the route of the proposed line which would be suitable for agriculture.

2708. Would all of that country be suitable for agriculture? No; the tops of the mountain ridges would not.

2709. What do you pay to have your wheat carried to Quirindi? About 1s. 6d. a cwt.

2710. Do you find that a handicap? Yes.

2711. Are you and your neighbours in favour of the construction of the proposed line? Yes; and I can speak for John Kelly, George Cameron, John Steel, William Della and brother, and Charles Crothers.

2712. Would they all go in more largely for cultivation if a railway were constructed? Yes.

2713. Would the line go through land belonging to any of those whom you have mentioned? No; we are all away from the route. I am 8 miles from Colly Blue; but my place would be within 5 miles of a station at Spring Ridge.

2714. With a railway you would save from 3½d. to 4d. a bushel in freight to Sydney? About 4d. a bushel.

2715. In view of that fact, would you and your neighbours be prepared to make any contribution towards decreasing any deficiency upon the working of a railway? I am not prepared to answer that question.

2716. What do you consider your land worth? From 30s. to £2 an acre, unimproved.

2717. If you saved 4d. a bushel in freight, on an acre yielding 20 bushels, you would save 6s. 8d.;—could you not, under such circumstances, afford to pay 2d. an acre towards reducing any loss on the line? I think so; on acreage under cultivation.

2718. If it became a question of having no railway, or having a railway and paying such a contribution, would you be inclined to make the contribution? Yes; under those circumstances.

2719. I suppose you send away fat sheep occasionally? If we had good seasons, I would send five or six trucks of fat sheep and two or three trucks of cattle away every year, besides sixteen or twenty bales of wool. With the railway close at hand it would pay us to send away a truck load of sheep at a time; but it does not pay us to drive a small flock 20 or 30 miles to a railway station. I might add that John Kelly, fourteen years ago, had 10 acres of black soil country under wheat, and got a yield of 20 bushels to the acre. Now he has 155 acres under cultivation, and the yield last year was 20 bushels to the acre.

William Douglas Simson, grazier, Trinkey, sworn, and examined:—

2720. *Mr. Watson.*] Have you any knowledge of the Crown land which would be affected by the proposed line if it were constructed? I know the Crown land on our own run, which is situated on the northern side of the route of the proposed line.

W. D. Simson.
12 May, 1900.

2721. What is the area of your run? 70,000 acres, including the land held under occupation license.

2722. How much of it is secured land? 28,000 acres.

2723. What proportion of the balance is suitable for agriculture? About two-thirds. Nearly all of that land will be thrown open for selection in a very short time, and other land in the district will also be available.

2724. Is that land now covered with green timber? Some of it is plain country, and some of it is covered with timber. The plain country has a light, black soil, which is suitable for agriculture.

2725. Do you know any other areas suitable for agriculture? There are 20,000 acres on a holding adjoining mine. There is a tremendous lot of good land on Bomera, and a lot of good land on Wandemah, 18 miles from the route of the proposed line, though some of it will be nearer to Curlewis.

2726. Do you think the Crown would be benefited by the construction of the proposed line by reason of the increased value which it would give to Crown land in the district? Yes; at the present time it will not pay us to clear and to cultivate this land; but if we had a railway here it would be profitable. I took up some land on an improvement lease, and most of that land would be suitable for agriculture if there were

- W. D. Simson.
12 May, 1900.
- were a railway near at hand; but the minimum rate of road-carriage now is 1s. 9d. a cwt., and in good seasons the roads are so heavy that it is almost impossible to get anything taken in at all, at cost of 2s. to 2s. 3d. per cwt.
2727. Is a large proportion of the secured land on Trinkeby holding suitable for agriculture? Yes; there is very little of it that is not suitable. The land that would not grow wheat would grow corn.
2728. Do you think that if the proposed railway were made landholders in the district would be prepared to cultivate their land or to lease it on the share system? Yes; if it would pay them to do so.
2729. Do you think it would pay them? I think so. I think that within a little while the returns from wheat will be much larger than they are now.
2730. What proportion of the leasehold areas that you are acquainted with is suitable for agriculture? I think about two-thirds. It is only the ridges that are not suitable. I have a garden at my place, and nearly everything seems to grow in it.
2731. Is it black soil or on the rising ground? It is nearly all red soil. I have had 70 or 80 acres of black soil under wheat for years, and in any sort of season we get from 3 to 4 tons of hay. We have never got less than 2½ tons.
2732. Is that soil lighter than some of the black soil? Yes; I once stripped 9 acres of wheat, and got a yield of 22 bushels to the acre. There would be a certain amount of traffic on the proposed line, not only towards Sydney, but also towards Melbourne. I have sent sheep to Sydney for sale, and they have been resold and sent on to Melbourne; but with a direct line I would send them to Melbourne myself. If there were a railway, all the fat stock going from the district would use it, because the roads are so eaten down that they are not fit for animals to travel on.

[The Committee met at the Spring Ridge House, at 4.45 p.m.]

George Clift, grazier, Breeza, sworn, and examined:—

- G. Clift.
12 May, 1900.
2733. *Vice-Chairman.*] What distance is Breeza from Werris Creek? Sixteen miles.
2734. Part of your holding is very close to the Breeza railway station? Yes; it surrounds the Breeza railway station.
2735. In what direction is it from the route of the proposed line? The proposed line would run parallel with our property on the southern side of it, all the way from Werris Creek to Spring Ridge, a distance of about 22 miles.
2736. What is the area of your holding? 130,000 acres.
2737. What is the average carrying capacity? From one to two sheep to the acre; it all depends upon the season.
2738. Is it all secured land? Yes.
2739. How much of it would be available for agricultural purposes? I could not say exactly, but some thousands of acres.
2740. Half of it? No, not so much. I dare say between 10,000 acres and 15,000 acres would be suitable for agriculture.
2741. Have you ever tried agriculture on any part of it? Yes.
2742. How much did you cultivate, and what yield did you get? My sons put in 50 acres last year, and, though the crop was a failure, they got 18 bushels to the acre.
2743. What yield do you expect in a fair season? From 35 to 40 bushels to the acre.
2744. What is the average weight of a fleece in this district? About 6½ lbs.
2745. Do you find any difficulty in sending away your wool and other products? Yes, from this side of the run.
2746. Is that because of the heavy roads? Yes.
2747. Would the proposed railway be of advantage to you? Yes. I could have sent 45,000 sheep away from here if there had been a railway and trucking conveniences.
2748. Do sheep lose in condition when being driven to the railway? Yes.
2749. If the proposed railway were made, would you truck from the nearest station? Yes, and I should send to other markets than those to which I now send.
2750. To what other markets? To Melbourne.
2751. Would it pay you to send stock from your place to Melbourne by rail? Yes, when stock was bringing good prices.
2752. Do you carry any cattle on your holding? Yes; but not a great number.
2753. Is yours good fattening country? Yes; I do not think you could get better.
2754. With the construction of a railway, would you be able to fatten more sheep than you can fatten now? Yes, and you could turn over your stock more quickly, and put others in their places.
2755. Have you at any time received large consignments of stock from other districts because of the drought in those districts? No; though some relatives of ours had 13,000 sheep on some of our country.
2756. Have you ever been forced to send away your own sheep during a drought to a more favoured district? Yes; twenty years ago.
2757. Not since then? No.
2758. Does this part of the country not suffer from droughts as much as other parts? No; and with rain it soon recovers.
2759. If the proposed railway were constructed, would you place a larger area of land under cultivation? Yes; I think we could lease a lot of land on the share system, if there were a railway here.
2760. Do you think that the share system would settle a considerable population in this district? Yes, under proper conditions, if people would live and let live.
2761. We have been informed that in some places where the share system has been in force, the landholders after three or four years have allowed the land to go back to pasture, and the agriculturists have had to seek fresh fields;—would that be the case in this district, or would agriculture become a permanent institution here? It would become permanent here.
2762. What area would maintain a farmer in this district in decent comfort? 300 acres.

2763. Under what conditions would you offer land to be farmed? A man now has 900 acres under wheat near Werris Creek on our holding. G. Clift.
12 May, 1900.
2764. What terms do you allow him? We have helped him along greatly.
2765. Do you think that if the proposed line were constructed the estimated deficiency of £18,000 per annum would shortly disappear? I think that the traffic on the line would increase every year.
2766. Would it pay you to contribute towards the reduction of any annual loss as much as you now pay in land tax on land within the influence of the railway? I am not prepared to answer that question, because I am only one of a firm, and the other members must be consulted.
2767. Do you think it would pay other landholders further along the line to contribute 1d. an acre per annum upon all land within 20 miles of the railway, in order to secure its construction? I think it would.
2768. Do you think that it would be of material advantage to have a connection between the Northern and Western railway systems? I think so.
2769. Would there be an interchange of products along a connecting line? I think so.
2770. Would you expect to find a market on the Western line, out towards Bourke? If there were a drought out there, we could buy stock there and bring them here by train; but it would not pay us to bring them by road.
2771. Are the runs in this district stocked to their full capacity? Our run is stocked up pretty well.
2772. Do you think that the construction of the line would result in a national gain, by reason of the saving of sheep which it would effect? I think so.
2773. Is there much room for starving stock in the New England district? Yes; that district is an outlet for stock from the plains.
2774. Would it pay stockowners out towards the west to use the proposed line to send stock to Aberdeen? Yes; because the driving of them by road takes away their condition.
2775. Would it happen in times of drought in the west that sheep in ill condition would be sent here to fatten, and then be trucked on to Aberdeen or some other place to be killed for export? Yes.
2776. What is the rainfall in this district? From 28 to 30 inches.
2777. What carriage do you pay from the furthest end of your property to the railway station at Breeza? I cannot say, because we use our own teams.
2778. Would you be willing to give the land required for railway purposes? Yes.
2779. Which line would you prefer—one from Dubbo to Werris Creek, or one from Wellington to Werris Creek? I should like the junction to be at Wellington.
2780. Is that because it would give you a shorter route to Sydney and to Melbourne? Yes.

Archibald Campbell, grazier, Spring Ridge, sworn, and examined:—

2781. *Mr. Watson.* What is the area of your holding? About 2,300 acres. A. Campbell.
12 May, 1900.
2782. Is it all conditional purchase and conditional lease? It is all conditional purchase or freehold.
2783. How far is it from where we are now? About 11 or 12 miles from here south of the route of the proposed line.
2784. Would this be the nearest point to it on the proposed line? Yes.
2785. What is the carrying capacity of your land? In reasonable seasons about two sheep to the acre.
2786. During the recent dry years how many sheep have you been able to carry? I have carried a sheep and half to the acre.
2787. Is yours all plain country? No; I have some timbered country as well.
2788. Is it fairly level country? Yes.
2789. How much of it is suitable for agriculture? I should think quite 1,800 acres.
2790. Do you cultivate any of it now? Very little.
2791. What distance are you from Quirindi? Thirty miles.
2792. Is that too far to enable you to cultivate with a profit? Yes.
2793. What is the maximum from a railway station at which a man can profitably cultivate? From 10 to 15 miles.
2794. Is the distance shorter in this district because of the heavy character of the road? Yes; it is very heavy drawing in this district, more especially in wet seasons.
2795. Are there many who have comparatively small holdings in the vicinity of your place? Yes.
2796. Is their land something like yours? Yes.
2797. Do any of them go in for agriculture? No, because they have no inducement to do so.
2798. What does it cost to send wheat from that part of the district to Quirindi? I should think it would cost from 1s. 6d. to 1s. 9d. a bag.
2799. Do you regard that charge as prohibitive? Yes.
2800. You have not grown anything yourself? Only a few acres for hay.
2801. With what result? With very good results. One year I got 2½ tons of hay to the acre; but when the season was dry I got less.
2802. Did you cultivate the plain country or the timbered country? The timbered country.
2803. Is that country regarded as better for agriculture than the plain country? It has not yet had a reasonable trial; but it is supposed to be equal to, and perhaps superior to, the plain country.
2804. Is there a good proportion of agricultural land between Trinkey and Werris Creek? Yes.
2805. Does the good land extend for any considerable distance on both sides of the route of the proposed railway? Yes.
2806. If the proposed railway were constructed would it pay you to go in for agriculture? Yes.
2807. Would agriculture assist your grazing operations? Yes, because it would improve the land.
2808. Do you fatten any stock? Yes.
2809. Would a railway close at hand be of assistance to you in sending away small consignments? Yes.
2810. Do you experience any difficulty in driving your stock to Quirindi? Yes; it costs as much to drive a small flock of, say 100, as to drive 500.
2811. If you were close to a railway, would you frequently send away small consignments? Yes; but under other circumstances we do not trouble about small lots.
- 2812.

- A. Campbell. 2812. Do you care to express an opinion about the suggestion that landowners should contribute towards the reduction of any deficiency? Personally, I should be prepared to make a contribution in recognition of the benefits which I would derive from a railway, and I can speak for a neighbour, Mr. Dickson.
- 12 May, 1900. 2813. Would it be worth your while to pay 1d. an acre towards making up any loss? Yes, for a time, at any rate.
2814. How far would you be from the line at the nearest point? About 5 miles.
2815. Would it pay people within 15 miles to make a contribution? I think it would pay them to make some contribution.
2816. Is there a great desire on the part of the people here to have the railway constructed? Yes.
2817. Will their operations be seriously handicapped if they are not given a railway? Yes. Without a railway very little farming will be done, but with a railway, new industries, such as dairying, will arise.
2818. Will this country be suitable for dairying? Yes, some of it.
2819. What sort of country would be most suitable for dairying? I think the timbered country bordering the plains, and in the winter time, when they produce rich herbage, such as thistles, the plains themselves.
2820. Do the large landowners here prefer to run sheep rather than cattle? Yes; because sheep are more profitable.
2821. That is not an indication that cattle would not do well here? No.
2822. Is there any large area of Crown land in the district which is likely to become available for settlement, or has most of the land here been taken up? Most of it has been taken up about here, though there may be some further out. Mr. Dickson, who is present, has asked me to speak for him. What would benefit me would benefit him.
2823. What area has Mr. Dickson of whom you speak? I think about 3,300 acres, or a little more.
2824. Are the small holdings round you similar in character and possibilities to your own? Yes.
2825. So that in speaking for yourself you are practically speaking for them? Yes.

Richard Kingston, farmer, Spring Ridge, sworn, and examined:—

- R. Kingston. 2826. *Mr. McFarlane.*] What is the extent of your holding? 180 acres.
- 12 May, 1900. 2827. Do you use the land for cultivation? Yes.
2828. How many acres have you under cultivation? About 60.
2829. Has your land been under cultivation for any length of time? Yes, for seventeen years.
2830. What do you grow? Wheat generally.
2831. What has been your average yield? My average yield has been from 27 to 30 bushels to the acre. I have had as many as 45 bushels, and as few as 16 bushels to the acre.
2832. How do you get your produce to market? I carry it to Quirindi.
2833. And it eventually goes to Sydney? Yes.
2834. What would it cost to convey it to Quirindi? About 5d. a bushel.
2835. Are there many agriculturists near you? Yes, three or four.
2836. What success have they met with? My neighbour, Mr. Barnes, has country similar to my own right through.
2837. Is it ridgy country or plain country? It is ridgy country.
2838. What has been your experience of the ridgy country, as compared with the plain country, for agricultural purposes? I have not seen very much of the plain country worked, except during the last two years, and agriculture has been almost a failure on the plains. The ridgy country stands the drought better than the plain country.
2839. Is most of the country which is fit for cultivation under crop? No.
2840. Is there any considerable area under crop? There would be if the land were available and we had a railway.
2841. Is there a large area of Crown lands not available? Yes; there is a reserve on each side of the plain.
2842. Are these reserves large? Yes.
2843. Is the country fairly good? Yes; most of it is as good as the country upon which I am growing wheat, though some of it is sandy.
2844. If the railway were constructed, would the larger landholders lease their land for agriculture? I believe that a good many of them would.
2845. How much agricultural land would it take to maintain a family? Four hundred or 500 acres; but I live on 180 acres.
2846. Do you think that mixed farming will continue in this district? Yes.
2847. If the proposed railway were constructed, would farmers use it to send their produce to market? Yes.
2848. Would its construction result in increased settlement? I believe that it would.

David Lawrence, saw-mill proprietor, Spring Ridge, sworn, and examined:—

- D. Lawrence. 2849. *Mr. Shepherd.*] How far is your place from here? Four miles, in the direction of Colly Blue, and it is 32 miles from Quirindi.
- 12 May, 1900. 2850. Do you supply timber to the district as far as Werris Creek? I supplied 50,000 feet for the meat-works at Werris Creek.
2851. How long have you been here? A little over seven years.
2852. Have you always been able to keep your mill at work? Yes, fairly well during the last twelve months; the previous year I had a great deal of lost time.
2853. How much land do you hold? I hold 69 acres, under special lease.
2854. Do you cultivate any of it? No.
2855. How far would the railway be from your place? It would be 200 or 300 yards from the saw-mill.
2856. If it were constructed, I suppose it would pay you to send timber to Werris Creek? Yes, or to Quirindi. I have numerous inquiries for timber from Quirindi and from Tamworth; but I cannot compete with the local mills. The price for carriage is 2s. 6d. per 100 feet, which is as reasonable a price as the carriers can draw for, though I have paid as high as 3s.

2857.

2857. Have you plenty of timber? Yes; timber that would keep several mills going.

2858. Is it a good class of timber? Yes. I had a letter from the contractor for the meal-works, in which he stated that the clerk of works considered that our timber was the best on the job. I believe that Mr. Clift, one of the directors, recommended the timber, although he is not a gentleman with whom I am acquainted.

D. Lawrence.
12 May, 1900.

2859. Do you think that you could compete with other saw-mills if you have cheaper carriage? Yes. They only charge 9d. a 100 feet to carry timber from Boggabri to Quirindi, so that I cannot afford to compete with that timber under present conditions. I had an inquiry for timber for the "Terminus Hotel," at Quirindi, but I could not accept the contract.

2860. What timber do you generally saw? Pine and iron-bark. The very best timber grows in this district. I believe that the construction of the proposed railway would be of benefit to every one out this way. The farmers must find it very hard not to be able to get their wheat to market without paying exorbitant prices. Of course, the carriers' charges are reasonable under the circumstances; but they are too high to allow producers in this district to compete with people elsewhere.

2861. Do the people here seem inclined to go in more largely for agriculture? I think that they would do so if they could get their produce to market more easily. We have splendid agricultural land here—I do not suppose you could get better anywhere.

2862. What is the pine suitable for? For cabinet-work and for ordinary house-building.

2863. What is the thickness of the sap-wood? Two or 3 inches, according to the size of the tree.

Charles Binnie, grazier, Spring Ridge, sworn, and examined:—

2864. *Vice-Chairman.*] Will you make a statement to the Committee of your views in regard to the matter into which they are inquiring? Perhaps I had better begin by giving you the results which we have obtained in this district from our agricultural and grazing operations. During the last two years I have been trying to turn my pastoral holding into an agricultural holding, with varying success, chiefly because of the very bad seasons which we have had of late; but, notwithstanding these bad seasons, I have had a sufficient measure of success to make me very hopeful of the final result when we again get normal seasons. The total area of my secured land is about 12,134 acres, and I hold 2,000 acres of land, which is of little value as regards returns, under annual lease. The cattle now upon the holding number 189; the sheep, 2,618; my horses, 82; and I am also carrying a large number of horses belonging to my tenants. The original "4 D" holding, which was my brother's property and my own, comprised between 18,000 and 20,000 acres. In 1889 our sales of fat sheep were 12,184; of cattle, 85; and of wool, 122 bales; and at the end of the year we possessed 7,900 sheep and 957 head of cattle. In 1895 our sales of sheep were 11,420; of cattle, 280; and of wool, 336 bales. The cattle and sheep were sent to market as fat stock, and at the end of the year we had 18,804 sheep and 130 head of cattle. In 1896 our sheep sales amounted to 29,211, 12,000 sheep being sold as dealers' lines. We sold no cattle that year, but our output of wool was 189 bales; and at the end of the year we had 13,847 sheep and 580 head of cattle. At the present time I am engaged in agricultural operations on the share system, and upon my property there are now seventy-two souls.

C. Binnie.
12 May, 1900.

2865. *Mr. Watson.*] Including both tenants and employees? Yes; everybody living upon the place. The total quantity of goods carted from Quirindi in 1898 was 81 tons, and in 1899, 96 tons. During the present year we have imported 32 tons to date. In 1898 we sent away to Quirindi 40 tons; in 1899 we sent away 50 tons; and this year we have sent away 31 tons to date, with a large quantity still to follow.

2866. What does the tonnage to Quirindi represent? A small part of it wool, and the balance agricultural products—wheat and chaff. In 1898 we ploughed up 1,053 acres, in 1899 we ploughed 2,870 acres, and this year we hope to plough 3,630 acres. There are also 800 acres in farms which are ready to let, but which I have not been offering vigorously because of the bad seasons. In 1898 we obtained 800 bags of wheat—the crop that year was almost a failure—and 180 tons of hay; and in 1899 we obtained 4,250 bags of wheat and 636 tons of hay, as nearly as the weight of hay could be estimated. At the present time we have 400 tons of wheat and 300 tons of hay to send away. That hay does not include the hay which is used for the tenants' horses. One farmer, who has ploughed 320 acres of the ridgy land, obtained 1,080 bags of wheat. Part of that crop was almost a failure, while other parts were very good; but the samples of wheat obtained were very promising throughout. I have been asked to quote the following results obtained last year from small areas. The sowings covered a long period, owing to the dryness of the season. Mr. Chas. Baker, who came from South Australia, obtained an average yield of 15 bushels to the acre from 80 acres sown in June and July. Mr. H. Ratzmann, from South Australia, obtained an average yield of 24 bushels to the acre from 30 acres sown on the 23rd June. His land is a black-soil plain. Mr. William Carlyon, from Victoria and Berrigan, had the misfortune to have his crop struck down when it was almost in the bags. He had 250 acres spoiled by an unusually late frost, on the 29th September, and he considered that the crop would have averaged 32 bushels to the acre. However, he cut most of it for hay, and obtained 400 tons; but where the thistle had overtaken the wheat it was not cut for hay. Since 1877 we have never suffered serious losses upon the "4 D" holding from dry seasons. In my fifteen years' personal recollection our biggest loss was in 1895, when 300 old ewes, which were weak after lambing, were killed by a very severe frost, which did terrible damage to stock coming off shears. In regard to the benefits which I hope from the construction of the proposed line to myself personally, I might mention at once the cheapness of carriage for the large amount of wheat which I hope to produce, and an interchange of products which I would benefit from, but which cannot be particularised. As an illustration, I might say that five or six months ago 7,000 wethers were being offered for sale in the Riverina, and if I could have trained them here in economic fashion I should have purchased them. Then, again, on several occasions in different seasons fat stock from "4 D" have been sent to Sydney and sold there, and have then been trucked from Sydney to Melbourne. Now, if we had had the advantage of a cross-country line, we should have saved the buyers' profit, and sent our stock to Melbourne ourselves. Under Federation I hope to gain great advantage if the proposed railway is constructed by trading with the southern market, and for that traffic I prefer the Wellington to the Dubbo connection. When I was in Moree a few weeks ago, making inquiries as to where their chaff and other produce supplies came from, I was informed

C. Binnie.
12 May, 1900.

that for the last two years contracts had been let in Orange for chaff, which had to be sent right round through Sydney. If the proposed railway had been constructed, that chaff would, of course, have been sent over here. I have 300 or 400 tons of hay to dispose of as chaff; but I shall find it difficult to obtain a profitable market for it, because of the expense of carriage. If there had been a railway, however, I could have sold it in the western districts at profitable rates. The northern districts are quite apart from the western and the southern districts. At the present time we cannot buy or exchange products with them because of the long distance by rail around through Sydney. West and north-west from Bourke, however, there is a very large market to look to for store stock. We are hardly able to avail ourselves of this market now, because of the distance and expense of travelling to and from it. I am, inclined, however, to think that if the proposed railway were constructed the people of the northern districts would largely avail themselves of it. In dry times it would pay us to take advantage of the starving-stock rates to stock up country here which might be under-stocked. The average rainfall of this district, as shown by the Government map, is upwards of 27 inches. I have heard it asked whether, in view of the big loss which it is said would be incurred by the construction of the proposed line, the people within 10 miles of the road could afford to contribute a penny an acre, and those within 20 miles of the route a halfpenny an acre, towards the reduction of the deficiency. From a business point of view, in order to get the railway, I should be ready to contribute; but, as a taxpayer, I would protest against any contribution being asked for, and for this reason: If I improve my leasehold land, so that it becomes more productive, I must pay a larger land tax to the Crown. If I turned my pastoral land into agricultural land, which I would do if the railway were constructed—and I think the same thing would be done right through the district, seeing the excellent climatic conditions, which you cannot make as you make railways—I should have to pay something more to the Commissioners of Taxation later on. A minor objection to the suggestion that the landowners of this district should contribute towards reducing any deficiency is that many other districts in the Colony are being served by railways for which we, in common with the rest of the taxpayers, are paying, and for which the people of the district served are not specially taxed.

2867. If your land was subjected to a charge for the upkeep of the railway, the Government Appraiser would be bound to deduct the amount of that charge from the taxable value of the land? Yes; but I do not think that that would be considered until we had a Privy Council case over it. That is my opinion from my dealings with the Commissioners of Taxation. Evidence has been given in regard to the possibilities of the timber trade in this district. I know that on the North-western line the timber trade, which was so profitable for many years, is now in a languishing condition for the want of timber to work upon; so that they are now drawing pine 30 miles to a sawmill, and are getting up trees that are practically saplings. The proposed railway, however, would open up a very considerable area of timber country. I believe I have £1,000 worth of matured pine upon my estate, and I would market it if the proposed line were made. I consider that 60 per cent. of the country between Oakey Creek and Werris Creek, a distance of 60 miles, and of which I have a fairly intimate knowledge, is fit for agriculture; and, if the line were made, large areas of land which is now considered only second-class grazing land, and is in many cases not used at all, because of the timber on it, would be put under cultivation, and that would enhance the value of all the land in the district. I have been informed that as many as 10,000 acres of land upon Brecza holding are shortly to be thrown open to settlement, as the result of an exchange, and that land would be within 10 or 14 miles of the proposed line. From the evidence which I gathered on the subject of agriculture before I went into it myself, I learnt that in making a comparison between this district and a district like Berrigan, which is an exemplary agricultural district, that the value of the land there rose in three years from 30s. per acre as pastoral land to £4 an acre as agricultural land. In the Berrigan district the climate is indifferent, the rainfall being only about 17 inches, and the soil weak; so that I am of opinion that it would not stand agriculture for any long period; whereas here farms have been cultivating for twenty-five years, and there has been very little diminution of the productiveness of the ground.

2868. *Mr. Shepherd.*] Have farmers been cultivating in this district continuously for twenty-five years without the assistance of manure? They do not know what manure is up here. The percentage of loss amongst crops, too, is exceedingly small. Mr. Kingston omitted to state that he has lost only one crop out of sixteen. With regard to the value of the black soil for agriculture, I desire to say that some of the best yields obtained in this district has been obtained from black soil.

2869. *Mr. Watson.*] Has any attempt been made to test the black soil country for a number of years? One farmer told me that he had cultivated both black and red soils for some years between here and Quirindi, and that if the season was bad he was likely to lose both crops, though he might save something on the ridgy land; but that in a number of years the black-soil country yielded bigger returns than the red-soil country.

2870. The returns from black soil are so large that a man can stand an occasional loss? That is how he argued; but our experience is not sufficient to enable us to say which soil lasts best. The black-soil plains have not been cultivated until recently in this district, and it has been a very vexed question whether black soil is any good for agriculture. Prejudice dies very hard; but the Darling Downs, which are almost wholly under cultivation, are a black-soil district.

2871. Is not the elevation of the Darling Downs greater than the elevation of this district? Yes; and the rainfall there is a little more. I think they had 31 inches about Warwick. I am cultivating four different sorts of soils. The very blackest and heaviest of soils has hitherto given the heaviest crop. That was the crop which I referred to as having been struck down by frosts. I am also cultivating chocolate soil, and the ridgy soil. That soil is very friable. Then there is a stiffer black soil which might almost be called a blue soil, and which has a slightly clayey element in it. On that soil I grew a crop of wheat twelve years ago, which was estimated by farmers at 40 bushels to the acre. I put the crop in to kill the very rank growth that came up and overmastered a lucerne patch that I was trying to establish. I had lucerne established here for twelve or thirteen years, and it would have died from neglect if that would have killed it. Because of the amount of work to be done, we allowed it to go to seed, but it lasted twelve or thirteen years, until, a short time ago, we put the plough through it.

2872. *Mr. Shepherd.*] What sort of soil is it in? The blue-black clayey soil. We have cultivated a small area of rather weak ridgy soil for fifteen or sixteen years. That soil has stood fairly well; but after ten years cropping it showed signs of getting a little weaker, though we seldom lost an entire crop. We grew hay on that land.

C. Binnie.

12 May, 1900.

2873. Have you ever tried oats? No; I would not try oats while growing wheat, for fear of getting them into the soil, and not being able to get them out again.

2874. Have you tried maize to any extent? Yes; I had about 14 acres under maize in my orchard during the three dry years 1895, 1896, and 1897. The ground is situated on a hillside, and has a good free loamy soil. The crop on that land averaged 45 bushels to the acre when crops on the low-lying land in the district were failures.

2875. You have not tried maize on the black soil? No. Our roads are in a terribly bad condition after rain. I have seen them so bad that for weeks at a time it has been impossible to take heavy traffic over them, and, sooner or later, as our production increases—and agriculture is stretching out through the district further and further every year—we must come upon our Parliamentary representatives, and ask them to give us roads. It will cost a very large amount of money to make roads through black-soil country, and the Crown will get no direct return from the expenditure, as it would get from expenditure upon a railway. I understand that a very large area of land along the route of the proposed line has already been surveyed for settlement, and that 50,000 acres on the Bomera holding, 50,000 acres on Tinkaramina holding, and 20,000 acres on Queensborough holding will shortly be available for selection, and I have no doubt that every acre, no matter how bad, will be taken up. This land has hitherto been entirely unproductive, and no doubt a small area will remain unproductive, do what you will; but hilly, ridgy land, which, under pastoral occupation often carries no stock at all, will, under agriculture, in most cases, be made productive. The construction of this proposed railway will assist to bring about that change. In my opinion, no railway proposal could be submitted to the Committee which would serve so great a number of people as the proposed line would serve, because it goes beyond mere local interests. A railway from Wellington to Werris Creek would serve people living beyond its terminal points. Notwithstanding this, however, the Commissioners of Railways, while recommending other railway proposals, have condemned this. In reply to their condemnation, I would say that it is impossible to make a climate. The people between Brewarrina and Collarenebri may want a railway; but the construction of a railway in that district could not benefit such a great number of people as the construction of this line would benefit, nor would it tend to alter the value of the land so much. That country is all pastoral country, and can never be anything else.

2876. *Mr. Levien.*] Do you think that the district gets full credit for all the produce that it sends away? I do not know if I can presume to comment upon the official evidence which has already been put before the Committee.

2877. *Vice-Chairman.*] You are quite at liberty to do that? The Members of the Committee have now occupied twelve days in their trip through the district which the proposed line would serve, and, although they have seen a good deal of it, I do not think they have seen it all. They have travelled, too, in fine weather. The Railway Commissioners, however, had the misfortune to meet with extremely bad weather for a start, and on the black-soil plains they got into a terribly heavy storm. I need not remark upon the delays which take place when our roads become wet. Notwithstanding the state of the roads, however, the Commissioners were only three days going through, and, upon their knowledge of the district, so hurriedly obtained, they put before the Committee a full account of its possibilities, and a condemnation of the scheme. I have taken the liberty to go through some of the evidence which has been placed before the Committee by three officers of the Railway Department—Messrs. Deane, McLachlan, and Harper—and I wish to draw the attention of the Committee to the contradictory nature of their evidence, and to the contradictions in Mr. Harper's evidence taken by itself. As a taxpayer, and as one who is interested in this proposal, I think I am justified in what I am about to say. Although Mr. Harper holds an important position as an officer of the Government, it must be apparent to anyone who looks through his evidence that the answers he gave when under cross-examination by members of the Committee, on the second day of his examination, are most unsatisfactory. That evidence is a mass of contradictions, and the evidence of the three gentlemen whom I have named will not bear comparison. Mr. Deane makes a small error in stating that the black soil plains are not suitable for agriculture (Question 21). That is still a moot question. Then, in reply to Question 37, he states that he believes "that the owners of land would be very glad to let out the land on the share principle," and that "there is a good deal of Crown land still for sale which would be suitable for agriculture." In reply to Question 42, he says that he believes the district is one which would carry a large population; and, in reply to Question 43, that "the alienated land by no means comprises all the best land." In reply to Question 47, he appears not to know how the Railway Commissioners make up their estimate of traffic. In reply to Question 49, he is of opinion that there would be a greater increase of traffic in an agricultural than in a pastoral district. In reply to Question 53, he agrees to the statement that "there is no population between the stations." That is evidently an error which the Commissioners fell into, since they did not announce their visit to the district, so as to give people an opportunity of coming forward to meet them. In reply to Question 57, Mr. Deane says that the box-tree country is magnificent agricultural country. His evidence, however, differs entirely from that of Mr. Harper and Mr. McLachlan, who voiced the opinions of the Railway Commissioners. Mr. McLachlan says, in reply to Question 87, that the proposed railway would not be of service in the removal of starving stock; but, in reply to Question 147, he says "I know from some squatters that in the last drought the western people found it difficult to find grazing country." Then, in reply to Question 91, he submits a return showing that the number of starving stock shifted during one month—November, 1899—was 68,500, and in his next answer he says, "during the two succeeding months we shifted 300,000. Yet he does not think that the proposed line would be of service in shifting starving stock; and in another place he says that he does not think it would pay owners to shift their stock. He also unwittingly makes a statement in favour of the proposal when he says that drought in this Colony are only partial; and he goes on to point out that while the Bourke district suffered in 1897, the Narrabri district had a good season then, and, the inference is, could have taken in starving stock. He told the Committee that bad droughts occur at Werris Creek; whereas, as a matter of fact, the Werris Creek district has a rainfall of 30 inches, and they do not know what it is to lose stock there. The only use that he could think of for the proposed railway is for the transfer of rolling-stock from the Northern line to the Southern or Western lines. He says, in reply to Question 106, that the Commissioners "do not anticipate any big development in agriculture"; and, in reply to Question 109, that they would prefer a connection between Collarenebri and Brewarrina, though, as I have shown, such a line could not increase the value of the land through which it would be taken. In
reply

- C. Binnie.
12 May, 1900.
- reply to Question 118, he says, "I believe there is very little Crown land left," and that the construction of the proposed line would not intensify production. Then I come to one or two answers which are rather vital. He is asked to compare an existing line with the proposed line, and he takes the Blayney-Harden line. In reply to Question 134, however, he contradicts his previous evidence, because he says that the Blayney line has encouraged agricultural settlement, and in his next answer he agrees that there is now more wheat and other produce grown in the district through which it passes. Although the Railway Commissioners say that they do not anticipate much traffic on the proposed line, and estimate its revenue at only £8,586, they admit that the Blayney line, which costs three times as much per mile as this line will cost, now pays working expenses. Mr. Harper states that he thinks that £150,000 would be required for the resumption of land along the route of the proposed line; but I believe that very little would be required for the purpose. Mr. Charrington, who has 7,000 acres of land in this district, and who has authorised me to speak for him, is willing to give any of his land that may be required for railway purposes, I should also be willing to give any of my land, and I am of opinion that most of the people on the first 60 miles of the Werris Creek end of the route would willingly give their land. I am also authorised to say, on behalf of Mr. Charrington, that if the line were made he would go in largely for agriculture. In reply to Question 170, Mr. McLachlan says, that the Railway Commissioners had based their estimate of traffic upon the existing traffic, that is, that they will not take into consideration prospective traffic. In reply to Question 179, he says, "The Commissioners do not anticipate that a development in agriculture would take place if the line were made;" and, in reply to Questions 182 and 183, he states that the three Commissioners drove through the district, and got information from local people. Now, although I have been along the route, I have been unable to find any local person from whom they got information, and the time they allowed for its collection was very limited. Nevertheless, Mr. McLachlan states, in answer to Question 181, "they always make due inquiry." In reply to Question 187, he says that, "they took three days" to make this inquiry. In reply to question 188, he says, that if the officers of the Department give evidence to the contrary of that it would be incorrect. Then Mr. Harper, Question 211, states that he did not think that the line would serve my estate. I beg to differ from him on that point. In reply to Question 213, he admits that, "there is a lot of land on that line which agriculturalists would be glad to get hold of." In reply to Question 211, he thinks that those who at present own the land would go in for agriculture. In reply to Question 260, he says that, although he has been over the country, he cannot give any information as to its character. Yet the day before, in reply to Questions 204 and 211, he does give an account of it. Then, in reply to Question 274, he will not answer when he is asked whether the country "is of such a character that it would carry a large population." Although he has been over the country, he says in reply to Question 276, that there is no good land near Werris Creek. I must leave the Members of the Committee to judge for themselves on that point. In his replies to Questions 290 to 296, he admits that the Moree line, the Cobar line, and the Berrigan-Kinlay line have all exceeded the estimated traffic return. I believe that the traffic estimate for the Moree line was exceeded in the first two months that the line was opened, and those were not the months of the wool season. As another instance of the inaccuracy of the estimates which emanate from the same quarter, I would refer to the results obtained by the George-street tramway.
2878. *Mr. Watson.*] Mr. Harper was not responsible for that estimate? But it came from the same department. These officers are only the Commissioner's mouthpieces. In reply to Question 305, Mr. Harper admits that any squatter will let his land if he can get good farmers to take it. In reply to Question 342, he says that squatters will not send stock to New England, because the grass there is too sour. I need not comment on that answer. Thousands of sheep went to New England during the last drought. Mr. Harper also says that fluke is always there, but that is another mistake. In reply to Question 344, he says that there is no foot-rot there. Again a mistake. In reply to Question 367, he says that he could not advance one valid reason in favour of the construction of the line, and, in reply to the next question, he repeats Mr. McLachlan's statement that the only use the Railway Department would have for the line would be in expediting the removal of rolling stock. I think that if the Railway Commissioners had wanted to damn this line, they could have done it in an artistic fashion. If one reads the evidence of the three officers whom I have named, he will find lots of excuses, but not one valid reason why the line should not be constructed.
2879. *Vice-Chairman.* You anticipate a large increase of agricultural settlement along the route of the line which would afford traffic to it? Yes, and I base that opinion upon the fact that agriculture has been stretching further and further away from the existing lines during the last four years. I know that agriculture is being prosecuted at Tambor Springs, and when I was out there lately, I saw a man carting his wheat from there to Quirindi.
2880. Will you not admit that a large portion of the best land in this district has been alienated? The bulk of the best land has been taken up, and that is only natural.
2881. The success of the proposed line, so far as it depended upon agricultural traffic, would depend upon the attitude taken by landholders along the route in regard to agriculture? Not entirely. There is quite enough land yet to be thrown open to give a sufficiently large agricultural area to make the line profitable. If the second-rate land in the district were brought under agriculture it would produce more than the best land originally taken up under stock.
2882. We have already seen in other districts that the share system, though apparently successful for a time, has not permanently settled population upon the land held under tenure; but that after, at most five years, the farmers had been sent away, and the land has been put under pasture again? There is no secrecy about the system on which I am working. I have spent enough money on each farm to show that I intend the farming on my estate to be a permanent thing. I hope that the farmers who have taken land for five years will keep it, and that their families will succeed them. I hope, too, with fair seasons to increase my agricultural area each year, until the whole of the land that is capable of growing produce is under crop.
2883. I understand that you have been to a considerable trouble in visiting other districts and obtaining information with a view to the utilisation of your land for farming? Yes.
2884. As a result, you intend to establish agriculture permanently on your estate? That is my intention, and, instead of having nomadic and single men, I will have no man that is not married. I let one farm to a single man, but he had it in his lease that he was to get married within twelve months. The bigger the family, the more consideration I shall give.
- 2885.

C. Binnie.
12 May, 1900.

2885. Have you had sufficient conversation with other landholders holding large areas, such as you hold, to be able to say whether they are likely to go in for the same system? Whenever a new thing is introduced into a district it comes in for a lot of adverse criticism, and when I started here most people thought I was utterly mad. Those who scoffed at me most, however, were, six months afterwards, letting their land on the share system. I believe, from conversations I have had with my neighbours, that they are watching this experiment, and I admit that it is an experiment. Although I have seen everything that I could see elsewhere, I have seen no place that promises better as a district for wheat-growing, and already some of my neighbours are following my lead in the share system of farming. I believe that my success would depend very much upon the construction of the proposed railway.

2886. Would you care to give the Committee the details of the agreement made between you and your farmers? Certainly. I clear the land, not for a stump-jump plough, but for a set plough; and I do all the fencing necessary to separate each farm, and to make a little horse paddock for each farmer. Then I give them galvanized iron for their houses, stables, barns, and so on, and they get what timber they require for building purposes in my forest. I also find water on every farm, where possible, by putting down wells; and I provide seed wheat for the first year. I have also helped the tenants, to some extent, with my own horses; but that is not in the agreement. The seed wheat for all other years has to come out of crop. The tenants find all the plant, and all the labour necessary for working the farm, and results are divided equally between tenants and landlord. I handle the seed wheat, taking out of the crop the quantity that has been put into the land, and I put back good seed in the shape of screened wheat, out of which all black oats and foreign grain has been removed, handing over each time as clean and perfect a sample as I can.

2887. What are the terms of the agreement concerning the use of the land between harvesting and next year's sowing? The use of the stubble belongs to the landlord, and the tenants' horses run in the station paddocks when they are not being used.

2888. For how long is the land let? For five years. On the ridge here there are 40 or 50 acres let on the share system, a small holder having let his land to a teamster, or some one of that sort. This side of the Mooki River there is another area let on the share system upon the Hawkesbury Benevolent Asylum land.

2889. What is the average extent of the farms which you let to each tenant? There is one farm of 200 acres, and from that area they increase in size up to 400 and 800 acres. The area of a farm depends upon the means of the tenant to cultivate it.

2890. Would 400 acres give a decent living to a man and his family under your system? I believe so.

2891. Has that system been long enough in operation to have been fully tested? Not locally; but it has in other districts. It was after having seen the system carried out under worse conditions, both as to soil and to climate, that I was induced to begin it here.

2892. What is the cost of clearing dead timber and green timber? It varies very much. In the open box forests I have been pulling down the trees with a traction engine. That costs me from 5s. to 6s. per acre for live timber. Owing to the very bad seasons, however, it has recently become more expensive, because the trees are apt to break off at the level of the ground now. If the ground were moist they would come up by the roots. When the ground is dry this work costs from 10s. an acre up to 14s. Dead timber in open box forest could be cleared, and the roots burnt to a distance of from 9 to 10 inches below the ground, for 10s. an acre.

2893. Would 400 acres be a sufficient area for a farmer to live upon along the route of the proposed line if he had absolute control of it? Yes, where the land was not precipitous and broken, though I cannot speak much of the land south of Oakey Creek. 400 acres of white box forest or good ridgy land and good plain land, not too damp, should keep a family very comfortably if it were cultivated.

2894. Is the district within 20 miles of the proposed line adapted for agriculture only or for mixed farming—I speak of holdings up to 1,500 acres in extent? I believe that if a man was feeling his way it would pay him to go in for agriculture, and I should say that 60 per cent. of the land between here and Oakey Creek would be fit for agriculture.

2895. Do you think that this district could afford relief to districts which were suffering from drought by maintaining their stock? It would no doubt aid, but when the good seasons came the stock would be too valuable to be sent back again, because the nearer stock is to port and facilities for transport the more valuable it is. What I consider is not so much the saving to the individual as the saving to the country at large by the keeping alive of stock during the dry seasons.

2896. How far is your property from the nearest railway station? Twenty miles.

2897. And from the nearest point on the proposed line? The proposed line would run through my property. It is not only the cost of getting produce to market but the delays which tell. Farmers, when they have to cart their produce long distances to a railway station, have to withdraw themselves and their teams temporarily from the work of their farms.

2898. As a rule, it is considered that a farmer who is within 20 miles of a railway station is well served;—do you consider this country so difficult to traverse that that is not near enough here? I should be quite satisfied to re-engage in farming at that distance if I knew that no railway at all was coming here.

2899. I understand that in this district the roads are so bad in certain seasons of the year that 23 miles is too far to go to a railway? Yes; 20 miles in this district is a more difficult and dangerous distance to traverse than it is in some other districts. I have seen teams stuck in the lane here for over a week.

2900. I understand that you wish to produce as exhibits some photographs of the grass that grows here in good seasons? Yes. This grass comes in the summer when we have a fair season, and grows as high as a horse. I do not know its name, though locally it is called kangaroo grass. In the winter time its place is taken by trefoil, crowsfoot, and a herbage known as carrots.

MONDAY, 14 MAY, 1900.

[The Committee met at the Werris Creek Railway Refreshment Rooms, at 9 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD,
JOHN CHRISTIAN WATSON, Esq.ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Samuel Clift, pastoralist, East Maitland, sworn, and examined:—

- S. Clift.
14 May, 1900.
2901. *Vice-Chairman.*] You are the owner of property in this district? Yes; I am interested in the Breeza holding.
2902. What is the area of that holding? It was originally 174,000 acres, but at present we hold about 130,000 acres of secured land.
2903. Any leased land? A little; but the greater portion of our leasehold has been lately alienated.
2904. Does your property begin close to Werris Creek? Yes; close to the railway line.
2905. How far does it extend along the route of the proposed line? The proposed line leaves our land at the Gap, and then comes on to it again past Walhallow and Spring Ridge.
2906. How far is the most distant part of your land from Werris Creek? About 32 miles.
2907. Taking one season with another, what is its average carrying capacity? In very good seasons it will carry a sheep and a half to the acre.
2908. Do you run any cattle on the holding? Yes; but we have only about 500 just now.
2909. Do you regard it as good fattening country for cattle? Yes, first class.
2910. Has it been your practice to fatten a large number of sheep on the run for market? Yes; the year before last we sold 59,600 fat wethers.
2911. Have you any difficulty at the present time in getting your sheep, your wool, or other products to the railway? No, though we have to bring them a long way from the back country into Breeza.
2912. Do you think that, with the construction of the proposed railway, you would be able to get sheep from the drought-stricken districts of the west, and to maintain them, and perhaps fatten them on your country? I am sure of it. If there were a railway to Wellington we could buy sheep down that way, and bring them here to fatten, and in bad seasons our sheep could be moved over that way. It is very seldom that the season is bad in both places.
2913. As a rule, this district does not suffer from the droughts which afflict other parts of the Colony? No.
2914. Would the proposed railway help you to take advantage of the southern and Melbourne markets? Yes, if the prices suited. I have known cattle to be driven from this district to Melbourne.
2915. What advantages would follow to the Colony as a whole, and to this district in particular, from the construction of the proposed railway? The proposed railway would open up the country for agriculture.
2916. Would you go in for agriculture yourself? I commenced last year by letting 850 acres at a place about a mile from Werris Creek. I have had applications for land from two other people, but I have declined to go further until I could see how the speculation would turn out.
2917. What yield has your tenant got from his 850 acres? I only cleared the land last year in time for him to commence ploughing for a wheat crop, and he got about 3,200 bushels of wheat from less than 400 acres, though the circumstances were most unfavourable.
2918. How far do you know the country along the route of the proposed line? I have travelled across the country to Dubbo twice, and I have been to Wellington.
2919. Do you think that that country would carry a fairly large agricultural population if it had a railway? I think that it would; the land is all sufficiently good to grow wheat.
2920. Do you think that the fact that it is mainly held in large areas by private owners would retard the progress of agriculture if the line were constructed? No; because I think that the landholders would be very glad to let their land to farmers on terms similar to those I have given.
2921. It has been stated that, in other districts, the landholders only allow agriculturists to hold land for from three to five years, and that at the end of that time it is used for grazing again;—would that be the experience here? I do not think so. My tenant only asked for a five years' lease, and if all goes well he will get an extension for another five years. I shall make the best use I can of my land, and, so far, it would seem that agriculture pays twice as well as grazing.
2922. What is your opinion of the black-soil country for agriculture? There are different classes of black soil. Some of it is light and friable, and will grow almost anything that will ripen before the hot weather sets in; but the cracking black soil is not so good. Out towards Walhallow the black soil does very well for agriculture; but out past Breeza it does not do well. The best wheat land we get here is the land upon which yellow box or "yellow jacket" grows.
2923. Can you compare the agricultural resources of this district with those of other districts with which you are acquainted? For wheat this district is better than the Maitland district.
2924. Wheat does not grow well on the coast? No; it is subject to rust there.
2925. What are the possibilities of this country for lucerne growing? I do not think you could depend much on lucerne, except in favoured spots, such as the bends of creeks, where the water comes pretty close to the surface, say—to within 10 or 12 feet. Mr. Binney can grow lucerne on his plain, but along the road from Spring Ridge a man got good water in a hole only 3 feet deep.
2926. How many acres of land in this district would keep a farmer in decent comfort? A farmer would require 150 or 200 acres in this district, because he would want ground for his horses and stock, but many live on much less. A man named Purcell has a larger area than that; but the good land on his holding would not comprise more than 100 acres. His yield last year was seven bags, or about 30 bushels, to the acre.
2927. Do you think there is room for the introduction of dairying in this district? Yes; this is a splendid dairying district.
- 2928.

2928. How would it compare with the dairying districts on the coasts? The natural grasses here are quite as good as any on the coast.

2929. At present dairying is not gone in for? Not largely.

2930. Do you think that that is due to the want of railway communication? I could not say that; but once the district through which the proposed railway would go is opened up, all the industries that will pay there will be entered into.

2931. It has been urged that the proposed line would be of advantage to the Colony from a national point of view;—what is your opinion on that point? Some day or other we shall be involved in war, and in that event, if the Hawkesbury Bridge were blown up, we should be unable, without some such connection as the proposed line, to get our troops from New South Wales to Queensland. Then, again, if the Federal Capital were established at Orange, the proposed line would bring the capitals of the other colonies within a reasonable distance of that place.

2932. Are there any commercial advantages which would follow from the construction of the proposed line, such as the interchange of products between the north-western and northern districts and the western districts? New England is a great district for potatoes and all sorts of vegetables; but I do not think that that traffic would affect the railway receipts very much.

2933. Is there much room in New England for starving stock in periods of drought? Yes; when we have droughts they have generally a favourable season, and their country is better in the dry season than in a wet season. They carry more stock to the acre than we carry, and their good country extends over on to the eastern slopes.

2934. Would the proposed line be of advantage in facilitating the transport of stock to New England? Yes; to New England and the northern districts generally.

2935. Has the removal of starving stock been profitable to stock-owners? It is costly; but at any rate it pays to save female sheep. Tens of thousands of sheep are now being brought from Charleville and Hughendon to the coast to be saved.

2936. The Commissioners estimate an annual loss of £18,000 on the proposed line;—could you, as a landowner, afford as a matter of business to contribute towards the reduction of that deficiency as much as you now pay in land tax on all land within 10 miles of the route of the proposed line? I daresay my people would agree to that, but I could not bind them.

2937. Do you think it would pay them to make such a contribution, and would it pay other landholders along the route? I think it would.

2938. That contribution would have to be paid only so long as the line was being run at a loss? Quite so.

2939. *Mr. Shepherd.*] Have you had any experience in fruit-growing in this district? No; we have only grown a little for our own use; but they get capital fruit at Currabubula, within 8 miles of Werris Creek. Fruit would grow very well out at Spring Ridge, and in the bends of the creek here; but I do not think it would be grown in any quantity.

2940. Would vines do here? Vines have done very well at Currabubula, but they have not been tried out along the route of the proposed line. Apples and pears do not seem to do too well here. The climate appears too hot for them.

2941. Has maize been grown to any extent in this district? No; and in favourable seasons the crops will not average more than 30 or 40 bushels to the acre.

2942. Have you ever drained any of the stiff black soil for the purpose of cultivation? No; but it will drain itself; it is all cracked through.

2943. Is there not a sort of blue clay in that soil? No; the black soil continues right down a long way, though it is more friable on the surface.

2944. You say that crops suffer as the summer comes on? Yes; corn or any summer crop is affected by the heat.

2945. Is it so with trees? No; you can grow trees. Pepper-trees, for instance, grow better here than on the coast.

2946. Is there something in the soil which would account for crops dying in the summer? I presume that the hot weather exhausts the moisture in the soil, and therefore the crops die. In my opinion, the Commissioners' estimate of revenue is lower than is reasonable. If Bomera were made a station it would get the traffic from Coonabarabran and the districts around it, and the proposed line would get a large part of the traffic that now goes to Quirindi, and some of that which now goes elsewhere.

James Scott, farmer, Terrible Vale, sworn, and examined:—

2947. *Mr. McFarlane.*] Have you any property or holding which the construction of the proposed line would serve? No.

2948. You are not personally interested in its construction? No; except that it offers a possibility of trade along the route.

2949. What prospect is there of trade from this district towards the Western line? I grow chiefly hay and fodder, and I sell it in the local market, so far as I can, though this year I have sent a lot out to Moree.

2950. Would you use the proposed line? There might at times be a demand for fodder in the western districts, and then I could use the proposed line.

2951. What places out west would require your hay and produce? I could not say; but sometimes the season is bad in some localities when it is good in others. For instance, the seasons in the north-west districts have been very bad, while this district has been comparatively favoured. It might happen that we might require produce from the Wellington district.

2952. Are you a large farmer? I cultivate 400 acres or 500 acres each year.

2953. How would you compare the land between Werris Creek and Wellington with that which you cultivate? It is a good many years since I was over it; but, so far as I remember, there is any quantity of good agricultural land there. I believe that if that land were thrown open for settlement, all that is near the route of the proposed line would very soon be taken up.

2954. Do you think that that district would carry a large agricultural population? I do not know that it would carry a very large population, but I think the general run of the land is as good as the land in this

S. Clift.

14 May, 1900.

J. Scott.

14 May, 1900.

- J. Scott. this district. I have been from Werris Creek to Dubbo, and I have been from Werris Creek to Mudgee, but I have never been to Wellington.
- 14 May, 1900. 2955. Where is your principal market? At present Newcastle is my principal market.
2956. Do you send any considerable quantity of produce to Moree? Yes; there has been a big demand for fodder out there for the past few years.
2957. Is that demand a continuing one? I do not suppose there would be a demand for produce in good seasons.
2958. If the proposed line were constructed, would you anticipate a market in the western district in times of drought? I suppose that we should have our share of the trade if there were a demand for produce out there.
2959. Do you think wheat-growers here will be able to extend their operations when they have to compete in the markets of the world at lower prices than those which rule in this Colony? I think so, if they go about it on a large scale, but I do not think it would pay on small areas.

Michael Joseph Daly, farmer and grazier, Currabubula, sworn, and examined:—

- M. J. Daly. 2960. *Mr. Watson.*] Do you think that the proposed railway will be of any advantage to the farmers and graziers about here? I think it would be in times of drought.
- 14 May, 1900. 2961. In giving them a chance to supply fodder to the western country? Yes; and in providing them with facilities for the removal of stock in times of drought.
2962. Would you use the line for the conveyance of fat stock to the southern markets? I cannot say; I have had no experience.
2963. Where do you send your fat stock? Towards Sydney.
2964. You usually have pretty good seasons about here? Good average seasons, considering what they get in other parts of the Colony.
2965. Do you have any total failures of crops? We have not had a total failure for many years.
2966. You are generally in a position to supply other districts? We are more favoured than any other district. I have heard people who have been over the line of route say that the country is good; and that if they could get produce away from the district they would take up land there, because the soil is suitable for agriculture.

Michael Henry Ryan, grazier, Walhallow, sworn, and examined:—

- M. H. Ryan. 2967. *Mr. Shepherd.*] How long have you resided at Walhallow? I have been there a little over twelve months, and I am a native of Werris Creek.
- 14 May, 1900. 2968. Are you acquainted with the country on the route of the proposed line? Yes; for a distance of about 60 miles from Werris Creek.
2969. Do you think that a fair quantity of land within the distance that you are acquainted with is suitable for agriculture? Yes. My place is only 13 miles from the existing railway, but I cannot grow wheat at present prices, because of the high charges for road carriage. If the proposed railway were constructed I would put my ground under wheat, and out towards Bomera a great deal of country would be cleared for agriculture; but the people out there cannot afford to clear and cultivate their land now, because of the cost of carriage on produce. Lots of small holders out there have told me that at the present time it is a struggle to make a livelihood, because they can only run a few stock. If they had a railway they would go in for agriculture.
2970. What is the extent of the holdings there? From 320 up to 1,280 acres, if you go back 4 or 5 miles. A lot of land there is scrubby, and is at present lying idle; but if a railway were made it would be got ready for cultivation. There is Crown land there which it would not be worth while to select unless the railway were made.
2971. Are there many very large holdings in the district? Yes; there are a lot of large holdings there—stations carrying 20,000 and 30,000 sheep.
2972. And up to 100,000 acres in extent? Yes.
2973. Do you think that the holders of these stations are likely to bring their land under cultivation? I am sure of it. Some of them out there now have tried the halves system; but it has been a total failure, because of the high rates of carriage.
2974. How much of the land there would be fit for agriculture, and how much for pastoral purposes? So far as I know, it will all be fit for agriculture.
2975. Do the people there carry on mixed farming, or do they go in entirely for grazing? They have no option but to go in for grazing, because of their distance from a railway.
2976. At what distance from a railway would farming be fairly remunerative? After you get 8 or 9 miles away from the railway you are considerably handicapped by the distance.
2977. I suppose a great deal depends upon the nature of the country and of the road? Yes; and the roads out there are very bad. The soil is black soil, and in some seasons you could not get your produce away at all.
2978. Would the construction of the proposed railway create much stock traffic? It would save thousands of starving stock; but the fat stock will come to the line any way.
2979. Do you think that the proposed line would pay? I am sure that it would. No one can estimate the probable traffic revenue, because no one can foretell the results of the encouragement which it would give to small settlers.
2980. What are your principal crops? Wheat and corn.
2981. How does corn grow in this district? Not too well. The season is not wet enough, though sometimes you strike it all right.
2982. How much does it cost to clear land here? About 30s. an acre. I have never cleared any yet, but I know what it would cost. We kill the timber first.
2983. What is the average yield of wheat here? About 15 bushels. You may get 30 bushels one year, and 5 or 6 another.
2984. What is your average yield of maize? That is pretty low; it would not be more than 6 bushels on the average. Some years you get none at all.

2985. Is any fruit grown in your neighbourhood? Yes; Mr. John Perry has an orchard where fruit-trees are doing very well. He grows pretty nearly every kind of fruit. M. H. Ryan.
2986. Are farmers who are living within easy reach of the railway pretty well satisfied with the result of their operations? The people out there know what their land will do; but they have never properly tested its capacity. 14 May, 1900.
2987. Would timber be carried on the proposed line? I am sure that it would.
2988. What kinds of timber grow in the district? Pine and iron-bark. At Trinkey there is splendid iron-bark.
2989. The Railway Commissioners estimate an annual deficiency of £18,000? I do not think any accurate estimate of the revenue of the line can be made at the present time. I only run stock on my land now; but if the proposed railway were made I should also grow wheat, and many others would do the same.
2990. Do you think that any deficiency would be made up within a reasonable time? I am nearly sure of it. At the present time most of the produce grown in the district goes to Quirindi, but if it went to the proposed railway the Commissioners would get 70 or 80 miles of additional carriage.
2991. Would the landholders along the line be willing to contribute something towards the reduction of any deficiency? Speaking for myself, I should be quite willing to do so, and I am nearly sure that all my neighbours would do it.
2992. Does the line run through your property? No; but it would be within a quarter of a mile of my place.
2993. Do you think there would be an inclination to give the land required for railway purposes? Yes, in the case of small holders; I cannot speak so well for large holders.
2994. *Mr. Watson.* Can you explain why it does not pay you to grow wheat at a distance of 13 miles from the main line, when in other districts they can grow it at a distance of 25 and 30 miles from a railway? If I had to pay a carrier something like 6d. a bushel to take my wheat to the railway station I am sure that it would not pay me to grow it, because there would be no profit in the business. Where a man had his own team, so that it would cost him nothing for carriage, except the price of horse-feed, he might be able to grow at a profit. Plenty of my neighbours are on the same footing as myself, in that they have no teams.
2995. I suppose that gradually you will get more capital, and will have teams of your own? Without a railway I may never try to grow wheat, because I may remain satisfied with the income which I make by keeping stock, but the construction of a railway would encourage me to cultivate my land.
2996. Are the roads usually bad between Werris Creek and Walhallow? No, they are fairly good, except in flood-time. Plenty of men who live further from the railway than I do have tried to make wheat-growing pay, but they have not been successful.

Henry Thomas Lucerne, butcher and stock-dealer, Werris Creek, sworn, and examined:—

2997. *Vice-Chairman.* Do you know the country along the route of the proposed line? Fairly well; I have been over about 90 miles of it once or twice.
2998. Would you consider it good country for agriculture? The greater part of the land along the route is fit for agriculture, though some of the land is poor. H. T.
Lucerne.
2999. Have agricultural operations in the district been retarded owing to the absence of railway communication? I feel sure of it. 14 May, 1900.
3000. Has any large number of stock been brought to this district from the Western and South-western districts? No; because the expense is too great; but if the proposed line were constructed very many more stock would be shifted than are now shifted.
3001. Do you think that the construction of the proposed line would save a number of sheep from perishing? I feel confident that it would. I know people who would have shifted sheep this year if it had not been for the expense.
3002. Do you regard the district as a good fattening one? I regard the Werris Creek district as a first-class fattening one.
3003. For large stock as well as for sheep? For all classes of stock.
3004. Are many large stock fattened here? Yes, in good seasons; but it is principally sheep that are fattened here.
3005. Where do you draw your supplies from? From the country within 50 miles of Werris Creek.
3006. Do you get much of your stock from the country between here and Wellington, along the route of the proposed line? Not from further than Yarraman.
3007. Do you consign much stock to the Sydney market? I have not done so during the last two years. The seasons have been irregular, so that I could not buy stock in any numbers.
3008. Have many sheep been brought to Werris Creek from other districts to be kept alive here? No; stock have never been sent here for grass.
3009. Would the proposed railway enable people not only to send stock to the Werris Creek district, but also to send stock to the New England district? Yes. I have been travelling through the New England district a good deal during the last twelve months, and many people have spoken to me about the likelihood of it paying to shift stock from the Western to the New England district.
3010. Do landholders in New England stock their land to its full capacity? Not as a rule, as they do on good country.
3011. Is the New England country sound sheep country? No; in the winter months it is not sound.
3012. Is there much fluke there? Yes; after sheep has been there more than five or six months 75 per cent. of them have fluke.
3013. Do they get foot-rot there too? Yes; but that is not so bad as the fluke.
3014. In what period of the year is the country worst—in a wet season? Yes. From March to the end of July.
3015. Is the unsoundness of that country a great reason for not sending stock there, or would starving stock be there for such a short period that they would not suffer much? In my opinion the unsoundness of the country does not make much difference, because when people shift stock they do it under the belief

H. T.
Lucerne.
14 May, 1900.

belief that the stock will not have to be away long. It would not pay them to keep their stock away for any long period.

3016. Mr. Harper has stated that he does not think that that country would be of much value to starving stock? I think it is a very good resort for starving stock.

3017. Do you think it has paid to transport starving stock from one district to another? Yes; unless the owners leave it too late, and the stock are too weak to travel. The timber along the route of the proposed line would give traffic to the railway. There is pine, iron-bark, and other timber in the district.

3018. Is that timber well within the reach of the proposed line? Yes; it is quite close to it, and I think that in some places the line would go through beautiful pine scrub. The pine that the sawyers are getting in Tamworth, Gunnedah, and other places further north costs them 3s. 6d. 100 feet; so that I am sure that the timber traffic on the proposed line would be very great. I think that the meat works at the Gap would also create traffic from country 15 and 18 miles away.

3019. Why are the meat-works not now working? Because of the drought. This is a splendid district in good seasons. When I started here I could buy any number of fat cattle, prime, for not more than 7s. per 100 lb., and now I cannot buy a fine bullock for less than 18s. per 100 lb.

3020. Do you think that if the proposed line were constructed a fairly large population would spring up in the district? I feel sure that the country would be well populated.

3021. How much of the land within 20 miles of the route of the proposed line is suitable for agriculture? I think quite two-thirds of it.

3022. And how much land of average quality would keep a farmer and his family decently? 300 acres I should consider a respectable farm in that district.

3023. Does the good country extend to 20 miles on each side of the proposed line? I have not travelled over it for 20 miles on each side of the route; but I could safely say the good country extends 10 miles on each side. I feel sure that after a time the line would be a paying one. The Moree line exceeded its estimate of traffic in less than eight weeks, and I think that the proposed line would be quite as good after a time.

3024. If you bought stock 60 miles from Werris Creek on the route of the proposed line, would you use the line to bring them here? Yes; I should use the line for all distances over 25 miles. Only last week I trucked stock from Boggabri.

TUESDAY, 15 MAY, 1900.

[The Committee met at the Municipal Council Chambers, Tamworth, at 10 30 a.m.]

Present:—

WILLIAM THOMAS DICK, ESQ. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD, |
JOHN CHRISTIAN WATSON, Esq. |

ROBERT HENRY LEVICK, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Alexander Matheson, farmer, and Mayor of Tamworth, sworn, and examined:—

A. Matheson. 3025. *Vice-Chairman.*] Will you tell us in what way you think the construction of the proposed line from Wellington to Werris Creek would affect the Tamworth district? One great advantage which I have always thought would accrue to this district from the construction of the proposed line is that it would facilitate traffic between the Tamworth district and the Western district. This is a great fodder-producing centre, and we send a large quantity of produce throughout New South Wales, but more especially to the Western districts of the Colony. At the present time, however, when we send produce out west it has to go first to Sydney and then out along the Western railway. The proposed line could also be used to transport stock to New England. Then, again, a great deal of timber comes to Tamworth. We have several saw-mills here which get their timber from the district which the proposed line would traverse. The line, too, would open up a lot of country which, unless a railway is constructed, must remain undeveloped.

3026. Do you regard the Tamworth district as a highly productive district? I think it one of the most productive districts in New South Wales.

3027. What do the people here grow? Wheat, barley, oats, lucerne, and all similar crops.

3028. Is the area under crop yearly increasing? Yes. At the present time the Peel River Company is throwing open a large area every year or two, and that land has all been taken up.

3029. Is there still a large area available for agriculture not under the plough? Yes.

3030. What markets do you supply, year in and year out? Sydney is our chief market, and we also send largely to Narrabri, Moree, and the Western districts. We have sent stuff to the Riverina.

3031. Is this district like other districts subject to droughts? Yes; but we can always produce something here.

3032. Do bad seasons occur in the Wellington, Dubbo, and Tamworth districts simultaneously? Yes; but droughts have not the same effect here as they have in many other places. Last year, although it was a dry season, we sent hundreds of tons of fodder away to the North-western district.

3033. As a rule, is the pastoral land in this district stocked to its full capacity? Yes, so far as this district is concerned; but starving stock could be sent on to New England. A very large number of stock travel through this district in time of drought.

3034. Is the Tamworth district a good fattening district for both large and small stock? Yes.

3035. Do you anticipate sending much stock from this district out west? It would all depend upon circumstances.

3036. If the Western district had been depleted by a drought would you expect to find a market there for your stock? Yes.

3037. Would the construction of the proposed line open to you the southern and the Melbourne markets? I dare say it would.

3038.

3038. Where does the stock go from this district? We do not usually go in for fattening large cattle in this district. Most of our sheep go to the Sydney market. A. Matheson.
15 May, 1900.
3039. In what direction from Tamworth are the forest reserves situated? All the timber that comes to Tamworth now comes from Boggabri and other places on the North-western line. I understand, however, that there is a large quantity of timber in the district through which the proposed line would pass, and if the line were made the saw-millers here would be able to use it.
3040. What market do the saw-millers here send their timber to? We have three sawmills constantly at work, and they send their timber in all directions.
3041. What wood do they saw chiefly? Pine.
3042. Do they send much sawn pine along the Northern and North-western line? There is not much sent up the North-western line; but sawn timber is sent up the Northern line into the various outlying districts. The mills here are kept going, so that it takes them all their time to supply orders. The great trouble is to get logs to cut.
3043. *Mr. Shepherd.*] What effect would the construction of the proposed line have in increasing the traffic between Wellington and Werris Creek? I cannot express an opinion on that subject.
3044. People would not be likely to send timber from Tamworth to Wellington? No; but timber would be brought to Tamworth from a certain distance along the proposed line.
3045. Have you ever to send starving stock from this district? Not in any great numbers.
3046. Would the proposed line be largely used by passengers going to Victoria for the sake of the shorter route? I think it would be availed of in that way.
3047. Do you think it would create much increase in traffic? No doubt it would open up a large extent of country, and in that way increase traffic.
3048. *Mr. Watson.*] We were told at Wellington that fodder had been sent last year, and some this year, from Orange and Wellington through Sydney to Narrabri and Moree? A gentleman who was here some time ago, who, I think, came from Orange, and who favoured the construction of the proposed line, said that they got a large quantity of fodder from Sydney, whereas if the proposed line had been constructed they could have got their fodder direct from Tamworth.
3049. Do you know if the Tamworth district has been short of lucerne hay this year? No.
3050. Can you explain why a firm in this town has been inquiring at Wellington for lucerne chaff, to be sent round through Sydney? No. I suppose they thought they could get it cheap there.
3051. We were shown a letter inquiring if 100 tons could be supplied? There is any quantity of lucerne hay in Tamworth at the present time.
3052. Where would you expect to find a market for your produce on the Western line—at Bourke, or Cobar? In all those western towns.
3053. The distance from Tamworth, *via* Werris Creek and Wellington to Bourke, would be 442 miles, and the freight on hay, chaff, straw, and so on, would be 11s. 10d. a ton in 6-ton lots; if the hay was sent round through Newcastle, the freight would be 14s. 2d. a ton, or 2s. 1d. a ton more; under those circumstances, could the Tamworth growers compete with the Hunter River growers? I think we could compete with them if the proposed railway were made just as well as we can compete with them now.
3054. In the western district the handicap against you would not be so great as it is in the Sydney market? No.
3055. If there were always large supplies of fodder to be obtained around about Wellington, Dubbo, Orange, and those districts, the probability is that places further west requiring fodder would draw from those supplies before drawing from Tamworth? Yes; but I know that last year as much as we could produce in the district went out to the Moree, Narrabri, and the north-western districts.
3056. Do you anticipate that the proposed line would be used to send fat stock to the southern market, supposing we had federation, and the stock-tax was removed? Yes; and I believe that Tamworth is one of the best districts to be found for that trade.
3057. Do they produce wheaten hay and chaff to any large extent here? Yes. There is very little demand for lucerne chaff here; it is required chiefly for stations where they are feeding sheep. The inquiry at Wellington must have been for some order like that; it could not have been for use in the Tamworth district.
3058. Do they grow oats here to any large extent for wheat and hay? Not to any large extent.
3059. The hay grown here is mostly wheaten hay? Yes. Oats do not do so well here; they are not a very profitable crop.
3060. I suppose they do better in the higher country—up New England way? Yes.

William Silver, engineer and sawmill proprietor, Tamworth, sworn, and examined:—

3061. *Mr. Watson.*] Have you resided long in the district? Nearly twenty years. W. Silver.
15 May, 1900.
3062. Have you formed any opinion with regard to the proposal before the Committee? We have now great difficulty in getting timber at Tamworth. We are getting our chief supplies from Curlewis, Gunnedah, and from pretty well as far as Boggabri. The forests are thinning out somewhat, and we have great difficulty in getting large sized logs with which to execute our orders. The proposed line, will, I understand, run through a large pine district, and at present pine is in great demand. We are sending it to Newcastle, Maitland, and throughout the Colony, and it is asked for even in Sydney. It is a timber which white ants will not touch, and it is consequently very valuable.
3063. *Mr. Shepherd.*] What is it chiefly used for? For all building material—flooring boards, ceiling boards, and framing. We are supplying all the Government contracts with this timber because the officers prefer it to any other. There is no better timber for building purposes.
3064. *Mr. Watson.*] You say that it is very difficult to get it about Tamworth? We are handicapped in not being able to get large logs. If the timber-getters had access to the forests through which the proposed line would run we could get an abundance of good logs.
3065. What price do you get for your sawn timber on the trucks per 100 feet? Twelve shillings per 100 feet in the rough, and 14s. per 100 feet dressed, on the trucks.
3066. Is there a considerable quantity of pine still available? I understand that there is an unlimited quantity of pine in the district through which the proposed railway would pass.

3067.

- W. Silver.
15 May, 1900.
3067. We have had evidence that the line would pass through or near to a great deal of timber; but most of it would seem to be iron-bark? Iron-bark is a very necessary timber. We could send timber to Quirindi, to Bingara, to Tenterfield, and to Glen Innes.
3068. Do you deal in iron-bark now? No; because we can only obtain it from Singleton or from Maitland, and that makes it expensive. I have to send now to Allandale for iron-bark. There used to be a great deal of iron-bark in the Singleton district; but the demand for it has been great, and consequently the supply has run out.
3069. So far as the Committee can learn, the greater part of the iron-bark would be more than 60 miles from Werris Creek or more than 90 miles from Tamworth;—would that be too far to bring it? No.
3070. What distance could you afford to haul it? We could certainly afford to bring it 100 miles.
3071. And how far could you afford to haul the logs to a railway station? From 25 to 30 miles.
3072. Would it pay you to bring iron-bark from a place 25 miles away from a railway station 100 miles from Tamworth? Yes; but that would be about the limit.
3073. What do you regard as the minimum size of commercial pine? At the present time the pine we get is not above 12 inches in diameter; but I believe that in the forests that I am speaking of the trees run over 2 feet.
3074. Are you not using logs of less than 12 inches in diameter? Our present minimum is 6 inches; but the minimum ought to be 12 inches.
3075. Do you think it is probable that an export trade in pine will be developed? I think so. There is no end to the value of that timber.
3076. Is not pine rather brittle after being worked up? There is a certain degree of brittleness in it, but when it is put into position in a building there need be no fear of it breaking. It is not, however, a timber which is suitable for heavy strains.
3077. Would you consider timber cut from logs 6 inches in diameter as good as timber cut from logs 12 inches in diameter? Yes. Small timber is now often superior to the large timber, which was probably passed by in the first instance because it was crooked. The Tamworth district is a very central one. We have factories here and large stores, and a great quantity of goods is sent from Tamworth to different parts of the country. If the proposed railway were constructed we should be able to send goods to people living along it.
3078. *Mr. Shepherd.*] Is dark-coloured pine considered more durable than light-coloured pine? No; we prefer light-coloured pine. Of course, the older the wood the more lasting it is.
3079. You are aware that generally when a tree is not matured, its timber does not last so long? Yes; but that does not apply so much to pine.

Charles Wane, Manager for Budge & Co., timber merchants, sworn, and examined:—

- C. Wane.
15 May, 1900.
3080. *Vice-Chairman.*] How long have you been in this district? About twelve years.
3081. Have you been occupied in the timber industry all the time? Yes.
3082. Did you hear the evidence of the previous witness? Yes.
3083. Do you confirm in general the statement which he made as to the possibilities of the timber traffic on the proposed line? Yes; and I agree with him in the opinion that the construction of the proposed line would open up a large timber industry. We find great difficulty in getting suitable logs now, and good timber is getting scarcer every year.
3084. The proposed line would enable this and other districts to get a better supply of timber? Yes.
3085. Do you know the country through which the line would go? I have been through the Trinkey scrub.
3086. Is the timber there pine or iron-bark? It is mostly pine, but there is a large quantity of iron-bark.
3087. Of a good marketable size? Yes; the trees there are larger than those we are getting now. The forests from which we are now getting timber have been gone through time after time, so that the timber is getting scarce.
3088. Is pine a timber which will not stand long haulage? Well, on the North-western line they cannot get water to enable them to make a long haulage. We are doing a large and increasing trade, and we cannot under present circumstances keep up with the demand. If we had more logs we could do better.
3089. What markets do you supply? We supply places round Tamworth, Manilla, Barraba, and places on the Northern line.
3090. Do you send timber towards Newcastle? Not very much; we have had to refuse orders because we could not supply them.
3091. Where do those orders come from? From Manilla, from Barraba, and from places round about Tamworth. I suppose that during the last few weeks we have refused orders for 100,000 feet of timber.
3092. Was that because of your inability to get the timber, or because the prices offered were not profitable? It was because of the difficulty in getting full sized logs. We have to send a large quantity of chaff to the log-drawers in many places, and if timber-getters were hauling timber to the proposed line we should send hay and fodder along it.
3093. From your knowledge of the timber through which the proposed line would pass, which would give most traffic to the railway—pine or iron-bark? We use pine more largely than iron-bark, though we should use more iron-bark if we could get it. We have to send down to places near Newcastle for iron-bark now.

Alexander Johnston, auctioneer, Tamworth and Scone, sworn, and examined:—

- A. Johnston.
15 May, 1900.
3094. *Mr. McFarlane.*] Is this a good district for sheep and cattle? A very good district.
3095. How does it compare with other districts in the Colony with which you are acquainted? Very favourably. In Tamworth we seem to be able to grow nearly everything.
3096. How would the country on the proposed line compare with the Tamworth country? I think that the country on the proposed line, as far out as Trinkey, is the richest that I ever travelled through. The Namoi country is very good; but I think the Mooki district is better.
3097. Is the land suited for pastoral or for agricultural purposes? For both pastoral and agricultural purposes. Until lately there has not been much agriculture there.
3098. Are the stock transactions between the Tamworth district and other districts of an extensive character? Yes.

3099. Does the Tamworth district suffer to any extent from droughts? Not nearly so much as the north-west country suffers. A. Johnston.
15 May, 1900.
3100. Is there always a good supply of feed for stock here? We have feed here when you will not see a blade of grass in the north-west country.
3101. Is stock ever sent from the Tamworth district to some other district in times of drought? I have known the Peel River Company to send stock to New England.
3102. Did the Company ever send stock towards Wellington or Dubbo? Not for feed.
3103. Is there a good market in Tamworth for the sale of fat stock? Surplus stock is sent from Tamworth to Maitland and to Sydney, and often to other parts.
3104. Does stock come to the Tamworth district from such places as Wellington, Dubbo, and Orange? I am not aware of it.
3105. Tamworth is chiefly an agricultural district? A pastoral and an agricultural district.
3106. Have you a good knowledge of agriculture in this district? Yes.
3107. What are the chief products grown in the district? Wheat is the principal crop; but a great deal of barley is also grown.
3108. Is it sold locally, or is it sent to other places? A great deal of the wheat goes to Sydney.
3109. A considerable quantity of lucerne is grown in this district;—does it find its way to the Sydney market? A great deal of it does, and in dry seasons it is sent along the North-western line.
3110. If the proposed railway were constructed, would it open up a market for the produce of this district? I think so.
3111. What kind of produce would be sent along the proposed line? Wheat and lucerne.
3112. Wheat is largely grown on the Western line? I do not know the country beyond Garrawilla.
3113. Would the proposed railway be largely used for the conveyance of stock? I am sure that it would. It is now a difficult matter to shift stock, because of the want of food and water, and animals have often to die in the paddocks.
3114. From what direction will stock come to the proposed railway? From out towards Trinkey, and from across towards the Namoi.
3115. Would the proposed railway be largely used for the stock traffic? I am sure that it would, especially in dry seasons.
3116. Would not a large number of people still travel their stock? Stock-owners prefer the railway, because it enables them to get stock to their destination more quickly, and I do not think it is more expensive. The losses of stock on the road are very heavy, and it is often difficult to get good trustworthy men as drovers. The iron-bark in the Trinkey scrub is very superior timber, it is of a close grain, and durable; the pine timber is exceptionally good.
3117. Would the timber trade give considerable traffic to the proposed railway? Yes; iron-bark is very dear in this district now, but in the long run, I suppose, it is cheaper than any other timber, being so durable.
3118. If the proposed railway were constructed, would you get timber from the Trinkey district? Yes; there is no doubt about that, we require an immense quantity of pine and iron-bark.

Henry Charles Ison, builder, Tamworth, sworn, and examined:—

3119. *Mr. Watson.* How long have you been residing in Tamworth? About twenty-two years. H. C. Ison.
15 May, 1900.
3120. Do you know any part of the country which would be traversed by the proposed Wellington to Werris Creek railway? I have been through part of it. I had a selection below The Gap, but it is only twenty-seven years since I left it, and I have not been there since.
3121. The Commissioners estimate that there will be a deficiency of £18,000 a year upon the working of the proposed railway;—can you tell us of any traffic which would assist to wipe out that deficiency? I have friends over in Wellington who tell me that if the railway was made there would be a large through passenger traffic. It is too expensive for them to travel round by Sydney to get to this part of the country, so that we never see them here.
3122. Are you aware of any other source of traffic? It would be a great thing for Tamworth if the proposed railway were constructed, because of the timber supply which it would give. The timber which we can draw upon is nearly worked out now, so that we get only small timber. It is very hard to get a log a foot in diameter.
3123. What kind of timber do you chiefly use in this district? The cypress pine.
3124. Do you find it a durable timber? It is very durable for building purposes. Iron-bark, too, is in request; but it is expensive. Ironbark costs £1 for 100 feet, and pine only 14s.
3125. *Mr. Watson.* That is, to buy it here? Yes. The carriage from Maitland is very expensive, and the timber is dear down there.
3126. *Mr. Shepherd.* Do you know anything of the movements of stock in this district? The railway would be of great advantage to the Wellington people, in providing them with facilities for sending starving stock to New England. They could not travel them across.
3127. Is there generally an abundance of grass in this district? Yes; this is a very favoured district.
3128. Is not Wellington also a favoured district? I do not know. The proposed line would also assist. We have land here which has been sold for £50 an acre—lucerne land—and the area of cultivation is increasing so much that it will be necessary to provide some further outlet for the produce. This outlet should be found in the dry parts of the Colony; but at the present time we have to send most of our produce to Sydney, because of the expense of sending it elsewhere. At Sydney it is sold, and then sent away; but this double selling might be avoided. We get oaten chaff from Orange, and we have got it from Victoria; but we have any quantity of wheat and of lucerne, and every year a larger area of land is put under cultivation. There are a lot of grazing properties about here. The Peel River Company have a large estate, and there are other large properties. Most of the land is fit for agriculture, and if there were an outlet for the produce it would pay people better to go in for agriculture than to go in for grazing.
3129. Have you any reason to believe that the construction of the proposed line would encourage the cultivation of larger areas in the Tamworth district? Yes; I have every reason to believe it.
3130. What are the chief productions of this district? Lucerne, tobacco, and wheat. We have exported wheat to England from this district. It would help the farmers here considerably if they could send their lucerne hay on the other lines.

H. C. Ison. 3131. They are growing lucerne, too, at Wellington? Yes; but not to the same extent as at Tamworth. We had a gentleman from Orange who told us that it would be a great boon to the people there if they could get lucerne sent over from this district. I cannot understand why there should be a deficiency on the working of the proposed railway. I have followed the railway from Newcastle. The Northern line goes through more difficult country than that through which the proposed line would pass; but it has always paid. Of course a line cannot be expected to be a success for the first year or two; but the proposed line would pay very well after it had been opened for some time, because, in my opinion, its construction would open up the country, and lead to a larger traffic.

Henry Light Cousins, stock and station agent, Tamworth, sworn, and examined:—

H. L. Cousins. 3132. *Vice-Chairman.*] How long have you resided here? I have been engaged in my present business for twelve years.

15 May, 1900. 3133. One of the advantages urged in favour of the construction of the proposed railway is that it would be a good stock-carrying line;—from your knowledge of the country, can you tell us in what direction stock would be likely to travel along it? In ordinarily good seasons there is a very large demand for sheep in New England, and stock-owners there prefer the plain bred sheep, because in wet seasons on some stations it is difficult to keep sheep sound. A larger business would be done in those sheep if there were easier access to the western district and to the Riverina district. If places like Bourke and Hay could be brought nearer, a great many people would go there for stock; but it is very difficult to drive stock from those districts here in dry weather.

3134. It is store stock that would be bought? Yes.

3135. For what purpose? To breed from, and to fatten. They fatten stock at Barraba, Quirindi, Bundella, Trinkey, and all those places. We often know of thousands of sheep which we could sell readily in this district if it were not for the difficulty of getting them across. Sometimes sheep could be bought in the drought-stricken districts for 5s. a head and sold here for 7s. 6d. or 8s. a head; but the seasons have been so bad that it has been impossible to drive them over.

3136. Would stock be likely to use the proposed railway if feed were good along the southern stock routes? We do not expect the railway to be able to carry stock, except when it does not pay to drive them. If the season were good, the stock would, as a rule, come by road; but for the last eight or ten years the seasons have been so bad that the proposed railway, if it had been made, would have been very much used.

3137. Would it have been of value in preserving the lives of many sheep which, for the want of it, have perished from drought in the western districts? I think so.

3138. The distance from Bourke to Tamworth would be 442 miles if the proposed railway were constructed, and the cost of trucking a sheep that distance would be 1s. 9d.;—do you think that, even in a droughty year, it would pay to send store sheep here at that price? It would in some instances; but in dry seasons there is a 25 per cent. reduction on rates for starving stock.

3139. The Railway Commissioners tell us that the starving stock traffic is not profitable to them, except indirectly, in that it saves sheep for future seasons? It is profitable indirectly, because it saves a national loss. If the Colony loses 1,000,000 sheep, that is a national loss.

3140. Do you think that the proposed railway would mainly have to rely upon dry seasons for stock traffic? I think so.

3141. Is there any other traffic which the construction of the proposed line will open up? I think a large quantity of fodder would be sent from this district along the proposed line. This district is particularly adapted for lucerne, and lucerne is a good food for starving sheep. It is found better to feed starving sheep with lucerne than with any other hay, because it has a laxative effect, which the oaten and wheaten hay procurable in Bathurst and Goulburn has not. We have sold hundreds of tons of lucerne hay during the last drought to the country on the other side.

3142. Do you know of any inquiries having been made in the Wellington district for lucerne chaff for this district? No. The Wellington district is, in my opinion, similar to our own—not a very dry district, and not a very wet one. Our hay has gone down to Berrigan and to Cootamundra, to Hay, to Corowa, and to other places like that, by way of Sydney; but if the proposed line had been made we could have sent away our produce more directly and more cheaply, and the people who bought it would have been able to use a larger quantity because of the lower price.

3143. Has the feeding of starving stock proved profitable to sheepowners;—are they likely to continue the practice if they have severe droughts in the future? I think so. The demand for fodder was very large, even before the 25 per cent. rise in the price of wool came. If they could afford to buy lucerne hay at Tamworth and take it to Berrigan to feed sheep when greasy wool was worth only 9d. a pound, they can afford to do it very much better now when wool is from 11d. to 1s. a pound.

3144. What sort of stock is fed on this lucerne hay, merely stud sheep? No; the manager of a station near Nyngan told me that for two years he was feeding 46,000 ewes on hay, chaff, treacle, and so on, and that he was cutting scrub for 80,000 more sheep. They found that they had to chance their wethers and to feed their ewes; and I think the same thing was done in a great many other instances.

3145. Do you think that that practice is likely to continue? Yes; especially if the price of wool keeps up. In those days ewes were worth 8s. a head, whereas now they would be worth 15s. Any man with 10,000 good ewes would not lose them when £500 or £1,000 worth of fodder would save them.

3146. How much fodder is allotted to 100 sheep? I think 1 lb. of hay a day will keep a sheep from starving, and perhaps keep it sufficiently strong to travel.

3147. I understand that 11,000 sheep were sold at Tamworth recently? We had 14,000 or 15,000 sheep through the yards last week.

3148. Where were those sheep drawn from, and where were they consigned to? There were 9,000 wethers which had been purchased on the flat country, and were going to New England. The owner thinking Tamworth a good market, offered them for sale. Then 2,000 or 3,000 sheep came in here from Queensland. They were travelling south for sale, but the owner took the opportunity to offer them at Tamworth. There were also 2,000 or 3,000 sheep in the yards which were travelling south from New England. They cannot keep their sheep many years in the New England country, if the seasons are wet, and therefore they send them towards the plains for sale, and buy others on the plains.

3149. Is the New England district subject to fluke and foot-rot? Yes; but in dry seasons things are better. Of course all the New England country is not subject to those diseases.

3150. Do you think that if the proposed railway were constructed the stock traffic between New England and the plains would be fairly permanent? Yes; in many places the New England people cannot keep their stock more than a couple of years. If they purchase two-toothed sheep, they will hold them for two years and shear them. The animals then will still be sufficiently sound to fatten on the plains, so they send them back there, and buy younger sheep.

3151. Would there be any other traffic along the line? As I have said, we have done a large business in lucerne hay in past years with the southern districts, and I think the proposed railway must increase that traffic. Then, too, lucerne seed is very largely grown here. The railway would also assist the timber trade. We used to get our timber from about Gunnedah, but timber is getting very scarce within 100 miles of Tamworth now. Then the Peel River Company, who own 313,000 acres of land in this district, have commenced to cut up their land, and sell it by auction, at an average price of from £3 10s. to £15 an acre. Of the 313,000 acres there must be 100,000 suitable for agriculture, and I understand that it is the intention of the Company to sell the land as fast as they can get people to take it up. When all this land is sold, Tamworth must become a very large centre.

3152. Do you think that the country on the route of the proposed line is likely to settle a fairly large population, seeing that most of the land there has been alienated from the Crown, and is held in large estates? Yes; if squatters find, as the Peel River Company have found, that they have been running bullocks on land, for which they could get £15 an acre, they will sell the land. I think that as soon as the land is worth cutting up, it will be cut up and sold.

3153. Has not the imposition of the land-tax contributed towards the cutting up of large estates? I do not think so. The land-tax is a very small factor as compared with the present high price of land. Just now there is a very great scarcity of store cattle in the Riverina; though feed there is very good, and buyers are very anxious to get beasts over there from the coast. They have only a few months of a good season to depend upon, and it would pay them better to send animals there by train than to lose the best of the season by driving them there. We have just sold cattle to a gentleman in Wagga who is most anxious to get them across, and at reasonable rates it would have paid him better to take them by rail than to drive them across, though, of course, that would not always be so.

3154. *Mr. Watson.*] Then you always have plenty of produce here? Yes, as a rule. The Nemingah Flat runs out for 8 or 10 miles, so that we can always grow lucerne here, because water is obtainable there within 12 or 14 feet of the surface, and the lucerne roots go right down to it. People can grow lucerne here when it will not grow anywhere else.

3155. *Mr. Aarons*, when giving evidence at Wellington, exhibited a letter from your firm asking for a quotation of 100 tons of lucerne chaff? He wrote asking whether we could dispose of 200 or 300 tons of oaten or wheaten hay, to which I replied that the district was full of it, but that we had that day been asked to quote a price for 100 tons of lucerne chaff, and that if he had that quantity ready I might dispose of it. There is not a large quantity of lucerne chaff cut here, the lucerne being sent away chiefly as hay. The application came to me from *Mr. Doyle* of Werris Creek. He wanted from 100 to 500 tons of lucerne chaff, and I informed him that there was very little lucerne chaff cut here.

3156. The freight of chaff from Wellington, under present conditions, would be 14s. or 15s. a ton? I suppose it would.

3157. Would it not be better to cut the hay into chaff here than to bring chaff all that distance? Decidedly; I asked *Mr. Matheson* what he would supply the order for, and his reply was that he was too busy just then to cut chaff. However, *Mr. Doyle* got an inch of rain and found that he would not require the chaff.

Francis Wyndham, auctioneer, and stock and station agent, Tamworth, sworn and examined:—

3158. *Mr. Shepherd.*] Have you been long here? About fourteen years in my present business. I have been in the district on and off since I was 10 years old.

3159. Are you acquainted with the country along the route of the proposed railway? Yes; I know most of it very well.

3160. What is your opinion as to the probability of there being a large increase in agricultural production in the event of the construction of the proposed line? I think that beyond a doubt there would ultimately be a very large increase. I look upon the district as one of the best agricultural districts in the Colony, and the country is all similar from the Liverpool Plains across to Coolah and Cobborah.

3161. Do you confirm the evidence which was given by *Mr. Cousins*? Yes; I think that in the main he is quite right.

3162. Is there anything that you could add to that evidence? I do not know that there is. He is perfectly right about the quantity of lucerne grown here. It grows on the flats in any season, and whenever there is a drought in the Western or Southern districts there is a great demand for hay. If the proposed railway were constructed we could supply hay to Bourke and places out that way at much more reasonable rates than can be given now.

3163. How many cuttings of lucerne do you get in a year? From five to six. We have the advantage of the Hunter in that the floods here never kill the lucerne, because the water lies on it for only a few hours.

3164. Has the fruit industry received any attention in this district? Very little. Fruit is grown here, but not to any large extent. It is almost impossible to travel stock along the stock routes now, because there is nothing for them to eat, and ultimately the railway must be resorted to get them along.

3165. Do you think that the proposed railway would be used for stock? Yes; in getting stock from the Northern district to Riverina, and from Riverina to New England.

3166. Both Wellington and Werris Creek are districts which are generally well supplied with grass? I look upon them as very similar districts; Wellington is very much like Tamworth.

3167. They would both have to look to the same outlying source for stock? Yes. I think, too, that if the proposed line were made there would be a large traffic in cattle coming from Queensland.

3168. Would the railway be used by small holders? Yes. I am almost inclined to think that at the present day it does not pay to drive stock at all; wherever the railways go the people seem to be sending away small lots of fat stock continuously.

H. L.
Cousins.

15 May, 1900.

F.
Wyndham.

15 May, 1900.

F
Wyndham,
15 May, 1900.

3169. Do you agree with what has been said about the timber trade? Yes, is the main. No doubt we are very badly off for timber in this district; there is not a good stick growing in the district now. I think that the chief traffic upon the proposed line would be stock traffic. If the Melbourne market were up we could send stock there over the proposed line; under present circumstances we could not take advantage of a rise in prices in Melbourne, because of the cost of sending stock there round through Sydney.

3170. It is estimated that there would be a loss of £18,000 a year on the proposed line;—do you think that the extra traffic that would be created would get rid of the deficiency within a reasonable time? I cannot say that I think the line will pay for some years; but as population increases, as it has done of late, I have not the least doubt that the line will pay. I should be surprised if it paid for the first few years.

WEDNESDAY, 16 MAY, 1900.

[The Committee met at the Council Chambers, Armidale, at 10.45 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN.)

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Charles Graham Wilson, Esq., M.P., sworn, and examined:—

C. G. Wilson,
Esq., M.P.
16 May, 1900.

3171. *Vice-Chairman.*] How long have you resided in the district? Over thirty years.

3172. Have you a good knowledge of the capacity of the district, both from an agricultural and a pastoral point of view? Yes.

3173. Would you mind making a short statement outlining your views as to the prospective advantages to be obtained from the construction of a railway from Wellington to Werris Creek, either to the Colony as a whole, or to this or any other district in particular? The direct advantage which I conceive would be gained by this district from the construction of the proposed railway is that that railway would open up the far west as a market for our produce. At the present time our chief market is Sydney, and there we have to meet the competition of New Zealand and other places, so that the prices we get do not pay us, and, as a result, many people in the district are now giving up farming. If, however, we could send our produce to Bourke, and the dry western districts generally, it would be a great advantage to us. During the thirty years I have been here New England has never suffered severely from droughts, and in dry years thousands of sheep and cattle have come here for grass. It would be a great advantage to the people of Wilcannia and Bourke, and that district generally, if the proposed railway were in existence, so that they could use it for sending stock to this district.

3174. How would you describe the district of which Armidale is the centre? It is a very good agricultural district. There is a large area here under cultivation, and a large area suitable for cultivation.

3175. What crops are usually grown? Wheat and oats, and this is the finest potato district in New South Wales. From a national point of view the proposed line will eventually form part of a line through to Broken Hill, and the construction of that line will give us a very much improved mail service, allowing the people of Brisbane to get their English mails twelve or thirteen hours earlier than they get them now. If we wanted to get to Bourke we could save 370 miles by using the proposed line. Armidale, too, is a great centre of education. There are schools of all denominations here, superior to any others out of Sydney, and youngsters come here from Queensland, from Narrabri, and from all parts of the Colony. If we had direct railway communication with Bourke, Wilcannia, and the western district we should get more youngsters from that part of the Colony, because they would come here on account of our healthful climate, and the Armidale schools are well known all over the Colony.

3176. Was any large quantity of produce sent from the Armidale district to drought-stricken districts during the last two or three droughts? A great deal of produce has been sent to places like Narrabri and Walgett.

3177. Have you sent anything to the Western line? No; because the cost of carriage is too great.

3178. Is the traffic in produce likely to be permanent, even during good seasons? I think that in all seasons there will be a great traffic in stock.

3179. I understand that you cannot keep stock long in this district, because the country is not too sound? That is the case. We generally prefer to get our stock from a dry district, and stock going from this district fatten splendidly in a warmer district. People who own country on the Liverpool Plains, or anywhere where the climate is warmer, like to get New England stock, because they fatten quickly; and our sheep-owners, on the other hand, like to get stock from other districts.

3180. Is this regarded as a better district for wool than for fattening? Yes; it is a good district for wool. In the summer months sheep fatten well here; but our winters are severe.

3181. Is the country good for large stock? Yes. During the last two or three years we have topped the market with cattle reared round about Guy Fawkes.

3182. What is your usual market for agricultural and pastoral productions? It sometimes happens, after we have sent produce to Sydney, that we get a debit voucher back, and that is very disheartening. When produce is at a good price we send a great deal to Sydney. We also send a good deal to Narrabri and to Moree.

3183. Do you think that this district could compete with the Wellington district and intervening districts for trade on the Western line? We should get a good part of that trade in times of drought.

3184. What is the rainfall here? Thirty-one or 32 inches.

3185. Is it the custom for pastoralists in this district to stock up to the full capacity of their runs? They do

do pretty well. They never make the provision against droughts here that they are obliged to make in other districts. In average country they generally carry a sheep to the acre.

3186. Then what reserve country is there for starving stock from other districts? There is a lot of country round Guyra and Guy Fawkes, which generally is not stocked at all; but in a dry season it will carry sheep for six or twelve months.

3187. Have you any preference for Wellington or Dubbo as a terminal point? I think Dubbo would suit us better than Wellington.

3188. Why? Because it would give more direct access to the western markets.

3189. Do you not hope to find a market down south and in Melbourne when Federation is accomplished? No. Of course, when Federation is accomplished, the proposed line will give greater facilities for inter-colonial trade. I think that the statement of advantages which was read by Mr. Deane before the Committee in Sydney puts the position as well as it can be put from a national point of view. It is an important thing that we be connected with the Western line, so that there may be two ways of visiting Sydney. The proposed line would be of great advantage in assisting the movement of troops in the event of the Hawkesbury bridge being destroyed.

C. C. Wilson.
Esq., M.P.
16 May, 1900.

William Cyril Higginbotham, farmer and storekeeper, Armidale, sworn, and examined:—

3190. *Mr. McFarlane.*] How long have you been residing in this district? Ten years.

3191. Have you a statement to make to the Committee? We are treating the proposed line as a national undertaking. We consider that eventually it will be part of a line going on to Adelaide—the line from Cobar to Wilcannia having been already passed. The distance from Wilcannia to Broken Hill is very little, so that it ought not to be long before we have a line right through to Broken Hill. Such a line would save about 320 miles between Adelaide and Brisbane, and would enable the mails to arrive in Brisbane twelve hours earlier than they do now. That is an important consideration from a business point of view. The proposed line would also save 100 miles in the direct route from Melbourne to Brisbane. Then, too, it would connect important mining centres, such as Cobar, Silverton, Broken Hill, Tingha, Inverell, and Hillgrove. A great many Adelaide men are interested in our Hillgrove mines, and if there were a through railway there would be a good deal of cross traffic. Hillgrove represents more Adelaide money than money from any other place.

W. C.
Higginbotham.
16 May, 1900.

3192. Is the traffic that you allude to passenger traffic? Yes. The absurd figures given by the Railway Commissioners may be easily rebutted. They have put down £3,766 for passengers, parcels, and mails; but the receipts would be very much larger than that. If the railway were constructed our cold-climate products would find a ready market in the western district. It has been said that we shall have to compete with Orange and Wellington; but in my mail this morning I received a communication from a produce merchant at Orange, giving his prices. He puts down potatoes at £2 7s. 6d. a ton in truck loads, or £2 10s. a ton in smaller lots; whereas our farmers would be willing to take from 35s. to £2 a ton.

3193. What would be the freight from this district to Orange? The rate is a difficult one to arrive at, because it is an "up" journey from Armidale to Sydney, and a "down" journey from Sydney to Orange. The rate to Sydney would be about 13s. a ton, and to Orange it would be very much more. The Armidale prices, however, are lower than the Orange prices for every article on his list. He puts down seed oats at 2s. 9d. a bushel and feed oats at 2s. 6d. a bushel, whereas we should be glad to sell for 2s. 6d. and 2s. 3d. a bushel.

3194. What is the freight on oats between Armidale and Sydney? About 5d. a bushel. Onions are put down at £4 10 a ton; but I should be very glad to supply them at £3 a ton. In times of drought, if the proposed line were constructed, produce would find its way even into the Riverina district. The construction of the proposed railway would tend to equalise prices between the Northern and Western lines. Our market now is Sydney and places on the North-western line; but the bulk of our produce goes to Sydney, where it has to compete with the water-borne produce of New Zealand, Geelong, and other places. In Sydney we have really to compete with the markets of the world. Mr. Coghlan, in his "Wealth and Progress of New South Wales," says that New England can produce the finest oats in the Colony, and that there are vast areas here where oats could be grown with the best results. That is so. The average yield of oats in this district is from 40 to 60 bushels per acre. The further you go west the lighter the yield. New England, for the products which she cultivates, obtains the highest yields in any part of the Colony. In the average production of wheat we stand foremost.

3195. What is your average yield of wheat? I think 25 bushels to the acre. Mr. Coghlan puts it at something like 15 bushels to the acre, and that is considerably higher than the yield which he records for any other district. I sent a sample of wheat, which I grew at a place about 2 miles out of Armidale, to the Agricultural Department the other day, and they told me there was no finer wheat conceivable for milling; so that we could do very well if we could only find a market. Our yield of maize is from 40 to 60 bushels to the acre; but I have seen crops which have given more than 60 bushels. We attract farmers here from Victoria, from New Zealand, from Riverina, and from other districts; but after they have tried the district for two or three years they want to get away again, because of the lack of a market. Hundreds of tons of produce are grown that never find a market. Some years back 400 or 500 tons of potatoes were left to rot on one farm alone because there was no market for it. The price of our farming land, as compared with that of other parts of the Colony, is ridiculous. We can get agricultural land here for from £2 to £4 an acre, and there are few places in the Colony where you can purchase first-class agricultural land close to a big city like Armidale at that price.

3196. What are your chief products? Potatoes, hay, corn, wheat, and oats.

3197. Do you send fodder to the north-western district in every season, whether there is a drought or not? Yes; in every season. We look upon the north-western district as a market.

3198. What kinds of produce do you send there? A considerable amount of chaff and oats, and a considerable quantity of potatoes.

3199. We have been told that they send chaff from Wellington and Dubbo to Moree? I was astonished when I heard that. In the Orange list of prices from which I have quoted wheaten and oaten chaff is put down at £2 12s. 6d. a ton; but I think that Mr. Pearson, of Guyra, who will give evidence, will be able to quote it at a lower price than that.

3200. For what products could you find a market on the Western line if the proposed railway were constructed? For potatoes, oats, chaff, and maize.

- W. C. Higinbotham.
16 May, 1900.
3201. Do you not think Orange could supply the western district with chaff? The Orange people are more closely connected with Riverina, where droughts are not infrequent. I think that we should find a market on the Western line in many seasons.
3202. The Orange farmers send large quantities of produce to the Sydney market? We have to compete with them in that market.
3203. What market would there be for your produce in the western district when they had a surplus? The freight on chaff is very light—I think it is only 14s. a ton from Orange to Moree, and our yield, is, I believe, much higher per acre than the Orange yield.
3204. The freight on potatoes from Armidale to Wellington, *via* Sydney, would be £1 14s. 2d. a ton, and *via* Werris Creek direct £1 3s. 11d. per ton? We should not send produce to Wellington or to Orange, but we should expect to find a market out west from Wellington, towards Bourke.
3205. And you think that you could compete with the Orange farmers in that market? Yes; we get from 3 to 6 tons of potatoes to the acre. Last year I cultivated some 15 acres of potatoes, and I am cultivating about the same area this year. I could put 60 acres under potatoes if there were a market for them.
3206. The construction of the proposed railway would encourage the extension of agricultural operations in this district? I believe that it would.
3207. Is that one of the reasons why the people here advocate the construction of the line? Undoubtedly. The first people in the district to take the matter up were the members of the Farmers and Settlers Association, who number 110.
3208. Is there much land suitable for agriculture in this district still available? No, not very much.
3209. Is much of the land held by private owners suitable for cultivation? Yes; but the farmers are abandoning their farms, and are going in for sheep. I could name haphazard six or seven who have recently turned their farms into sheep walks.
3210. What traffic in stock would there be between this district and the Western district? I think that the stock traffic would be considerable if the proposed line were constructed. Drovers pass through this district periodically, and there must always be a considerable number of stock passing through from the western plains to New England. The Railway Commissioners' officers report that fluke exists in this district. It may have existed here years ago; but there has been no fluke during the last three years. Besides, the years in which people want to send stock here are droughty years, and in dry seasons we are always free from fluke. It has also been said that the grass here is sour. If that is so, it is very strange that we can provide the Sydney market with fat stock, and have done so for the last two or three years. It is estimated that the traffic receipts on the proposed line would be £8,586; but that must be only the local revenue; it cannot include the revenue which would be obtained from traffic passing on to the main line towards New England and Moree, or towards west. Mr. Coghlan in his "Wealth and Progress of New South Wales," says that there is no finer climate in the Colony than that of Armidale, and he says that it closely approximates to the famous health resorts in the South of France. All sorts of people are attracted here from different parts of the Colony. Our principal school has some eighty boarders, some of whom have come from the northern parts of Queensland, others from the western plains, others from Narrabri and Moree, and a great many from Sydney. A ladies' school has fifteen out of twenty-five pupils who have come from other districts, and another school has obtained 75 per cent. of its pupils from other districts. Armidale is rapidly becoming a scholastic centre, children being sent here because of the climate. People in the western districts, however, have no facilities for sending their children to our schools. Under present conditions the distance by rail from Dubbo to Armidale is 635 miles. I estimate that if people in the Western district would send their children here there would be an increase of pupils from those districts equal to something like 50 per cent.
3211. Which would suit this district the better, a connection with Dubbo or a connection with Wellington? A connection with Dubbo would suit the New England district better, because it would give us a more direct route to the west; we do not wish to have 60 miles extra carriage for our produce. From a national point of view, too, it would be better to have a connection with Dubbo, because that would give a shorter line between Adelaide and Brisbane. The Railway Commissioners report that they anticipate no benefits from the construction of the line; but they have for years been looking for a line which would carry a heavy traffic from Sydney without crossing the Blue Mountains, and why should not that line go from Newcastle? No doubt heavy traffic, such as sugar, iron, wire, and other things would be sent out to the western district along the proposed line if it were constructed, for the sake of avoiding the zigzag. Then, too, if the Commissioners use Newcastle coal on the Western line, the construction of the proposed line would save them some 90 miles of haulage. Apologies for non-attendance at the inquiry have been sent to me from several people who were to have been here as witnesses. Mr. Scoce, of Uralla, in stating his regret that he cannot be present, says, that the proposed line would give an outlet for fruit, chaff, and potatoes grown in his district, and would also be of value for stock traffic, besides opening up trade generally. Mr. Mackay, of Uralla, also favours the construction of the line; but his business prevented him from attending before the Committee.
3212. Has anybody formed an estimate of the value of the traffic which is likely to be sent over the proposed line? We have been unable to do that. We have been prevented from getting information from the local stationmaster, although Mr. Monteith will give you information about the Guyra traffic. He will show that 8,000 tons have been sent from Guyra within two years, and I believe that not 1 ton would go to Sydney if the western markets were open to us; it would all go over the proposed line.

Richard Wearne Nicholas, farmer and grazier, Tilbuster, near Armidale, sworn, and examined:—

- R. W. Nicholas.
16 May, 1900.
3213. *Mr. Shepherd.* What is the extent of your holding? I have 1,148 acres at Tilbuster, and I also rent land in other parts of the district. I rent 2,500 acres of grazing land at Guy Fawkes.
3214. How much land have you under cultivation? I cultivated 170 acres last year.
3215. What do you grow? Wheat, oats, maize, and potatoes.
3216. What yield do you get per acre? The last four or five years have been rather dry. I have only been here eight years, and I spent twenty years in the Orange district. The yield has averaged from 12 to 30 bushels of wheat to the acre, and from 1 to 5 tons of hay. During the last two seasons the yield of hay has not been much over 1 ton. The yield of oats runs from 20 to 50 and 60 bushels to the acre. I have had as high a yield as 12 tons of potatoes, and as low as 3 tons.
- 3217.

R. W.
Nicholas.
16 May, 1900.

3217. What has been your yield of maize? I have not gone in very extensively for maize. Most of my maize has been grown during the last two or three years, when the seasons have been dry. Twenty bushels to the acre is perhaps as much as I have got during the last two years, and I did not grow any before that time. I have land which in fair seasons would give a yield of 60 bushels to the acre.
3218. Where is your principal market? I have sold most of my produce locally, and I use some of it myself. I have a large butter factory and a large dairy, and consequently I require a large quantity of produce for my own use. I have not sent anything out of the district, though I have sold a good deal of chaff at Hillgrove, and a good many potatoes locally. I have at times sold as much as 50 tons of chaff round about Hillgrove.
3219. Have you had any difficulty in selling your produce? Yes; most of the farmers here have produce to sell, and they compete with each other in the local market. Our only other market is the North-western district. I believe that a great quantity of produce has been sent there, though I have not sent any.
3220. Do you think that in a few years the proposed railway would be self-supporting? Yes; though I do not know that it would be so at the start. I believe that there would be a great demand for New England produce in the west in dry seasons. I lived for twenty years in the Orange district, farming there most of the time, and we could not supply the Western district in times of drought. I was told that last year there were over twenty chaff-cutters and engines going as hard as they could, and they were unable to supply the orders that came in. In such a season we could compete with the Orange farmers. The prices I got in Orange were higher than we can get here. When I was leaving Orange I had about 70 tons of hay and 20 tons of straw to dispose of, and a merchant there told me that he would give me £3 a ton for the lot on the ground. He cut it up to send west from Orange as orders came in.
3221. Is your chaff made chiefly from oats? Sometimes from oaten hay, and sometimes from wheaten and oaten hay mixed. If we cut wheat for hay, it is because of the black oats amongst it.
3222. Do you think this district could compete with other districts along the proposed line for the western trade? Yes; we can grow much better crops here than they can grow in Orange, Springhill, or Millthorpe.
3223. Have you tried lucerne? Yes; and it answers fairly well.
3224. As a rule, do squatters buy lucerne in preference to oats for starving sheep? Yes, where they can get it; but round Orange and Blayney they do not grow lucerne.
3225. What is your opinion of the district through which the proposed line would pass? There is a lot of good country between Wellington and Werris Creek. At Cobborah, Denison Town, Coolah, and Rockgedgiel there is a lot of land suitable for close settlement, but at the present time large areas are in the hands of large holders.
3226. Are you acquainted with the country at any distance away from the route? Just where the railway would go there are some poor patches; but on the whole the country is good.
3227. Does the good country extend back any distance from the Northern line? Yes; especially on the Liverpool Plains.
3228. What is your opinion of the timber along the line? There is some pine scrub, and I noticed one saw-mill on the road, but I cannot speak much about the timber there.
3229. Would the timber trade contribute much traffic to the proposed railway? I think not; but the line would be largely used in carrying produce from this district in dry times, and in the transport of stock. I can show you in the butchers' shops in Armidale beef fattened within 5 miles of Armidale which is as good as any in the Colony.
3230. Has this district been considered a dry one? During the last four years we have had dry seasons; but I have been able to carry on my dairying, and the cattle have done very well. For sheep, they say that the drier the season the better in this district.
3231. How much butter do you make? I milk 100 cows now, and in good seasons I have made 7 lb. of butter to the cow per diem. In one season I made 95 lb. of butter daily from 140 cows, and nearly all of them have been in milk for some time. The construction of the proposed railway would benefit the district. There are large areas of land here which are now idle. I could cultivate 800 acres if I could find a market for my produce.
3232. Is yours good wheat-growing land? Yes.
3233. You are not further from a market than other people? No; but the local price of wheat is only 2s. 2d. a bushel, and it does not pay to grow wheat at that price.
3234. What can you afford to grow wheat for? With improved machinery and implements, one could grow wheat for 2s. a bushel, or perhaps less in good seasons.
3235. What does it cost to grow and harvest wheat? I suppose it would cost about £2 an acre, allowing for the rent of the ground. You cannot work heavy ground as easily as loose soil. A neighbour of mine has six horses in a single-furrow plough; you will see from that that the soil here is very stiff.
3236. We have had it in evidence that clearing has been done in other districts for 8s. 6d. an acre? We could not do it at that.
3237. What would it cost you to plough your land, put seed into it, and harvest for market? In heavy black soil I do not think I could do it for less than 30s. an acre.
3238. *Mr. Watson.*] How would the seasons here compare with those in Riverina and on the Southern line? We do not suffer from droughts here as they do in the places you mention, though we sometimes have dry seasons. Our stock never starve here; they keep in fair condition even in the driest seasons. Of course, if we have a severe winter following a dry season there are sometimes losses in stock; but we can always provide winter feed.
3239. Does it not seem strange that you cannot grow wheat here when the people of Narrandera, who pay within 3d. a ton freight of what you pay, are able to grow it;—one would think that with good land and a fair season you could afford to put the whole of your 800 acres under crop? I find that dairying pays better than farming.
3240. Would the construction of the proposed line give you a better market? Not for wheat; but it would give us a better market for potatoes and chaff in dry seasons.
3241. Is this district suited for potatoes rather than for wheat? Potatoes at £2 a ton pay better than wheat when you can get from 4 to 6 and 8 tons to the acre. We grow what will pay us best. I find that dairying pays better than anything else. Of course, I have to employ a number of hands to do the milking, and to look after the place, and I have to engage in cultivation to keep them employed when they are not at work milking.

John Cameron, farmer and grazier, Morden, Saumarez Creek, near Armidale, sworn, and examined:—

J. Cameron
16 May, 1900.

3242. *Mr. Watson.*] How long have you been here? I have been here for forty-six years.
3243. How do you think the construction of the proposed railway would affect the stock traffic between this district and the Western district? I think that the construction of the proposed railway would give the farmers in this district an outlet for their produce. At present we have no market, and I have had stuff lying in my shed for two years because I could not sell it. I am almost giving up farming now, and going in more for stock, because I find that it is more difficult to get a market for your produce than to grow it.
3244. Are you worse off in that respect than farmers in other parts of the Colony? No. We grow more than the local demand, and then we have to send our produce to Sydney or to some other place outside the district. I sent 40 tons of chaff to Sydney one year; but it did not pay me, because of the high charges for carriage. When we get to Sydney we have to compete with the markets of the world.
3245. The carriage for produce from here to Sydney is about 11s. per ton;—you could not get a much cheaper rate than that if you were in a position to send away your produce by steamer? I paid 10s. a ton for having my hay cut up, and 15s. a ton to have it trucked and delivered. As a rule, we sell our hay to local men, who cut it into chaff, and then sell it. They are better able to find a market for it than we are.
3246. Do you think that the Hunter River farmers, the Orange farmers, or the Bathurst farmers can compete with you because of their better climate and soil? I am not acquainted with those districts; but, judging by what I hear, I think we get larger crops than they get.
3247. They send their produce regularly to Sydney, and yet the freight that they have to pay is not much less than you have to pay? I only tried it once, and it did not pay me then.
3248. If they could beat you in the Sydney market, they will beat you in the western market, because they are nearer to it? In New England we have a lot of country which, in good seasons, is not sheep country, but which carries sheep well in dry seasons. One year we had, I think, 25,000 sheep in the New England district which had come here from other districts. Drovers of sheep come here every year.
3249. I suppose most of the sheep that come here are driven here? Yes; all of them.
3250. From what direction do they come? From out to the west.
3251. And from the south? Yes.
3252. What route do they take? I think they keep to the north of the route of the proposed line.
3253. Out in the direction of Coonabarabran? Yes.
3254. Do you think that owners of sheep would use the proposed railway? I think it would pay them to do so, because it would prevent the losses which now occur when sheep are driven over a bare piece of country. I believe that such a saving would go a long way towards making up the railway charges.
3255. The experience in other parts of the country is that stockowners will not truck store stock, except at starving-stock rates;—that being so, the Commissioners cannot expect to get much revenue from the stock traffic that you speak of? I cannot offer an opinion on that point.
3256. Would it pay an owner to truck stock from Cobar to Armidale, *via* the proposed line, at ordinary rates, which would come to something like £8 18s. 8d. for 100 sheep, or 1s. 9d. a sheep? I think so; because the losses are not so great when sheep are carried by rail as when they are being driven.
3257. Then, too, the country every year is becoming more settled and fenced, and consequently there is less prospect of getting grass for travelling stock? Yes. It will be impossible to travel stock in the future, because there will be no grass along the roads for them to eat.
3258. Do you fatten any big stock for sale? Yes; some train loads of fat stock have been sent from this district during the last few years.
3259. Is this looked upon as a fair fattening district for big stock? Not for big stock.
3260. Do you think that people in this district and further north would be able to compete in the Melbourne market with stockowners from Queensland, who send their cattle down through Bourke? Only occasionally. Stock are fattening here now better than they did thirty years ago, because the country is getting more civilised. When I came to New England first people were thought mad if they put sheep on country such as that on which I am now running a sheep and a half to the acre. There was nothing but rank grass then, which only cattle would eat.
3261. Have artificial grasses been introduced into the district, or have you to depend upon the native grasses? I have used artificial grasses; but I find that native grasses are better, because they are acclimatised.
3262. What sort of country is this for sheep and cattle? Country that has been well improved will carry from a sheep and a quarter to a sheep and a half to the acre. I am running a sheep and a half to the acre every year, and I sold some animals the other day which were a good size.
3263. Is your land better than the average? No, mine is average land; there are thousands of acres of land round my place which are as good as mine.
3264. Do you spell your land? No; I have only 600 acres, and I run 1,100 sheep, besides cultivating 70 or 80 acres. Of course, I do not run that number always.
3265. How many acres would be required to feed big cattle? About 5 acres to a beast. At Guy Fawkes there is country that at one time was looked upon as useless; but thousands of heads of cattle have since been trucked from it to the Sydney market, and they have brought high prices. If those cattle could be sent direct to Melbourne they would have a chance of competing with the Queensland cattle, but if they had to be travelled to the Melbourne market they would be only store stock when they got to Melbourne.
3266. They seem to have more bad seasons than good seasons out west? Yes; they are always complaining about the scarcity of grass out there. I have sent 800 cases of fruit to Queensland, because I could not find a market for it in this Colony; but if the proposed railway is made it will open up a market for fruit in the west.
3267. How did you send your fruit to Queensland? By rail. I sent it to Bundaberg and to other places.
3268. What kind of fruit was it? Apples and pears. We do not know what to do with them some years, and a lot of the fruit goes rotten. I made bacon of my apples the year before last.
3269. Did it pay you to send your fruit to Queensland? The fruit did not bring high prices; but it was better to send it there than let it rot. I have got as much as 9s. a case for some of my fruit, and I have also made as little as 1s. 6d. a case, after paying carriage. One one occasion, though I got about £40 for my fruit, when I paid for carriage and other charges, the amount coming in to me was only £20.
3270. How far is Armidale from Brisbane? About 365 miles. A lot of fruit is sent out as far as Charleville. I sent a consignment to Rockhampton, but it did not pay.
3271. That was merely an experiment? Yes.

Joseph

Joseph Monteith, farmer, Guyra, sworn, and examined:—

3272. *Vice-Chairman.*] Are you here to speak for yourself and for other farmers in the Guyra district? J. Monteith.
I am a practical farmer, and have a good knowledge of the district, extending over seventeen years. Mr. Pearson and myself have come from Guyra. 16 May, 1900.

3273. Will you describe the Guyra district, from an agricultural point of view? It is a very good agricultural district.

3274. Is it similar to the Armidale district? It is better.

3275. What are your principal crops? Potatoes, wheat, and oats.

3276. What yields do you get? We get from 3 to 6 tons of potatoes to the acre in good seasons. The last five years have been very dry; but even this year, which has been the driest of all, people have got over 3 tons of good marketable potatoes to the acre. The general yield of wheat is from 25 to 30 bushels to the acre. I have had 60 bushels, and never less than 25 bushels; but this year the crops did not turn out so well.

3277. Is it good milling wheat? Yes; in a good season it is really prime wheat.

3278. What is your average yield of oats? Between 40 and 50 bushels.

3279. What is the average size of the holdings about Guyra? Most of them are about 640 acres. I have more than that myself; there are 150 acres of my land under cultivation.

3280. Do the people in the district cultivate the greater part of their land? Some of them have a few sheep, and others run large cattle. The cattle do well in good seasons; but the winter is rather cold for them, so that from May until the beginning of November they are generally poverty-stricken. I have been in New Zealand and in Victoria; but I never saw a place where cattle fatten more quickly than they do on some holdings in our district in the summer.

3281. What area is there under crop on your holding? From 80 to 100 acres. The land is chiefly under potatoes.

3282. Do the Guyra farmers complain that they have no market for their produce? I do not say that they have no market; but it is such a poor market at the present time that they find a great difficulty in selling anything.

3283. You grow potatoes chiefly? Potatoes, hay, and oats. The price of wheat has been so low that wheat is not much grown.

3284. Do you find a good market for your potatoes? We do very well when there are famine prices in Sydney and Melbourne. We can grow potatoes at £2 10s. a ton, but when they get lower than that we cannot sell them. Nine or ten years ago we did not sell either hay or potatoes for two years.

3285. How is it that farmers do not go in more substantially for wheat, if they can get from 25 to 30 bushels to the acre? Lately potatoes have paid very well. Land will not stand wheat unless we alternate the wheat crop with a crop of potatoes.

3286. What has been your usual market for wheat? Armidale and Glen Innes, and in two seasons we sent our wheat to Sydney. When wheat is 4s. or 3s. 6d. a bushel we can send it to Sydney, but when it gets below that we cannot do much with it.

3287. What sort of farming implements are used in the Guyra district? The latest and best that you will find anywhere—Massey and Harris, and Martin's implements.

3288. Is that land hard to clear? Yes; what has been cleared has been very difficult to clear.

3289. What market do the Guyra farmers expect out west? The people out west cannot grow what we can grow.

3290. We have it in evidence that potatoes and onions grow as well on the Talbragar as in any part of the Colony, and that district is closer to the western market than the Guyra district? We believe that there is a demand for produce, such as we grow, out west, and that higher prices could be obtained there than we now get.

3291. We have received the following letter from the chairman of a public meeting held at Guyra only yesterday:—

Sir,

Guyra, 15 May, 1900.

At a public meeting held at "Guyra Hotel" it was unanimously agreed to send a letter to the Public Works Committee sitting at present in Armidale on the following:—

Protesting against the proposed line of railway from Werris Creek to Dubbo or Wellington, on the grounds that it would be of no benefit to the farming population of the table-land of New England, if anything a serious injury, the market of the table-land to be west, and that there are no delegates publicly authorised to represent the district.

JOSEPH McMULLEN,

Chairman of above Meeting.

F. T. Goulder, stock and station agent.

J. T. McGovern, hotel-keeper.

Robt. Moore, farmer.

William Stapleton, farmer.

Wm. Beckwith, agent.

E. J. Lackey, storekeeper.

W. M. Stevenson, Guyra.

P. J. Garrahy, Guyra.

C. Smith, farmer.

Henry Heydon, storekeeper.

Matthew Smith, farmer.

The Chairman, the Public Works Committee.

? What I have stated is the general opinion of the neighbourhood.

3292. Does the protest which I have read in any way convey the views of the Guyra farmers? Not in the least.

3293. Is the area under crop in the Guyra district still increasing? Yes.

3294. Is it increasing fast? Yes; new ground is being broken up every year. I think it would be a national gain to have a railway constructed which would shorten the distance between Adelaide and Brisbane. The proposed line would also be of service in transporting stock from the drought-stricken west to New England. During the last few years a large number of stock had come to New England.

3295. Is the transport of the stock profitable to stockowners? I am certain that it is. I know several people who would have used the train if they could have done so. In dry times the stock can get nothing to eat along the stock routes.

3296. Do you agree generally with the evidence which has been given this morning? Yes.

3297. And also with what has been said about the New England country? Yes.

3298. Mr. Harper says that pastoralists on the plains have been very timid about sending stock to New England, because the grass is sour, and fluke is always present? That is not true of the district of late years. Since 1895 we have heard nothing about fluke. No one except one who has lived here can understand

J. Monteith. understand how much the country has been improved by ringbarking. No doubt sheep will not do well here in really wet seasons; but sheep would not be sent here in such seasons, because there would be grass for them elsewhere. Ringbarking sweetens the grass so that sheep fatten twice as quickly on ringbarked country as they do on unimproved country. If there is a ringbarked patch in a paddock cattle will always go there.

George Hargrave, farmer, Armidale, sworn, and examined:—

- G. Hargrave. 3299. *Mr. McFarlane.*] Have you been long in the district? I have been here for the last twenty years, and I have been farming for four years.
- 16 May, 1900. 3300. What crops do you grow? Maize, wheat, and oats.
3301. Have you a satisfactory market? During the last year or two the market has not been satisfactory.
3302. What is the reason for that? We are over-producing; at any rate, we grow too much hay.
3303. Do you get as good results from the outside markets as from the local markets? No.
3304. Is this good agricultural land? Most of the land under cultivation is rich land.
3305. Would the construction of the proposed railway give you an additional market? I believe that it would.
3306. You have heard the evidence of a number of gentlemen to-day in favour of the construction of the proposed line;—do you confirm the statements which they have made? Yes, in the main.
3307. Do you differ from them on any material point? It seems to me that the rates which they would have to charge on the proposed railway to make it pay would prevent us from sending produce along it to the far western districts.
3308. What do you call the far western districts? Districts are far west as Wilcannia. I think we could send produce as far as Bourke.
3309. Do you think that stock would be sent from the western district to this district over the proposed line? I think it would pay to send stock here by train rather than lose them.
3310. Would stock traffic take place only in times of drought? Mainly in times of drought; but people who have had more experience in droving stock than I have had inform me that it pays to send store stock to fattening country rather than to drive them there. I think that store bullocks coming from Queensland, instead of going by the western route, would come this way to get to Orange and to Dubbo.
3311. Do you consider this good fattening country? Only in the more settled parts.
3312. Where it has been improved? Yes.
3313. Have you had much experience in droving stock? No.
3314. Would people travel store stock rather than send them by train? I think it would pay to send them by train, because of the loss in condition when travelling. I have tried growing root crops here, and I think that there is no other district in the Colony as good as this for the production of mangolds and beet. I have grown 20 tons of beet to the acre, and it is a most fattening food, and one that could easily be sent out to the western districts. We could produce beet here at a few shillings per ton.
3315. *Mr. Watson.*] If the proposed railway were constructed the freight on hay and produce generally to Cobar would be 14s. 3d. a ton, and to Bourke 14s. 7d.;—could you afford to pay those charges? Yes, in good seasons.
3316. *Mr. Shepherd.*] Are they using mangolds and turnips here for winter feed? Yes; they are coming into use.
3317. Do you anticipate great benefit from their use? Yes; especially to the dairying industry.
3318. I suppose there is not much natural grass here in the winter? In an open winter like that which we have had so far, there is good feed; but when winter sets in with a hard frost the grass suffers. I produce a sample of the maize grown on my land.

Richard Pearson, produce merchant, Guyra, sworn, and examined:—

- R. Pearson. 3319. *Mr. Watson.*] Have you been long in business in Guyra? Fifteen years.
- 16 May, 1900. 3320. Do you regard the district as a good one for agriculture? I regard it as a very good district.
3321. Are the farmers there making money? I cannot say that they have been doing too well; but during the last three or four dry seasons they have been doing fairly well.
3322. Is that because of a better market, or because they have grown more? Because of a better market; chiefly on the North-western line.
3323. Has any considerable quantity of produce been sent from your district to the North-western line during the last two years? Yes; I have sent a considerable quantity myself.
3324. Have you ever attempted to send produce to Sydney? Yes; but, as a rule, with unsatisfactory results. I have sent produce—hay, chaff, and potatoes—as far as Walgett.
3325. At what price could you send hay to Sydney from Guyra? For £3 or £3 5s. a ton.
3326. Do you send hay or chaff? Chiefly chaff. As a rule, derrick-pressed hay does not bring a good price in Sydney.
3327. What could you sell chaff for in Sydney? For about £3 5s. a ton.
3328. You sent some potatoes recently, I understand, but they did not meet with a good sale? Yes; the returns were not satisfactory. As a rule our Sydney returns are not satisfactory, unless the prices there are at famine rates, as they were two years ago.
3329. Who are your competitors in the Sydney market? Chiefly the farmers from Tasmania and New Zealand.
3330. Do you think you can successfully compete with the Orange and Hunter River districts? I think so.
3331. If the proposed railway were constructed, could you compete in the western market with districts such as Orange and Wellington? I think so, in times of drought.
3332. We have heard that large quantities of hay and other produce have been sent from those districts through Sydney to Narrabri and Moree? Yes; a large quantity of produce was sent from Orange last year.
3333. Were your supplies exhausted then? We had no great quantity to send last year. What we had was required in Armidale and Hillgrove.
- 3334.

3334. Do you think that people would cultivate larger areas if the proposed railway were constructed? Yes; if they could get an outlet for their produce. R. Pearson.
16 May, 1900.
3335. The western districts would not require much produce in good seasons? Not very much.
3336. Would this district receive sufficient encouragement from the construction of the proposed line if it got a market in the west only on the occasion of a drought there? It would not pay them to increase their cultivation if there was only one dry season in five; but for the last five or six years the drought has been almost continuous.
3337. *Vice-Chairman.*] Does the letter which the Committee received from a public meeting at Guyra represent the opinions of the farmers in that district? No.
3338. It may be taken as representing only the opinions of those who signed it? That is so. There was no public meeting held in Guyra with reference to the matter. The total tonnage of agricultural produce sent from Guyra south during two years was 8,067 tons 18 cwt. 2 qrs.

Michael John Walsh, storekeeper, Walcha, sworn, and examined:—

3339. *Mr. Shepherd.*] How long have you resided at Walcha? For thirty-eight years. M. J. Walsh.
16 May, 1900.
3340. Is there anything you desire to add to the statements which have been made here this morning? We were trying to get a small branch line from Walcha roads into Walcha, and we then prepared the following statistics, which I think will be of interest to the Committee:—

TO THE HONORABLE THE MINISTER FOR WORKS.

Walcha is the most southern town on the New England tableland, and is situated directly to the east of Walcha Road railway station, which is 320 miles from Sydney and 218 miles from Newcastle, and has at the present time a district population of over 3,000 inhabitants.

The area within the trafficable sphere of a line to Walcha embraces somewhere over 1,000,000 acres, of which we would respectfully point out:—

322,062 acres are held under freehold and conditional purchase.

493,222 acres are held by way of conditional lease.

102,000 acres are held under annual lease.

8,698 acres are held under settlement lease.

6,984 acres are held as homestead selections.

In addition to which a large area is held under occupation license.

The stock returns for 1899 show the following, viz.:—443,000 sheep, 31,000 cattle, 3,027 horses, and 1,196 pigs, which shows a large increase on past years' returns.

The area under and cleared and prepared for cultivation within the above trafficable sphere is estimated at about 12,400 acres, and the average yield per acre for the various crops is—wheat 18 bushels, oats 28, maize 27, and potatoes 4 tons.

The area under artificial grasses is upwards of 4,500 acres.

The revenue derived from lands and miscellaneous items from the year 1890 to June of last year amounts to £165,437, being an average of approximately £17,500 per annum; in addition to this foregoing revenue there is the sum of £1,889 18s. 1d. paid yearly direct to the Treasury for lands in the Walcha Land District, held under occupation and preferential occupation licenses.

The number of letters dispatched from the local post office for the year 1898 was 83,290, and the revenue derived for the same period amounted to £1,100, and for the year 1899 to £1,260, showing an increase of £100.

The number of bales of wool dispatched from Walcha Road railway station for the year ending June, 1899, was 5,862, showing an increase of 2,666 bales over the same period ending June, 1896, and that the return of the number of live stock forwarded from Walcha Road for the year ending June, 1899, shows 34,886 fat sheep, 968 fat cattle, 125 horses, and 96 pigs, which shows a large general increase over previous years. In addition to the above, some 35,000 sheep were trucked to Walcha Road from droughty districts in 1899.

The return of revenue of the Walcha Road railway station for the year ending June, 1899, as compared with the same period in 1895, shows as follows:—Tickets sold in 1899, £1,417 17s. 8d., as against £1,088 15s. 7d. in 1895; goods and live stock in 1899, £4,336 7s. 11d., as against £2,864 1s. 6d. in 1895; or a total revenue in 1899 of £5,784 5s. 7d., as against £3,952 17s. in 1895,—showing an increase of £1,831 8s. 7d. in 1899 over 1895; and that the passenger and goods traffic show the following, viz.:—Number of tickets sold in 1899, 1,506, as against 1,311 in 1895; goods out in 1899, 2,228 tons, as against 1,069 tons in 1895; goods in, 2,020 tons in 1899, as against 1,400 tons in 1895.

There are about 300,000 acres of rich soil within the district that, with the increased settlement produced by the extension of the railway to Walcha, would be cultivated, and thereby bring about additional traffic to the main line which, after deducting working expenses, cannot be put at less than £2,000 per annum. To this may be added a saving on road maintenance of £400, and on the carriage of mails, &c., of about £150.

The passenger traffic would largely expand, there being much to recommend Walcha as a summer resort, but the present 12 miles of coaching from rail are a great drawback to the advent of visitors. This contention is borne out by the part of the petition for the railway to Walcha has been signed by a large number of the leading and other residents of the Tamworth district.

Within 30 miles of Walcha an unlimited supply of magnificent timber is to be found, comprising red stringybark, blackbutt, sassafras and cedar, a large trade being done in the latter, which will be largely increased by railway communication, as the supply is unlimited.

Seeing the large number of bales of wool, fat stock, and goods dispatched and received, and the undoubted expansion of the passenger traffic as set forth, and the saving of something like £300 to £400 per annum in the maintenance of the present road, consider that if a light line of railway were constructed to connect Walcha with the Great Northern Railway it would pay from its inception.

During the last three years some thousands of acres of suburban lands have been thrown open to homestead selection, the whole of which are settled on—supporting twenty families; and besides there are thousands of acres of good land, agricultural and pastoral, which are now of no value to the Crown, but would eventually be taken up if such were thrown open under suitable settlement.

With the advent of railway communication a great impetus would be given to several industries, viz., agricultural, pastoral, dairying, fruit-growing, mining, &c.

3341. How would the traffic that you have spoken of benefit the proposed railway? It is the general opinion of the people of Walcha that the proposed railway would give them a valuable market. They consider that there is too much competition in the Sydney market to make it a good one for them, and the railway charges that they have to pay to get there are considerable.

3342. Is it your opinion that the construction of the proposed line would open a larger market for the produce of the Walcha district? Yes.

3343. What grasses have been laid down in that district? Prairie-grass, blue-grass, rye-grass, cocksfoot, and other grasses. In dry seasons stock come by train to our district from the north-western district; but when they have attempted to drive them by road they have died on the way in thousands. At the present time there are about 40,000 sheep in the district which have come from the lower country.

3344. Is there generally grass to spare for stock coming in from outside? Yes; we sent a good many fat stock from our district last summer, and obtained good prices for them. Stock fatten remarkably well there.

Robert

Robert Brown, pastoralist, Aberbaldie, near Walcha, sworn, and examined:—

- R. Brown.
16 May, 1900.
3345. *Vice-Chairman.*] How far is your holding from Walcha? It is 13½ miles from Walcha, and 14 miles from Walcha-road.
3346. What is the area of it? 16,000 acres.
3347. What is its carrying capacity? At the present time I have 16,000 sheep on it.
3348. Is any of your land under crop? I have 60 or 70 acres under oats for hay, and I also grow a little wheat, corn, and potatoes.
3349. Which crop suits this district best—wheat or oats? Oats.
3350. Does wheat do well here? Wheat has done very well at times. In two out of three years, when I have tried it, I have had excellent crops. The crop last year was a failure, but the season was very dry.
3351. When you speak of oats being a suitable crop, do you mean for grain or for hay? For both. I had one of the best crops last year that I have seen.
3352. You only grow for your own consumption? Yes.
3353. Where is the chief market for produce grown for sale? I think at Tamworth, and down that way.
3354. One of the reasons urged in support of the proposed railway is that it will enable stock to be transported to New England from drought-stricken parts of the Colony? I lived in the Dubbo district for eight years, and I have brought stock over from there myself. A neighbour of mine buys 20,000 and 30,000 wethers every year. A great many of these sheep would travel by train if the distance were less. Of course, it is out of the question to use the existing lines. I have bought sheep about Dubbo, and as far west as Nyngan.
3355. Is the stock traffic permanent? Yes; a great many people do more in buying and fattening wethers than with breeding. They take a clip or two off the wethers, and then sell them and buy some more.
3356. Do they deal in wethers in that way because of the unsoundness of the country? No; but it pays them better to deal than to breed. During the last four years the country has been very sound.
3357. You do not look upon this as a profitable breeding country? I do not consider it an unprofitable breeding country, because I breed sheep here myself; but it is more profitable, in some parts of the New England country, to deal in sheep in the way I have described.
3358. Do you think that we could anticipate a permanent stock traffic to the proposed line, whether the seasons were good or bad? I think there will be a large traffic.
3359. Are the sheep which are bought and fattened here sent back to the district from which they were drawn, or are they sent to the Sydney market? We send them either to Sydney or to some other market.
3360. It has been stated that the proposed line would be beneficial in providing facilities for the removal of starving stock from drought-stricken districts to New England? Yes; and I believe that it would be an advantage to have the line for that purpose. In the summer we cannot stock this country too heavily. I have had 20,000 sheep on my 16,000 acres until recently. In summer time the more stock you put on the country the better it is. In the winter you have to reduce your stock.
3361. Do you anticipate any other traffic on the proposed line? I think there would be a considerable quantity of produce carried on it, and that it would assist the farmers in these districts by opening up another market for them.
3362. Do they complain that they have not a sufficiently large market now? Yes.
3363. Has the want of a market retarded their operations? Yes; and especially around Walcha in the matter of wheat.
3364. Is there a fairly large area of agricultural land in the district? Yes.
3365. Why does it not pay to consign wheat from this district to Sydney, or to the world's market? Because of the long land carriage. The farmers of this district have to compete with those of the Hunter River district, who have not so far to send their produce.
3366. Do you think that, if the proposed railway were constructed, the farmers of this district could compete with those in the western districts? Yes. I have seen 40 bushels taken off an acre of land in this district. David Green had about 500 bags of wheat this year, and Mr. Steele between 400 and 500 bags of wheat and oats, although it has not been a favourable season for wheat.
3367. In good seasons would graziers drive their sheep across to the Northern line from Dubbo, or would they truck them from the nearest railway station, supposing the proposed line to be constructed? I think that large numbers of sheep would be trucked in any case. If graziers could get their sheep across by train for 6d. or 7d. a head they would sooner truck them than drove them, because the train would bring them across in twenty-four hours.
3368. *Mr. Watson.*] The rate from Nyngan to Walcha Roads would be 1s. 5½d. per sheep? I think that sheep would most likely travel down to the junction before being put upon the train.
3369. *Vice-Chairman.*] But you think that a cross-country railway would be used? Yes; and it would benefit the farmers and pastoralists of New England very much.
3370. *Mr. Watson.*] If graziers only used the cross-country line, the rate would be 10d. a sheep;—would that be cheaper than to drive stock across? It would be easier to use the train. In driving sheep across you might have them three months on the road, and there is always risk of loss when you have stock on the road, especially in summer time, because of the long distances they may have to travel without water. It would be a great convenience to be able to send sheep through in twenty-four hours.
3371. Ten-pence a sheep would not be a prohibitive rate? I do not think so. I would sooner pay for trucking the sheep than have them driven across, because the trucking would save the knocking about that they get on the roads.
3372. *Vice-Chairman.*] Is Walcha a good fattening district? Yes; in certain seasons. We are sending away a large number of fat stock this year.
3373. What do you consider good seasons? The dry seasons are the best here.
3374. Do you agree with Mr. Harper that there is always fluke in the New England country? There are parts of New England where there is always fluke; but in other parts sheep will last as long as they are wanted to last.
3375. Mr. Harper also says that the country is sour? It is sour in wet seasons, more especially in the swamps; but the ridges are fairly good.

3376. You do not think that there is a large percentage of sour country? I think there is a bigger percentage of sweet country. At the present time I am breeding from ewes which I myself bred four years ago, and I am sending wethers to the market which I bred four years ago. If sheep will give four fleeces of wool, and then go to the market fat, there cannot be very much wrong with them.

R. Brown.
16 May, 1900.

3377. Mr. Harper, in reply to Question 236, suggests that a line from Brewarrina to Collarenebri, and the extension of the Coonamble line to a point between the two places, would serve the Northern districts better than the proposed line? I consider that a junction between the Great Northern line and the Great Western line would be of more advantage to the country than anything else. Some years ago I bought 7,600 ewes on the Bogan, and I tried to arrange with the Commissioners to truck them right round through Sydney; but they would only give me ordinary rates, so that I could not afford to do it.

Edwin Parsons, grazier, Eilerslie, near Guyra, sworn, and examined:—

3378. *Mr. Shepherd.*] How far is your holding from Armidale? Thirty-two miles.

E. Parsons.

3379. What is the extent of it? 4,000 acres.

16 May, 1900.

3380. Are you grazing sheep on it? Chiefly sheep.

3381. Do you breed sheep? Yes.

3382. Have you been successful with them? Yes.

3383. Have you any disease amongst them, such as fluke? During the last four or five years sheep have been free from most of the diseases that we get in New England in bad seasons. In seasons such as we are getting now nearly every part of the district is sound.

3384. How many sheep are you running? 3,600.

3385. Do you cultivate any portion of your land? Some of it; I would cultivate more if there were a market for my produce.

3386. What is the extent of your cultivation? From 30 to 40 acres.

3387. What do you grow chiefly? Potatoes and oats. We consider that the land in our district is not fit for wheat. We grow oats both for hay and for grain, and we also grow maize.

3388. What yields do you get per acre? As a rule, we get about 40 bushels of oats to the acre, and from 30 to 40 bushels of maize. This is not a really good maize-growing country.

3389. Do you make much oaten hay? I make enough for my own use.

3390. How much hay do you get per acre? From 3 to 5 tons.

3391. And what weight of potatoes? Generally speaking, we get enormous crops of potatoes, though sometimes we have a failure. We get as much as 6 and 7 tons to the acre at times.

3392. Would the construction of the proposed line give you a better market than you have now? I think so; it would open up the Western district for our potatoes and oats.

3393. Are you only waiting for that market to cultivate a larger area? As soon as we can get a market, we shall cultivate a larger area. People holding from 3,000 to 5,000 or 6,000 acres would like to do some farming, if they could do it with advantage; but at the present time there is no profit in it, because there is no market.

3394. How much of your land is fit for cultivation? 600 or 700 acres.

3395. What market have you for your sheep? Our fat stock go to Maitland or to Sydney. In some years we send our store wethers to the plains in the north-west or west to be fattened; but latterly we have been able to fatten them ourselves. With a change of season, however, we may have to sell them as stores again.

3396. I suppose that in the winter it is difficult to keep stock in good condition here? Yes; winter is the worst part of the year in New England.

3397. Do you find that the grass is plentiful in summer? Yes; it is difficult to keep it down in summer; but in the winter we have to reduce the number of our sheep.

3398. In the summer can you lay yourselves open to receive large numbers of starving stock? Nearly every summer we can buy some store stock to carry for a time. The sheep which come up as starving stock go on to waste lands, sour, inferior country which is not used, except in dry years.

3399. What is the average extent of the holdings in your district? From 2,000 to 7,000 acres.

3400. There are no very large estates there? Not just there.

3401. Are many large stock carried in your district? No; the district is chiefly a sheep district.

3402. Have you gone in for dairying at all? Only for own use.

3403. Do you think that the country is suitable for dairying? Not in my immediate neighbourhood, though I think that the country about Guyra would be suitable for dairying. If the proposed railway were constructed, and the Melbourne market were open to us, we could use the line to send fat stock to Melbourne. We could not send our stock there by road, because the distance is so great that they would fall off in condition on the journey.

Joseph Scholes, farmer and fruit-grower, Armidale, sworn, and examined:—

3404. *Mr. McFarlane.*] How much land do you cultivate? Between 80 and 90 acres.

J. Scholes.

3405. Have you resided long in this district? Since 1849.

16 May, 1900.

3406. What is the feeling of the farmers here in regard to the proposal into which the Committee are inquiring? They are very anxious that the railway should be carried out, because they believe that it would give them an additional market for their produce.

3407. Are you of the same opinion? Yes; I think that if we were connected directly by rail with the drought-stricken parts of the Colony it would be of great advantage to our farmers, because we always produce more than this district can consume, and we could look to these other districts for a market for our surplus.

3408. What do you do with your surplus at the present time? Some of it goes to Sydney and some of it to Narrabri, Moree, and the North-western districts.

3409. Is there a continual demand for your produce? Yes; because trucks are constantly taking it into those districts. I was told of a man who was sending produce away at the rate of 20 tons a day. This traffic is, of course, heavier in times of drought than in ordinary seasons, when there is grass.

3410. Do you think that if the proposed line were constructed there would be much movement in stock between this district and the Western district? Yes; in dry seasons. There is scarcely a dry season now when

- J. Scholes. when more or less stock do not come from the drought-stricken parts of the Colony to New England. In the summer-time the growth of grass here is very rapid, but in the winter we suffer, to a certain extent, from the severity of the climate. If the summer months are a little droopy, the growth of grass is so rapid that we can put on almost twice as many sheep as the country will carry at ordinary times; that enables us to take starving sheep and cattle. Of course, in the winter-time we could not carry them.
- 16 May, 1900. 3411. Can you speak of any traffic that there would be on the proposed line besides the stock traffic? There would be stock traffic and produce traffic, and no doubt the stock traffic would create a certain amount of passenger traffic.
3412. Do you think that there would be much traffic from this district to the Southern line by way of the proposed line? At the present time every one going south has to go first to Sydney; but I think that if we had a market for our produce and stock in other directions it would create a certain amount of passenger traffic to those places. Beyond that I do not know what additional passenger traffic there would be. I should like to refer to the fact that sugar-beet grows remarkably well here. Samples which have been analysed by the Government Analyst have given very good results. Turnips, mangels, and other root crops, which would be useful for feeding dairy stock and pigs, also grow well here.
3413. How far have you been successful in fruit-growing here? I have been very successful in growing fruit, but not in selling it. The conclusion I have come to is that the best thing you can do is to turn your fruit into bacon.
3414. Is this a good fruit-growing district? Undoubtedly. All kinds of English fruits grow remarkably well here—plums, apples, pears, cherries, and even grapes, though grapes are better in a warmer climate. Fruit-growing is an industry about which there is a great deal to learn, and one in which young people could take an interest; and no doubt it would be a success here if opportunities were given to get rid of the produce. I have seen apples almost the size of young pumpkins. Jacques' orchard here is a great resort for visitors in the summer-time.
3415. Would the construction of the proposed railway cause more people to go in for agriculture? Yes. At the present time we are over-producing. I have a large shed of hay for which I should be glad to take £2 a ton, although that is a low price. If you send produce to Sydney, the charges are so many that very little profit is left. I think that the proposed railway would give us a good additional market from the west.
3416. If it is constructed will it get a considerable amount of traffic from this district? Yes, a considerable amount of traffic in produce and merchandise of all kinds.
3417. *Mr. Shepherd.*] Do not cherries pay to send to Sydney? Cherries are about the best paying fruit we have, and suffer least from disease. We grow very fine cherries in this district.

George Wigan, M.D., honorary treasurer, Armidale Proprietary School, sworn, and examined:—

- G. Wigan, M.D. 3418. *Vice-Chairman.*] It has been pointed out to us that this district offers great facilities for the establishment of schools? Yes. Armidale at the present time possesses more scholastic establishments than public-houses. The Armidale school has been established now for four years, and during that time we have had 154 pupils, who have come here from places 64 miles away and further from Armidale. We have boys at the school now who came from Fiji, others who have come from Toowoomba, Townsville, Mackay, Casino, Wollongong, Muswellbrook, Inverell, and places all over the Colony. If the proposed railway were constructed it would enable boys to come here from the Western district who at present are debarred from coming owing to the long railway journey.
- 16 May, 1900. 3419. Do you think that the excellent climate of Armidale is an attraction? It is a great attraction. The number of Queensland pupils here point to that. There is also a girls' high school here which has been in the hands of the present proprietor for four years. During that time forty-two pupils have come from Brisbane and other places a good distance from Armidale. The average amount paid in railway fares by the pupils of the ladies' school is £50 a year, though school children travel at very reduced rates. The railway fares paid by the pupils of the Armidale boys' school amounted to £130 in 1898, and to £140 in 1899. Then, too, families come here from places like Townsville and Brisbane, so that their children can be educated more cheaply than if they came as boarders. My twenty-four years' experience as a medical man here shows me that people come here from all parts of New South Wales and Queensland, especially in the summer months, for the benefit of their health.
3420. Would Armidale offer greater attractions than Orange to the people in the Western district, supposing the proposed line were constructed? I do not know anything about Orange; but I know that people pass such places as Orange to come to Armidale.
3421. Has the Armidale district other attractions than the climate? There are places here which people can visit with interest; but it is chiefly to benefit by the climate that they come here.

Russell Blaxland, stock and station agent, Armidale, sworn, and examined:—

- R. Blaxland. 3422. *Mr. Watson.*] How long have you resided here? I have been in this town for six years, and I have been in the district for over twenty years.
- 16 May, 1900. 3423. There seems to be a good deal of controversy as to whether the New England district would be taken advantage of to any great extent by stock-owners in less favoured districts, supposing the proposed line were constructed? I am almost certain that the Western people would gain a great advantage in the construction of the proposed line. The other day we sold 10,000 sheep from a place the other side of Bourke, and they arrived at Narrabri, about a week ago, 2,000 short. Had we been able to take them across the proposed line, we should have saved very many more. The year before last a number of stock coming from the Macquarie were trucked at Narrabri, and it would have been impossible for them to have been brought here without the railway. I do not know that people would be able to take advantage of the railway if it were not for the starving-stock rates.
3424. The Railway Commissioners state that to carry sheep at starving-stock rates is a distinct loss to them? Now that you can get 10s. a head for store stock it pays to send them by train, even at high rates; but for many years the price of stock coming from a drought-stricken district varied from 2s. 6d. to 5s. a head, and if it paid to shift them at starving-stock rates I am sure that it would pay to shift stock now at full rates.
3425. Do you think that it will be some years before the price of stock will go down again? We make no very great progress here in breeding, and I think it will take three or four years for the Western districts to breed up again.
- 3426.

3426. Is there plenty of land here for starving stock in bad seasons? Yes. I heard one man say that this country was stocked throughout; but, as a matter of fact, on the eastern slopes there is a great area of cattle country which is only adapted for sheep in very dry seasons, and that country will carry millions of sheep in the summer months. R. Blaxland.
16 May, 1900.

3427. Is it used for cattle? In the summer months it will carry both sheep and cattle. The country there is as good as that on some of the best runs that we have in the district, but it is not sound, because it has not been improved. The Guyra district would be splendidly adapted for heavy stocking if it were laid with artificial grasses. I have known 8,000 acres there to carry 16,000 sheep, not in one year, but in two years. We invariably have food for starving sheep in this district.

3428. Where land has been improved to its fullest capacity the presumption is that the holders will put on as many stock as it will carry? In years to come that will be done.

3429. I understand that there is country in this district which in wet seasons is unsuitable for sheep, but which in droughty seasons is available for starving stock requiring agistment? Yes. Only a comparatively small area of country in this district has been thoroughly improved. There are millions of acres in New England which could be made to carry sheep. People talk about the fluke here, but there are parts of New England where you could not produce fluke if you tried, though if you go eastwards it was almost impossible to avoid it, unless the runs are thoroughly drained and improved. Ringbarking has worked marvels here. Our indigenous grasses are not adapted for sheep.

3430. I suppose the high land here can always be drained? Yes; it is only a matter of capital. If we get direct communication with the west, good is bound to come from it; but it is very hard for anyone to show exactly what a line like the proposed line would produce.

3431. In regard to the proposed line, the people at the Wellington end seem to think that they will get a market out in the north-western country, while the New England people think that they will get a market to the west? I think the New England people have very strong rivals in the Wellington people, and farmers here do not take the thing up as they should. They cultivate 50 acres when they should cultivate 100 or 1,000 acres. The Wellington country is as good wheat-growing country as can be got, but farming is not carried out in New England as it should be. The Guyra district is a magnificent agricultural district, though the land costs £3 or £4 an acre to clear, because the timber is chiefly white-gum and peppermint, and will not burn well.

3432. I suppose a man would have to grow a more profitable crop than wheat to be able to afford to spend £3 or £4 an acre on clearing? I think that the wheat crop is a very profitable one here. If the farmers here had gone ahead with the times they would be very much richer than they are now.

3433. Do you think that the construction of the proposed line is justified from the point of view of stock traffic? That is my opinion; and it would open up a lot of very good country.

George Smith, mining manager, Hillgrove, sworn, and examined:—

3434. *Vice-Chairman.*] What effect would the construction of the proposed railway have upon the mining industry in this district? I do not think that it would affect this district; but it might affect the Cobar district. Cobar is one of the best mining centres in the Colony. G. Smith.
16 May, 1900.

3435. How would the line affect Cobar? Miners are not producers; but they consume great quantities of agricultural stuff, and the proposed line would enable them to get it from this district instead of from Sydney or from Orange.

3436. Do you mean food supplies? All kinds of stuff. I think that the line would be a beneficial one to the country generally. Knowing what I do of farming and sheep-raising, I think that it would be of advantage to the pastoral and farming industries of the Colony. The district that the proposed line would traverse is not a mining country; it is all tertiary rock. You might strike coal measures, and you might get a little gold about Coolah and Cobborah. The proposed line would give an outlet into the flat country to farmers in this district, and would assist in the transport of stock backwards and forwards. New England is similar to the Monaro country; but it is a better producing country, and the proposed line would give a direct route from the best mining district in the Colony—Cobar—to the garden of the Colony. I have had as many as 219 men in my employment, and they consume a large quantity of oats, potatoes, and vegetables of various kinds, none of which they grow themselves. South-east of Coonabarabran the line is in coal country, the coal lying under marine deposits.

Sydney Henry Wickerson, journalist, and Secretary Railway League, Armidale, made an affirmation, and was examined:—

3437. *Vice-Chairman.*] I understand that you wish to read a letter to the Committee? Yes. I wrote to the Railway Commissioners, asking them if they would send an official to Armidale to lay statistics before the Committee whereby the benefit to be derived by Armidale from the construction of the proposed railway could be proved, and I received from them the following reply:— S. H.
Wickerson.
16 May, 1900.

Sir,

Office of the Railway Commissioners, Sydney, 14 May, 1900.

I have to acknowledge the receipt of your letter of the 12th instant, asking that a railway officer be sent to Armidale to give evidence before the Public Works Committee on the proposed railway from Werris Creek to Wellington, and in reply to say that the Railway Commissioners have already given evidence in regard to the proposed line.

I have, &c.,

H. McLACHLAN,
Secretary.

Mr. Chard, who was for twenty years surveyor to the Armidale district, would have attended to give evidence before the Committee, but he was called away yesterday, and has been unable to get back in time.

THURSDAY,

THURSDAY, 17 MAY, 1900.

[The Committee met at the "Curlewis Hotel," Curlewis, at 11 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Thomas Henry Hall Goodwin, Esq., M.P., sworn, and examined:—

T. H. H.
Goodwin,
Esq., M.P.
17 May, 1900.3438. *Vice-Chairman.*] You were at one time occupied in surveying this district? Yes; I had charge of the county of Pottinger for over ten years.

3439. Will you kindly make a comparison between the Curlewis-Gilgandra, and the Wellington-Werris Creek routes for a railway to connect the western with the northern railway system? The greatest objection that I have to the Wellington-Werris Creek route is that it would require a bridge over the Mooki, and that it would have to pass over a very rotten plain on each side of Spring Ridge. The plain at Spring Ridge is one of the very worst on the Liverpool Plains. Then, too, that line would practically pass through nothing but freehold property from the time it left Werris Creek until it reached the western side of Merrigala Plain. If I were told off to survey a route, the first I would try would be one from Breeza, branching off a short distance on the north-west of the railway station, and running across the ridges known as the White Ridges. That line would pass to the north of Goran Lake, and go thence to Trinkey Scrub, meeting the Wellington-Werris Creek route between Merrigala and Bomera: thence I should go to Binnaway. A line from Curlewis to Gilgandra, however, would probably open up more agricultural country than either a line starting from Breeza or the proposed Wellington-Werris Creek line. I estimate that a line from Curlewis to Gilgandra would open up over 20,000 acres of agricultural country more than the Wellington-Werris Creek line would open up, taking into consideration the country within 30 miles of each route. The 20,000 acres I refer to would be nearly wholly to the north of a line from Curlewis to Gilgandra, and not more than 12 miles from such a line.

3440. *Mr. Watson.*] On what holding? On Wandebar and Ghoolendaddi, and a little on the north-east corner of Bando. The rest of the agricultural land on the Curlewis-Gilgandra route would be equally well served by either the Breeza or the Werris Creek route.3441. *Vice-Chairman.*] How would a line from Curlewis to Gilgandra, or from Breeza to Gilgandra, suit the Spring Ridge district? A line from Curlewis to Gilgandra would not suit that district at all; but a line from Breeza to Gilgandra would pass within 5 or 6 miles of the north end of Spring Ridge.

3442. What is the first general advantage to be urged in favour of a Curlewis-Gilgandra line as against a Wellington-Werris Creek line? A line from Wellington to Werris Creek would pass chiefly through freehold property for the first 30 miles. In my opinion a line from Breeza to Gilgandra should follow a reserved road 3 chains wide as far as Goran. It would then leave the road and run almost in a westerly direction until it struck another 3-chain road running from Curlewis to Tambar Springs. Between one road and the other it would pass through freehold property.

3443. *Mr. Watson.*] For what distance? Speaking from memory, I should say for 10 or 12 miles.3444. *Vice-Chairman.*] Is the land on both sides of the first 3-chain road freehold? No. The Breeza freehold abuts on the road on the south side; but the land on the north side is held under some form of lease, and has only recently been taken up. Twelve or 14 miles out from Breeza it is freehold land right through to the second road, and then until you get to Trinkey bush, another 8 miles.

3445. If there is any advantage in making railways through leased land instead of through freehold land, the Curlewis line would have an advantage over the Breeza line? Yes; though it would be a little longer.

3446. Would the construction of a line from Curlewis to Gilgandra be followed by fairly close settlement in the district through which it would pass? I feel confident that it would.

3447. What is the nature of the country? It is very mixed; part of it perhaps is some of the richest pastoral land in the Colony, and the balance is very good wheat growing land of proved quality.

3448. Does the proposed line pass through much black-soil country? It passes through the narrow part of the black-soil country between the north-west and western lines. At Trinkey bush there is black-soil country for a distance of from 15 to 18 miles.

3449. You are a large landholder in this district? I hold about 15,000 acres freehold and conditional purchase.

3450. Is it partly black soil and partly red soil? Yes.

3451. Have you conducted any experiment with the black soil? Not personally; but when I was surveying I saw many settlers cultivating black soil, and nineteen times out of twenty their labour was wasted, because of the uncertainty of the seasons.

3452. In what way is the black soil country affected by the seasons? In my opinion, the absence of a subsoil renders it totally unfit for cultivation. I have frequently seen a crop 18 inches high, which looked as well as a crop could look; but which after six weeks of dry weather turned brown and dried off.

3453. Then for 16 miles on the Curlewis-Gilgandra line there would not be much farming? No; that land is freehold land.

3454. Do you regard it as good grazing land? It is extremely good grazing land; perhaps some of the richest grazing land in the Colony. I have gone pretty extensively into farming myself; but, rather than put a plough into some thousands of acres of black-soil country which I own, country which requires no clearing, I have gone to the expense of clearing the red-soil forest country, and have never yet obtained less than 17 bushels of wheat to the acre. Last year I had 1,000 acres under wheat.

3455. *Mr. Shepherd.*] What kinds of timber were grown on the land which you cleared? Chiefly box, interspersed with rose-wood, bull-cak, and pine.3456. *Vice-Chairman.*] It has been stated that the construction of a cross-country line would create traffic by reason of the interchange of products between the Western and the Northern and North-western lines which it would facilitate? I do not think that the interchange of products is a matter which

which need be considered at all. My knowledge and observation lead me to believe that the people in the neighbourhood of Binnaway and on the Castlereagh are situated in very similar country to ours, and their products will be the same as ours. I think, however, that a cross-country line would create a great deal of close settlement in the district through which it would pass.

T. H. H.
Goodwin,
Esq., M.P.

17 May, 1900.

3457. How many acres would be sufficient to keep a farmer in decent comfort in the country through which the proposed railway would go? My opinion is that, to live comfortably, a settler should have about 2,000 acres, and his attention should not be given to one industry alone. He could combine agriculture and grazing.

3458. Would a cross-country line facilitate the transport of starving stock from the western and north-western districts to the New England district? I think that in times of drought the line would be largely availed of for stock coming from country to the north and north-west of Gilgandra.

3459. Would there be any other traffic besides the starving stock traffic? There would be a great deal of fat stock traffic.

3460. Which way would the fat stock come? The Bando stock would be trucked at Bando and it would come into Curlewis, Breeza, or Werris Creek. The McMasters have a very rich tract of grazing country, and their stock now travel by road; but with railway communication they would be trucked whether the seasons were good or bad. Their stock would go either to the Northern line or to the Western line, whichever was nearer to the place at which they were fattened.

3461. Are the coal deposits in the neighbourhood of Curlewis valuable? They are very extensive; but I can only give you general information with regard to them. There is a pit within 2 miles and 10 chains of Curlewis, which is managed by Mr. Poole, and 6 or 8 miles north of it there is another pit which has been opened by the Gunnedah Company.

3462. *Mr. Watson.* Can you tell us anything of the country between Curlewis and Gilgandra, from an engineering point of view? There are no engineering difficulties to be contended with.

3463. Would you follow the big bend of the Castlereagh from Binnaway, or would you bridge the Castlereagh there? My knowledge of the country ceases 15 or 20 miles beyond Binnaway; but I am inclined to think that the line should strike a point further south than Gilgandra.

3464. And follow the Castlereagh down for some distance? Yes.

3465. On the northern side of the Castlereagh the country seems rather rough? Yes; and to the north of Binnaway the country is barren and sandy. There has been a good deal of agitation for railway connection with Coonabarabran; but, personally, I have never been able to agitate for the construction of such a line. My idea is that the line should go a considerable distance south of Coonabarabran, striking the Dubbo-Coonamble line between Dubbo and Gilgandra.

3466. *Mr. McFarlane.* What would it cost to clear timbered country between Werris Creek and Wellington? Speaking generally, it costs from £3 to £3 10s. an acre to clear timbered country when the trees are living.

3467. Do you clear land when the trees are living? The land which I have cleared was ringbarked in the first instance, and used for grazing for six or seven years, and I then set to work and took out the dead timber. By working in that way you can clear at the minimum cost.

3468. What does it cost to clear timbered land, the trees on which are dead? I got nearly 500 acres cleared for 3s. 6d. an acre. The timber was perfectly dry, and the work was done during a drought, so that the roots of the trees burned clean out. Another patch that I had cleared the same year cost me 17s. 6d. an acre.

3469. What would you consider a fair price? From 7s. 6d. to 10s. an acre for dead timber. The green timber would cost you more.

3470. What is the usual price for ringbarking? From 7d. to 8d. an acre, and perhaps less.

John Joseph Poole, grazier, farmer, and coal-mine manager, Curlewis, sworn, and examined:—

3471. *Mr. Watson.* Do you know the country between the North-western line and the Liverpool Ranges? *J. J. Poole.*
Yes.

17 May, 1900.

3472. Several suggestions have been made as to which is the best starting point on the North-western line for a railway to connect the Western with the Northern railway system;—can you offer an opinion on the subject? I understand that a line from Curlewis to some point on the line from Dubbo to Coonamble has been suggested. The grazing capabilities of the country through which such a line would pass are equal to those of any part of the Liverpool Plains, and its agricultural capacities are undoubted. Our average yield of wheat is as high, I suppose, as that of any part of the Colony. How far out they are carrying on agriculture I can hardly say, but I believe there are a number of farmers on the Merrigala Creek. Within 10 miles of Curlewis the settlers have increased very rapidly, and are likely to increase still more rapidly. This is bringing more and more land under cultivation.

3473. I understand that you can give us some particulars about the Bando holding? I asked the Bando people to come and give evidence, and I received from Mr. Cobb, the manager, a letter giving particulars of the holding, which I think will be interesting to the Committee. Mr. Cobb says:—

Bando is a freehold property of about 70,000 (seventy thousand) acres, besides leasing from the Government about 16,000 acres, and is the property of Mr. H. C. White, of Havilah.

Stock.—On an average the place carries from 50,000 to 70,000 sheep, besides cattle and horses, but in a very good season a great many more are kept. Most of the stock fattened on this property (which is very widely known as, perhaps, the pick of the country of New South Wales) is sent to Sydney, in trucks, for sale at Homebush. I append, separately, some information re trucking wool, &c., for your guidance. You will, of course, take into consideration the bad seasons we have had of late. Hoping this will be of some use to you.

During the year 1898 there were 50,727 fat sheep and cattle trucked at Gunnedah, for Homebush, from Bando alone, representing about 600 trucks.

Wool.—This same year 814 bales of wool were sent per rail to Sydney; a total weight of 140 tons.

1899.—735 bales of wool, 125 tons. Sheep trucked, 23,587—about 280 trucks.

The years 1898 and 1899 were very bad years, and could not be taken as an average.

As an example: The year 1896 saw 1,360 bales of wool sent per rail; sheep trucked in proportion; and in the year 1892 or 1893, saw 94,000 fat sheep sold from off Bando, most of them going per rail.

In excess of these figures, I have not given weight of other produce going away, such as skins, tallow, &c., and have made no mention of goods arriving here by train to carry on the working of the station.

No doubt stations like that are great feeders to a railway. The farming industry in this district is likely to be a great factor in supplying traffic to the railway.

3474.

- J. J. Poole. 3474. Which country would furnish the more traffic to a railway—that between Werris Creek and Bomera, or that between Curlewis and Bomera? I should say that between Curlewis and Bomera. The country out from Werris Creek to Walhallow, and the Brecza country, is already served by the existing line. Then, too, it is black-soil country, and is not likely to come under the plough. Leaving Curlewis, however, you go through agricultural country from the very start. Then, too, the carrying capacity of the country which the Curlewis line would serve is quite equal to that of the Walhallow or the Brecza country.
- 17 May, 1900. 3475. Then there would be just as much chance of fat stock traffic on the Curlewis line as on the Werris Creek line, and a bigger chance of agricultural traffic? Yes. The Werris Creek line would go over black-soil country until it got to Spring Ridge, and you could get no agricultural traffic from that country. It is difficult to maintain a line on black-soil country. I know that, as an old officer of the Permanent Way Department of the Railways. We always found that it cost 100 per cent. more to keep a line in repair on the black-soil country than it did on red-soil country.
3476. A line starting from Curlewis would pass on the northern edge of the black-soil country? It would pass on the north-western edge of the black-soil country, and would go through red-soil and gravelly country. Then it would touch upon a big iron-bark forest north of Tronkey.
3477. Is there pine on the Curlewis route? I understand that there is an abundance of pine on that route.
3478. Large pine is becoming very scarce around Curlewis itself? Yes.
3479. They seem to be cutting mere saplings here now? Yes; they are cutting down every stick.
3480. Is the small pine taken off forest reserves or off private land? Off the public estate. If a line were taken from Curlewis westward you would have a beautiful natural formation to go over, with easy grades. There is an abundance of timber in the country through which the line would pass, and either gravel or basalt ballast. From here as far as Raby (Bundella), and until you touch upon the auriferous country about Gulgong, you traverse a carboniferous formation. I have brought with me some samples of coal from a property 5 miles west of Curlewis, which I own.
3481. How far from the railway station is the coal-mine which you manage? Two miles and 10 chains.
3482. The mine is connected with the main line by a branch line? Yes.
3483. Where do you find a market for your coal? I am manager for the Centenary Coal and Coke Company, Limited, and the Railway Commissioners are our biggest customers: but I have also sent coal to various private owners at Tamworth, to some gold-mining companies at Uralla, to the Brown's Creek Gold-mining Company, and to a mill at Quirindi. Our private buyers are increasing very fast.
3484. So that your coal is evidently giving satisfaction? Yes.
3485. Do you look upon it as of good quality? I look upon it as coal of very fine quality.
3486. How would it compare for general purposes with Newcastle or Greta coal? The departmental reports speak of it as equal for steam purposes to any coal that they buy.
3487. What is the thickness of the seam in the company's mine? Six feet.
- 3487½. Are there any bands through it? No.
3488. Are there any indications of seams above and below the seam which you are working? Besides the seam which is being worked by the company there occurs a seam 270 feet higher, which is believed by Mr. Pittman to be a continuation of the Black Jack seam which is now being worked at Gunnedah. That seam shows 14 feet of coal, and about 7 feet of it could be worked. The top seam is very regular in thickness.
3489. What depth from the surface is the Black Jack seam? They are all adits.
3490. Are there any other indications of coal in the district? Yes, there are very strong indications of a third seam below that which the company is working. It is pretty evident that there are three seams of a very rich quality.
3491. *Mr. Shepherd.*] What percentage of ash does the Company's coal produce? Five or 5½ per cent. The percentage of ash in the Black Jack coal is 3 or 3½ per cent., and that coal, I think, gives the lowest percentage of ash of any in the Colony.
3492. Have these seams been identified with any of the more generally known seams in the Colony? They are classed with the Greta seam, I believe. I understand that Professor David and Mr. Pittman are agreed that they are connected with the Greta seam.
3493. Are the deposits extensive? I think so. I have discovered the Black Jack seam 5 miles out from Curlewis, and I firmly believe that the coal formation extends as far out as the range near Raby (Bundella), and runs right round at the back of Walhallow.
3494. *Mr. Watson.*] How far is it from here to Bundella? Over 40 miles. I have never found the seasons fail me during my experience of farming here, and I have always had remarkably good crops, compared with the general average yield of the Colony. I have been farming in this district for the last ten years, and the seasons have never failed, and others have had a similar experience. I find that when the box-country is cleared and ploughed, if it is left without being cropped it produces a superabundance of the old fattening herbs, such as crowsfoot, geranium, and others, that we used to have on the plains years ago; so that it will carry more sheep after being ploughed than it would before. Fattening herbs are in abundance on the tops of the highest hills here.
3495. If the proposed railway were constructed, and agriculture followed, the land would carry more sheep than it does now? Yes. They have only just touched upon the resources of the soil here; but they will find out its richness and value later on.
3496. *Mr. Shepherd.*] How long is it since you discovered that this herbage came after ploughing? I have been ploughing for ten years, and the herbage has come up every year.
3497. Do these herbs disappear from the ordinary pastures before ploughing? No; but they do not show up so much before the forests were cleared as they do now. We were under the impression that all our natural herbage would die out when the plough turned it over, but we find that it is increasing in strength. The seed must be in the soil, and the cultivation improves the conditions for growing. So much does that natural herbage gain strength after the land has been ploughed that in many places it has stifled the wheat.
3498. Where would you take the line from Curlewis—to Dubbo or to Wellington? I think a line from Curlewis should go to some point on the Dubbo-Coonamble line—say, to Gilgandra. Apart from local considerations, and as a national work, I should be in favour of the Wellington-Werris Creek line.
3499. What do you mean by a national work? Federation is now almost an accomplished fact, and we must take into consideration the conditions of other portions of the continent besides our own Colony, and

and construct lines for national defence, and to give communication between the various capitals. A line from Wellington to Werris Creek would undoubtedly give the most direct route between Brisbane and Melbourne. J. J. Poole.
17 May, 1900.

3500. *Vice-Chairman.*] Do you think that the time has arrived for the building of such a line? I think we might wait another decade before troubling about it.

3501. Do you regard the Curlewis-Gilgandra line as likely to create closer settlement than the proposed line would create. Yes; to my mind the various surveyors have laid out this country in too big areas.

3502. How much land is required in the district between Curlewis and Gilgandra to keep a man and his family? 640 acres, with a system of mixed farming. Old settlers know very well that sheep are very profitable in small lots. To put part of the land under the plough, and to use part for grazing sheep, is the best way to deal with a holding; 2,500 acres makes too big a holding, because people would take up 640-acre blocks, and that would make settlement closer.

3503. How many sheep could a man fatten on 640 acres? If he put half his land under the plough, and stumped and cleared the other half, he could fatten from 320 to 350 sheep on it in the year.

3504. Is it not rather expensive to drive small lots of sheep to a railway? Yes; if you have to drive them any distance.

3505. And is it not difficult to get truck accommodation for small lots which are only sent occasionally? The Department allow you to send away a half-truck load of sheep—that is, 45—and they are pretty punctual in sending up trucks. A sheep to the acre is a very low estimate of the carrying capacity of this land when it is properly dealt with. The country in its natural state is classed as being capable of carrying a sheep to the acre.

3506. *Mr. Shepherd.*] Could a man breed sheep on 640 acres? I think that he could carry 500 ewes and lambs, and fatten the lambs; but he would not fatten the ewes. When you engage in the fattening business you buy store wethers, and sell them when they become fat; and with a good season you can fatten two or three lots in a year. If you breed, you have to keep stud rams. With mixed farming 640 acres of land should return £500 a year at the present price of wheat. I stripped 800 acres last season, and obtained 1,700 bags of wheat. Of that, I sold 1,200 bags to go to London, and I was told that it was some of the best wheat that went. It was some of the "Lota's" cargo.

Frederick James Young, farmer, Curlewis, sworn, and examined:—

3507. *Mr. McFarlane.*] Have you been residing in this district long? About two years. F. J. Young.

3508. How many acres of land do you hold? A little over 2,000. 17 May, 1900.

3509. How many acres have you under cultivation? This year we expect to have between 600 and 700 acres under wheat.

3510. Is your agricultural land of good quality? It is first-class wheat land.

3511. What is the average yield per acre in an ordinary season? Last year I got a little over 16 bushels of wheat to the acre.

3512. Have you been engaged in farming in any other district? In Victoria.

3513. How would you compare the land there with the land here? The land here is better wheat land than I had in Victoria.

3514. What market have you for your wheat? Our chief market is Sydney.

3515. Is wheat-growing profitable at present prices, notwithstanding the long railway carriage? There is just about a living in wheat-growing, but not much to spare, at present prices.

3516. What else do you grow? I have grown oats.

3517. For grain or for hay? For grain. I have also grown malting barley, and I obtained a very fair sample of grain.

3518. What price did the barley realise? It is worth about 2s. 6d. a bushel in Tamworth.

3519. It has been stated that if the Northern and Western lines were connected there would be a market in the west for the hay and chaff produced in this district? No doubt there would, if that market has not already been overdone. There always seems to be a demand for produce in the west. No doubt the more lines a district is connected with the better its position.

3520. Have you considered the question of railway connection with the Western line? No; I have thought more of a connection with the Southern line.

3521. What advantage would a connection with the Southern line give you? Well, just now I am frequently travelling backwards and forwards.

3522. Would it open up a market for you in the south? I think not, because our natural market is on the seaboard.

3523. Do you know the country between Werris Creek and Wellington? Only at this end.

3524. What kind of country is it that you know? The country, as far as I have seen it, is black soil plains.

3525. How does the black soil country compare for wheat-growing with the chocolate soil and the box country? I would rather have 1 acre of red soil than 3 acres of black soil for growing wheat.

3526. Notwithstanding the expense of clearing the red-soil country? Yes.

3527. What does the clearing cost? My clearing would cost me from 10s. to 15s. an acre. The timber had been ringbarked, and had been dead for some years.

3528. Is it the practice to clear land when the timber is green, or to ringbark the timber first and then to clear it some years afterwards, when it is dead? The most economical way is to wait until the timber is dead before you clear. If you do that, the leaves and some of the wood decay, and go back into the ground again.

3529. Which would be more useful to this part of the country, a line from Curlewis to Gilgandra or a line from Wellington to Werris Creek? I should be inclined to think a line from Curlewis to Gilgandra would serve more people than a line from Wellington to Werris Creek would serve. There are more holders along the Gilgandra route, and I believe more Crown lands to be thrown open for settlement. Without a railway small areas of country out there would be of no value for grazing purposes, and the growing of grain would be impossible.

3530. How far from a railway does it pay to grow grain? I should think within 20 or 25 miles. Even at that distance a man is heavily handicapped.

- F. J. Young. 3531. Would either the Gilgandra or the Wellington line open up to the farmers of this district a new market? I do not value the Western district very much, because it is only occasionally that it would be of use to us, though it would be well for us to have two strings to our bow. I think that there are other districts which are in a better position to take advantage of the Western market than we are.
- 17 May, 1900. 3532. Would districts like Orange be in a better position than you are to supply produce to the Western districts? I think so, because they are nearer.
3533. How do you use the land that is not under cultivation? I graze sheep and cattle on it.
3534. Where do you market them? Most of the cattle which are not sold locally have to go to Maitland or to Sydney.
3535. What area would be sufficient to maintain a family in this district on what you consider good wheat-growing land? Not less than 600 acres.
3536. Would a man have to use the whole of that area for wheat? He would have to put three-fourths of it under wheat, for such an area would be too small for grazing.
3537. Do the small settlers to whom you have referred put the whole of their land under wheat? I do not think so. They seem to have been rather behindhand in this locality until lately; but things are altering now, and they are beginning to pay more attention to wheat-growing. Small areas are of no value for grazing in this district, unless you have facilities which the ordinary man does not possess.

(George Henry Peard, farmer, Curlewis, sworn and examined:—

- G. H. Peard. 3538. *Mr. Shepherd.*] What is the extent of your holding? I represent the firm of H. T. Peard & Sons. We hold 4,600 acres.
- 17 May, 1900. 3539. How long have you held that land? This is our third year there as farmers.
3540. How much land have you under cultivation? We shall have about 300 acres this year.
3541. What stock do you carry? Cattle and sheep.
3542. How many sheep to the acre? A sheep to the acre is a fair average.
3543. And how many acres to a beast, large stock? Eight or 10.
3544. Then a large beast is equal to about eight sheep? Yes, generally.
3545. Have you taken any crops off your land? Yes, two.
3546. What has been your average yield? Last year about 16 bushels to the acres, and the year before slightly more.
3547. Are you cultivating anything but wheat? No.
3548. Have you tried fruit? There were a few fruit-trees around the house, but the position did not seem to suit them.
3549. What sort of timber grows upon your land? Principally box and pine.
3550. What does it cost you to clear the land? From 10s. to 15s. an acre.
3551. That is after it has been ringbarked and killed? Yes.
3552. What is the cost of growing and harvesting a crop? Including seed, something less than 8s. an acre. We have a harvester, and employ our own labour.
3553. If you had to hire labour, what would it cost? Between 10s. and 12s. an acre.
3554. Where is your chief market? Sydney; but we have also sent to Armidale and to Tamworth.
3555. What do you generally get for your wheat? This year about 2s. 2d. a bushel; last year we got 2s. 9d. a bushel.
3556. What does it cost you to send wheat to Sydney? About 5d. a bushel.
3557. Did that pay you? It just about pays us, if we reckon in the advantage that we get by using some of it for stock.
3558. Did you sell your wheat locally this year? No; we got 2s. 7d. a bushel for it in Sydney, or about 2s. 2d. a bushel net.
3559. Are you thinking of trying any other crops here? No.
3560. Are oats grown here? Not to any extent.
3561. Do they do pretty well? Yes.
3562. I suppose the cost of carrying hay to Sydney would be rather great? Yes; I do not think it would pay to send hay to Sydney.
3563. Has lucerne been tried here at all? Yes, to a small extent.
3564. Does it seem to do well? Fairly well.
3565. Is the timber trade here large? Fairly large. There are fifteen or twenty log drawers here at the present time.
3566. Have you noticed the size of the pine logs that they are cutting? Yes; they are cutting very small logs, just now.
3567. Do you think it is wise to cut pine so small? No; I do not think they should be allowed to cut such small pine.
3568. Have you found small logs equal to large logs, as far as the timber is concerned? No; the timber in the small logs is inferior to that in the large logs.
3569. Do you think that the construction of a railway from Wellington to Werris Creek would be of advantage to this district? I do not think that it would make any difference to this district. I think that a line from Curlewis to Gilgandra would be preferable.
3570. Do you think that such a line would open up a market in the west? It would give a get-away for produce, and the means of transport for stock.
3571. Would such a line be largely used for the conveyance of starving stock in dry seasons? I do not know that it would be largely used; but it would be used to some extent.
3572. Have you, generally, a good supply of grass here in the summer? Unless there is a drought the country here is well grassed.
3573. What is the average size of the holdings in this district? I cannot say; but 2,500 acres is the limit for a conditional purchase. The station properties in this district are not large compared with those in the Narrabri district.—I suppose they would carry from 20,000 to 50,000 sheep.
3574. Is there much Crown land here? I think it has pretty well all been taken up during the last three years.
3575. Has there been much extension of cultivation here lately? Yes; the cultivated area has increased 100 per cent. of late years.

3576. Is there every prospect of the cultivation continuing to extend? Yes; 20,000 acres were thrown open on Bando lately, mostly in blocks, for homestead selection and settlement lease. All that land was taken up in one day. I think there were 120 blocks altogether. Now, 20,000 acres more are to be thrown open. G. H. Peard.
17 May, 1900.
3577. *Mr. Watson.*] Were there many applicants for the land? Yes; far more applicants than there were blocks. For some blocks there were thirty or forty applicants.
3578. How do people expect to get a living on small areas here? I do not think they can.
3579. So that if they are to remain there the railway must be brought near to them? Yes.
3580. What is the smallest area upon which a man could live in this district, within 20 miles of a railway? From 600 to 1,000 acres.
3581. Do you think mixed farming, or agriculture alone, is the better way of using the land? Mixed farming.
3582. Would a man who held only 600 acres be able to run enough sheep for market? Yes; he could send his increase to market.
3583. I suppose a man who had 600 acres would cultivate half and keep the other half for grazing? Yes. A man who did that could run pretty well as many sheep on half his land as another man could run on a block the size of all his holding, but uncultivated. There are only a few months in the year when you cannot run stock on your cultivated land.
3584. How long a period is there between the ploughing of the land and the harvesting of the crop? You can keep stock on the land until August, and harvest in October.
3585. Is it usual to put sheep upon a young crop? Yes; because it improves the crop and the ground too.
3586. Does it make the plants stool more? It brings the crop up more evenly; but if the crop were left to itself it would grow too rank.
3587. I suppose it would not do to put large cattle upon a growing crop? No; sheep are much better.

SATURDAY, 2 JUNE, 1900.

[The Committee met at the "Telegraph Hotel," Gilgandra, at 4:30 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Alfred Arthur Mudie, commission agent, and Secretary, Gilgandra Railway League, Gilgandra, sworn, and examined:—

3588. *Vice-Chairman.*] It has been suggested that a line from Curlewis to Gilgandra would be a more advantageous one to construct than a line from Wellington to Werris Creek, inasmuch as it would involve less construction, being shorter by 50 or 60 miles, and would open up better country; will you kindly give us your views upon the subject? I only know the country to about Binnaway on the Curlewis route, and to about Denison town on the Werris Creek route. There is some very good country on both lines, but the Curlewis line would tap a lot of country which would not be served by the Werris Creek line; whereas the Cobborah district, which would be served by the Werris Creek line, is near enough to the Western line to be served by it. Coonabarabran is a good farming and fruit-growing district, and a considerable quantity of wool is produced near there, so that a railway would be of great service to that district. It would increase the traffic on a line if it ran nearer to Coonabarabran than the proposed Wellington to Werris Creek line would run. A. A. Mudie.
2 June, 1900.
3589. Do you think that Coonabarabran is a sufficiently important centre to justify a nearer approach to it? Yes; they have had two flour-mills there for some years, and that is an indication that the district is a good wheat-growing district.
3590. Will you kindly describe the country on the Curlewis route, as far as you know it? For about 20 miles from Gilgandra the line would pass through somewhat rough country; but selectors who have taken up small patches of it have proved that it is rich agricultural country. It is country that is largely timbered with iron-bark, but some of it is box and budda country. Box, almost without exception, grows upon good soil in this part of the Colony. Of course, some of the iron-bark country is really poor, and some of the country on the first 20 miles of the route was abandoned for years, but now that it is being taken up in small areas, chiefly under settlement lease; it is found to be good agricultural land. It is not rich fattening country, but it is country that stands the dry weather.
3591. How would you describe the soil? It is somewhat of a red soil, with small patches of chocolate soil; red and yellow soils predominate. Further on, again, there is rough country, especially to the north of the line, but between Gilgandra and Binnaway a railway would run through some very good agricultural land. There are some rich patches of black-soil country between the two places, though there are some poor patches too; but, on the whole, there is a very fair extent of good country.
3592. How far is Binnaway from Gilgandra? Forty miles, or a little more.
3593. Do you think that a line should go as close as possible to Coonabarabran? The nature of the country prevents a line from being taken to Coonabarabran; but I think it should go as close as possible to it.
3594. Would it be necessary in making a line to Curlewis to cross the Castlereagh twice? Yes; once at Gilgandra and once further on.
3595. Do you know enough about the country to say if two crossings could be avoided? If you make Gilgandra the junction, you cannot avoid having two crossings.
3596. How would you describe the country north of the big bend in the Castlereagh? There is some rich agricultural and pastoral land along the river. The land within a few miles of Gilgandra, and going towards the mountains, is, most of it, suitable for agriculture, though it is heavily timbered.

- A. A. Mudie. 3597. Is there any rough country there? Yes, some; but it is not particularly rough.
3598. How far north from Mundooran would the good land extend? Sixteen or 17 miles.
- 2 June, 1900. 3599. And how far east and west would it extend along the route of the line to Curlewis? It would extend from the river in this direction about 20 miles, and then it would narrow down a bit on account of the spur of the Warrumbungles.
3600. Would the line to Curlewis open up a market in the north and north-west for produce grown about Gilgandra? The advantage of a connection with the Northern line would be considerable in a dry season, because of the facilities it would give for the transport of stock and of fodder. About Coonabarabran they are able to grow any quantity of fodder.
3601. Do you think that stock would come from the north or north-west across the proposed line to get to Mundooran? The probabilities are that a considerable number of store stock would come to the district, either to be sold here or to be fattened here. During the course of a year a large number of store stock come to Dubbo to be sold, and from there they are distributed to various places to be fattened; but in some seasons it is difficult to travel them, because of the want of grass and of water.
3602. You look upon a line to Curlewis as one which could give relief to starving stock in times of drought by providing facilities for their transport to the northern table-land? Yes.
3603. Would many starving stock be carried along such a line—from places on the Western line or from places north or west of Coonamble? It would depend upon the season. During seasons similar to some which we have recently experienced, a great number of stock would be sent over the line, and it would be of great advantage to stockowners to be able to send them.
3604. Apart from the transport of fodder and starving stock in times of drought, what traffic would there along the line? I do not know the capabilities of the country on the Northern line, nor the nature of the market there; but the Gilgandra district, and the country between here and Curlewis, could grow great quantities of fodder, and if the northern market were a good one, there would be a considerable produce traffic on the line all the year round. A lot of the land between here and Binnaway, which is not yet occupied, is good agricultural land, and would probably be occupied if there were a railway.
3605. *Mr. Shepherd.*] What is the area of the unalienated land between Gilgandra and Binnaway? I cannot say; but there is a fairly large area in it. I believe that there are 30,000 acres comprised in timber reserves.
3606. Is there any land available for selection? Yes; a fairly large area.
3607. Why has it not been taken up? One great reason is that the old residents of the district do not know the value of it. Settlers have come from Riverina and Victoria, and have taken up parts of it, and they are proving its value as agricultural land; but they do not care to go too far back. With the prospect of a railway coming here, some of it has been taken up only quite recently. The proposed line would be of considerable value in times of drought, in enabling people living along the Western line, at places such as Bourke, to send their stock to the Northern line, and in allowing the people on the Northern line, when the seasons were bad there and good here, to send their stock here. The line would also be used for bringing down Queensland stock. Dubbo is a centre for the sale of fat stock.

Arthur Frederick Garling, storekeeper, Gilgandra, sworn, and examined:—

- A. F. Garling. 3608. *Mr. Shepherd.*] Have you resided here long? I have lived at Gilgandra for three or four years, and for some years I lived at the foot of the mountains between here and Coonabarabran.
- 2 June, 1900. 3609. Are you acquainted with the country between here and Werris Creek? I am acquainted with the country between here and Coonabarabran for a distance of 50 or 60 miles from Gilgandra.
3610. How would you describe that country? Most of it is agricultural country. In through the mountains it would be fit for grazing, and patches of it would be fit for agriculture, too; but the difficulty would be in getting produce away from there. A line from Gilgandra to Curlewis would go through good agricultural country most of the way. On the other side of Bearbong, and about Yarragrin, there is very good agricultural land. Between Gilgandra and Bearbong there is loamy iron-bark country, and country on which box and budda grow. That country is good agricultural land. It does very well for wheat and for maize, if there is enough rain; but the seasons are not generally good enough for maize.
3611. Does the country you describe extend any distance from the route of the suggested line? From here to Tooraweenah it is the same right through, though you may get a sandy stretch here and there. On this side of Mundooran, too, there is a streak of white ironstone country that would be of little or no good for agriculture; but to the right of that there is some very good country.
3612. Is cultivation carried on in this district to any great extent? Not to a great extent; they are just beginning to go in for cultivation about Bearbong and through there. They seem to be able to grow more maize there.
3613. What yield do they get per acre? Last year I think they got from 15 to 20 bushels of wheat to the acre, although the season was a dry one. The yield of maize averaged from 25 to 30 bushels; but only small areas have been put under maize. Last year they got no maize; but the year before they got fairly good results.
3614. I suppose that during the last five years the seasons have not been good in this district, so that agricultural returns during that time would be below the average? Yes.
3615. Do you think that there would be a disposition among the people between Gilgandra and Coonabarabran to go in largely for agriculture if a line were to be constructed through that district? Yes. The only thing that prevents them from cultivating their land now is their distance from a market. There is a lot of wheat about Bearbong now which people are holding on to in order to see if prices will rise sufficiently to make it worth their while to cart it into Dubbo. It costs them 6d. or 7d. a bushel to send wheat to Dubbo; but if it only cost 1d. or 1½d. they could afford to send it. At present rates for cartage, all they would get for their wheat would be about 1s. 8½d. a bushel on the ground. It is wheat of good quality, and I have had a lot of it turned into flour.
3616. Does the district produce a fair number of live stock? Yes; but they grow wool chiefly, and deal in stock; they have not gone in much for fattening.
3617. I suppose Dubbo is their chief market? Yes.
3618. What does it cost to send wool to Dubbo? About 30s. a ton from round about Gilgandra.
3619. Is the timber in this district pretty good? There is some splendid iron-bark here.

3620. Would there be ample for railway sleepers? Yes; there are splendid forests of iron-bark.
3621. Would the timber trade contribute traffic to a railway to Curlewis? Yes. It would take many years to work out the timber in this district. In through Yarragin there is a little mountainous country; but once you get on to the top of it you can run along fairly well. There are no engineering difficulties there, such as there were on the Mudgee line. They grow a good deal of maize on the Coonabarabran side; but the Gilgandra district has now to get its maize from Sydney, or from the country round about Milthorpe. If the Curlewis line were made, the Coonabarabran maize would come here. At the present time the maize grown about Coonabarabran is almost valueless, because of the cost of sending it away.
3622. *Mr. Watson.*] Is trade increasing round about Gilgandra? Yes, considerably.
3623. What is the inward tonnage of Gilgandra? Last year I imported about 480 tons, and between the 4th March and the present date I have imported 100 tons, or a little more.
3624. Was much of that fodder? Very little of it was fodder; it was nearly all goods. I imported a few potatoes, a little maize, and a few oats; but nothing in the way of chaff.
3625. Besides what you import there is what comes to the local storekeeper? Yes; and what people in the district import directly.
3626. Have there been any developments in the timber industry of late? Three saw-mills have been erected at Gilgandra during the last two months.
3627. Where would they draw their supplies of timber from? The timber comes principally from places lying easterly from Gilgandra, near the route of the suggested Curlewis line.
3628. Where does the timber go to? To Coonamble, to Dubbo, and out towards Bourke and Cobar.
3629. What timber are they cutting now? Pine and iron-bark.
3630. How near to Gilgandra can they get good timber? At the present time they are getting good timber within 3 or 4 miles.
3631. Good big trees? Yes; some of the trees are very big, and a great deal of iron-bark has been carted into Dubbo for bridge work from places quite close to Gilgandra.
3632. Are they getting sleepers about here too? Yes; from country through which a line to Curlewis would pass.

A. F. Garling.

2 June, 1900.

Archibald Campbell Berry, Senior-constable, and Acting Clerk of Petty Sessions, Gilgandra, sworn, and examined:—

3633. *Mr. McFarlane.*] How long have you been stationed here? Very nearly four years.
3634. Have you been acting in your present capacity during the whole of that time? Yes.
3635. What is the population of Gilgandra? The population of the town is about 250. In my evidence before a previous Works Committee I gave the population of the district as about 1,400; but my district has since been made smaller. It extends now as far as Berrida Station, about 16 miles west.
3636. Have you noticed any marked increase in the population during the last four years? Yes.
3637. Has there been any increase in the area put under cultivation in your district during the past few years? Yes; a very marked increase.
3638. What do they principally grow here? Wheat, for hay and chaff.
3639. Do they export any wheat? A good deal of chaff goes away from here, and a good deal of wheat is sent to Dubbo. Wheat is also sent to Coonamble, and a good deal of chaff too.
3640. Do many stock come through Gilgandra? Yes, a number of fat stock come through here going to Dubbo, to Mudgee, and to Murrumbidgee. They come through here from the direction of Coonamble, and a few come in from about Tooraweenah.
3641. All kinds of stock? Both fat and store stock.
3642. Does a large number of stock travel in times of drought? Yes.
3643. Where does it come from? Most of it from around about Coonamble; but some from the district between Coonamble and Walgett. Stock come here for grass.
3644. Has there been a drought in this district during the last few years? Last year was our worst; before that we had fairly good seasons.
3645. Has any stock left here on account of the drought to seek food elsewhere? No.
3646. Do you know the country between Gilgandra and Curlewis, along the route of the suggested line? I know the country between here and Tooraweenah.
3647. What sort of country is it? There is some iron-bark country, interspersed with pine and box and budda country. Some of it is good agricultural land.
3648. Is much of it under cultivation? Not a great deal, except at the homesteads. All the settlers grow hay for themselves; but most of them are new-comers.
3649. If there were railway facilities, would people settle on that land and put it under cultivation? Yes.
3650. Do many people in that district live by farming alone? Yes, about Gilgandra.
3651. Have you noticed any increase in the number of farmers during the time that you have been here? A slight increase. Last year there was an increase in the area put under cultivation; but, I think, a decrease in production, owing to the dryness of the season? The farmers here keep a few sheep and cattle.
3652. *Vice-Chairman.*] Has a larger area of land been brought under the plough this year? Yes; more this year than last.
3653. Is the increase a very marked one? No; but still it is an increase; it might amount to 150 acres. Last year there was an increase of more than 300 acres over the cultivation of the year before.

A. C. Berry.

2 June, 1900.

Richard Gware Hitchen, farmer and grazier, near Gilgandra, sworn, and examined:—

3654. *Mr. Watson.*] Are you acquainted with the country between Curlewis and Gilgandra? Yes.
3655. Do you think it would be possible to get a fairly cheap route for a railway to Gilgandra, going in the direction of Tambar Springs? I think so. The country is pretty level until you get out 27 or 28 miles, when you come to the hills; but they are not very high.
3656. Could you go between the higher rises? If you went across to Binnaway you would pass by the tail-end of the mountains. By keeping a little north of Binnaway you get a better run of country.
3657. What is the country like from north of Binnaway to Tambar Springs? It is all level country—scrubby country, with small hills, but no mountains which would require extensive cuttings.

R. G. Hitchen.

2 June, 1900.

- R. G. Hitchen. 3658. What is the country like from Tambar Springs to Curlewis? It is flat country right through.
 2 June, 1900. 3659. How would you describe the land between Gilgandra and Tambar Springs? From here to the mountains, a distance of 27 or 28 miles, it is all good farming land, and a lot of it is good grazing land, too. On the flats a good deal of farming is done; but the land is used chiefly for grazing.
 3660. Would that country continue on to the Castlereagh? Yes; for another 20 miles.
 3661. Is it as good there as along the first 28 miles? No; there are 10 or 12 miles of grazing country—black and red country—kurrajong country.
 3662. After crossing the river, what is the country like in the direction of Tambar Springs? You have 7 or 8 miles of bad country, and then you get box, pine, and budda country; it is all good farming land. The further you get the better the country is. After you get about 12 miles from the river, on the other side it is good farming and good grazing land right through.
 3663. Then, of the total distance, only about 20 miles would be poor country? Twenty miles at the outside.
 3664. Would that poor country be unsuitable for grazing? A lot of it would do for farming; in fact, there are a lot of people who have been farming on it for the last twenty years. It is chiefly iron-bark country; but it is not like the iron-bark country on this side. On this side the iron-bark grows on the flat country, but over there it grows on poor country on which cabbage gum grows. There are seven or miles of that country, and then you get into box, kurrajong, and yarran country.
 3665. Leaving out of account the 20 miles of poor country, would the rest be country suitable for agriculture? Yes; every bit of it.
 3666. Would the same description apply to the land lying any considerable distance north and south of the suggested line? Between Gilgandra and the mountains the good country would extend 30 or 35 miles towards the south, and close on to Calga on the north.
 3667. Then there would be good land on both sides as far as the influence of a railway would reach? You could get 30 miles of good country on each side of the line. Beyond the mountains the land is pretty well all the same until you get between Merrygoen and Digilah, where there is a lot of ironbark country. There are a few people living on that country and farming there. Between Binnaway and Coonabarabran you would not get more than 6 or 8 miles of bad country on the north side of the line before you were back on to the box country again.
 3668. Would all that country be capable of large agricultural development if there were a railway? Yes.
 3669. Could the hilly country 28 miles from Gilgandra be avoided? No; not unless you went pretty well down to Caigan, some distance below Binnaway, to within 15 miles of the route of the proposed Wellington to Werris Creek line. Then you would run past the end of the mountains.
 3670. If you crossed the Castlereagh above Binnaway, would you have to climb over big hills, or could you run between them? You would have to cross the hills; but the grades would not be very heavy, because the rise is gradual.
 3671. Would the suggested line be of advantage to farmers here in giving them access to the Northern line? It would be of great advantage to the people on the other side of the mountains in giving them an outlet for their produce.
 3672. Would it provide an additional market for produce grown here? Yes.
 3673. How would the line affect the stock traffic? In times of drought, when people wanted to send stock to New England, instead of travelling them by road and losing a great many they would truck them.
 3674. Does any considerable number of stock go towards Munderoran and Coonabarabran for agistment in droughty years? Yes; stock travels to both places.
 3675. All that hilly country has fair pasturage in summer? Yes; the line would go through splendidly timbered country—country on which both ironbark and pine are growing.
 3676. Is the iron-bark of good quality? A lot of it is pipey, but, taking it right through, there is a lot of good timber, especially on the other side of the Castlereagh beyond Binnaway.
 3677. Is it suitable for market purposes? Yes; a great deal of it is.

TUESDAY, 19 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Charles Lancelot Garland, mining expert, sworn, and examined:—

- C. L. Garland. 3678. *Chairman.*] You are a mining expert? Yes; and a mining investor.
 19 June, 1900. 3679. For some years you were a Member of Parliament? Yes.
 3680. Do you wish to make a statement in reference to the proposed railway? I want to point out to the Committee that some time ago there was a line surveyed from Werris Creek to Wellington, and in a direct line between those two points there is a very important mineral belt which, in my opinion—and I have had a great experience of it—is likely to form quite as important a mineral district as Cobar. But it badly wants a line of railway through there to enable progress to be made. The same applied to Cobar, which is now a very important centre. I noticed on looking at the suggested route to-day for the first time that there is a line shown which goes considerably to the north of Leadville, which is the centre of which I speak. The line, as shown on the map, would really be of no service to that mineral country. The belt of country, taking a straight line from Werris Creek to Wellington, is north of Gulgong, and 50 miles from the Mudgee line. I assume that it would be fully 50 miles. That would involve a longer railway journey to the seaboard than going direct to Mudgee. That is the position of this wonderful mineral country. The chief mine there is the Mount Stewart mine at Leadville. Some seven or eight years ago that

C. I.
Garland.
19 June, 1900.

that mine was opened up, and equipped with large smelting furnaces, and when silver was at a fair value I think the run of the furnace extended over twelve months, during which time no less than 1,500 tons of lead bullion was sent away from the mine to London, and 250,000 oz. of silver. This will show the Committee that the mine is a substantial one. For at least $2\frac{1}{2}$ miles there are enormous outcrops of mineral lodes, some of which have never had a pick put into them. But every outcrop which I have been interested in developing has been found to contain payable ores. The Mount Stewart mine went into liquidation when the fall in silver took place. At the time I have mentioned we were giving the railway to Mudgee something like 100 tons of carriage a week, having 50 tons of coke sent up per week to Mudgee, and 50 tons of bullion returned from one furnace. We had 50 miles of land carriage, and freight on the railway being very heavy, that made the cost of production so great that we could not carry on in view of the existing price of metal. The mine was then shut down, and the Company which had spent something like £80,000 on the mine went into liquidation. I was the largest shareholder in the mine, and having great confidence in it, I and James Channon, a large mining investor, in Wyalong, bought the mine at public auction, and we have been working it constantly ever since. We have been doing development work since July, 1898, during which time we have spent in wages and stores, £3,778 2s. 6d. My own expenditure in the mine amounts to very nearly £10,000 since it commenced, and, I think, Mr. Channon has spent £5,000. He owns one-third of it, and I own two-thirds. We are opening up large bodies of copper ore. We have one body there over 20 feet wide, and the bulk assays are going between 7 and 8 per cent. of copper. There are also large bodies of sulphide of silver ore, not of a very high grade from 15 to 20 oz. of silver per ton, a little gold, and a little copper. We have also one lode 20 feet wide carrying a very heavy percentage of zinc, which, in view of the developments being made now in the treatment of zinc will become a valuable asset. We have no less than seven distinct lodes within our leases varying from 6 feet to 80 feet wide. I have here the plans of the lode which we are at present working. One lode is 80 feet wide. There is another shown that is 20 feet wide, and there are the works that we have carried out during the last two years. Out of those stopes in the old mine above the 157 feet level, we took out £80,000 worth of metal at the then value, which was shipped to London. The mine is totally untouched between the 157 feet and the 217 feet levels. Below that we have not been; but we purpose sinking to a depth of 500 feet in the ore which is carrying downwards. This portion of the mine is at least half a mile further north than the portion we are working now.

3681. The 80 feet lode? Yes, that is half a mile further south. Then beyond that for a couple of miles south there are large outcrops of gossan ore, so that the possibilities of that mineral belt with railway communication should be quite equal to those of Cobar. What really has thrown the field back is the fact of its being 50 miles from a railway. We could never get carriage at less than 25s. a ton, and it ranged from that to £2 a ton.

3682. Could you give in figures what it means to your company? If that railway were carried through the mine as originally surveyed between Werris Creek and Wellington, we could give the railway at least 200 tons of carriage per week. That, I think, would amount to more than the other line would give.

3683. I suppose you know the character of the trade which is done at Cobar; there is back loading from there;—do you think there would be the same character of trade in this district? Yes; coke would be carried to the mines, and matte or bullion would be carried to the seaboard.

3684. What district do you look to for the treatment of your crude ores, or half-developed ores? We now have three furnaces on the ground, and I suppose about £10,000 worth of machinery; but in order to treat the ore by modern methods, that is by pyritic smelting, we should require similar furnaces to what they have at Mount Lyell, and that would mean considerable expenditure. What we should send away from the mine then would be high grade matte, which would be sent to London or Dapto, or some other place where they deal with high-grade matte. The carriage to the mining district would be the ordinary supplies and coke.

3685. Do you consider that the mineral district there is extensive? Yes, very extensive, although we are the only people who have done any considerable work there.

3686. Could you give any approximate idea of the area of mineral country there? As far as I have examined it on the surface, the mineral outcrop extends between 2 and 3 miles. Extending for 2 miles or more, there are very large mineral outcrops. Those that we have worked vary from 6 feet to 80 feet, and in every one that we have worked, we have discovered payable ores. The old line, as surveyed, was near and parallel to those mineral outcrops, which some day will all be developed and worked.

3687. *Vice-Chairman.*] Those lodes you have spoken of—do the poorest of them run as high as 7 per cent? No. We are opening up some ores which go from $1\frac{1}{2}$ to 2 per cent., but they carry a little gold and a little silver. I think the ore bodies which we have opened up now will average 3 per cent., and 3 per cent. with railway communication would give a profit.

3688. If you had railway communication, what is the poorest ore that you could treat? We could treat the 3 per cent. ores.

3689. Do they include gold and silver? Yes; a little gold and a little silver.

3690. The copper alone would not pay? Yes, it would, with the system of pyritic smelting adopted at Mount Lyell.

3691. What is the value of the ore which is being worked at Cobar now? I am not sure as to the value of the ore there.

3692. You said that this mineral district will be as good as Cobar? I think that Cobar ore runs about 3 per cent., but it also contains a fair amount of gold—2 or 3 dwt.

3693. Does the gold there make the profit? I think the gold there is sufficient to pay, not for the smelting, but for the mining. At Cobar the mine is developed to a depth of 500 or 600 feet. These ore bodies at Leadville have never been touched below 250 feet, and as we go down the gold increases.

3694. Is the surrounding country of much the same character as that around Cobar? No. The country surrounding Leadville is all good pastoral and agricultural land. It is beautiful country.

3695. What is the character of the rock? The bulk of the rock is slate, with diorite dykes coming through it. Where we are working it is chiefly diorite. We are not very far from the carboniferous formation.

3696. Where do you get your coke from? We were getting it from the Purified Coke Company, of Newcastle. I believe they are making very good coke now at Eskbank.

3697. You know that a good deal of coke is sent from Rix's Creek? Yes.

3698.

C. L.
Garland.
19 June, 1900.

3698. If a line were made across from Dunedoo, could you get that coke? Yes.
3699. Would it pay you to bring it that distance? Yes; if we could get it 20 miles nearer to the mine, it would pay us to take it round that way.
3700. Has there not been a railway projected from Werris Creek pretty nearly through Dunedoo? The only line that I know of is the one that comes through Leadville.
- 3700½. Do you know why that was given up? No; I was in hopes that that was the line that was to be carried out, and I wanted to strengthen your hands by giving this evidence.
3701. Is it not a fact that some of the Cobar matte is now being treated at Lithgow? Yes.
3702. Would it be a saving to treat your own matte instead of sending it to England? It would depend on the contents of the matte. I have made inquiries on the subject, and I find that the Lithgow people will not treat matte which has 6 or 7 per cent. of zinc in it. The only way you can dispose of it is to send it Home. The ores we propose to smelt at Mount Stewart have very little zinc in them.
3703. Do the Cobar ores contain zinc? I think they contain very little.
3704. What is the character of the country near Gulgong and Mount Stewart? It is beautiful, agricultural country.
3705. Is it much settled? No; it is too far away from the railway; but there are beautiful, black-soil flats.
3706. How much of it has been purchased by the squatters? Here and there there is a selection on it; but the land is held chiefly by cattle and sheep breeders.
3707. Is it held in freehold? It is pretty well all held in freehold—at any rate, the best of it.
3708. Then that line would pass through private estates all the way? Most of it would pass through private estates. In some portions of the district there is a good deal of Crown land—gold-field reserves.
3709. You are strongly of the conviction that a railway would lead to great material development there? I think so. I might mention that when Broken Hill mines were first discovered I was in Parliament, and I was one of the first visitors to Broken Hill. I was so impressed with the magnitude of Broken Hill that when I came back I tried to get the Parkes Government to make a line of railway direct to Broken Hill before the Silverton tramway was built; but the Government did not take it up. I felt so strongly on the matter that I put a resolution on the subject on the Business Paper of the House, in the hope that I would get it carried; but, unfortunately, very few Members had seen Broken Hill, and very few of them would have known what it was going to be if they had seen it; and I got so little support that I had to withdraw the motion. It will be generally admitted that if we had carried out that railway everything that I said in connection with it would have been justified.
3710. By what route did you propose to go? From our existing lines right through Wilcannia to Broken Hill.
3711. If you had built it, do you not think that South Australia would have made a line to the Border? They could not have touched our territory. We should have concentrated the trade, and we should have had big works established in this Colony. Five years ago this Committee had an inquiry in respect to Wyalong. I have made a study of Wyalong, and I gave evidence before this Committee strongly urging that Wyalong would be a permanent field, and I think that events have justified my predictions, because, as regards the lower level, Wyalong is opening out splendidly. You will find from the records of the Committee that the evidence which I gave has been borne out by subsequent developments. I have, therefore, no hesitation in making the statements which I am making now. If my expenditure gives any weight to my statement, I may point out that I have spent over £10,000 at Leadville, and that I am still spending £60 a fortnight there.
3712. How far is your property from Dunedoo? I have not been in that direction. It is 25 miles from Gulgong. Leadville is not an unimportant place; there are two hotels there, a post and telegraph office, a number of private houses, and a Public School with sixty or eighty attendants.
3713. *Mr. McFarlane.*] Do you know the nature of the country between Werris Creek and Wellington? Only that portion through which I have travelled from Gulgong to Cassilis.
3714. Could you give a comparison between the country on the proposed route of railway, and that on the other suggested route? No; it might be better where the line is proposed, but I can scarcely conceive of better country for settlement than what I have referred to.
3715. Is it country that will carry a good population? Yes, all round that district.
3716. I notice that is a shorter route than the one now proposed? Yes; it is almost a straight line.
3717. You stated that a Mudgee extension would be much more convenient for you? Yes, inasmuch as it would involve less mileage in travelling to Sydney.
3718. In the event of this line, as proposed from Wellington to Werris Creek, being carried out, do you think that a line would be justifiable to connect Mudgee with the line now proposed? I think so, inasmuch as when you get to Mudgee you just begin to touch country that is fit for cultivation and settlement. Right up to Mudgee the country is very poor. The railway seems to have stopped the moment it touched good country. I think the whole of the way from Mudgee towards the north-west there is really good country, which would warrant a railway being constructed.
3719. What part of the country have you the best knowledge of? From Mudgee through Gulgong, Denison town, Leadville, and Cassilis. I know all that country fairly well.
3720. Is all of it similar to the country at Leadville? Yes. Round about Gulgong the country is a little more undulating; but there is a good red soil, and when you get beyond Gulgong, going towards Leadville, the country is flatter and the soil is deeper. It will grow anything; but you cannot get the stuff to market.
3721. Is it box country? On the hills there is box. It is good cultivable country. There are some little ridges, such as Mount Stewart, which are a little bit rough; but there are patches of those which would grow anything. Fruit grows splendidly there. The district has a good rainfall.
3722. What are the mining prospects? The only people who have carried on any extensive mining there are the Mount Stewart Company. There have been a number of small mines worked in a primitive way, which promised well, but there was not sufficient capital employed to properly develop them. There are many outcrops which would be developed if the railway were made.
3723. Mining to a considerable extent would be carried on at Leadville? Yes.
3724. What have been the largest results obtained so far? When silver was higher than it is now the Mount Stewart Company subscribed £15,000 to open up the mine. They had an overdraft of £4,000 at the

C. L.
Garland.

19 June, 1900.

the bank, making £19,000, and during the twelve months run of the furnace we paid off the overdraft, and paid three dividends, besides doing a lot of developing work.

3725. How long has that company been established? That company was in existence for about four years. It is about seven years since we first started developing.

3726. Did you experience very much difficulty in regard to the cost of carriage? Yes. The cost of carriage was excessive. We were paying 17s. a ton for the carriage of coke to Mudgee.

3727. That is from Newcastle to Mudgee? Yes. Then we were paying from 25s. to £2 a ton for the carriage of the coke from Mudgee to the mine.

3728. What distance is that? Fifty miles. We were paying the same for the carriage of our bullion to Mudgee, and the Government were charging 30s. a ton for the carriage from Mudgee to Sydney.

3729. Would the line you suggest to any extent minimise the cost of carriage? We could start the mine straight away, and make a profit if we had a line running within a reasonable distance of it.

3730. Would that line run from Mudgee or from Werris Creek? From either place.

3731. Which line would be of the greatest advantage? A line from Mudgee would suit us best, as the cost of carriage by that route would be lower.

3732. Would it make a material difference in the cost to send the traffic by Werris Creek to Wellington as compared with the route *via* Mudgee? I do not think it would amount to more than a few shillings per ton extra. It would suit us much better to have the extra mileage by railway than to pay 30s. per ton for road-carriage, and be at the mercy of bad roads.

3733. Would the traffic to and from the mines be a considerable item? Yes, it would be a very big traffic. I had directly and indirectly 500 men working there when the Mount Stewart mine was in full swing.

3734. Can you give us any idea as to what the annual output would be of traffic from the mine to Sydney or Newcastle? I think we could give about 200 tons of freight a week backwards and forwards.

3735. Outside your company would there be any considerable mining operations? I have no doubt that, if we made a profitable enterprise there, the whole line of loads would be taken up, although it is on private property.

3736. You think it would tend materially to develop the mining resources of that place if it had railway communication? Yes. If there had been a railway there the Mount Stewart mine would never have been shut down—it would have been producing to-day. The only thing that shut us down was the cost of transit. We could have kept on, notwithstanding the fall in the price of silver, if it had not been for the road carriage.

3737. I think you said you got coke from several places? We got coke from the Purified Coke Company of Newcastle chiefly, but I think we could get it now for less at Eskbank, near Lithgow, which is nearer.

3738. How would this line answer with regard to getting the coke there? If it went near the mine it would not matter whether it went by Wellington or not.

3739. Speaking as a mining expert, do you think there is a large area of country that would be developed if this line were made? Yes. I think that north of Mount Stewart, towards Cassilis, there is a great deal of country that would be developed.

3740. If the proposed line of railway were carried out, would it in your opinion, open up the country for agriculture also? Yes, it would open up a large area suitable for agriculture. The farmers round there are crippled by the want of access to a market, and beyond a certain radius from the Mudgee line they will not grow anything—they merely keep a few sheep. They say it is the cost of cartage that kills them.

3741. Do you think that if they had railway communication the land in that district that is suitable for agriculture would be cultivated? I have no doubt about it. The Hon. G. H. Cox had a very fine estate at the other side of Leadville.

3742. You stated that a considerable amount of the land where the minerals are is private property? South of Mount Stewart it is private property, held, I think, by Mr. Buckland; but it is all available for mining under the Mining on Private Lands Act. I made arrangements with the owners of the land by which I took up four 80-acre blocks with a view of forming a large company to put something like £50,000 worth of capital into it; but I could not raise the money at the time, so I had to abandon the leases. But I have no doubt that if a railway were made through there, the whole of that country would be worked. I am negotiating for a capital of £50,000 to work the Mount Stewart mine. If I can raise that capital, I have no doubt that we can make that one of the most important mines in the Colony, and with railway communication provided I shall have no difficulty in raising the money.

3743. Would the land which you spoke of as being suitable for agriculture be private property also? There is a gold reserve there which is all good agricultural land. I could not say from memory what proportion is Crown land, and what proportion is private land; but I think that most of the best land in the district has been alienated.

3744. Would the property-owners there subdivide their lands and let them for agriculture if they had a railway? I think there is no doubt of that. The land is really good, and there is a very good rainfall in that district. It is very similar to the land round about Mudgee. A good deal of wheat and maize are grown there. Within 3 or 4 miles of Leadville there is one of the black-soil flats where you can grow almost anything.

3745. It has been stated that the black-soil country wants heavy rainfall for agriculture? They have a good rainfall in that district. We never had any difficulty in conserving water for the furnaces. We conserved 1,500,000 gallons in one dam, and we laid down 2 miles of pipes to a creek.

3746. Is the district through which this proposed line will pass fairly well watered in ordinary seasons? Yes.

3747. There would not be any difficulty in getting water? No; there is no difficulty about water.

3748. Is there any difficulty in getting timber for mining purposes? No; they can get splendid timber for that.

3749. Can you get it near the mine, or have you to carry it far? I think they carry it 2 or 3 miles.

3750. What kind of timber do they use? Chiefly box and hardwood. There is a good deal of pine in the mountains; but we do not use that in the mines.

3751. *Mr. Watson.*] From the feature-map it will be seen that the distance from Leadville to Dunedoo is 9 or 10 miles? Yes.

3752. And the Committee about a year ago, in connection with an inquiry into a proposed line to Coonamble, suggested that it might be taken from Mudgee towards Dunedoo;—do you think that that line would serve the mineral district, which you have spoken of, as well as the surveyed route now before us?

C. L.
Garland.
19 June, 1900.

us? Yes; it would come within 10 miles of that mineral district, and it would serve it much better coming from Mudgee.

3753. It is nearly 30 miles from Mount Stewart to Cobborah, the nearest point on the proposed line? Then it would be absolutely of no use to us. The distance into Mudgee from the mine is 50 miles, and there is a good road. Fifty miles of good road and a shorter distance by rail would be better than 30 miles of bad road, and 100 miles further by rail.

3754. Would there be any great difficulty about carting ore or matte 10 miles, or would you endeavour to get a tramway to your mine? If it were necessary to make the line 10 miles from a big mineral belt like that, if through some engineering difficulty it would be desirable to put a side line in, that might be done; but I think that whenever it is possible to run a line of railway to a mineral belt, it gives a greater certainty of that line paying if that is done, thus suiting both the Government and those engaged in the industry. Take the case of the Cobar line. If that railway had gone right along the line of the lode, which it might easily have done, no doubt most of the mines there would have been far ahead of what they are now.

3755. When that line was made there was only one mine at work? Any geological officer of the Government could have pointed out the value of that line of lode, and how important it was to run a railway along it.

3756. Your suggestion is that, if the line is taken out from Mudgee, it should go as close as possible to Mount Stewart? Yes. I have no doubt that it will pay handsomely then. It is not a field that is up to-day and down to-morrow. It is not a temporary field, such as an alluvial gold-field, but the lodes there are big and permanent, and there is scarcely any limit to the depth to which they could be worked, provided that they could produce their metal at a cheaper rate, and there is nothing that will assist them more than cheap railway communication.

3757. Do you know what they have been paying for road carriage between Mudgee and Mount Stewart? From 25s. to £2 a ton. That takes all the profit off low grade matte, and it makes coke very dear.

3758. Of course you have to pay railway carriage in addition to that? Yes. That class of mining also involves the carriage of heavy metals, furnaces, and very heavy carriage in the way of mine supplies and coke. I think when we opened the furnaces we paid the Government something like £2,000 in freight.

3759. *Mr. Shepherd.*] How long is it since the Mount Stewart mines were first opened? It is six or seven years.

3760. Were there a great many men employed there at one time? I think that, directly and indirectly, we employed about 500 men when the mine was in full swing.

3761. Was the mine paying then? Yes; it paid no less than three dividends out of twelve months' production with one furnace, and defrayed a big bank overdraft.

3762. How many men are there employed there now? Only twelve men are at work there now.

3763. How do you account for the falling off? The furnaces were shut down when silver fell from 3s. 6d. down to 2s. 2d. an ounce, and I saw no hope of obtaining a profitable product, in view of our distance from the railway. Then we were shut down for some considerable time under suspension, and silver did not rise again. But I made up my mind that there was copper in that mine, and with what little money we had remaining we went in for development work and discovered copper, but we did not open it up sufficiently to know its value. I then tried to reform the company. I was the largest shareholder, having some 27,000 shares, most of them contributing. I tried to get the shareholders to subscribe more money and offered to take up every share that I was entitled to take up, by reason of my big holding, but they collectively offered us something like £7 10s. One small shareholder said he would take up his proportion, but out of 600 shareholders none would come in, and we were left no alternative but to wind up the company. That was done. We paid what money we had in hand, and the mine was submitted to auction by Messrs. Hardie and Gorman, and Mr. John Howell and myself were bidding for it. Mr. Howell ran me up to £1,750, and then stopped bidding, and so I got the mine. And one of our directors, Mr. Channon, offered to join me and take one-third. That was two years ago. We have been carrying the mine on for two years, and our total expenditure since we started has been £3,779 2s. 9d. We have opened up this copper ore; we find it is payable, and we are opening up large bodies of it. That is why I am so confident of the future of the property.

3764. Where did you get your supplies from? From Mudgee.

3765. I think Leadville is about 71 miles from Wellington? The distance from Mudgee is 50 miles.

3766. Are you acquainted with the country all the way between Wellington and Werris Creek? No, only between Mudgee and Cassilis.

3767. Do you know why the line makes that great curve;—is it not because of the rough country in the direct line? I do not know of any rough country in the direct line. They surveyed a line right through the mine, and that is the line that I thought was going to be constructed. I had some correspondence with the railway authorities when they made that survey, and they never, as far as I remember, stated that there were any engineering difficulties.

3768. You do not know why they have taken that tremendous curve? No.

3769. The direct line there must be a great many miles shorter than the surveyed line? Yes.

3770. Is the Mount Stewart Mine the only one at work at Leadville? Yes; the only one that I know of. There may be other small things there.

3771. Has there been any prospecting there? Yes; there was a mine called the Dynever Mine on which a great deal of money was spent, but the ore obtained was not of a kind that could be treated by smelting. I think the mine was abandoned on that account.

3772. Do you think that, in the event of a railway being constructed in that district, other mines would be worked? I have no doubt that other valuable properties would be opened up.

3773. You said that the copper had been traced for a distance of about 2 miles? The series of outcrops upon which the Mount Stewart Company is working can be distinctly traced for over 2 miles.

3774. Has there been no sinking beyond where the outcrop has made its appearance? Yes. Nearly 2 miles below a small prospecting shaft was put down, and very good assays were obtained. Wherever these outcrops have been followed down we have found a silver lode and other metals.

3775. Have they not come at the true lode? Only in the Mount Stewart Mine.

3776. So there is every prospect of this becoming an extensive mining field? Yes. I have no doubt, if I succeed in obtaining a capital of £50,000, that it will be a very good field.

THURSDAY,

THURSDAY, 28 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

3777. *Chairman.*] You produce a map showing the tract of influence of this cross-country line, and indicating in that tract the various holdings, and their size and character? Yes. The limit of the tract taken is 20 miles on each side of the proposed line. At the Wellington end, we start halving the space between the proposed cross-line and the existing main Western line until we get 20 miles from the proposed line. Then we continue 20 miles up until we come within the sphere of influence of the Werris Creek to Narrabri line. C. E. Rennie.
28 June, 1900.

3778. The Dubbo-Coonamble line makes the narrowing of your tract extend further north than the Western line? Yes; the Dubbo-Coonamble line has an influence, too. I have allowed for both the main Western line and Dubbo-Coonamble line. On the eastern side, allowance is made for the main Western line, and also the main Northern line at the northern end, tapering off at a point at the Werris Creek junction. Within that area, regarded as the sphere of influence of the proposed line, there are, of alienated lands, 1,429,900 acres; of reserves, 514,300 acres. The alienated land is shown by the blue tint; the reserves are shown by the green tint; and the various kinds of leases—settlement, improvement, and scrub leases—are shown by blue hatching. They comprise 250,800 acres, as follow:—settlement leases, 118,200 acres; improvement leases, 118,100 acres; scrub leases, 14,500 acres. There are 905,300 acres of Crown lands shown by the brown tint. The Crown lands are held as follow: leasehold areas, expiring in the year 1900, 205,700 acres; held under occupation license, 347,700 acres; untenanted, 351,900 acres.

3779. Will you indicate where the largest tracts of unoccupied land are situated? The unoccupied land is distributed fairly well over two-thirds of the area from Wellington, northward. There are two large areas east and west of Mundooran, and there are two large areas just south of Mundooran, both east and west of the line. Those are the two largest areas in one place. Then there is another large area north-west of the line, where it crosses the Dividing Range.

3780. Can you indicate the localities of the timber reserves? There is a large area of forest reserve south-west of Mundooran, and on the verge of the boundary of the affected area. There are about 58,000 acres of forest reserve there. Then there is another large forest reserve adjoining the line, in the parish of Trinkey.

3781. Are they ironbark reserves? I believe the one near Mundooran is. There is also a small forest reserve near the parish of Bundulla. There are smaller forest reserves throughout the affected area.

3782. How much of the Crown lands now held under lease will be available for closer settlement, if required? The leases of the leasehold areas—205,700 acres—will expire this year, and a part of that area will become available. The area held under occupation license is open for settlement, excepting reserves.

3783. Roughly speaking, the greater portion of the tract of country which you have outlined is alienated? I can scarcely say that. The total alienated land is about 1,429,900 acres. The reserves, the leases, and the Crown lands together, amount to about 1,600,000 acres. The reserves and Crown lands together amount to 1,400,000, so that there is a greater area of alienated land of about 200,000 acres.

3784. Practically, one half the area is alienated? About that.

3785. *Mr. McFarlane.*] What is the total area of land open for selection at the present time? Roughly speaking, about 347,700 acres.

3786. *Mr. Watson.*] That has been open under occupation license for a good time? Yes.

3787. *Mr. McFarlane.*] At what period will the land, which is to be thrown open, be available? The leases will expire about July of this year. It will depend on whether Parliament adopts any special policy with regard to the disposal of the Central Division leases. Ordinarily, after the expiry of the leases, we have the areas examined, and a design prepared for subdivision. Subdivision follows, and the land is set apart.

3788. Are there other leases to fall in some years hence, until about the time when the next batch of leases expires? Practically, all the leases in the affected area will expire this year. Of course, the settlement, and the improvement, and scrub leases, are only for a limited period; but they are mostly for a long period, generally twenty-eight years.

3789. I suppose that we may conclude that the best of the land has been taken up? Naturally.

FRIDAY, 29 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 3790. *Chairman.*] Since you last gave evidence one of your officers has made a report on an alternative route from Curlewis to Gilgandra? Yes; the report is as follows:—
29 June, 1900.

GILGANDRA TO CURLEWIS.

Memorandum to the Engineer-in Chief, Railway Construction.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,

Sydney, 15 June, 1900.

Sir,

I beg to report that I have examined the country between Gilgandra, on the Dubbo to Coonamble Extension, and Curlewis, on the North-western Railway, with the view of a proposed railway connection between the two places, and I have laid down a route (shown by a green line) on the accompanying diagram tracing. This route, after leaving the proposed station site at Gilgandra, would cross the Castlereagh River at a suitable place on the southern side of Gilgandra township, and, bearing for a short distance in an easterly direction, would cross the main road from Gilgandra to Murrumbidgee, about 321 miles from Sydney by the Great Western Railway; thence, bearing north-easterly, it joins the valley of Wallamburrawang Creek, and follows up this valley (crossing the creek itself at Biralbung) to near where Gundy Creek joins it; crossing this latter creek the line runs up for a few miles on its northern side, and thence, recrossing the creek, bears round to the right till it reaches a small table-land dividing the waters of the Lower Castlereagh from those of Yarragrin Creek. This table-land is crossed in a north-easterly direction, and thence the line, bearing round to the right at the back of old Bibbon station, gradually works down and crosses Yarragrin Creek in an easterly direction, about 1½ mile above McKellar's selection; thence it follows up the valley to the north of Mount Abundance, and, passing over another small table-land, runs down the valley of Myall Creek to its junction with Greenbah Creek, crossing the trial survey—Murrumbidgee to Coonabarabran—at 357 miles; thence the line would follow down the southern side of Greenbah Creek to below where Wangabutt Creek joins it, and crossing Greenbah Creek near Coolamobla Springs, the line would bear northerly for a short distance, and then, turning to the right, recross the Castlereagh River in a north-easterly direction; thence running up the valley of Mow Creek, on its southern side, and passing over the divide between this and Back Creek it would bear easterly and cross Terrawinda Creek just below where Box Ridge Creek joins it; thence bearing north-easterly, the line joins the explored route Bomera to Coonamble, via Coonabarabran, and crossing the main range dividing the waters of the Castlereagh from those of the Namoi at a very low point, it follows this exploration down the valley of Saltwater Creek to near its junction with Bomera Creek, thence leaving it and turning northerly the line crosses Saltwater Creek about 4 miles to the south of Tamba Springs, and follows down the western side of Bomera Creek to its junction with Turrabic or Cox's Creek; crossing this latter creek it bears north-easterly across the Liverpool Plains, and, passing over a small range between these plains and Curlewis, joins this latter place on the Narrabri side of the station at a point about 436 miles from Sydney by the Great Western line, and 283 by the Great Northern. The line itself would be about 121 miles long.

At the second crossing of the Castlereagh I have shown (by a green dotted line) a deviation running up Woolshed instead of Mow Creek; this would probably be equally easy to construct, and help to straighten the general direction. Another improvement might be made by junctioning with the North-western line at Breeza. This, although it would lengthen the line, would do away with the crossing of the range at Curlewis and bring the junction nearer to Werris Creek.

Taking into consideration the broken nature of the country traversed by the proposed route, I do not anticipate there will be any difficulty in obtaining a fairly easy line with a limiting grade of 1 in 60, or possibly better, by increased lengthening and with the use of 10-chain curves. The most expensive works are the two crossings of the Castlereagh River, particularly the one at Gilgandra, where the present road-bridge consists of seven 75-foot timber trusses, with two 30-foot and two 25-foot timber openings at the ends.

Ballast is plentiful, considerable stretches of the country being volcanic, and ironbark suitable for sleepers and smaller bridges is met with at intervals all along the route.

The country passed through is for the greater part eminently adapted for farming purposes, and may be described as follows:—Starting from Gilgandra it is a good, sandy, loam, box; country with alluvial flats of yellow box, apple, and flooded gum, and interspersed with sandy belts timbered with ironbark and pine; this extends up to the edge of the first table-land at the head of Gundy Creek; thence good volcanic country, varying from black and chocolate to a free sandy loam, stretches to Myall Plains, the prevailing timbers being box and apple. Beyond this, and extending up to the summit of the divide between Mow and Box Ridge Creeks, the country varies from poor to fairly good, timbered with box, white or cabbage gum, and stringybark, interspersed with belts of ironbark and a little pine. After passing this divide the country again improves, becoming of a free, sandy loam, the principal timbers being apple and yellow box; this continues to the main divide, when rich volcanic country is again encountered, extending down the valley of Saltwater Creek. After crossing this creek, the soil becomes poor and sandy, and, besides box, ironbark, stringybark, and pine are again met with. This belt only extends for a few miles, the country on the edge of the Liverpool Plains (which are black soil) being of a free, chocolate loam timbered with box, apple, and myall; similar country is met with when approaching Curlewis.

On the whole, I consider this proposal would serve the country it traverses, and the surrounding districts, very well; it comes within 15 miles of the township of Coonabarabran, and is within fairly easy reach of most of the good country on the central portion of the proposed Wellington to Werris Creek line.

Another route, which would probably serve even a larger extent of country, would be an extension of the line from Mudgee, via Gulgong, Dunedoo, and Binaway, and stopping within some miles of Coonabarabran owing to the increasing difficulties in the formation of the country towards the end. This route, however, has not been examined in detail.

CHAS. McD. STUART.

The only thing to which I would call attention is that Mr. Stuart reckons that a ruling grade of 1 in 60, or possibly better, would be obtained, whereas, of course, on the Wellington to Werris Creek route we have a ruling grade of 1 in 75. As regards the cost, it is impossible to tell what it would be with any approach to accuracy, but Mr. Stuart thinks it would not be much more expensive per mile than would the Wellington to Werris Creek line. I have a few of the distances for the information of the Committee. From Wellington to Dubbo, the distance is 30 miles; Dubbo to Gilgandra, 40 miles; Gilgandra to Curlewis, 121 miles; Curlewis to Werris Creek, 29 miles. The total distance from Wellington to Werris Creek by that route would, therefore, be 220 miles. From Wellington to Werris Creek by the direct route it is 159 miles 27 chains.

3791. As far as the cross-country connection is concerned, it is about 180 miles from Wellington to Curlewis, via Gilgandra, as against 159 miles from Wellington direct to Werris Creek? The distance from Wellington to Curlewis, via Dubbo and Gilgandra, is 190 miles, as against 159 miles from Wellington to Werris Creek.

3792.

3792. With this advantage: that it would have 74 miles of line already constructed which you could use? Yes. Being a shorter line to construct, of course it would probably be a good deal cheaper in the total. H. Deane.
29 June, 1900.
3793. Would the district around Cobborah, Dunedoo, and Coolah be within the influence of a line from Gilgandra to Curlewis? I should think it is doubtful whether the southern portion of that district would be served. I should think the producers would send their produce to Mudgee—it would be shorter and the carriage by rail to Sydney much less.
3794. Around Cobborah, Dunedoo, and Coolah, there is a considerable tract of good agricultural land? Yes.
3795. Do you think the land between Gilgandra and Curlewis is of as high a quality as that? From what Mr. Stuart says, I should say that it is a similar class of country, where you get really good land.
3796. The good country in those districts seems to lie on each side of the watercourses; the line from Gilgandra to Curlewis would only cut the Castlereagh, and would leave the Talbragar and the southern watercourses practically out of reach? Yes.
3797. Are there any other advantages, from a railway point of view, which the Gilgandra to Curlewis connection affords as against the Wellington to Werris Creek connection;—would there be any difference in working expense? Being shorter, it would probably be cheaper to work, in direct proportion to the mileage.
3798. About what average distance does it keep from the proposed Wellington to Werris Creek line? Thirty miles.
3799. And it practically brings Coonabarabran within easy reach of railway facilities, being only 15 miles from it? Yes.
3800. They would have more watercourses to cross than on the Wellington to Werris Creek line? Yes; and the line would be somewhat rougher, and more up and down.
3801. *Mr. Shepherd.*] And more expensive in construction, I suppose? A little more. I questioned Mr. Stuart as to that point, and he thought it would be a little more expensive, but he considered that if a survey were carefully made it would not come to much more. There would be the bridge over the Castlereagh River, at Gilgandra, an important crossing, and another higher up.
3802. *Mr. Watson.*] The Wellington to Werris Creek line will cost £3,207 per mile;—do you think the alternative line would cost more than another £300 per mile, bringing it up roughly to £3,500 per mile? I could not say without an estimate, but if any one told me it would cost a little more, without particulars, I should reckon on an increase of about 10 per cent.
3803. Allowing that it would cost 10 per cent. more per mile, that would bring the cost of the 121 miles to £423,500 as against £511,000? And then you have to bear in mind that there are worse grades—1 in 60 as against 1 in 75.
3804. Mr. Stuart says that grade may be bettered? Yes; we may even be able to reduce some of the 1 in 75 grades on the submitted line. I do not wish to say anything against the line, but only to point out what are the facts. You have to cross a good many watercourses, and it is much more up and down than the Wellington to Werris Creek route. I think it is possible, if a survey were made, that there would be a greater aggregate of altitude to surmount.
3805. *Dr. Garra.*] There seems to be a *prima facie* case for this line in its greater shortness? No doubt.
3806. Looking at the map it seems that the line from Werris Creek comes very near Mundooran; suppose that instead of going to Wellington we went from there to Gilgandra, through pretty good country, along the valley of the creek, we should have almost as short a cross line from Curlewis to Gilgandra? It would be much the same.
3807. The line you have already surveyed does not cross so many creeks, nor has it so many ascents and descents as the proposed new line? Yes.
3808. That would make a cross-country line worth considering? I am not at all sure what the character of the country would be on the southern side of the Castlereagh. Between Gilgandra and Mundooran, I am inclined to think it is rather rough.
3809. You have no surveyor's report on that part? No. I have no doubt the Werris Creek line could be shortened at the Werris Creek end by touching at Brecza—that is, if you wanted to shorten it.
3810. The Wellington to Werris Creek line, if we are simply intent on a cross-country line, can be shortened without any engineering difficulties? Yes.
3811. We are not shut up with the Wellington route as surveyed, and with the Dubbo route as surveyed? They can be modified.
3812. The survey by Mr. Stuart has, I suppose, only been a light survey? It is only an exploration. He is an officer who is possessed of very good judgment; but there has been no actual survey.
3813. Do the spurs of the Coonabarabran range come down as far as where he would go south of it? There are spurs which run right down, but some of them flatten out. For instance, the divide between the Namoi and the Castlereagh continues right across from the Liverpool Range to Coonabarabran, but it is very flat at some places.
3814. Where your proposed line crosses it is very low? Yes; that is to say, it is low, compared with the surrounding country—about 2,000 feet above the sea. The rise to it is very gradual. From Bomera the rise is very little noticeable.
3815. *Mr. Watson.*] Can you state why the survey from Wellington, which runs through Dunedoo, Coolah, and up to the proposed Wellington to Werris Creek route, was abandoned? On account of expense. It was anticipated that there would have to be a tunnel at the upper end.
3816. That is, crossing between Coolah and the present survey? Yes. The present survey is undoubtedly the cheapest line you can get through the district.
3817. The other day, in giving evidence, Mr. Garland, who is interested in the Mount Stewart mines, put forward that locality as an important one from a railway-traffic standpoint, and thought the line, if it remained, should be diverted so as to go through Leadville, which the previous survey did? If the question of making a cross-country connection is put on one side, the proper way of serving that district would be by an extension from Mudgee through Gulgong, and then towards Dunedoo.
3818. That extension northwards of the Mudgee line would go very close to the district spoken of by Mr. Garland? Yes; I believe you could go right into it without difficulty.

- H. Deane.
29 June, 1900.
3819. Between Gulgong and Dunedoo there seems to be a range running northward, which, apparently it would be advisable to keep on the east side of? I think you get through it, or round it, although I have not any accurate information.
3820. Do you remember how much extra the line, as first surveyed, from Wellington to Coolah, and on to Werris Creek, was to cost, as compared with the present proposal? I do not think it has been accurately determined. A casual inspection of the section, however, will, I think, show that it is far inferior to the line submitted to the Committee.
3821. And would be considerably more expensive? I think so; and the grades are not so good. Between Coolah and the part where the dotted line on the map joins on, there would be some difficulty in getting suitable grades, and there would probably have to be a tunnel.
3822. *Chairman.*] What was the reason the survey from Wellington to Werris Creek was sent on to Werris Creek;—was it because there was a junction there, or was it because the country was easier than that which could be obtained by a direct line to Curlewis? It was considered that Werris Creek would be the proper point to aim at for the Northern line.
3823. For what reason was it looked upon as the proper point? So as to make as short a connection as possible with New England and the north.
3824. But a direct line to Curlewis would shorten the amount of construction? Yes; there would be a difference.
3825. Would it be necessary to have any of the appliances usual at junctions at Curlewis, if you junctioned this cross-country line there? I have no doubt it would.
3826. Would the annual expense involved in providing them be greater than the annual expense involved through the greater length of construction? I do not think you would save anything in annual expense, although the traffic expenses might be less; but I should say that, as regards maintenance and so on, the expense would be pretty nearly as great, on account of the grades and the somewhat more uneven character of the line. Then, at Curlewis, if you made it a junction proper, and did not run your trains right through, you would be bound at the end of a long line like that to have engine-sheds, a turn-table, and all the appliances you have at a junction. If you join at the gap, of course the trains will run right into Werris Creek.
3827. *Mr. Watson.*] Mr. Stuart mentions in his report the occurrence of pine on the more northerly route which he has explored;—could you ascertain the last point at which pine is met with going towards Curlewis? There must be pine not very far from Curlewis, because in travelling along the North-western line I have frequently seen pine brought in there. I think there are some saw-mills there.
3828. *Mr. Shepherd.*] What is your opinion of Mr. Stuart's suggestion and the alternative route? It was not Mr. Stuart's suggestion. I think it was suggested by one of the traffic officers that that line might be examined.
3829. I do not think you are in favour of any junction with Gilgandra; you expressed yourself rather strongly against it some time ago? Yes; I was under the impression then that it would be very difficult to cut across there with a decent line; but Mr. Stuart's report shows that a much better line can be got than was anticipated at that time. At the same time it is not so good a line as the other, as you see by the grades, and the up and down character of it, which Mr. Stuart describes. . . By keeping further north, as he does, he gets into the ridgy country, and he has to negotiate that by curving round.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

- H. C. Russell,
C.M.G.
29 June, 1900.
3830. *Dr. Garran.*] As a general rule, the rainfall diminishes as we go west? Yes.
3831. A line from Werris Creek or Dubbo is a western-going line;—would your figures show a falling-off in a line, as between Werris Creek and Dubbo, sufficient to affect agriculture? It would amount to some inches going west. It would fall off 4 or 5 inches between Werris Creek and Dubbo.
3832. Can you give us the rainfall at points along the whole line? Yes; I have taken the stations a little west and a little east of those two points, and beginning at Molong we have an average rainfall of 30·37 inches; Katella, 27·44 inches; Wellington, 24·09 inches; Obley, 27·66 inches; Dubbo, 23·26 inches; Narromine, 20·10 inches; Wambalong, 27·74 inches; Munderooran, 27·03 inches; Cobrouraguy, 24·52 inches; Goolli, 26·08; Coolah, 29·96; Wcetalibah, 23·90; Ulinda, 28·45; Silent Dale, 25·82. You will observe that I am carrying the records towards the north-east over to Werris Creek. Blackville, 30·72; Moan, 28·10; Weblands, 31·60; Gunnedah, 26·47; Tamworth, 28·82; Goonoo Goonoo, 26·63; Wallabadah, 31·29; and Murrurundi, 32·70. You will observe that the rainfall ranges from about 24 to 30 inches going across from Dubbo to Werris Creek.
3833. The lowest figures you have given us are 20 inches for Narromine;—is that enough for wheat? Yes.
3834. And between either Wellington and Dubbo and Werris Creek the rainfall is between 24 and 30 inches? Yes.
3835. That is a good rainfall? Yes; it is a satisfactory rain, and it improves going eastward, as the land rises.
3836. It has been suggested to us to push the line a little further north, and take it from Curlewis across to Gilgandra;—going northward would not make any material difference, I suppose? No; in fact, some of the stations I have named are along that line.
3837. What is the rainfall of Curlewis? That is a little south of Gunnedah, close to Weblands, where the rainfall is 31·60.
3838. What is the rainfall of Gilgandra, north of Dubbo? 27·16 inches.
3839. And as between Curlewis and Gilgandra, we may say that the average is 23 or 24 inches? Yes.
3840. Going north, is there any diminution? Not materially; the diminution going true north is slow.
3841. What is the rainfall for Coonabarabran? 31·06 inches.
3842. Is it the hilly country which brings the rain there? I have not the hills marked on the chart; but, judging by the watercourses, they all run out to nothing in that neighbourhood, and I take it that it must be on high land.
3843. Do you notice whether hills or forests mostly cause precipitation? Forests do not seem to make any difference if they are cut away. For instance, I have had places cleared out in the middle of forests, and I find that the rain is no less than it is outside or in the forests; but rising to an elevation of about 300 feet makes a difference of an inch of rain.
- 3844.

3844. Taking that as an average, is this a district much subject to drought? Not so much subject to drought as places to the west of it. H. C. Russell,
C.M.G.
3845. Some of the witnesses say they have hardly ever had a season near Wellington in which they could grow wheat? I know that the drought affects this part of the country less than it does that further west. 29 June, 1900.
3846. Are there any places further east where it is more severe? Not that I am aware of.
3847. Why has Cassilis a heavier rainfall than Dubbo? Cassilis partakes of the coastal rain on the eastern slopes, and they get a good deal of rain on the Upper Hunter.
3848. Have the easterly gales we have had lately reached as far west as Dubbo? Yes; we have had a great deal of rain over the eastern half of the Colony.
3849. Does the rain get over easier where the range is low and flat? Yes. Speaking generally, the easterly rains do not cross the range at all, except in the Upper Hunter. For some reason—probably a geological one, the material of the mountains being softer—the rain has cut away all the hills on the Upper Hunter, and the main range is lower there than it is either north or south of it.
3850. West of Cassilis the rain gets over the range easily? Yes. They often get the easterly rains, which never reach the western part of the high lands.
3851. Does the rain in this district fall seasonably for wheat? Fairly well. Of course drought will not be limited to any area; but it is less severe here than it is west of it.
3852. So far as droughts are concerned, they will come at any time of the year? Yes.
3853. There is no month in the year which can be said to be drought free? No.

Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

3854. *Mr. Watson.*] You have recently been over the country between Gilgandra and Curlewis, and a report which you presented has been handed in. Did you take particular notice of the timber on the route? Yes; taking it right through it is box country, and there are belts of iron-bark scattered through it. There is not much pine; but I think there is a sufficient amount of iron-bark on the line to sleeper it. C. McD.
Stuart.
29 June, 1900.
3855. In the immediate vicinity of the line? Yes; but you will not get many very big sticks in the immediate vicinity.
3856. The ironbark country seems to lie a little away from the line? Yes, on the other side of the Castlereagh, towards Dubbo.
3857. Would the effect of having sufficient iron-bark in the immediate vicinity help to cheapen the construction by saving the carriage of sleepers? I think so.
3858. What about the pine? There is not much of it.
3859. Are they not getting pine now from about Curlewis? Yes; there is a saw-mill there.
3860. Would the railway give access to any great amount of pine some distance out of Curlewis? I do not think so, because most of the pine they are getting at Curlewis is pretty close to it, and in the country through which the line goes there is not much pine to be seen—not close to the line.
3861. You do not think it will have any great influence on the traffic of the line? No.
3862. Did you form any opinion of what it would cost to bridge the Castlereagh twice, taking each instance separately? No; but roughly speaking, I should say it will cost £30,000 for the two.
3863. Do you think the cost of construction, generally, would be very much greater than that of the Wellington to Werris Creek line? It would be more costly on account of those bridges.
3864. Apart from the bridges it would be much similar? Yes. If anything, it would be a little more expensive. You have to cut through so much of the country at right angles to the watercourses.
3865. Is there likely to be any difficulty in getting through the same broken country immediately east of the Castlereagh, where you cross it a second time? Not as much as I anticipated. You can get valleys to run up, which take you over the divide.
3866. Looking at the country generally through which you went, do you think it would be likely to contribute much in the way of traffic in agricultural produce for the line? I think there is a great deal of good agricultural country—above the average.
3867. Leaving out of account the cross-country-connection aspect of the line, there would be some reasonable probability of getting traffic from the immediate vicinity of the line? I think so.
3868. With the additional advantage of going closer to Coonabarabran as a centre? Yes.
3869. Did you obtain any information as to the tenure of the land through which you went? There is not much of it purchased land. There is a lot of country to be thrown open, and most of the land held by squatters is held under lease.
3870. Did you go as near to Coonabarabran as you think it is possible to get in your suggested line? You get within 15 miles of it. Of course it is possible, by a good deal of lengthening, to get closer, without heavy work; but it would mean a very great twist in the line.
3871. The country immediately around Coonabarabran does not contain large areas of good agricultural land? There is more good country about there than I thought there was. The road the Public Works Committee drove over goes through the worst bit.
3872. Anyhow, the good country about Coonabarabran would be tapped by a line going within 15 miles of it? Yes.
3873. In your report you state that grades of 1 in 60 could be obtained, and, possibly, by further exploration, lower grades? Yes; by lengthening out you could probably get a grade of 1 in 75.
3874. Would that add materially to the length? Probably about 5 miles.
3875. *Mr. Shepherd.*] What is your opinion of the whole of the line on which you have reported? As a line to suit farmers I think it is a very good line; but I do not think that there would be a great deal of traffic other than farming upon it.
3876. What advantage do you think it possesses over the line which the Committee has already examined? The great advantage is in so much of the country not being alienated. Against that, you do not connect with two junctions already existing, which is a serious drawback.
3877. Do you think the country is equal to the country on the other line? I do.
3878. What proportion do you suppose is not alienated on that line? More than double what there is on the other line. 3879.

- C. McD. Stuart.
29 June, 1900.
3879. Do you think the line would be much more expensive to construct? It would be more expensive per mile, owing principally to the cost of the two bridges over the Castlereagh.
3880. The country itself, exclusive of the bridges, would be equal to the other line? Fully equal to it.
3881. Is it not rather more hilly? It is; but it is very good country for farming purposes.
3882. The timber, you say, is sufficiently good to provide sleepers? Yes.
3883. And the country is better? It is a particularly well-watered part of the Colony.
3884. Taking it altogether, how would the mileage compare with that of the other line? This proposal is 121 miles, and the other is a little over 159 miles, so that there is a saving of nearly 40 miles.
3885. *Mr. McFarlane.*] One of the reasons given for the construction of a cross-line between Werris Creek and Wellington is on account of traffic coming from the Northern line, and using it as a cross-line;—how would the Curlewis connection compare with the Wellington to Werris Creek line in respect of that? I do not think it would compare well. If there is any through traffic people would prefer going from Werris Creek to Wellington.
3886. Where do you think the bulk of the traffic for the cross-line would come from—from the Northwestern or the Northern line? I do not think there would be much traffic further than what the line itself developed.
3887. Presuming there is traffic from the Northern line, in the event of the Curlewis-Dubbo line being constructed, they would have to shunt at Werris Creek, and then at Curlewis? Yes, or run the trains through from Werris Creek.
3888. Would that be looked upon by the Department as an inconvenience? Of course, a double junction is always an inconvenient thing, unless you run from the one junction and run two trains.
3889. What sort of country is there between Curlewis and Gilgandra? It is all good, loamy soil—there is very little plain country. Most of it is open forest.
3890. Does it compare favourably with the country between Wellington and Werris Creek or Dubbo, for agricultural purposes? Yes. It is also equally good for grazing.
3891. According to the map, the line to Curlewis crosses more water-courses;—are they of any importance? No.
3892. Is any of the land subject to floods? No. The watersheds do not extend to any great distance.
3893. Are there any serious obstacles to the construction of the railway? No.
3894. *Chairman.*] Would the cost of the alternative line be very much increased if you attempted to get a 1-in-75 grade? I do not think so, further than that the total cost would be increased by the extra length; but I do not think that the cost per mile would be much more.
3895. In your report you speak of the tableland which you cross a little to the south of Coonabarabran;—is that a serious obstacle in the way of construction? No.
3896. Would you like to offer an opinion as to the amount of good land on the two alternative lines;—which do you think would have the more? I am of opinion that the Gilgandra to Curlewis route has the more.
3897. *Mr. McFarlane.*] Is there much settlement on the route? No.
3898. Have you any further information to offer? Only that the junction, not being at Werris Creek, is a serious obstacle for the line. It makes it more of a cross-country line than anything else.
3899. *Dr. Garran.*] If the trains always ran straight on to Werris Creek that would not be of so much importance? No.
3900. If the trains got in at Breeza they would all run to Werris Creek? Yes.
3901. So that that objection would not be of much importance? No.
3902. It would be an objection at the other end, at Gilgandra? Yes.
3903. Breeza, I suppose, is as good a starting-place as Curlewis? Probably better. It is easier of access to the line. You would avoid a small range.
3904. And it would not be much longer? Not very much.
3905. *Mr. Watson.*] Some time ago the Committee suggested that the country out towards Cobborah should be opened up by an extension to the Mudgee line;—do you think that would be an expensive line? The line, as laid out, is an expensive one.
3906. Do you think it could be improved? It would have to be looked into before I could express an opinion. Of course, it could be improved by lengthening out, but you might lengthen too much.
3907. It looks as if a better route for the extension of the Mudgee line northwards would be to keep a little easterly of Dunedoo, instead of making for Cobborah? By doing that you would avoid the bad country before you get to Cobborah. Then, after you cross the Talbragar, you come to two other ranges, and you may be able to work through them.
3908. As far as serving the country generally is concerned, a line a little east of Dunedoo would do as well as one over towards Cobborah? Yes; you would get the valley, and the Talbragar, Coolah and Mount Stuart traffic. I think you would serve as many people.
3909. Assuming that you went a little east of Dunedoo, do you think there would be any difficulty in getting up towards Binaway? That is a bit of country we have never examined. There will be some difficulty, no doubt.
3910. Do you think Binaway would be as near as it would be advisable to go, consistent with economy, towards Coonabarabran? I think so.
3911. Do you cross a second time, with the suggested line, the Castlereagh above Binaway? Yes, about 7 miles above it.

TUESDAY, 3 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

John Haynes, Esq., M.P., sworn, and examined:—

3912. *Chairman.*] How long have you represented Wellington in the Legislative Assembly? Between five and six years.

J. Haynes,
Esq., M.P.

3913. Will you favour the Committee with a statement of your views on this proposed Railway from Wellington to Werris Creek? Yes; I previously represented Mudgee, in that part of the country; but on the rearrangement of the electorates I stood for Wellington. I have had considerable experience of the various country districts, both in a Parliamentary and in a journalistic sense; and I can say, from my own experience, that I have not found any other district make, in so short a space of time, such remarkable progress or development as the Wellington electorate has during the period I have been the Member for it. That, of course, did not arise from the fact of my being the Parliamentary representative, but from a variety of causes, including the fact of the magnificent rich lands in that portion of the country becoming in part available for settlement. Just about the time that I was elected for Wellington, one very large estate—the Nanima estate—which cramped the development of the town, became, by reason of some financial changes, available for settlement, and in a space of three or four years, I think, every acre of that land has been taken up, and every acre of it fit for cultivation is under cultivation. That is within a small radius of the town of Wellington, and I know that that land under cultivation has given almost phenomenal returns of wheat. The development between Wellington and Bodangora—or as it was known then, Davisville—has been simply remarkable; in fact, it has been very much like what our experience has been in connection with the sudden opening of gold-fields. The whole of the country has been put under the plough, and where I used to see cattle and sheep some years ago there is nothing now but wheat-fields. The town of Wellington, for some reason or other, was up to that time like a tree that was girded with iron. By reason of the estate round about, the development of the town and district was cramped. Whilst on the one hand Orange, and on the other hand Dubbo, developed, owing to the lands there being open, Wellington was to a certain extent cramped; but when this estate was broken up, the development set in, and simultaneously a very large area of Crown lands became available, and I know that no available lands have been twenty-four hours unapplied for in that part; and in the great majority of cases there has been, I suppose, on an average, from ten to twenty applicants, and in many cases very many more, for every portion of the land. Great as has been the area of land rendered available, a very much vaster area of land is now falling in, to the extent, I roughly estimate—within a short distance of Wellington, and which would affect the Wellington and Werris Creek railway—of not much less than 150,000 to 200,000 acres. Every day I have requests from people round about with regard to these areas of land which are falling in under the leasehold system—all the large estates round about, extending out towards Cobborah—and requisitions are being prepared at this very moment to have made available for settlement 40 or 50 miles of country, extending in the direction of Cobborah, which land has been applied for for scrub leases, and has been asked for for ordinary purposes of settlement. I think there are three estates of very large dimensions, the better portions of which would be available for the plough and settlement in small areas by January next. I may say that the tenor of the whole of the requests that I have received from public meetings and otherwise, and also the tenor of the requisitions, is that the areas, which previously were to the utmost extent of the Act, should be reduced to 500 acres each, which fact shows that the district is estimated by the people to be about the wealthiest and the best supplied with rainfall and natural advantages to be found. I may say that one gentleman who came to Wellington about seven years ago, and took up land in the vicinity of Wellington, was a Victorian farmer, who obtained an estate on which he has made a most successful competence. He obtained the estate, he told me afterwards, owing to the dead condition of affairs about Wellington, at about one-third of its natural price. The farmer to whom I refer is Mr. Trevaskis. In one place, which is supplied now by a railway in another direction, but which is a fair sample of the wealth of the district in the locality of this railway, one small station alone last year paid £2,000 for ploughs purchased from one firm alone; and a comparison has been made of the amount of revenue paid by one farmer who became possessed of land which had been previously locked up. I find that a man farming 2,000 or 1,500 acres paid to the Railway Commissioners, in a year, for in and out traffic on agricultural implements and his own produce, more than was paid in the same year by the holder of the large pastoral leasehold area, consisting of 140,000 or 150,000 acres. I may say that all that land is practically of one quality, and I feel convinced that the country right through towards Cobborah, excepting a small portion of it, will be a succession of farms which will require very many railway platforms for the accommodation of the produce. I may say, as indicating the reliability of my statement on this point, that one farm in the district of Wellington, at a place called Maryvale, practically absorbs the whole trucking accommodation of the Railway-station, in consequence of the area of cultivation and the richness of the country. In the vicinity of Wellington—a portion of the country which would be served by this line—farming operations are carried on to the very mouth almost of one of the most stable gold-mines in New South Wales. That is at Bodangara, formerly known as Davisville. Recently a large area of this country was held under various kinds of reserves, and a portion of the railway reserve, extending out from Wellington towards Forbes or Parkes, was, through my instrumentality, at the request of the people, thrown open, and every acre of it was taken up in a single day. For the area of country lying between Wellington and the north, which is now reserved to the extent, I think, of a mile on each side of the railway peg, a great fight has been going on for years, and I know from applications that have been made that the whole of the land will be taken up, extending really right through to Cobborah, and that settlement will grow there. The tenor of all the letters

3 July, 1900.

addressed

J. Haynes,
Esq., M.P.
3 July, 1900.

addressed to me from this great wheat district is in favour of opening up the land. Some time back I opposed the action of Mr. Carruthers, when, as a member of the late Government, he brought in a Bill called "The Lands for Closer Settlement Bill," and I opposed it on the ground that, taking the Wellington district as a sample, there were thousands of acres of land of the best description locked up in various ways. I am justified in my statement by the fact that every acre opened to the people has been taken up, and these great areas are still open for a population which, in every single instance, has been singularly prosperous. I do not think, from my experience, that in any other part of New South Wales so many farmers, taken as a body, have been so signally successful in their operations as have those in the Wellington district. If inquiry from the banking institutions were possible, I think it would be found that the farmers there—the total number almost—have not only redeemed themselves absolutely, but are in a most sound financial condition beyond their previous expenditure. In my opinion a great feature in the recommendation of this railway is the fact that for 20 or 30 miles outside Wellington a stubborn fight is going on amongst the people for the purpose of preventing any sale of the Crown lands in larger areas than 250, or at the outside 500, acres—that is, within 25 miles from Wellington. The Cobborah people have pointed out that there are large areas of reserves which are unnecessary, and which would be rendered immediately available, and the land, I believe, would pay magnificently if served in the way proposed by this railway. I do not see that any evidence has been taken in reference to the fact that beyond Wellington, in the direction of Forbes and Parkes, is one of the most remarkable and wealthy wheat-growing table-lands, I think, to be found in New South Wales—I mean in the direction of Curra Creek, out towards Cumnock—magnificent soil hitherto held altogether against the people, but which is now becoming available for settlement. The remarkable condition of affairs in regard to Wellington is illustrated by the fact that all this land is now being taken up, that the trade of Wellington has more than quadrupled, and that the railway returns are enormous. On one side you find a town like Orange, with vast development, and on the other side a town like Dubbo; and my opinion is that the cramped condition of Wellington is explained by the fact that, from a variety of causes, this land was held intact. On this land near Wellington being made available, we shall have another Dubbo at Wellington, but, in my opinion, a long way more prosperous than Dubbo, because of the better rainfall, the better climate, and so on.

3914. This railway has been put forward, in the first instance, as a cross-country railway to connect the Northern and the Western systems; you seem to regard it as being a railway, the construction of which would be justified from a developmental point of view—the opening up of the country? Yes, a good deal. I confine my remarks up to the present to Cobborah, which is the most distant part of my electorate. I know a good bit of the country also from Werris Creek this way, which, also, in my opinion, is magnificent land.

3915. If the Northern line were not built, do you think it would be a wise thing to construct a line out in the direction proposed for the purpose of opening up that country? I do think so. I think it is a terrible hardship for the people of the west to have to fight such prolonged battles in drought time. We know that in the northern districts, such as the Hunter, where I came from, the Upper Hunter, Armidale, and other parts, there are magnificent rainfalls, and produce is enormously plentiful; and it is a sad thing to find people in the west perishing because of the terrible difficulties in the way of carriage along the ordinary roads. I am positively aware of the fact that some of the station proprietors in the west—even in the direction of the Lachlan—although they have a railway, are, by reason of the distance, situated similarly to the people who would be served by this projected line. I know for certain that, in the face of such prolonged dry weather, they have been unable to master the drought, solely by reason of the fact that, although produce was plentiful elsewhere, it could not reach them except at exorbitant figures.

3916. Do you think that there would be a considerable cross-country traffic in produce in time of drought? Yes. Taking the last seven years of drought, I am certain that there would have been an enormous traffic of produce from the north on any line running between Werris Creek and Wellington.

3917. Taking an ordinary fair season—one in which drought does not appear—what interchange in produce or commodities would there be along the line, then? We are sending, and would send, some of the produce of our district to the far west. Magnificent prices have been obtained by our farmers at Wellington by sales of produce sent to the far west.

3918. Do you anticipate that you would send similar produce across this line if it were built to the Northern line? Yes, I feel sure we should. The Wellington produce has had a very good market in Sydney, and practically there is a competitive market between Sydney and Bourke, so far as Wellington is concerned, and I am quite sure that we were unable to supply anything like the wants of the people of Wellington. It seems to me to be an extraordinary thing that huge loads of produce in bulk should come to the west, *via* Sydney, which, I presume, came from the north—it seems extraordinary that it should come by way of Bathurst, Orange, and Wellington on to the west, when the short stretch of country intervening could be traversed, and the rich northern country could be brought within reach of our torrid areas in the west.

3919. You think then that the produce of the Northern district would be sent across this cross-country projection out to the west? I think a good deal would.

3920. What produce would be sent the other way;—would there be any return traffic? Cattle would travel a great deal. The cattle traffic has been enormous on our railways in that direction. In my opinion the condition of the west beyond Dubbo is that of paralysis, and it appears to me to be chronic. From my experience of affairs out there, I think that the drought conditions have, from some cause or other, become permanent—probably from the cutting down of scrub, or from the fact that we do not store any water. For some reason we have reached a chronic condition of drought there, which is such an affliction that I think some extraordinary steps should be taken to connect these drought-stricken areas with areas that never experience these drought scourges. I know Armidale well, and I see there is a movement there on behalf of the farmers to get a quick means of reaching a market in the west. My experience of the two extremes—of the west and of the New England and Liverpool Plains table-land—tells me that it would be a most statesmanlike and generous thing to provide some readier means than we have at the present time, whereby the people of the west should be relieved from such terrible losses and terrible sufferings. I have recently travelled in the west, on a trip by myself, when I took particular notice of the surrounding districts, and I say that it appears to me that the time has arrived when some extraordinary steps should be taken to save that country.

J. Haynes,
Esq., M.P.

3 July, 1930.

3921. You indicated, in your opening remarks, that this line should have some connection—at any rate in the future—to the Blayney-Harden line by constructing another link? Well, it might. It is 30 miles from Wellington to Orange—by a very good grade, except in one or two places which could be altered—and 15 miles further to Blayney; but I am presuming that it might be found possible to run across the Wellington line towards Forbes or Parkes, and in that regard I referred to the tableland of Curra Creek and Burnwood. I have not the slightest doubt that a railway will be eventually required out towards Cummoock and those parts, by reason of the richness of the soil, and the settlement going on there, and the country from Wellington out towards that district is surprising. It is indeed surprising to find, in so short a space of time, such an enormous area of land under wheat cultivation.

3922. You see that there is a fairly large area between the Western line, and the proposed Dubbo-Coonamble line on one side, and the North and North-western lines on the other;—do you think that that large patch of land not now served by railway would be better served by an extension from Mudgee, or by this proposed cross-country line? In my opinion a great country would be served, and great traffic would be developed, if a railway were continued from Mudgee to junction with this line at Cobborah.

3923. You mean to construct the Wellington-Werris Creek line and then have an extension to it from Mudgee? I mean that if the line were constructed from Wellington to Werris Creek it would be wise to have an extension from Mudgee to serve that country. I think that a railway from Mudgee to Gulgong was approved. That is a very rich stretch of country.

3924. Do you think that the construction of the Wellington-Werris Creek line would bring about a material change in the character of the operations going on in that country now? Yes, I feel sure of it. My reason for saying so is this: we have no district south of Newcastle, on the coast or inland, which can provide the distant arid west with the produce which is essentially necessary for the successful working of the west. We have not, for instance, south of Sydney, any district like that of Armidale, Glen Innes, a portion of the valley of the Hunter, nor have we any district like the North Coast. The western district, by reason of its distance, and also by reason of our present railway system, is practically isolate from those rich areas of the country which never have any experience of a year's drought, and I have never failed to notice that the carriage of produce produced a corresponding traffic back in some form or other.

3925. *Dr. Garran.*] Has not the arid west drawn very heavily on all the good country between Orange and Narromine? I do not look upon Orange as being a very productive district in regard to fodder. I think it is pretty well tied up in providing for its own needs. Orange and Bathurst are districts that do not grow anything to any extent beyond that. The development that is going on in our district, from Narromine down, is, in my opinion, for an export trade. The great effort being made now is for the purpose of growing wheat. We make fodder only when the season looks adverse or the market is falling considerably. Then the wheatfields are generally put under the machine and the crop is converted into chaff or fodder.

3926. But has not the great demand for fodder made it pay better to grow hay sometimes, than to grow wheat? Yes: I daresay in drought time it has, but at that time, although it is to some extent against the interests of my district, I say that it is a great handicap for the people of the west to be forced to pay famine prices for produce when it is so plentiful and cheap in other parts of the country.

3927. But has not this demand in the west been part of the cause of the prosperity of Wellington? I do not think so. I do not think that the prosperity of Wellington has arisen in that way at all. There are only some very large farmers, such as Mr. Barton and two or three others, who have, in a sense, catered for the west. Most of the farmers have gone in for wheat-growing.

3928. You say that you had paid some attention to this western country;—do you think it pays better to send the stock to the grass, or to send fodder to the stock? Well, it largely depends on circumstances.

3929. I ask you because it is a much disputed point amongst witnesses we have had—practical men seem to differ? Well, if produce is available at all at reasonable prices, from what I can learn I should say that squatters prefer keeping their stock at home.

3930. We have been told by several witnesses—practical men—that even if we had railways going into the west abundantly, it would be simply impossible for the east to take all the stock from the starving country—that there would not be sufficient room there for grazing them? I daresay that is so. One of the things that has to be considered is where are you going to put them.

3931. Well, if we cannot save the lives of the sheep by sending them to the east, the only way to save their lives is by sending food west to them? A reciprocal arrangement, to some extent.

3932. Well, say, half and half;—will it pay to keep alive the average kind of sheep that are depastured in the west by giving them imported food—I do not say a few stud stock, but a whole flock? I cannot give a definite answer on that point. One very extensive squatter in the Condobolin district told me that they prospered very decidedly when they were able to obtain produce by train, and could feed their flocks.

3933. How far was he from a railway? Not very far—about 10 miles.

3934. Then he had very little cartage? Yes.

3935. He got his produce cheaply? Yes, comparatively cheaply; but the distance it was brought was great.

3936. While, in connection with this cross-country line, one of the recommendations is that it would give access for eastern fodder to the western arid lands, do you know what it would cost per head to get the sheep to where there is feed? I cannot give you definite information on that point.

3937. If it will not pay to take the sheep, there is an end to the trade? The fact is, that a number of the squatters, by reason of the situation, preferred to travel the sheep. I know it paid them enormously to travel them by train, although the difficulty and the cost were great. But the means of quick transit have not been available in this direction. I have not the slightest doubt that, in a dry time, we should see the great bulk of our western stock taken to the north, where the country is good. I knew the district about New England well for many years, and I know that the squatters out in the west, and stock-owners generally, lamented the fact that only certain districts could be reached by rail at all, and they were very sorry that they could not get their stock up to the north.

3938. Take the line to Bourke—all the stations 30 to 50 miles to the west of that line are within easy reach, pastorally speaking, of that railway? Yes.

J. Haynes,
Esq., M.P.
3 July, 1900.

3939. They could all have sent their stock, but did they send their stock away and try to save them all? No; because every available portion of country open at that time was taken, but the country that was not available by the railway was not reachable. It would hardly pay them to take them by the present route.

3940. But if the country were already fully stocked with starving sheep that could get there, where was the chance, even if you made a railway, for the rest of the sheep? This line would open up an entirely new area of country, which hitherto has not been of any use to our pastoralists in the west.

3941. Some of the evidence taken by the Sectional Committee shows that a great deal of starving stock was sent from between Wellington and Werris Creek? No doubt; but not nearly so much as might be.

3942. Which country are you referring to as being opened up? Werris Creek. To most people it seems ridiculous to think that it would pay to train starving stock; but it is a fact, nevertheless. But I know that the difficulties in the way of removing stock to the north country from the west, at present, are so great that people have practically given it up. I know that the demand for the lower portions of the Wellington electorate—where there is a pretty good rainfall—on the Macquarie River, has been so great that the holders of land there have made considerable sums of money by reason of the fact that stock could not be taken elsewhere at anything like a paying rate.

3943. Well, if we are going to make the railway to pay, and part of its revenue is to come from starving stock, we have to see that it will pay to take the starving stock? Yes, undoubtedly.

3944. At present, the Railway Commissioners take it at a price that barely covers the cost of taking it? That is true.

3945. So that if they get all that traffic, perhaps there will be no great profit, but only an indirect gain by keeping the stock alive? I do not regard the conveyance of stock by train as satisfactory in regard to the returns.

3946. It appears that this land is so good that if the proposed railway were made an immense area now under pasture would go under agriculture? Yes.

3947. If so, it would not be of much use for starving stock? Undoubtedly. I do not lay much stress on the value of this land as stock-carrying land, but my contention is that the development of farming would be so great that the backwards and forwards traffic on that account would pay the railway. The travelling of stock at a time of drought may occupy the railways, but, in my opinion, it is in itself a condemnation of a system whereby people are located in a place where they cannot feed their stock.

3948. One of the strong arguments put before us on behalf of these railways is that they will be available for starving stock? But I would not recommend the construction of this line on that ground alone.

3949. You recommend the line for the purpose of settling the country with *bona fide* tillers of the soil? Precisely. And I do not think I should be dealing solely with imagination were I to say that if the whole of the land from Wellington to Werris Creek were rendered available for cultivation—the distant parts in rather longer sections in order to combine grazing on a small scale with farming—every acre of it would be taken up within one week; I mean adjacent to the railway, within 10 or 20 miles.

3950. How far from Wellington does this prosperous farming now reach? There is a succession of farms, with a very slight break of brush country, all the way to Cobborah.

3951. How far is that? About 55 miles. A singular thing in connection with this country was, that at the time I went touring the district, after the new arrangement of the electorates, I took one of the persons who is thoroughly acquainted with the locality, and we found ourselves completely bushed by reason of the fact of the opening of so many roads, and the closing and the fencing of different portions; the settlement had become so enormous, and the farms continuous. There is only one other part of New South Wales that, in my opinion, compares with it, and that is the district around Bogan Gate. The settlement out there reminds me of the time of the gold rushes, because it is an unusual thing to see such activity and development in what are called agricultural areas; but this country is one succession of farms, and the farmers are prosperous men, too.

3952. Our evidence generally is to the effect that an agriculturist cannot prosper much more than 20 miles from a railway station—that he ought not to take more than one day to go in, and come out, but you say that the men in your district go 40 or 50 miles? They take different routes. Some of our wheat is carted all the way from Spicer's Creek to Mudgee—that is, from 45 to 55 miles. A great deal of our wheat supplies the Gulgong and Mudgee mills.

3953. How far do farming operations go west of Werris Creek, on that route? A good portion of the district, I should say, from what I can recollect of what I saw when travelling over it on horseback as a newspaper reporter; and I thought then that the country looked capital.

3954. Which would be the better for the district lying between the Western line and the North-western line, at present—to make a cross-country line, or to extend the Mudgee line to the Northern line? I maintain that the Mudgee line must be extended, but I say that an extension from our Western line, at some point or other, is inevitable.

3955. If the Mudgee line were extended, it would go between the other two lines, and it would draw everything from, say, 20 miles north of its terminus, wherever that was? But as far as I can see I do not think that there would be any justification for it at the present time, seeing that a railway has been determined upon between Dubbo and Coonamble. I do not think that any extension beyond Cobborah would pay, because I believe that that is exclusively pastoral country. But the proposed line to Werris Creek keeps within a very well-watered portion of our country. I wish to impress on the Committee the fact that, as the result of farming in these districts, one farmer alone in our district has paid regularly for some years past to the Railway Commissioners, for the carriage of his produce and agricultural implements, although he holds only 1,000 acres, more than has been paid per annum by the holder of the adjoining pastoral leasehold of 130,000 acres.

3956. That is a very strong argument in favour of close settlement in good districts, but you could not do that in a good district? No; and I do not think it would be justifiable.

3957. If the existing railway line serves the purposes of farmers for 20 miles out, and the Werris Creek station serves them for 20 miles out at the other end, it is the middle part of this projected line that would be most useful? Yes, undoubtedly. I do not say that the construction of a railway very much west of Cobborah would be justified by what are called produce returns, because the drought conditions commence not very far out of Cobborah to the west. But the country intervening between Wellington and Cobborah must be served by a railway immediately, because the public cannot stand the handicap they

they have now. The enormous cost of roads is such as to afflict the State treasury with a huge expenditure, and the price of produce is so great, because the cost of carriage is so great. A farmer has to cart his stuff such a long distance, and the country is all volcanic soil, and, consequently, very soft; and the necessary expenditure on roads is very great. I feel sure that, with the exception of a very short interval of naturally barren country—I think it is ironbark country—the whole of the railway line from Wellington to Werris Creek would pass through a succession of farms.

J. Haynes,
Esq., M.P.
July, 1900.

3958. Another point is that it does not pay at present to make our railways so close to one another? I admit that.

3959. We want to hit the intervening country between our lines as much as possible, and do the greatest good to the greatest number? Exactly.

3960. This line from Werris Creek to Cobborah would run pretty close to a line from Wellington to Gilgandra? Of course the character of the country there is totally different, and the pursuits of the people are different. Beyond Dubbo, except when you get to Narromine, the paying avocations, so far as immediate returns are concerned, cease.

3961. But we are told that we may expect cultivation as far as Gilgandra, at least, if not as far as Gulargambone; the country does not get purely pastoral until we come in sight of Coonamble, almost? There is no doubt that that railway line would serve a district, but it would still leave our portion unserved.

3962. But what I want to know is, would not a line from Mudgee north be more midway between the two lines than the line from Wellington to Mundooran? It would serve an area of country, but I do not think it would pay to go much beyond Cobborah at the present time.

3963. Well, if it would not pay to go beyond Cobborah, why would the Wellington line pay to go beyond Cobborah? I mean in that district. I am keeping pretty well to the rain-fed country.

3964. But if a line were made from Mudgee, or from Gulgong, north, would it not strike the route of this cross-country line somewhere north of Coolah? It would no doubt serve good country, but I do not think that that country is equal to the other.

3965. Would it not open up a much larger area of country than a mere cross-country line would? I do not think so, as regards country that would be fit for cultivation—such returns as we get now from between Geurie and Dubbo.

3966. How far is Cobborah from Dubbo in a practicable way by road? About 50 miles.

3967. Where do the Cobborah farmers send their wheat to now? I think they try to reach Dubbo and different places.

3968. Dubbo is their nearest station, I suppose? Dubbo is one of their stations, but I think that the most of their wheat goes to Gulgong and Mudgee.

3969. Is it not a much longer route to Gulgong than to Mudgee? I think that it is. There is a better market at Wellington.

3970. But there is a shorter railage to Sydney from Mudgee? Yes.

3971. So there would be an inducement for them to go to Mudgee? Yes.

3972. But the country you speak of as being so rapidly settled now would be really served if a line were made from Wellington to Cobborah? Yes—that is one portion. I say that that would pay immediately.

3973. Merely a cocks spur line? Yes, undoubtedly. I think it would be one of the best paying lines in New South Wales.

3974. You know that, as a rule, cocks spur lines do not pay—that they have failed in Victoria very largely? They may have failed in Victoria, but they would not fail in this district.

3975. You think that the line would be so well patronised that it would pay within two or three years? I am certain that it would pay from the opening. It is astonishing how much produce comes from that district.

3976. *Mr. McFarlane.*] In the event of the proposed line being constructed, do you think there would be a large cross-country traffic? I think there would be a great traffic. The system that we have now on one line over that great barrier—the Blue Mountains—does materially hamper the development of the west.

3977. What direction would the traffic principally come from? I think the northern traffic from Queensland and those parts would come down to New South Wales.

3978. Would there be much traffic between the New England district and the Western line? I think so. I am fully convinced that the whole of the development of the west has been seriously hampered by reason of the fact that everything has to be brought down to Sydney from the interior in the north, and then from Sydney out into the west.

3979. Have you a good knowledge of the country between Werris Creek and Wellington? A pretty good knowledge.

3980. What should you class the country generally as? I think that, on the whole, farming and small pastoral work would be carried on.

3981. Do you think that a large proportion of the land is suitable for cultivation? A very good proportion of it is.

3982. Do you think that the opening of the railway would have the effect of placing that land under cultivation? Yes; I think it would. I do not think there are many districts in New South Wales so overrun as Wellington is by people from Victoria and other parts waiting for land. I have been very much disgusted at the fact of men having to spend £25 to £30 in looking for land, and then getting none.

3983. Does that happen frequently in that part? It happens at all times when land is rendered available in the Wellington district.

3984. Do you know the character of the available Crown lands between Wellington and Werris Creek? There are great areas of Crown land available for combined farming, such as is now being carried on in our district—wheat-growing and sheep-raising.

3985. Do you think it would pay to cultivate wheat in that area if this railway were constructed? provided that facilities were given for shipment. Four or five years ago, when I first went to Wellington, the freight charge on wheat was pretty considerable; but the Railway Commissioners undertook to reduce it fully one-third, if not one-half, if we could arrange to have large consignments going at the same time, and I think development is in that direction. At the present time you may see at the Wellington station a most extraordinary state of things—the storage of enormous quantities of wheat that cannot find an outlet

J. Haynes,
Esq., M.P.
3 July, 1900.

outlet by reason of the railway arrangements; and in the town of Wellington the sight round about the mill is something painful to any one who knows how development must go on.

3986. What is the principal wheat market at present for the farmers round about Wellington? Sydney, largely. We sold a great quantity of wheat, to be sent to Adelaide, the year before last, I think, and also to be sent to Melbourne. I think that our anticipated return for this year was 600,000 bushels.

3987. Does much produce go to the west? Yes; a great deal, when it pays the farmer.

3988. The proposed line would pass through large areas of freehold land? Yes—that is to say, as far as Cobborah.

3989. And various other places also? It goes through freehold land; but that is in small areas. The line from Wellington to Cobborah, in my opinion, is the portion which would sustain the paying character of the railway line right through.

3990. I am not speaking particularly about the country between Wellington and Cobborah; but in many parts the holdings are large.—do you think if the railway were constructed it would have the effect of inducing the holders of those large areas to subdivide their property into small agricultural areas? That has been the experience so far. Where railways have gone the land has been thrown open and cultivated.

3991. *Chairman.*] Is there anything you would like to add? I should like to say that I understand that a very strong approval of this line comes from the Queensland people in connection with Federal considerations.

3992. Is that in view of the transference of cattle to southern markets? I think there will be a good deal in that. I should like to urge on the Committee the fact that if a glance be taken at the condition of affairs at the present time it will be seen that our trunk line of railway, connecting with the rich areas of the north, being by way of Sydney, and across the natural barrier of this country, the Blue Mountains, is a serious permanent handicap to independent development in the west. Why people should be compelled to use a railway line coming by way of Newcastle, Gosford, Sydney, and the Blue Mountains, when they could come across country from the table-land on the north, to the west, I cannot understand. I could understand the country continuing in that condition if it were necessary, owing to its not having enough population, or sufficient financial strength, to construct the proposed line. But, I think, that this line is justifiable on the ground that it will bring the drought-stricken west into connection with the northern district. Although the conveyance of starving stock on our railway lines may give a certain amount of return for the time being, I think that, to a large extent, it hampers railway development. It, most undoubtedly, affects the pastoral industry in the west, and I do not see how we can get rid of what we suffer from in the west year after year, except by having a new line of railway connecting us as quickly and cheaply as possible with the north. Why the people in the west, who have to fight under conditions not experienced in other parts of New South Wales, should be compelled to use a railway line coming *via* Sydney and the Blue Mountains, is a thing which, on being investigated, cannot justify its continuance. I am not moving in regard to this railway project merely by reason of the fact that I am the Member for Wellington. In cases of this kind I take a much broader view. I say that the condition of the people in the west—Narromine, and those parts—is such that they deserve the most earnest and generous consideration from those who control the affairs of the country, and, in my opinion, there is no means of affording them relief, except by giving them quick communication with the north, in the way proposed. The cost of bringing trains over the Blue Mountains, to the west, is astounding, and, together with the congested state of the traffic, sometimes, is a tremendous handicap. I think that the people of the west, as well as those in the north, have a right to special consideration. Without this line the people in the north are handicapped as much as we in the west are. What market have the people of Armidale and places in that district. I know that the riches of the country round about Armidale are practically undeveloped by reason of the fact that the people there have such a poor market. The people of Armidale and those parts are compelled to compete in a market that is served by the enormously rich district of the valley of the Hunter, and the coastal districts. We have a market for their produce in the west, and it seems to me the most monstrous thing that they should be compelled to send their produce by way of Newcastle, Gosford, and Sydney, when attempting to reach the market in the west. My experience is that produce of one kind is never carried without produce of another kind being obtained for the return journey. It is a huge satire on the railway system of this Colony, as we have experienced during the last five or six years particularly, that a man travelling west should see a continuous succession of costly railway trains carrying starving stock. It seems to me to be a monstrous thing that the railway should be devoted to that purpose, and it is ridiculous to assume that it is not done at the cost of the ordinary running of the railway. To cater for that trade I am sure that the trains are run at a price at which they would not be run for ordinary produce, and I think that that paralyses the whole development of the west. In travelling from Bathurst to Wellington, at every small station where there is a siding you will find a double-engined train-load of stock, and a little later in the day you will see engines running with enormous empty trains to the west. That seems to me to be radically wrong. Any man travelling at the present time—and especially people living adjacent to the railway line, from Dubbo out—sees the condition of affairs in which our people are striving to make a living, which condition of affairs is not creditable to those who manage the public affairs in New South Wales, and which cannot be allowed to continue. People are in such straits there that it is abominable, and it arises from the fact that they are shut out from the oases of the north, which have not had an experience of the drought for the last fifty years, so far as my reading or experience goes. I object to Newcastle being the funnel for our communication with the north just as much as I object to Sydney on the same ground. I think there is no escaping from the fact that the proposed line should be constructed from either Dubbo or Wellington, but in my opinion it should be from Wellington, because the country for one-third of its condition is such as would make the railway line pay immediately from its construction. If one farmer alone is able to sustain the traffic of one railway station outside Wellington, I think the same thing might be expected from other farmers. If it were possible for the Committee to have special reports made on the character of the country, I would be glad, and, if the inquiry does not close immediately, I will deem it my duty, to furnish the Committee with all the data possible in connection with the matter.

John Connelly, storekeeper, Wellington, sworn, and examined:—

3993. *Mr. Shepherd.*] What are you? I was an hotelkeeper in Wellington for about nine years; but I have a little store at Wellington now. I desire to speak in regard to the growth of the town. Being at the "Royal Hotel," I know a lot of commercial travellers, and they often told me they thought it would be a good thing if there were a line of railway from Werris Creek to Wellington, because it would save them a lot of trouble in having to go to Sydney and to come up the Western line to Bourke, and other places where they did business.

J. Connelly.
3 July, 1900.

3994. Have you been long resident in Wellington? Ten years.

3995. Would you kindly make a statement giving your opinion as to the advantages to be derived from the proposed railway from Wellington to Werris Creek? I have been out 15 or 20 miles along the proposed line, and the land appears to me to be very good all through. It is a great farming district, and I know a lot of people who want land there at the present time. In dry seasons a lot of sheep come down from the northern part, where there is no grass or water, and the people lose a lot of the sheep in coming through. Sometimes they get as far as Forbes, and have to be sold there at a very small price, owing to so many dying on the road. The people told me that if they had a railway, and could truck the sheep, they could get them through much more easily and quickly. The town of Wellington has, I think, improved 50 per cent. in ten years, and I honestly think that the proposed line would pay very well.

3996. Are you acquainted only with the country for about 15 miles from Wellington? Fifteen or 20 miles out.

3997. Not beyond that? No. But I have been to Werris Creek once.

3998. You have formed your opinion only from hearsay? From what I have seen myself for 20 miles out, I know that to be very good agricultural country.

3999. You see that 15 miles can hardly be taken into consideration, because that is already served by the line passing through Wellington; you may count 20 miles from Werris Creek and 20 miles from Wellington as being already served by railway; it is the immediate country we want to deal with, and to find out whether it is likely to support a railway or not? In the direction from Wellington to Parkes, I have been about 30 miles along that way, and part of that country is good farming land.

4000. What proportion would you class as good agricultural land within that 30 miles? Three-quarters of it, I suppose.

4001. You have never been right along the proposed line? No.

4002. Do you know anything about Werris Creek? Yes, I have been there; but as far as I could see from the railway, or from the station itself, there seemed to be nice level country for miles towards Wellington.

4003. You have not been along the proposed line from Werris Creek? No.

4004. You know only what you have seen from the train? That is all.

4005. Is there anything else you can think of that would assist the Committee in coming to a decision about the proposed railway? I think it would be a very good thing for the district, and also for the country at large, if we had a railway to get stock even from Queensland to Melbourne. A lot of fat stock comes from that direction in good seasons, and the cattle get poor through travelling by road so far, and it would be better for them to travel by rail.

4006. Are many starving stock sent in dry seasons to the district of Wellington? The year before last there was a great number.

4007. You know what districts they came from? They came from Bourke and places to the north of Bourke.

4008. Have you heard of very many losses in travelling starving sheep long distances? Yes, I have—travelling them along the road.

4009. That is, where there is no feed? Yes.

4010. So with quick transit by railway sheep would often be saved? Yes.

4011. Do you know the country round Dubbo? Not well.

4012. So that you are really able to give an opinion only in regard to something like 30 miles along the line from Wellington? Yes; about 8 miles out there is a very good gold mine.

4013. Have you been any distance on either side of the proposed line? I have been all round that country to about a distance of 15 or 20 miles.

4014. And it is fairly good country for a considerable distance on each side of the line? Yes; and further out it is pretty well all farming country, and there are very good farms, too.

THURSDAY, 5 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY JEVJEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Robert Edward Jones, M.I.C.E., District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

4015. *Mr. McFarlane.*] I understand you have furnished reports in connection with the proposed line from Wellington to Werris Creek and other lines? Yes; I reported on the Wellington to Werris Creek line in 1890, and on the alternative scheme—Dubbo to Werris Creek. My instructions were to report on various proposed railways, giving access to the north-western country and cross-lines from Young to Dubbo or Wellington, as the case might be, and on to Werris Creek—in all about 2,000 miles of railway schemes. This work I undertook in 1890, and completed my report in June, 1891. With regard to the Wellington to Werris Creek railway, I had only my own estimate to go upon for a heavier line than is now

R. E. Jones,
M.I.C.E.
5 July, 1900.

E. H. Jones, now contemplated. My estimate was £804,700 for a line 146 miles long. I understand that in regard to the proposal before the Committee the estimate is something over £500,000. My reports on the two lines are as follow:—

M.I.C.E.
5 July, 1900.

Wellington to Werris Creek; length, 146 miles; estimated cost. £804,700*.

Having dealt with the various proposals to connect the Southern and Western main lines, I now come to what may be termed a continuation of this connection to join the northern portion of our railway system. The project under consideration commences at Wellington, proceeds *via* Spicer's Creek, Denison Town, and Coolah, to Breeza Gap, near the junction of the North-western and Northern lines at Werris Creek.

The country passed through for 70 miles is (except a small portion near Cobborah) of a fertile character, much of it fit for the production of cereals. In the neighbourhood of Wellington especially, the soil is deep red volcanic, so suited for wheat-growing.

There is considerable settlement on Mitchell's and Spicer's Creeks, the latter 18 miles from Wellington.

At Dapper or Sandy Creek (29 miles) there is cultivation and several selectors. At 38½ miles the proposed line from Mudgee to Coonamble is crossed, the township of Cobborah being 5½ miles to the west. At 46 Duedoo is reached. It is a township on paper only. The Talbragar Valley is here entered, the river being crossed near Denison Town, an improving place, due, no doubt, to the existence of the Mount Stewart and other silver-mines in course of development, 3 miles beyond the township.

Coolah is reached at 71½ miles from Wellington. A few miles of hilly and rough country are then traversed before entering the Liverpool Plains, where the line passes through the well-known runs, Binna, Oakley Creek, Bomera, Trunkey, &c., on to the North-western line at Ereeza Gap.

The cultivated land ceases at Coolah. The soil on the Liverpool Plains is rich enough to produce almost anything; but there is a lack of permanent water.

At Mitchell's Creek, 7 miles from Wellington, there is a gold-mining company employing a large number of men. The silver-mines too at Mount Stewart appear to be progressing, but the permanency of the field can scarcely be termed proved. There is also an outcrop of coal at several points on the route.

The trafficable area includes 2,717,726 acres, but of this quantity, 1,346,470 would also be served by a line from Mudgee to Coonamble. I will therefore give the two sets of figures:—

Wellington line (sole):—Alienated, 643,584 acres; Crown lands, 727,672, including 151,019 acres reserved.

Joint with a line from Mudgee to Coonamble; alienated, 412,524; unalienated, 933,946 acres, inclusive of 268,159 of reserves.

Cultivated area for Werris Creek line (sole) 3,637 acres, and jointly with the Mudgee-Coonamble line, 4,757 acres.

Population on route, exclusive of Wellington, but including Coonabarabran, 5,000, but, of this number, 3,800 would be served also by a line from Mudgee to Coonamble.

Ballast would not be difficult to obtain.

Sleepers would, however, have to be brought from the iron-bark forests at the back of Cobborah.

No expensive bridges would be needed.

There are objectionable grades of 1 in 40 at several points upon the line, and, although considerable improvement can often be made by a revised survey, in this case I am afraid little can be effected, owing to the hilly nature of the country, especially near Coolah.

With respect to traffic, I apprehend that local requirements, although of an increasing character, cannot be looked upon as likely to produce much revenue. At present, two-thirds of the traffic goes to Mudgee, remainder to Wellington, Quiriudi, and Gunnedah.

Should a line be made to Mudgee, either from Coonamble or Dubbo, it would absorb nearly all the local traffic, being the shortest route to Sydney. On the other hand, if the Coonamble-Muswellbrook scheme were adopted, the trend of traffic would be towards Newcastle.

The value of a cross line to Werris Creek is more especially due to the facilities it affords for intercommunication between the different sections of our railway system, and thus creating increased traffic.

It is a midway connection, thereby insuring a great saving in distance over the existing routes. Taking Wellington and Werris Creek as common points, I find there is a gain of 352 miles compared with the present railway journey, *via* Sydney.

Should the line from Cobar to Broken Hill be made, the Wellington-Werris Creek cross-line would bring Adelaide within 1,439 miles of Brisbane, as against 1,508 by the present route, *via* Melbourne and Sydney, thus giving a saving of 369 miles.*

With respect to Melbourne and Brisbane, assuming the present Harden to Blayney branch be used, the Werris Creek connection would shorten the journey by 143 miles.†

I think there can be little doubt a cross-line would be largely used for the carriage of mails.

It will also be a good stock-carrying railway, and, in time of drought, would afford facilities for the transfer of starving stock from the west to New England and other districts.

The military and strategic value of such a connecting line as the one under consideration cannot be overlooked. It would greatly aid, should occasion require it, in the speedy massing of troops or their transport to any part of New South Wales or the other colonies.

In the event of the Hawkesbury Bridge being damaged by an enemy or otherwise rendered uncrossable, the Werris Creek line would be found most useful as preserving intact the continuity of our railway system.

Dubbo to Werris Creek; length, 155 miles; estimated cost, £812,350.

This line is a competitive scheme to that from Wellington. It, however, starts from Dubbo, a point 30 miles further west.

It follows the valley of the Talbragar for a distance of 35 miles; then passes through poor hilly country, but good for timber, to Merrygoen, where it crosses the Mudgee-Coonamble proposed line.

A new survey is in progress towards Werris Creek which, to give improved grades, takes the line nearer to the Castlereagh River for some miles beyond Merrygoen than as originally laid out. At Westalah the Liverpool Plains may be considered to be fairly entered upon, so that no detailed description need be given from here to Werris Creek, a distance of about 90 miles. The line being almost identical with that from Wellington for 60 miles.

The country traversed consists of black soil plains with belts of box chiefly, and a series of sandstone ridges of no great height. There are many patches of rich agricultural soil of a red sandy nature; but there is a lack of permanent water, and very little cultivation exists beyond 60 miles from Dubbo.

The quantity of settlement along the route is not equal to that on the Wellington line; but the Dubbo scheme serves the country along the Castlereagh Valley from Gilgandra to Coonabarabran much better, and gives access to very valuable timber reserves amounting to nearly 100,000 acres, containing splendid iron-bark, pine, and other timber.

The mines at Stuart Town would not be well served by this line, and the townships of Denison Town and Coolah, although within the sphere of traffic, would be better suited by the Wellington proposal; but, as before stated, a line to either Mudgee or Muswellbrook would absorb nearly all this local traffic.

The trafficable area of a line from Dubbo contains 3,348,640 acres; but this quantity includes 1,944,945, which would also be served by a line from Mudgee to Coonamble; while the alternative scheme from Muswellbrook to Coonamble would absorb 1,956,686 acres. I think it will be advisable to give the three sets of figures:—

Dubbo to Werris Creek (sole):—Alienated land, 611,120 acres; unalienated, 792,575, including 166,887 of reserves.

Joint Dubbo to Werris Creek and Mudgee to Coonamble:—Alienated, 518,433 acres; unalienated, 1,426,512, inclusive of 329,805 reserved.

Joint Dubbo to Werris Creek and Muswellbrook and Coonamble:—Alienated, 588,464 acres; Crown lands, 1,368,222 acres, inclusive of 281,295 of reserves.

I may remark that here, as also on the Wellington and Mudgee proposed lines, the usual reserve of 1 mile wide on each side of the surveyed routes has been made.

Land under cultivation, 6,890 acres, of which 2,133 may be taken as served by the Dubbo to Werris Creek line alone, the balance being also within the trafficable sphere of the Mudgee scheme.

The

* Note (on revision):—Revised survey reduces this to 355.

† Note (on revision):—Revised, 129.

The population within the sole and joint areas already mentioned number 4,550, exclusive of any within the town of Dubbo already served by existing railway. R. E. Jones,
M.I.C.E.

The stock at beginning of this year was as follows:—

Werris Creek line (sole):—2,087 horses; 7,916 cattle; 695,411 sheep, and 234 pigs. Number of owners, 85.

Joint with Mudgee to Coonamble 4,259 horses, 11,282 cattle, 637,633 sheep, and 949 pigs. 391 owners.

Plenty of ballast exists for first 60 miles, afterwards sandstone from the ridges, &c., on Liverpool Plains until near Breeza Gap, where better stone can be obtained.

The line is well situate with respect to sleepers and girders, as it passes through some iron-bark forests, and is within easy distance of other reserves containing splendid timbers, including iron-bark, box, and pine, which latter is largely used for building and flooring purposes, it being a timber peculiarly successful in withstanding the ravages of the white ant.

The steepest grade will not be less than 1 in 70.

No expensive bridges will be required, and very good grades can be got for the whole distance.

I need not recapitulate the remarks made on the Wellington scheme, with respect to probable traffic, but I would mention that by going from Dubbo the gain in the route from Brisbane to Adelaide is increased to 300 miles, and from Melbourne, assuming the Parkes connection be made, will be 138 miles. It must not be overlooked too, that traffic for Adelaide and the west to the north—the additional distance to be traversed by going from Dubbo to Wellington is rendered more objectionable by the heavy grades existing between the two places, necessitating the division of goods trains at Dubbo. At present I believe a train of forty-five truck-loads can be brought to Narramin, and, but for the objectionable grade (which is being done away with), could also reach Dubbo. Only sixteen loaded trucks can, however, be carried on to Wellington.

The more westerly the line is, the greater the value for the carriage of starving stock. Especially will this be the case, should the great grazing districts of Coonamble and Walgett be opened up by railway, either from Mudgee, Muswellbrook, or Dubbo.

A new market will also be created for the produce of the Warrumbungles and Talbragar districts, thus giving an impetus to farming—whereas at the present the whole of the western district has to depend upon Wellington and Orange for produce.

In addition to mails, this line will bring in a good revenue from timber and stock.

One argument against such scheme as the one put forward is, that the mileage revenue is lost to the existing railway by the creation of a shortened competing route. I think this is, however, a very narrow way of looking at the subject. If it be for the benefit of the people that such a line should be made, the fact that the Government possesses a monopoly, should be no reason why localities should be for ever handicapped through the want of railway communication, which if given, will in itself probably pay, although in a measure at the expense of existing lines.

There can, I think, be little doubt that eventually considerable through traffic will pass over this railway if made. That it will pay for some time to come, I do not think, but with the increased value of a large extent of unalienated land, and the national advantages of the connection between the trunk lines; there may be factors which may cause a favourable consideration of this proposal.

4016. Is the report which you have just read identical with the proposal which the Committee are now considering to connect Wellington with Werris Creek? It serves the same localities and the same townships; but the distance has been increased by the revised survey in order that better grades may be obtained. I understand that the distance has been increased from 146 miles to 160 miles, and the cost has been reduced from £804,700 to something over £500,000.

4017. In view of the reduced cost, would there be a much stronger probability of the line paying now than it would have paid when you made your estimate? I think so. I may mention, however, the Mount Stuart Silver-mines, to which I have alluded, have not turned out a success. The Mitchell Creek Mine is still going well.

4018. What is your opinion of the proposal before the Committee to connect Wellington with Werris Creek, as compared with your survey *via* Coolah? I think it is somewhat better, especially in view of the determination not to make the Mudgee to Coonamble line. It bisects the country better.

4019. Would it serve more country? Yes, in the neighbourhood of Mundooran.

4020. Would it serve Coonabarabran? Yes.

4021. What distance is the line from there? I should imagine that the new line would not be more than 21 miles to its nearest point.

4022. Would that be sufficiently near to serve the interests of the Coonabarabran people? Yes, when going west; but if they wanted to go to Werris Creek to come to Sydney, Bomera would be the nearest point—about 40 miles away.

4023. Had you a good knowledge of this country previous to making your survey? I had nothing to do with the survey. I was the Divisional Engineer of fourteen or fifteen districts in the north-west, including the Coonabarabran and the Walgett districts, so that I have an intimate knowledge of the country.

4024. Is it a class of country which will carry a fairly large population if the lands are thrown open for settlement? Yes; but there are some very large holdings. I think the large holdings would have to be subdivided in order to carry a large population.

4025. Are you referring now to the private lands? Yes.

4026. Are the private lands suitable for cultivation, or are they sufficiently good for grazing purposes to enable smaller areas to maintain a family? The only difficulty is the want of permanent water; otherwise they would. There is no better country in the world for pastoral purposes than that on the Liverpool Plains; nor is there better country for agricultural purposes, if they could get water.

4027. You are speaking particularly with regard to the Liverpool Plains? Yes.

4028. What about the rest of the country between Wellington and the Liverpool Plains? That is good country, and would carry a larger population. Agricultural pursuits would increase if a railway were constructed.

4029. Do you think that if a railway were constructed, those people who own large areas of Crown lands would be induced to subdivide them? Yes.

4030. Have you made any calculation as to the extent of population this country would carry if that were done? I should imagine that, if the country from Wellington to beyond Mundooran were subdivided into agricultural areas, population would increase to double its present extent.

4031. And that would mean increased traffic on the railway? Yes.

4032. The Railway Commissioners make a very small allowance for the increased traffic on the line—some £300 or £400;—do you not think that that is a very small allowance? I think it is too small, considering the magnificent country right up to the Warrumbungles, the produce of which would come to the line. There is magnificent agricultural country under the Warrumbungle Range, and a lot of wheat is growing there now.

4033. Would the proposed line be sufficiently near for farmers to take their produce to it? Yes. They would not go to the Coonamble line.

- R. E. Jones,
M.I.C.E.
5 July, 1900.
4034. What average distance would that country of which you speak be from the line? Do you mean for the purpose of getting to Sydney?
4035. No, but in order to get upon the proposed line? Of course, the Cassilis people would go to it if they wished to get upon the Western line, but not to go to Sydney.
4036. We will presume that the country of which you are speaking is settled by farmers;—in order to get their produce to market, what average distance would they have to travel to reach the proposed line? The limit would be towards Coonamble from the nearest point—Mundooran—35 miles. Beyond that they would go to the Dubbo-Coonamble line. Towards Coonabarabran 30 miles.
4037. Do you think there would be much cross-country traffic on the line if constructed? I am not so sanguine about that item as I was when I made my report.
4038. Do you think the line would be used for the conveyance of stock? Yes.
4039. We have it in evidence that there is a good deal of stock coming to and from the New England district? Yes. Calga station has recently sold sheep in New England.
4040. It has also been stated that it would be used for conveying produce to the north and north-western districts in time of drought? That is so.
4041. Do you think it would be largely used for that purpose? I do not think it would be largely used, but it would be used to some extent.
4042. Have you considered which would be the best connection to make—Dubbo with Werris Creek, or Wellington with Werris Creek? My reason for recommending the Dubbo to Werris Creek line was more because I also recommended a line from Parkes to Dubbo, and from Young to Forbes, and it was, therefore, a continuation of the through connection from south to west, and west to north. I have not recommended it so much on account of its local aspect as on account of it connecting the Western with the North-western line.
4043. If it were purely a matter of connecting the Western and the North-western lines, which, in your opinion, would be the best points to connect—Dubbo with Werris Creek, or Wellington with Werris Creek? In view of the fact that a line from Dubbo to Coonamble is authorised, I consider that the Wellington to Werris Creek would be the better. It would serve a largely-settled country between Cobborah and Wellington. There are the Mitchell Creek gold-mines and a large amount of settlement between the point of junction at Spicer's Creek and Wellington. There is more settlement there than on the same length of the Dubbo line.
4044. How does the country between the junction and Wellington compare with the country between Dubbo and the junction with Spicer's Creek? It is in favour of the Wellington line.
4045. Are there many stock crossing between the North, North-western, and Western lines? They were very limited at the time I made my report.
4046. Do you think, in consideration of the class of country there is between Werris Creek and the Western line which we propose to connect, that if there were stock transactions, the graziers would use the railway or drove the stock? If they wanted to go to Melbourne with fat stock, I think they would use the railway; but if it were a matter of sending stores from one place to another they would not, except in time of drought, when they could not travel by any other means.
4047. The country between Werris Creek and Wellington, and between Dubbo and Wellington, is mostly sheep country? Yes, beyond Cobborah.
4048. In the event of the stock-owners situated between Werris Creek and Wellington having fat stock to send to the Sydney or Newcastle market, would they use any part of the proposed line, or would they travel them? I think they would use the railway.
4049. Do you think that would be a considerable item in railway revenue? It is certainly an increasing item on the railways.
4050. Is the country capable of improvement for pastoral purposes;—is it scrubby or heavily-timbered country? There is only one belt of heavily-timbered country north of Mundooran. There is a bit of iron-bark forest there; otherwise it may be considered as really good country.
4051. Do you think, if the pastoral holdings were subdivided into smaller areas, the railway would carry much additional stock? Undoubtedly.
4052. And if the line were used for the conveyance of fat stock there would be an increase of traffic? Yes. The small holders would use the line more freely than the large holders.
4053. *Chairman.*] Have you had an opportunity of examining the revised survey between Wellington and Werris Creek? No.
4054. You seem to think that the alterations have mainly been made to avoid the stiff grades? Yes.
4055. Can you say, from your knowledge of that part of the country, whether the revised or the old survey goes through the better country? The first portion of it does. It better serves Mundooran, which is an improving place, and it serves Cobborah equally as well as would the other line.
4056. Can you give any detailed information as to the intercepted cross-country traffic, leaving out of consideration the further connection which you propose? Those who had a desire to reach the north-west, or Brisbane, or even our northern towns, would, of course, prefer the shortened route instead of going to Sydney. With regard to goods traffic, I am afraid it will have very little influence, except to bring supplies from Sydney by way of Werris Creek to Coonabarabran and the districts it serves, or *via* Wellington for the first part of it.
4057. Considering this is only one link of a larger connection, what would be the main value of the completed connection—that is, from Werris Creek to Wellington, and then connecting the Southern line? The value, from a national aspect, would certainly be the shortened access between Melbourne and Brisbane.
4058. Do you consider that that is an advantage worth more than £500,000? No; because we get the benefit of very much of that traffic at present.
4059. *Mr. Watson.*] You cross the Talbragar going north-east by the revised survey, and from there on to Merrygoen;—have you been on that portion of the survey? Yes.
4060. How would you describe it? It is very rough. There is a gap which has to be crossed. They had a lot of trouble to cross it with the Dubbo scheme. I was there when Mr. Stawell was making the survey.
4061. So that, whichever of the routes for the cross-country line is adopted, there would be a certain amount of rough country? Yes, and not producing much local revenue.

4062. It has been suggested that a cross-country connection giving practically the same results could be obtained at a much less cost between Curlewis, on the North-western line, and Gilgandra, on the Dubbo-Coonamble line, which is shortly to be constructed;—have you been over that country? I have crossed it at different points, but I have not been over it. I should hardly think that would be such a good line as the other one. It would be more circuitous, and it certainly does not serve such good country. The proposed line really intersects and serves the Liverpool Plains better than any line you could have, and a line to Curlewis would not do that. It would serve Coonabarabran better, but it would take you into very rough country between Bomera and Gilgandra.

4063. It seems that whatever route you take you must get into some rough country;—do you think there would be more on that route than on the present survey? I think so.

4064. *Mr. Levien.*] Do you think the proposed line could be run into Quirindi? That district was explored. The line as surveyed is more direct to get to the north. With regard to the question of revenue, I do not think there would be much in it, but the construction would be greater.

4065. What additional construction would be necessary to take the line to Quirindi? Eight or 10 miles.

4066. Would you advise that it be taken to Quirindi? No. I visited Quirindi, and at the time I made my report the people did not take any interest in the matter. I may state that there is now more settlement in that part of the country than there was then.

4067. Do you mean that there is more settlement between Quirindi and the point where the line crosses? Yes.

4068. Has the settlement increased very much? There is a fair settlement.

4069. If the line went to Quirindi, would it pass through richer agricultural land? Not to any great extent.

MONDAY, 9 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

John Joseph Poole, farmer, grazier, and coal-mine manager, Curlewis, sworn, and further examined:—

4070. *Chairman.*] You wish to make a statement in continuation of your former evidence? Upon leaving Curlewis the other day I had placed in my hands two letters from residents and landowners of the Curlewis district, in which they requested me to inquire into the best means of constructing a railway $7\frac{1}{2}$ miles from Curlewis, going west. I found, on making inquiry, that it was not possible to construct a railway privately without getting an Act of Parliament, and I was requested to appear again before the Committee. In these two letters these landowners, namely, Mr. Turner, the surveyor, Mr. Young, Mr. Doyle, and myself, offered to guarantee to the Railway Commissioners the interest on the cost of constructing a line 6 or $7\frac{1}{2}$ miles from Curlewis, in the direction which the line is supposed to take towards Gilgandra. I am authorised to give that guarantee to this Committee. To show you that we have no doubt about the paying capacity of a line, if built from Curlewis in the direction of Gilgandra, we are quite prepared to give that guarantee.

4071. What do you call the $7\frac{1}{2}$ mile point;—is there any name to the locality? It would extend to the boundary of Mr. Young's property, which they call Garrir. It is on the surveyed road. We would have liked to build this line ourselves, but we found we could not construct a line without getting an Act of Parliament.

4072. What rate of interest are you prepared to pay? Four per cent.

4073. *Mr. Watson.*] Did you get any estimate made of the cost of the line for the distance you wished to go? Yes. If we could have constructed the line ourselves it was estimated to cost £1,500 a mile, but I think that estimate would be somewhat under the mark now. After being with Mr. Harper to-day I found that the price of rails has materially increased since I purchased rails for my coal company. He tells me that the price of rails has gone up by about 100 per cent., so that it would cost nearly £2,000 per mile, if we were to construct the line ourselves. I find that there are insurmountable difficulties in our way.

TUESDAY, 10 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

William Henry Hall, Sub-editor, Statistical Year-books, Government Statistician's Department, sworn, and examined:—

4074. *Chairman.*] You have prepared some statistics in regard to the proposed railway from Wellington to Werris Creek? Yes.

4075. Will you state the limits of the area from which you have drawn the figures? I have taken a distance of 20 miles on each side of the line between Werris Creek and Dubbo, and between Werris Creek

W. H. Hall. and Wellington, on the north, to include Coonabarabran, and then to take into consideration the influence of the line which has been determined upon from Dubbo to Coonamble. I have also allowed for the influence of the main line from Wellington to Dubbo to a certain extent, and also for the influence of the Northern line.

10 July, 1900.

4076. Will you first give the estimates of population which you have prepared in each case? The returns I have prepared read as follows:—

POPULATION ESTIMATE.

PROPOSED Railway from Werris Creek to Dubbo:—

Locality.	Estimated population.
Blackville ...	670
Cobborah ...	1,100
Coolah ...	620
Coonabarabran ...	1,450
Daviesville ...	1,630
Leadville ...	810
Mundooran ...	750
Tambar Springs ...	580
Dubbo ...	200
Total ...	7,810

POPULATION ESTIMATE.

PROPOSED Railway from Werris Creek to Wellington:—

Locality.	Estimated population.
Blackville ...	670
Cobborah ...	1,100
Coolah ...	620
Coonabarabran ...	1,450
Daviesville ...	1,630
Leadville ...	810
Mundooran ...	750
Tambar Springs ...	580
Wellington ...	180
Total ...	7,790

4077. Will you now give the agricultural and pastoral statistics in regard to the proposed railway from Werris Creek to Wellington? The return reads as follows:—

AGRICULTURAL AND PASTORAL STATISTICS.

Proposed Railway from Werris Creek to Wellington.

District	Year.	Total Area cultivated.		Wheat.		Maize.		Other Grains.	Hay.		Green Food.	Area under					Horses.	Cattle.		Sheep, including lambs.	Swine.
		Acres.	Yield.	Acres.	Yield.	Acres.	Yield.		Area Cut.			Acres.	Potatoes.	Grape vines.	Oranges.	Other fruit orchards.		All other crops.	No.		
								Wheat, Oaten, and Barley.	Lucerne.	Acres.	Acres.						acres.			acres.	acres.

WEDNESDAY, 11 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

The Hon. Francis Bathurst Suttor, M.L.C., sworn, and examined:—

4079. *Chairman.*] You are a Member of the Legislative Council and Vice-President of the Executive Council? Yes.

4080. You know the nature of the inquiry on which the Committee is engaged? Yes.

4081. It is practically a connection between the northern and western system of railways;—would you care to make a statement of your views on the subject before proceeding into any detail? I was asked to come down here and to express my opinion on the desirability of constructing this line. I do not think it will be necessary for me to touch on the advantages of the line, from a local point of view. I suppose that evidence has been given on that point by many persons perhaps better qualified than I am to express an opinion. But I would like to speak in favour of the line from, perhaps, a more national point of view. I do think it is very desirable to connect this line from Werris Creek to some point on the Western line, say at Wellington.

4082. The main reasons urged in support of its construction are, first, that the line will make a complete connection of the whole railway systems of the Colony west of the Dividing Range; and, secondly, that it will afford facilities for speedier inter-communication between the Northern, Western, and Southern main trunk lines, and will, therefore, tend to create increased traffic;—these two reasons are somewhat general in their character? Yes.

4083. Can you tell us any particular advantage which you think would accrue under these two heads; for instance, what general advantage to the two railway systems of the Colony would follow from the construction of this line? I think, as time goes on, there will be a good deal of traffic between the Northern districts and the Western districts, and the Southern districts right away to Victoria.

4084. Could you specify the nature of the traffic which you anticipate in the near future? To a great extent in stock. For instance, during this last disastrous drought, which we have had in the extreme west,

The Hon. F. B. Suttor, M.L.C.

11 July, 1900.

The Hon.
F. B. Suttor,
M.L.C.

11 July, 1900.

west, it is well known that the price of beef has been excessive, and it is very often likely that there is plenty of meat in some parts of Queensland, but that the cattle cannot be got down, because of the impossibility of travelling them through the extremely arid country west of Bourke.

4085. That is practically drought traffic which you are talking of now? Yes. If this line were open perhaps these cattle could come down. The drought is never so universal but that there is grass in some of the districts.

4086. Where do the starving stock from a line west of Nevertire usually go to get grass? For instance, the drought has been very excessive at Nevertire, and all the country west of Nevertire, and they have been depasturing all about Wellington, Dubbo, and Orange, Mudgee, and all the intervening country between Wellington and Mudgee, and Hill End, Bathurst, and right out to Oberon, east of Bathurst. Wherever they could get paddocks they have had them; in fact, for the last eighteen months I have heard of people giving £1 and 30s. an acre for the use of the grass on the land, being almost as much as the land itself was worth.

4087. Do you think that the construction of this line would allow the pastoralists along the Western line, and out past Bourke, to avail themselves of the New England country? I am quite certain it would.

4088. In spite of the very long distance they would have to travel? Yes; I will give you an instance. A very large squatter, Mr. Samuel McCaughey, moved a great number of sheep from the Darling into the country about Cowra, and right up nearly as far as the Snowy Mountains, and he trucked them as far as Dubbo and Wellington. So did some other squatters, and they had to buy feed for them in some of these places, giving them a rest—taking them out of the train for a day or two, and sending them on. If you can shorten the distance by some hundreds of miles by the construction of a cross-country line, it will be of great convenience to squatters in moving stock about. Undoubtedly the railway authorities during a period of drought have been somewhat compensated for the loss of wool traffic by the amount they have received from carrying the travelling stock.

4089. Is there any other traffic which we may reasonably anticipate between the western district and northern district across this line? Yes; a great portion of the fat stock consumed in Sydney and Melbourne comes from Queensland, and if this line were constructed, so that the cattle could be sent direct from the lines north of this right through to Melbourne, I think that more cattle would be sent, and at less cost to the sender, than are now sent. For instance, suppose it is necessary to take cattle out of the trucks. If they are in country like the country between Werris Creek and Wellington, and on further to Blayney, a man can take his cattle out for a day or two, and let them be fed and trucked again, but after you get into the metropolitan area such a thing is impossible. Then I think you may fairly conclude that the greater number of cattle would be sent, perhaps, to Victoria, fattened up in the north in Queensland as soon as the border duties, which now reach £1 a head, are taken off. If they can afford to send cattle, and pay the stock duty, they can still afford to pay the duty in the shape of railway charges, perhaps.

4090. You have mainly indicated the traffic down to the south? Yes. The fat stock would generally tend in the direction of the south. And there would be store stock too, because there is a great demand for store stock in Victoria. When they have this duty taken off at the border under Federation, I think we can conclude that the demand for store stock will be a great deal more than it is.

4091. Will there be any traffic to the north which you can indicate—back loading? Simply in the interchange of stock, which is always going backwards and forwards.

4092. It would be mostly a stock line, you think? That is, taking it from one extreme point to the other. I think, if the line were constructed, the greater part of the country is very fair agricultural land. After the train would leave Wellington, for a good many miles in the direction of Werris Creek—I do not know about the Werris Creek end—it is all very fair white-box country, which is very admirably suited for agricultural purposes, and, from a farming point of view, I do not believe there is any more popular district in the Colony than the Wellington one.

4093. The estimated cost of constructing this line is £511,149, and the estimated revenue is £8,586 against an annual estimated cost of £26,954, leaving a net deficiency of £18,368 per annum; now, do you think the country would be justified, taking into consideration the advantages which you say will flow from this line, in incurring that annual loss; in other words, do you think the time is ripe for constructing the line? I think it is. I think, perhaps, reasons might be shown why a line would so feed other lines and encourage traffic that from that point of view its construction would be justified. Take, for instance, the Mudgee line, which, instead of being a feeder, has been a sucker ever since it was constructed. The line from Wallerawang to Mudgee ends simply in Mudgee. Some time ago, in the Assembly, the question was discussed whether the line to Coonamble should be carried on from Mudgee or Dubbo, and I think the determination was that it should go from Dubbo. At that time I was in the House, and I urged that it would be infinitely better, in the interests of the Mudgee people, to advocate the construction of this line from Werris Creek to Wellington with a connection from Mudgee to that line, and thus it would be giving an alternative route for the Railway Commissioners to utilise for the carriage of goods, and it would also open up country both north and west to the people using the Mudgee line now. I think that would tend to make the Mudgee line pay, and the Mudgee line would also assist in making this line pay, if constructed.

4094. Taking that centre of country which you have indicated about Cobborah and Coolah, which of the two lines—this proposed cross-country line, or an extension from Mudgee—would better suit that district? I think this cross-country line would suit it quite as well as an extension from Mudgee. Of course, if you construct this proposed line, there would be no necessity to construct the Mudgee line further than where it strikes this line west.

4095. Then you would have within rather a short distance of one another practically three lines, namely, the Mudgee extension, the Wellington extension with Werris Creek, and the Dubbo-Coonamble line, none of these being very far from one another;—do you think that country sufficiently good to carry three lines? You could hardly consider them as running parallel.

4096. Not parallel, but fairly close? From Mudgee to this proposed line would be at right-angles practically in the northern portion of it. For a short distance from Munderooran to Wellington it is parallel to the Dubbo-Coonamble line, and then you can hardly call it parallel.

4097. *Mr. Levien.*] Of course, you are talking about starving stock going across this line from Wellington to Werris Creek; but, suppose they had good seasons at both ends for some time to come, would this line pay then at all;—would you support it? The increase of produce generally, and the stock, by reason of the good seasons, would make the line pay, I think.

4098.

4098. There is no population between the two places? There is a considerable number of persons living near Coolah, Cobborah, Mudooran, and Gulgong.

4099. We are told that even giving Blackville in—right from one end to the other—there are only 7,000 people, and they are distributed over some tremendous area in those two places;—how would that line possibly pay at all, supposing there were good seasons? Perhaps you will tell me how far back you go to embrace the 7,000 persons.

4100. Right out to Blackville, which is, I suppose, 30 miles from this proposed railway, and generally within 30 odd miles of it, for that was the area given yesterday by Mr. Hall from the Statistician's Department;—now, how would this line pay, supposing there were good seasons? You are looking upon it now entirely from a local point of view. As to the local traffic, I think if you construct this line, it will be an alternative route from the north of Queensland right away to Victoria, and therefore it will so lessen the distance between the Victorian border and the Queensland border that there ought to be a considerable amount of traffic going directly over these lines which at present is forced to go by way of Sydney. It must materially reduce the mileage by train from Werris Creek, say, to the Victorian border, as compared with the mileage from Werris Creek before to that border by way of Sydney.

4101. Do you know of many stock which are carried by the railway from Werris Creek, or from the border of Queensland, into New South Wales along the railway? I think there will be a general interchange of commodities.

4102. Do you know of any yourself? No; because I do not know much about the railway traffic. I think we may fairly conclude that, in a very short time, there will be a great increase of the traffic between the Colonies—that is, when all these intercolonial duties are taken off.

4103. Are any of the cattle which are brought into New South Wales from Queensland coming through Collarendabri and Moree, and not through Wallangarra? I am only speaking of the Queensland border, because I thought that would embrace all the traffic on the line. Outside Queensland, no doubt, there would be a good deal of traffic between Moree and all those places you mentioned.

4104. But that would come from another line—the Narrabri line? The traffic you speak of would go to Werris Creek, would it not?

4105. Then this line, virtually from Wallangarra to Werris Creek, would be of no use so far as travelling stock are concerned? All that traffic would have to go past Werris Creek.

4106. From Brisbane down to Werris Creek, that line would not carry travelling stock? I do not suppose it would. I only mention Queensland as taking one extreme point. I only say that if this line is constructed from the Queensland border to the Victorian border, the distance must be very materially decreased, say, for through traffic.

4107. Suppose they had good seasons at Dubbo and all round there, they would not want to take their stock to New England, would they? No.

4108. So that the line, as far as travelling stock goes, for drought purposes would be of no use at all? It would not be of much use; but good seasons, I should think, would encourage persons to take up all this land, which is now lying available on each side of the proposed route, but which people say is not taken up, because there is no railway communication. You know there is a great demand for land near a railway. They naturally hug a railway as close as they can, because of the cheap means of transit it gives for their produce and stock.

4109. Do you know anything about the capabilities of the land between Werris Creek and Wellington? I know the land at the Wellington end, but not at the Werris Creek end.

4110. So that you can give no information about the land at the Werris Creek end? No.

4111. How far from Wellington and to how far from Werris Creek do you know the land? I know the land from Wellington out to Gulgong, and as far as Coolah.

4112. The train does not go that way? I am advocating the construction of the other line.

4113. Leaving that alone, how far out from Wellington do you know the country? I do not know the country very far out—only out as far as opposite Gulgong, because Gulgong is east of this line.

4114. It does not go along that line at all—I mean along the proposed line? The immediate route of the line I do not know very much about. I know the country generally to the east of it, and I know it is all good white-box country, and very suitable for agricultural purposes.

4115. Do you give an opinion without knowing the capabilities of the land between Werris Creek and Wellington itself;—do you say the proposed line will pay, without having any knowledge of the exact capabilities of the land itself? I have not been over the land. I have no personal knowledge of the land; but I think many of us know the general bearing of the country from our knowledge of the land in surrounding districts, and from what we have read, and what we know generally of the country.

4116. You do not know what quantity of land is open for settlement? I do not. I told the Committee at the beginning that I did not wish to attend, and I said that I would like to speak generally on the national importance of the line as compared with the local advantages, of which I do not know much.

4117. You have no knowledge of the land itself between Wellington and Werris Creek, except from a national standpoint—as a politician more than anything else? I do not say as a politician.

4118. You know nothing about the capabilities of the land between one point and the other? I know a good deal of the capabilities of the land about Wellington, for I have been in and out of that country.

4119. I am talking of the land from point to point? I have not actually seen the land.

4120. Seeing that this line would be worked at an annual loss of £18,000 to the State, and not having any knowledge of the country itself from point to point, would you, in the face of that, recommend the construction of this railway? I still think it would be desirable to construct this line, because I consider that we should make our communication between the different colonies as short as possible.

4121. No matter what the loss is—because, remember, there is an annual loss of £18,000, as the Commissioners report;—would you, with no absolute knowledge of the country or its capabilities between point and point, recommend its construction? I do not admit absolute ignorance, because I have not been over every line. I recommend the construction of the line, and I think it is desirable if it could be constructed, in view of extending a line from the Mudgee line to this line, and, therefore, giving an alternative route to our own metropolis.

4122. Do you think it would pay? I cannot offer any opinion as to what would pay.

4123. It is stated that there is to be an annual loss of £18,000 on this line;—then, generally, you are in favour of constructing any line which will connect one place with another? I am generally in favour of the

The Hon.

The Hon.
F. B. Suttor,
M.L.C.
11 July, 1900.

the construction of lines, so long as they can be constructed at a cheap rate. I do think the more railways we can construct the better, so long as they can be constructed cheaply. And, after all, I believe railways are the cheapest roads you can make. If it is admitted that roads must be made in these districts—if it be a question of making a road or a railway between Werris Creek and Wellington—surely, considering that some road is desirable, a railway must be the cheapest in the end.

4124. Considering that there is no absolute traffic between Werris Creek and Wellington, as far as the ordinary road is concerned, a road would be of no use there, would it? I think, if it be admitted that some roads should be made railways are the cheapest roads to make.

4125. Supposing there is no necessity for a road there, as there is no intermediate traffic between the two places? I think they very frequently make roads to encourage traffic and open up districts.

4126. I am not finding fault with your evidence;—do you know Quirindi? Only from passing through it.

4127. Would you favour a railway running into Quirindi where all the centre of traffic is, instead of going to Werris Creek? If you are constructing this line to lessen the distance in the mileage from one Colony to another, you cannot strike a more convenient place than Werris Creek. The shortest practical route I would advocate between the two different places so as to bring the termini as near to one another as possible.

4128. Would you ignore an important town like Quirindi, and though the only trade is from Werris Creek, would you make a difference of 12 or 13 miles in the length—would you still go to Werris Creek? Yes. If Quirindi be to the east of Mungindi, people coming from the Northern line, or the National line, would have to run down to Quirindi and then go back. I would carry these lines as direct as possible, so that you can shorten the distance between the different colonies.

4129. What trade are we going to strike with Victoria? We want to keep the trade in our own Colony, do we not? We would get the Victorian trade to come over.

4130. *Mr. Shepherd.*] The railways are generally used now for bringing fat stock over a long distance? Yes; but they are used very extensively for moving poor stock too. I suppose some millions of sheep must have been moved during the recent drought, and the freight on fat stock is higher than the freight on starving stock.

4131. They make special rates for carrying starving stock? Yes.

4132. So that, in a good season, the railways would be likely to benefit more in moving stock than in a droughty season? They would get more per head.

4133. If they would have a larger number to move it would pay better altogether, would it not? Any stock they would move in a good season would be all fat stock; but the stock they would move in a dry season would be poor stock moving for grass.

4134. Mr. Levien almost suggested that the trains would be comparatively idle in a good season, and I want to ascertain whether the trains would not be likely to pay better in a good season than a bad one? They would, because the only traffic there in a bad season is in the poor unfortunate animals which are being moved about for grass. In a good season there is a plethora of everything—good grass and more wool. A rapidly increasing number of sheep means an increasing number of bales of wool, and an increased quantity of wool means not only the carriage of wool, but the carriage of all sorts of machinery in connection with wool—rock-salt and everything in connection with the pastoral industry generally. But then I am very much inclined to think that this district is very rapidly developing. It is now one of the most favoured agricultural districts in the Colony. All through these five years of drought they have had good seasons round Wellington the whole time.

4135. And as the freights would actually be higher, it would pay better to carry fat stock than starving stock? But still you would not carry the same quantity of fat stock. The freights are higher; they make special rates for starving stock.

4136. As you have not been over the route of the proposed line from Werris Creek to Wellington, you cannot give any idea as to the carrying capacity of that country? I know a good deal of the carrying capacity of the country for a good many miles out from Wellington. I know the Gulgong country and all round there, and I know the Mudgee district very well.

4137. But that country would help to feed this line in the event of its being opened? Yes.

4138. *Dr. Garran.*] You said that you came here to give evidence at the request of certain persons;—do you know any good reason why those persons could not have come and given their evidence themselves, instead of asking you to be their spokesman? Yes. The Progress Association at Bathurst were anxious that some person should represent them, because, indirectly, this line will benefit Bathurst if constructed. They asked me if I would go and give evidence in Wellington, knowing that I knew something of the Wellington district, and I said I could not very conveniently go there when the Committee was up, but that I would give evidence here if an opportunity were afforded to me.

4139. It is as the representative of that Progress Association that you are here? In that sense.

4140. You are recommending the line as a cross-country line on national grounds? Yes.

4141. We have one cross-country line from Blayney to Murrumburrah;—do you know whether that has been a success? It was a success when it was first opened, but it has not been a success, from the passenger point of view, at all, because the Railway Commissioners apparently have never endeavoured to encourage passenger traffic. You can never hear of anyone coming to the west a second time from Melbourne or Victoria by that line, because the trains are not run for a speedy passenger traffic. I have not studied the time-table before coming here, but I have been frequently told that on one station—Cowra—you have to wait from four to eight hours. I know that a number of my friends have gone there once, but they have never gone there a second time; they say the time-table is so atrocious, and the delays are so long, that they do not go at all.

4142. Do you think the putting on of the stock duty in Victoria was quite sufficient to account for the non-use of that line for stock traffic? I do not know that it was. I think the duty was on before the line was open, if I recollect aright.

4143. The stock duty could not be the reason why this line has been a failure;—some people have said that the duty was off? I am not quite sure of that, but I understand that for the first two or three years after the line was opened it paid very well, and there was a great deal of traffic upon it; but the reason why it has not paid since, I cannot explain.

4144. If that line has not paid, what sufficient reason have we for assuming that a second cross-country line will pay better? Perhaps, if you complete these cross-country lines, and make a very material difference

difference in the length of the line from Werris Creek to the Victorian border, you may feed the Blayney line even. Take the question of fat stock or store stock coming from Queensland. If they ever come by train at all, they never would go all the way round by Sydney.

The Hon.
F. B. Suttor,
M.L.C.

11 July, 1900.

4145. I want you to see that the stock traffic which used to go to Melbourne came down the Western line, and then joined on to the Southern line, so that the junction between the Western line and the Southern line was likely to have been useful for stock traffic; but this line will join the Northern line with the Western line, and very little cattle comes down the Northern line—much less than went down the Western line;—if it did not pay to join the Western line with the Southern line, how could it pay in respect to the cattle traffic to join the Northern line with the Western line? I think I am right in saying that it did pay, and paid well, for two or three years; but, of course, for the last four or five years the droughts have been so excessive that a great number of stock which used to come from Queensland have not been coming over our lines.

4146. You admitted some time ago, I think, that the traffic in stock which comes in from Queensland comes in to the west, and does not come down our Northern line? Yes.

4147. If there is very little traffic coming down the Northern line, how can there be a need for a cross-country line to carry that traffic from Werris Creek to Wellington? Because, if you cheapen the expense of sending a beast from Werris Creek to the Victorian border, instead of going *via* Sydney, I think the cattle might go by this line, and then on to the Blayney line as well.

4148. Do not the cattle come from parts of Queensland far west of Warwick or the junction station at the border? Yes.

4149. It is not the Northern line which the traffic takes, because it is not the shortest line to market? This is the only line they can go by.

4150. It is the line which strikes our Colony at Collarendabri, Walgett, Angledool, or some of these places? Yes.

4151. It does not strike it at Stanthorpe? No; but if this line is constructed they can strike the line anywhere. If they find the distance is so materially decreased, if it will pay them to truck their cattle, they will truck them.

4152. Suppose we extend the line to Collarendabri or Walgett, is it likely that the cattle from Queensland will go to the Northern line in preference to getting to the Western line at Bourke or Walgett? Where would you extend your Walgett line from.

4153. Is it not all western cattle which come from Queensland? Yes.

4154. How would making a line from Werris Creek to Wellington get any portion of that cattle? If you are going to send a line from Brewarrina to Walgett, perhaps it might not. That would take the cattle traffic which would go by this line.

4155. Even as it is, Queensland cattle which come by train strike our railway system at Bourke? When they can get through.

4156. According to your evidence, and to the evidence of other witnesses, there is no great quantity of Queensland cattle coming down the Northern railway? I conclude so. I think the majority of the cattle come to Bourke; that is, if they can get through.

4157. There is no particular business to be catered for in carrying cattle from Werris Creek to Wellington or Dubbo? Unless on occasions when the country is so bad, as it is very often between Bourke and the Queensland border, that they could not get through, and then they might get in by this line.

4158. The question is, if it is so bad as that, can they get to the Northern line? Yes.

4159. Sometimes the season is good about Moree when the country is quite impassable about the Queensland border and this side? If they are already at Moree.

4160. They are already provided for? Then they can catch this line.

4161. The line will be open to Coonamble very shortly, and if travelling stock can reach Moree they are not very far off Coonamble;—would they go to the Northern line? The Queensland cattle might come in and strike Moree, but it is a long way from Moree to Coonamble.

4162. As far as it is going to settle land, you say that except in the district round Wellington, you do not know much of the country between Werris Creek and Munderooran? No.

4163. So that you cannot give us any information about the probability of settlement? No.

4164. You do not know how much land is taken by squatters, or how much land is open for free selection? No.

4165. Now, in what particular way is this line to benefit Bathurst? Not directly, I think, except, of course, that any branch line would benefit any of these western towns, because it would give them more direct communication with all the western interior.

4166. Of course, if cattle and traffic of that kind go to Bathurst at all, it would be simply to pass through Bathurst? There is a considerable local demand for cattle in all these country towns.

4167. Is not that demand pretty well satisfied already by being connected with Dubbo and Bourke? There is a good deal of interchange. Sometimes cattle from Bathurst go west, and some cattle from the west come to Bathurst for sale.

4168. Do you not think the interest of Bathurst in that line is rather shadowy? I do not know that it is. I think the better communication you give the people in all these western inland towns, the more direct communication they have with the west—for that is where their market is—the better for the Colony at large. Look at the farmers about Bathurst, Wellington and Dubbo; they do not look upon Sydney as the market for their produce, they look upon the drought-stricken districts in the west as their market.

4169. Those are people who would not buy wheat? They would be.

4170. They would grow wheat? Yes.

4171. *Chairman.*] Is there anything further which you can add? No. I suppose you have not considered the construction of this line in connection with any possible Federal Capital.

4172. If you have any views on that question we should be glad to hear them? On the Western line there are three or four sites, the eligibility of which has been admitted by the Commissioner, I conclude. He has held an inquiry in different places along the Western line—at Orange, Milthorpe, Blayney, Bathurst, and, I think, Wellington too. If the site of the Federal Capital be ultimately chosen in one of these western districts, I think that is a strong argument. I think you will see the most direct line of communication with the different Colonies will be made from that point.

Alexander Wilson, stock and station agent, sworn, and examined:—

- A. Wilson.
11 July, 1900.
4173. *Chairman.*] You are a stock and station agent carrying on business in O'Connell-street, Sydney? Yes.
4174. *Mr. Watson.*] When you were giving evidence on another inquiry some time ago, you incidentally suggested that, in considering any connection between the Northern line and the Western line, the route from Gilgandra to Curlewis might be inquired into? I did.
4175. Since that suggestion was made, Mr. Harper, Chief Traffic Manager in the Railway Department, has made some inquiries into that aspect, and Mr. C. McDonnell Stuart, of the Railway Construction Branch, has inspected the possible route? So I understand.
4176. Have you had an opportunity of seeing Mr. Stuart's report? I saw the resume of it, and I had a conversation with Mr. Stuart.
4177. You think that Mr. Stuart in his exploration got on to the best line which could be got in that district? I think not, and he is rather inclined to think, after having had it explained by me, that a better line could be got. He only had some four days, I understand, to make the whole inspection, which, of course, was not reasonable in a country like that. He admits that several suggestions I made were leading him to think it is quite possible that a better line than even what he brought before the Committee might be obtained.
4178. Could you indicate roughly where you think his suggested line might be deviated from with advantage? On this wall-map Mr. Stuart's suggested line starts from Gilgandra, and is shown in green tint on the map, crossing the Castlereagh above Binnaway, and then getting on to the explored line from Quirindi to Coonabarabran, and leaving that a little further on across the easy country to Curlewis.
4179. It shows a possible deviation just above Binnaway, following Woolshed Creek in lieu of Mow Creek? Yes.
4180. Will you now suggest your alterations? Starting from the terminal point at Gilgandra, I agree, as far as my observation goes, with the line as indicated by Mr. Stuart that approaches the second crossing of the Castlereagh above Binnaway. Subject to further examination—I know this route, for I have ridden it, almost exactly—I would suggest that an examination be made from the second crossing of the Castlereagh, with a southerly trend towards Binnaway, then making an almost direct line to Bomera, and then keeping about 2 miles to the east of Mr. Stuart's line till you get within about 10 miles of Curlewis.
4181. Do you think that would probably give easier country than a line as sketched by Mr. Stuart? I think so. I discussed that question with Mr. Stuart, because I considered that he has followed not a difficult line of country, but a more difficult line than a great deal of this line I suggest. He is following along a creek, and he admits that, possibly, my knowledge of the country was greater than what he was able to obtain in the time at his disposal, because the only piece of line he knew was the part of the line which follows the Quirindi-Coonabarabran exploration; but he is quite prepared to find on further examination that my suggestion would be a distinct improvement, and probably shorten and cheapen the line.
4182. I presume that once you leave the Castlereagh the second time, going north-east, you enter into country that is, generally speaking, rough for a little distance? When you come up Mow Creek, and get on to the watershed between the Castlereagh and the Namoi, it is about the poorest piece of country on the whole route. Of course, there is one feature of this alteration which would be unfavourable to some extent, in that it brings the line several miles further away from Coonabarabran.
4183. Not so much; but still it would be slightly in that direction? It is only problematical. You see, instead of following the river north towards Coonabarabran, the line follows south-west on the other side, and the station for Coonabarabran would be somewhere near Binnaway on the present main road, or it might be at a small settlement called Warkton, or at another small place, the name of which I do not remember.
4184. Do you think you can get through the rough country immediately north-east of the Castlereagh near Binnaway easier than Mr. Stuart does with his line? That is the only bit of the line from that side of the Castlereagh above Binnaway till you get into the drop of the Namoi that I am not personally acquainted with. I discussed the matter with Mr. Stawell, of the Railway Department, who spent some time in trying to improve the approach to this Warrumbungle Range for these lines, and he told me that the further west you get here the easier it is to cross the range. Of course, the range when you get out to the north is very indistinct; it is only a flat table-land, but he says the more you keep to the west the easier it is to approach the ridge on an easy grade. That was speaking of it as compared with any of these other suggested Werris Creek lines.
4185. Mr. Stuart made a tentative suggestion in favour of Breeza as against Curlewis for a junction? So he mentioned to me. That was first suggested by Mr. Goodwin, Member for Gunnedah, who spoke to me about it when I first propounded this idea of mine. Of course, both Mr. Goodwin and Mr. Stuart, to my mind, are looking at it solely from the railway management point of view—the doing away with the junction station. That is all very well, but we hope that these lines, when made, will develop a traffic sufficient to justify junction stations.
4186. The feeling is that with a junction at Breeza you could utilise the existing workshops at Werris Creek? I quite understand the argument for what it is worth, but, as against that, you will see that that suggestion makes a narrow angle of the line. You have about 15 or 20 miles of railway practically unproductive. If it gets any traffic at all, it is only taking it from the existing line, because all on the south side of the North-western line is a great wet plain in the hands of one proprietor, and with no settlement on it at all, and it is not land suitable for cultivation. The land in the angle between the two lines is thoroughly well served by the existing line. Besides, it must lengthen the line, I should say, by 15 miles, judging by this map. That is an important consideration as against the expense of managing a junction station, whereas, starting from Curlewis, the line is going for the first 25 or 30 miles admittedly through nearly all first-class agricultural land, a great deal of it being under settlement at the present moment.
4187. And starting at right angles from the existing line would draw traffic from either side almost immediately? Immediately. It is better than a right angle, because it is striking off at the curve of a bow. It is more like the three legs of the Isle of Man. There is another point which I am not able exactly to elucidate there, because this map leaves off just where I want it. I think, in considering such lines as this,

this, you ought to endeavour not to drag the traffic away from the local county town. There is a great deal of business which requires people to go into the local town—the Assize town, the Land Office town, and all this kind of thing; and that traffic should be encouraged, and you should not drag people away down a line either to force them to go to Sydney, or Newcastle, or some utterly useless place for the local traffic. If you have the line to Gunnedah, you see this line almost runs on into Gunnedah, the local district town, which is only 9 miles from Curlewis, surely that is an object to be considered. Furthermore, there is the question of the stock traffic. All the country to the north and north-west of this is in fair seasons a great stock-producing country, and runs right in and commands a great deal of the western Queensland stock country. If there are markets to the south, that is the natural line of traffic. I have myself trucked sheep which came from Narrabri at Rylstone to go to Melbourne. Now, if that can be done, surely there are good reasons why, in some seasons, such a line as this might expect to bring a considerable traffic from that direction, and the more you drag that traffic down along V-shaped angles and backwards the less you encourage it.

A. Wilson.
11 July, 1900.

4188. So that for stock coming from the North-western line and branches it would be actually a saving to go a little further west, such as a Curlewis connection would mean? An enormous amount. You have only to look at the angle to understand. You have to come to Werris Creek, and then you have to go right back, quite two-thirds of the distance it would be from Werris Creek to, say, Bourera. You see, with my suggestion, how this would commend Gunnedah and all the business out here to pass Bourera. Gunnedah is its local town. To the Assize courts, and Land Board sittings, and many other things, many people have to come in. If you make them go down to Werris Creek and then come back—and perhaps the trains would not be convenient—this line would not be of any use to them, and still they would have the heavy journey across country as they have at present. That appeals to me as a very considerable argument, if the reasons are not very strong to the contrary. Perhaps I may take the liberty of saying here, having heard part of Mr. Suttor's evidence, that he is not as well up in the stock trade as perhaps we might expect him to be, because, lately, store cattle have been trucked from Wallangarra to Wagga and Albury. I saw some of them very poor too. You see store cattle are worth up to £8, £9, and £10 in Victoria, and taking a normal state of affairs it is very difficult to say what traffic might develop on a line.

4189. But that is an abnormal condition? Yes. Australia, especially New South Wales, is more or less abnormal. It is always abnormal somewhere, and that is one reason why this line will be carrying some traffic one way different from what it will do at another time. I mention that matter as Mr. Suttor did not seem to have a good grasp of the subject. He also forgets that in a great deal of this western country in Queensland—that is, north-west of Collarenebri—there are no cattle, it is all sheep. The cattle in Queensland, to which we would have to look for railway traffic, are either on the coast, inside the range, or on the extreme western part of that Colony. The main intermediate country carries all sheep now.

4190. Taking the Queensland cattle that are located towards the coast, is it not likely that they would come down in fair seasons by the various rivers—the Condamine, Warrego, and Culgoa—as far as Bourke, with a view to trucking to Melbourne rather than trucking on the North-western line? No; Moree down to Bingara would be the routes they would come. Take Goondiwindi, take from the main range at Wallangarra, at the range there are no cattle at all till you get as far west as Thargomindah; it is all sheep.

4191. Taking Thargomindah, from the map it would appear as if it is not so much out of the road to make for Bourke or else to go right down? They either make to Bourke or to Broken Hill; but the traffic in cattle is either west to Walgett or it is in about Moree.

4192. Taking the Great Northern line and the north-western branch at Moree, or any extension of that branch, which of these lines would be more likely to attract Queensland cattle which are making for Melbourne? Moree.

4193. In that case the Curlewis starting-point would be better than Werris Creek? Undoubtedly that is the most likely for either cattle or sheep. That is the line of traffic from north to east most likely to have a permanent, continuous, and developing traffic.

4194. Is there much cattle traffic on the North-western line now? Not much, because almost the very last of the cattle country, even what is purely cattle country, is nearly starved out by the late drought. Any cattle country at all suitable for sheep has been converted into sheep country. They can be handled so much more easily in a drought with the possibility of saving them, and they are better worth saving.

4195. Leaving for the time being the saving in cost of construction which your suggested line would mean as compared with the Wellington to Werris Creek line, are there any other advantages which present themselves in favour of it? There is the advantage that you are tapping fresh country every mile of the way, and you are not competing with any existing line, and you are drawing traffic from both sides of it.

4196. Would not two of these points apply equally to the Wellington-Werris Creek line? No.

4197. That is, that you draw traffic from each side, and that you go through good land? No; as I shall explain. You have the same objection at both ends of the Wellington-Werris Creek line as I indicated the suggested deviation to Breeza would have. You will go off at a sharp angle, and you will get no traffic on that line till you get quite past Pine Ridge.

4198. You will get traffic from Pine Ridge? From my knowledge of it, you will get no traffic unless in a very wet, flooded season, when the roads are impassable. You will get no traffic from the Quirindi side of Kickerbil—I know that country well, as I used to have a place further on there—because people not immediately on the line, if they have to go some distance to the railway, would prefer to go from there to a considerable town on the main line where they could do other business than to go a shorter distance to a local line with one town and, perhaps, detention at the junction, and then get into another train to arrive at their destination.

4199. The latter involving much greater railway haulage? Yes; for instance, it is 22 miles by road from Quirindi to Kickerbil. Kickerbil would, I fancy, be 11 or 12 miles from any principal siding on the proposed line. They would prefer to go 22 miles to a main line station in most of the cases, and the traffic certainly would. You see there is the saving of extra haulage.

4200. How far would you have to go on from Werris Creek on the proposed line before you began to tap new trade? Of course, you will get a little close to the line. People will, of course, make use of it. You will get none, except they can just step on to the line.

- A. Wilson. 4201. Why? There will be almost no traffic that the railways do not get, till you get to Spring Ridge on the proposed line.
- 11 July, 1900. 4202. From Spring Ridge right on? You would gain very little till you got past Collie Blue. Of course after that you would get it on both sides. All this country south of the proposed line towards Quirindi, is all large grazing freeholds, and mostly land only suitable for grazing.
4203. Does that apply to the land through which the line goes before you get to Spring Ridge from Werris Creek? Yes; to a great deal of it with only odd patches of exceptions, in fact, till you get to Bomera or near the range.
4204. *Dr. Garran.*] For the first 20 miles along this line from Werris Creek a very small proportion of the country is agricultural country? It is not good agricultural country.
4205. *Mr. Watson.*] The country generally is held in large holdings? Almost entirely in the hands of six or eight persons. Moreover, when you get a little further on the traffic is all fenced in on the south by the main Liverpool Range. There are only one or two stations here which run up, you can only have one station to draw on for traffic at all. When you pass by Bundella you are on the other end of the run, for the top end of that holding is on the top of the Liverpool Range. The same with Moredevil and all the holdings along there that run through the plains. There is only one holding between the railway line and the top of the ridge till you get to Dempsey's, which is on the very top of the range almost.
4206. From Dempsey you continue on up to Weetalibah and Ulinda towards the Castlereagh? Yes.
4207. Referring to the country from Binnaway to Merrygoen on the proposed line, how would you describe its character? Of course you strike a patch of the worst country on the whole route there, in fact it is mostly very poor from where this bend begins to develop near Binnaway, till you get quite close to Talbragar at the back of Cobborah. That is the worst patch of country anywhere about there.
4208. For a distance of how many miles? About 50 miles.
4209. Going on from Cobborah again, you approach the influence of either the Dubbo-Coonamble line, or the main Western line? Yes; you have the same sharp-faced approach here, instead of a blunt approach. If you get the traffic here you are probably robbing the main Western line of it.
4210. That applies to the western side of the proposed line? Yes.
4211. On the eastern side, so far, there would be no competitive line unless the Mudgee line were extended? Yes.
4212. The country from Cobborah into Wellington is good? It is nearly all good agricultural land; there are only odd places which are not good.
4213. Taking the country through which the proposed line goes generally, and that through which your suggested line would go, which do you think would have the smaller proportion of bad land? My proposal.
4214. How would you describe the country through which your proposed line goes, you having been over the greater part of it, I understand? I know it all pretty intimately, except the 15 or 20 miles I explained on the other map, east of the second crossing of the Castlereagh.
4215. Will you now describe the rest of the line? Starting from Gilgandra, for the first few miles it is rather hard-timber country; it is agricultural land, but of rather inferior quality. Then, as you approach the Wallamburrawong Creek, the quality of the land improves. There is a considerable patch of volcanic soil, and that extends more or less all the way till within a short distance of the second crossing of the Castlereagh. Then there is the bit I am not personally well acquainted with, but I know it is fair to good grazing land, and a great deal of it is very good agricultural land. I am not speaking from my personal knowledge. I know from the owners of properties the description of this land. From there to past Bomera a great deal of it is really good agricultural land. From below Bomera, there would be about 15 miles of heavy black soil of the Liverpool Plains, and then really good agricultural land the rest of the way into Curlewis.
4216. How is that land on the Curlewis line generally held? Most of it is in the hands of small holders—holders under 10,000 acres, and a large proportion of it is still Crown land, or has been recently settled under the present Land Act. The only large estate which the line would skirt—it would not traverse it—is Bando.
4217. I understand that a number of settlement leases and other forms of close settlement have been thrown open there very lately? Within the last twelve months there has been quite an area of the part of Bando which I suggest the line should go through, taken up under settlement lease, and I believe some more are about to be taken up. That is one reason, amongst others, why I suggest Mr. Stuart did not keep enough to the east. He has kept too close to Tambar Springs, and too close to the edge of a long range of low hills. I might mention, too, that when you do get away from the Liverpool Range here on the proposed line, this patch of country between Coolah and the proposed line is almost entirely unproductive. One or two large holdings there were deserted for the last two or three years. The holding, Bothero, which used to run 30,000 sheep, was absolutely denuded of stock.
4218. It is very rough country? It is very poor country. If you get down to Denny Kinnie there are several other poor miserable holdings which do not make a living for a family.
4219. Would your description of the land, through which your suggested line runs, apply for any distance on either side, north and south? Yes; I mean it to apply to a considerable area of country on both sides. I have described it on the line. If I go near a range, as you do over this range at Tambar Springs, that is not very serious, it is only for construction purposes that he may be so near—you pass no country within 10 or 15 miles which is unproductive.
4220. Where you cross the Castlereagh the second time, immediately north-east of Binnaway, would you call that good country? No. There are small patches—and that is what I said—just near Binnaway. There is the patch a little north of Binnaway and up M'ow Creek. Still, although it is not attractive sheep country; a great deal of it is good agricultural land. It is grass-seed country; it is coarse sandy country. In some places, where it is hard soil, it is iron-bark, and where it is more sandy and loamy, it is white-box or pine and apple tree. Of course, this deviation would require to be considered, in view of the accommodation to Coonabarabran. That is only a detail, and no doubt it will be taken into consideration.
4221. Your line generally, though whether Mr. Stuart's route is adopted, or whether your suggested deviation is adopted, would go much nearer Coonabarabran than the proposed line? I think, perhaps, about 15 miles nearer; it depends upon how the survey panned out.
4222. So that you are still of opinion that your suggested line is much superior to the proposed line from every aspect? From the national point of view, I think so. I saw Mr. Deane's evidence, where he gave

gave it a very short shrift in his earlier report, and before Mr. Stuart was sent out, and spoke very disparagingly of the rough country and the expense it would be. Mr. Stuart practically endorses everything I have said, and it shows—although it is a broken country—it is not a difficult country, because you do not attack any main range, and you avoid nearly all the minor leading ranges. You skirt them; you do not go jumping up and down over the banks of the country. In fact, Mr. Stuart says that the estimate would be very reasonable if it were not for the two long bridges over the Castlereagh, that that addition adds so much to the general cost, and he admits that my first contention, which, of course, was based simply on local knowledge, would, very probably, prove correct; that it would prove that there is a difference of 50 miles between the two lines. At present he makes it out to be 40 miles.

A. Wilson.
11 July, 1900.

4223. *Mr. Hyam.*] How far would Coonabarabran be from the nearest point on your suggested line? It would be not nearer than 15 miles, and not further than 20 miles, allowing for the different surveys which might be made.

4224. How many miles of that country south-east of Coonabarabran would it have to go through? I do not think more than 8 or 10 miles.

4225. You have been through it? Yes. As it happens Mr. Stuart has almost adopted a line of route I travelled a couple of years ago on a business errand. I went a little out of my way to pick up some of the features I had in view for this line, and I found that he has much more closely followed the route I travelled than I had anticipated.

4226. According to your opinion is that country good for anything at all? There is no country on that route which is not good for something—I will not say that there is not 500 acres, because even the richest country contains patches of poor land.

4227. Do you not think that there is a considerable extent of country there which is not good for agriculture or grazing? No; I do not think there is a patch of 500 acres of what I would call bad country. Of course a great deal of it is bad sheep country, but some of it is very good agricultural land.

4228. It is some years since I went through that country, but it struck me at that time that there was a very considerable extent of that heavy, bad country? If you travel right from Coolah or Binnaway into Coonabarabran you would follow along the top of a ridge. For the last 15 miles into Coonabarabran you would be just on the top of a bad ridge.

4229. Your suggested line is east of that? It is endeavoured to keep to the east of this very bad bit.

4230. *Chairman.*] All your evidence is, of course, proceeding on the assumption that it is desirable to construct either of these lines? That is so.

4231. I think you know the details of the finance of the line? Roughly.

4232. The Railway Commissioners anticipate a loss of £18,000 with local rates, and £20,000 with through rates; could you indicate any other sources of traffic or revenue besides the one you have already indicated, namely, the cattle traffic? I cannot indicate that either of the lines is likely to pay for some time to come. I am very definitely of that opinion; but, if it is a choice of evils, I claim that my line will be the less evil, and a greater prospect of good.

4233. *Dr. Garran.*] Your line will be 40 miles shorter, and therefore less capital will be involved in it? Yes.

4234. *Chairman.*] You think it would open up a larger area per mile of this agricultural country? Distinctly, because the good country on the Wellington-Werris Creek line is almost entirely held in large holdings, and is country which is not likely to be opened up for a long time to come.

4235. Whereas on your suggested line you think there is considerable room for closer settlement? It is developing every month. I think any close inspection would go to prove that.

4236. From your general knowledge of the operations of the railways and the country, can you indicate any benefit, apart from opening up this country, which would accrue from connecting the Northern line with the Western line? Of course, there must be an advantage. It happens sometimes that the run of traffic, say of stock, is all on the Northern, or the Western, or the Southern line—at least a great preponderance of it. I know it has been, in some instances, a great convenience that the Commissioners could work the rolling stock from the Western to the Southern lines, or *vice versa*, without hauling them to Sydney, because, of course, they must keep a certain standard of supply on the different lines ready for the ordinary traffic.

4237. That is just about the only reason which the Commissioners urge in favour of the line, and they do not seem to think much of that either? That is a saving and an advantage to the country which does not come out in any returns. If they haul that traffic at a loss—if they haul the trucks, say, from Blayney to Sydney, and have to haul them back to Harden again—of course, it is an addition to the working expenses, but it cannot be particularised very well. But they admit at times that they have had great savings in that respect. There is another point of this cross-country drought traffic to which I do not attach a great deal of importance. See the advantage of this line as compared with the Werris Creek line, because, as the last witness told you, the Wellington district does not suffer from drought. I agree with that up to a point. It does not suffer like the western country; but the country which wants to be relieved is the country all west of Narrabri, Moree, and Dubbo. You see this line gives a good opening to do that, and if a good season is on in New England, or down about Orange, they have a choice of routes, and they never would want to send sheep from Wellington to New England. From nowhere here would they ever send their sheep in a drought to New England; they might once in ten or fifteen years. I am speaking of the great tract of sheep country in towards Coonamble; that will not be helped in any way. They will be in direct communication with New England by my route, and at a great deal shorter distance than by the other connection.

4238. *Mr. McFarlane.*] One of the arguments in favour of connecting the two lines is that with a cross-country line conveying stock, say, from Queensland to the Melbourne market, and also for passenger traffic, it would be much nearer than by going round, *via* Sydney, to Melbourne or Adelaide, in the event of the cross line being continued. In the event of that being done, people coming from Brisbane, or stock coming from there, by your proposed connection between Curlewis and Dubbo or Wellington, they would have to change at Werris Creek from the Northern line, and there would be another junction at Curlewis, instead of taking the straighter course at Werris Creek going due south? A junction does not necessarily mean a change.

4239. It would mean a great inconvenience? I do not hesitate to say that any expectation of a through express traffic from Queensland to Victoria by any of these routes would be absurd.

- A. Wilson. 4240. That is put forward by a number of witnesses? I do not put it forward. I would not expect to get any material return from any through passengers. It might be a different question if the Federal Capital were put here, as Mr. Suttor suggested. So far as we can see at the present time, as regards any probability of a through passenger traffic from Queensland to Melbourne, I would not attach any importance to it.
- 11 July, 1900. 4241. How would it affect the stock traffic? I have explained that I claim very considerable advantages for my proposal in the way of stock traffic either from the north to south as fats, or from west to east as stores.
4242. I quite understood the advantage which you pointed out, but I am speaking now of Queensland stock? I do not think the Commissioners would be justified in building very largely on any through traffic in Queensland stock on either of the lines.
4243. You think it would not be sufficiently large? They will get it at times, but it is a very inconvenient and uncertain quantity. I see no prospect of it being a regular trade.
4244. Would you consider it an argument sufficient to be considered in connecting the Western with the Northern line? You could allow a certain guess system that you would occasionally earn something from that traffic, but no business man could reduce it to a business calculation at all—at least, I do not think so—and I think I have a pretty good idea of what it might develop into. You could not say that there would be 10,000 cattle and 100,000 sheep. There might not be 10,000 sheep and 100 head of cattle in six months. I am speaking of what you might call the through traffic from different parts. Of course, the local traffic can be fairly estimated; I mean that through traffic from away up beyond Tamworth or beyond Narrabri. Coming down and crossing over on this line, and going away through Blayney or anyway there is a mere guesswork, but it will happen occasionally. Sometimes considerable numbers will come for a few weeks, and sometimes almost nothing will come for a year or two. It will be very irregular.
4245. *Chairman.*] Is there anything else which you would like to add? No.

WEDNESDAY, 18 JULY, 1900.

Present:—

WILLIAM THOMAS DICK Esq. (CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD. The Hon. ANDREW GARRAN, LL.D. The Hon. SOLOMON HERBERT HYAM.		JOHN CHRISTIAN WATSON, Esq. ROBERT HENRY LEVIEN, Esq. JOHN MCFARLANE, Esq.
--	--	--

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

George Charles Yeo, draftsman, Stock Branch, Department of Mines and Agriculture, sworn, and examined:—

- G. C. Yeo. 4246. *Chairman.*] You have brought the stock statistics in reference to the proposed railway from Wellington to Werris Creek? Yes.
- 18 July, 1900. 4247. Will you kindly indicate the area from which you have drawn the statistics? Starting from Wellington, it runs practically north to Coonabarabran, and branches across in a direct line to Werris Creek, and on the south-eastern side it follows the Coolaburragundy River to Werris Creek.
4248. At about what distance is your area, keeping on each side of the route of the line after it leaves the terminal points? The centre is about the widest part; on the north-west it will be between 40 and 50 miles, and on the south-west it will be about 30 miles—that is, down towards Cassilis.
4249. You have allowed for the influence of the existing lines? Yes; I have divided the area between the existing lines and the proposed line equally.
4250. Is there any special name for this district? Not that I am aware of. It embraces the biggest part of what we call the Coonabarabran sheep district.
4251. Will you be good enough to read the return which you have prepared? It is as follows:—

NUMBER of Sheep and Cattle depastured in area affected by proposed railway Wellington to Werris Creek.

Cattle.	1898.										Sheep.
9,405	815,623
Cattle.	1899.										Sheep.
9,243	796,219
Clip for 1898	12,225 bales.
" 1899	11,940 "

There was a drift of stock from the north-west through Coonabarabran for the last two years of 850,000 sheep and 85,000 cattle.

4252. I suppose you are not able to go back any number of years and show what increase has taken place? I can go back to the year 1896 and give you the increase, not particularly in that portion, but in the sheep district including that portion, which will give you an idea of the increase in the same area.
4253. Will you read the statement which you have prepared? It is as follows:—

Stock Returns.

Year.											Horses.											Cattle.											Sheep.		
1896	6,139	16,084	1,012,008
1897	6,056	14,406	942,461
1898	6,132	13,692	993,974
1899	5,768	11,809	833,576

4254.

4254. That, of course, has been due to the continuation of bad seasons? Yes; owing to the drought. G. C. Yeo.
4255. We can take it that the figures which you have given us for this special area about the line do not represent by any means the full capacity of that country? No, if I had gone further back—to the year 1896—they would have improved considerably. 18 July, 1900.
4256. Can you state what relation the present amount of stock bears to the whole amount which could be carried by that country in a fair season, and in what proportion? No more than that return shows. It shows that in 1899 there were 796,219 sheep, and in 1898, 815,623 sheep.
4257. Do you think that that district would stand, in a fair season, twice the number of sheep? No; it would not stand that. In 1896 that district—that is, the Coonabarabran district—carried 1,000,000 sheep, and in 1899, 863,000 sheep. Of course, there has been a falling off since 1896.
4258. *Mr. Levien.*] 1896 was a good season? It was.
4259. And I suppose the previous seasons had been good? The seasons previous to 1896 were good too.
4260. *Dr. Garran.*] Is the quality of the sheep in that district a fair average of the New South Wales sheep, or do you know nothing about that matter? I do not know anything about that.

THURSDAY, 19 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	JOHN CHRISTIAN WATSON, Esq.
The Hon. SOLOMON HERBERT HYAM.	ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.	

The Committee further considered the expediency of constructing a line of Railway from Wellington to Werris Creek.

Simeon Phillips, Esq., M.P., sworn, and examined:—

4261. *Chairman.*] You are Member of the Legislative Assembly for the electorate of Dubbo? Yes; and I have resided in Dubbo for twenty-two years. S. Phillips,
Esq., M.P.
4262. You have a fair knowledge of the surrounding country? A very fair knowledge. 19 July, 1900.
4263. Since this proposal was remitted to the Committee a rival connection starting from Dubbo has been placed before our notice;—the cross-country connections really only differ in route as regards the part from Dubbo to Murrungundi, and the part from Wellington to Murrungundi;—can you give us an idea of the relative character of the two connections as far as Murrungundi, with respect to ease of construction? I believe the line would be more easily constructed from Dubbo than from Wellington. I am better acquainted with the country between Dubbo and Murrungundi than the country between Dubbo and Wellington, about which country I know very little, except in the immediate vicinity of Wellington.
4264. Would you say that the country in the immediate vicinity of Wellington is more undulating than that near Dubbo? Yes, very much more difficult country, I should say.
4265. How would you compare the two sections of country with respect to their agricultural possibilities? I know there is a large amount of agriculture between Dubbo and Murrungundi.
4266. Is it all—and suitable for agriculture? Yes.
4267. It has also been suggested that this cross-country connection, if built, might in the future be extended further south;—from which point would the cross-country connection be more easily extended, from Dubbo or from Wellington? Certainly from Dubbo.
4268. For what reason? I have formed that opinion largely from the reports of Mr. Jones, who made a very elaborate survey and report, and who, I see, has given evidence in this inquiry.
4269. Do you think the fact that the Dubbo-Coonamble line is about to be constructed is an argument against joining Werris Creek with Dubbo rather than with Wellington? I cannot see that it affects the question. It appears to me it would be an advantage from a railway point of view.
4270. In what way;—on account of the running-sheds? To have running-sheds, trucking-yards, and so forth.
4271. Looking at the map, and presuming that this line were constructed, and that the future extensions became necessary, from which point would the future extension south-west open up the most country not now served by railway from Dubbo or Wellington? I know the map pretty well. I have been looking at a smaller map, and I should say that an extension to Dubbo would open up more country.
4272. Is that the reason why the Condobolin line and the Western line are rather close to one another near Wellington? From Dubbo it serves a larger scope of country going down, not already served by railway.
4273. Is there any detail information which you could give us as to the general scope of this inquiry? I should like to point out that a line from Dubbo to Werris Creek would probably afford a larger passenger traffic. Dubbo is a very large centre. In that town two Circuit Courts and four District Courts are held during the year, and the Central Land Board sits in Dubbo.
4274. Which includes Wellington? Yes. Another important fact is that coal has been discovered at Ballimore, which is 22 miles distant from Dubbo, on the proposed line. Mineral springs also exist at Ballimore. These mineral waters are very well known in the whole of the colonies, and are now largely used in Sydney, under the name of Zetz Spa waters.
4275. *Mr. McFarlane.*] How far would it be from Wellington? Taking the surveyed route from Wellington, I do not know how far it would be as compared with the surveyed route from Dubbo; but I think it is nearer Dubbo.
4276. *Chairman.*] Where do the supplies of these mineral waters come to the railway now? To Dubbo. In the report which Mr. Jones made in 1891, he favours the construction of a line from Dubbo to Werris Creek in preference to a line from Wellington to Werris Creek, and after summing up the conclusions which he has arrived at, he ends with this remark: "I am, therefore, compelled to favour the rival route from Dubbo." But I should look upon a line going from Dubbo to Werris Creek as more of a national line than a line from Wellington would be, for the reason I have already stated—that it will get away from Dubbo much more easily than it can from Wellington. 4277.

S. Phillips,
Esq., M.P.

19 July, 1900.

4277. *Mr. Hyam.*] Do you favour the route from Dubbo to Werris Creek in consequence of there being less engineering difficulties in the way? That is one of the reasons; but as I have already stated, I think it will get away from Dubbo much more easily for further extensions.

4278. By bringing the line from Dubbo you would increase the distance to Sydney? Yes, by the distance between Wellington and Dubbo—about 28 miles. I do not think you understood my reply to the other question.

4279. Possibly not? One of the reasons which I regard as making Dubbo a better terminus is that the future extension which must take place to Parkes, Forbes, Grenfell, and Young will be more easily constructed from Dubbo than from Wellington.

4280. I am glad you mentioned that matter, because I was going to speak about it;—where would you propose that the line from Parkes to the Western line should junction? There is a difference of opinion as to that—either at Dubbo or at Narramine.

4281. I have been over that country a good deal;—do you not think that to junction with Dubbo would be rather costly, for there is no doubt that it will have to come some day? I do not think it is as costly to junction from Dubbo as it would be from Wellington.

4282. From Narramine it would be less costly? Yes, as it is nearly all level country. From Narramine to Peak Hill it is almost level country.

4283. You think that with the possibility of the railway from Parkes to junction with the Western railway it would be desirable to make Dubbo the terminus of the proposed railway from Werris Creek? Yes.

4284. Do you know anything of the country on the route you advocate, say within 30 or 40 miles of Dubbo? Yes.

4285. Is it good land? It is nearly all good land.

4286. Agricultural land? First-class agricultural land. In fact there is a good deal of agriculture going on now to within Murrungundi, which is the point at issue, as far as this terminus goes.

4287. How far is it from Dubbo? It is 35 miles from Dubbo on the proposed route. After leaving Murrungundi, the lines from Wellington and Dubbo are identical.

4288. *Mr. Levien.*] You know nothing about the country between Werris Creek and Wellington? I know part of the country between Wellington and Murrungundi.

4289. Of course you would sooner have the line going to Dubbo? Certainly; but I have given reasons already, in reply to the Chairman, why I think it should go to Dubbo.

4290. *Mr. Shepherd.*] Do you know the country about Mundooran? Yes; I have been there.

4291. In going to Dubbo, would you not take the line nearer Mundooran than you would by going to Wellington? Yes.

4292. Is not the country about Mundooran very poor? There is some poor country, but there is also some very fine country about Mundooran.

4293. The line is slightly shorter to Dubbo than to Wellington—by 2 or 3 miles? According to Mr. Deane's report, it is 2 or 3 miles shorter *via* Dubbo, being 159 miles.

4294. Have you been along the whole line? No; I know the country between Dubbo and Murrungundi and about there, and Cobborah, and Mundooran, and so on.

4295. Have you not been any further along the line? No.

4296. You know the country pretty well within 15 or 20 miles from Dubbo? Yes.

4297. Is the country equally suitable for a railway from Dubbo as it is from Wellington;—is the country as easily worked for a railway? I should say so.

4298. I understood it was rather more hilly from Dubbo? I think it is easier country—not so hilly.

4299. There is a portion of it which I know is very poor and very scrubby, because we were taken that way at the time we went over? Perhaps you only kept to the road.

4300. We did not go far off the road, but out Mundooran way; we did go off the road a good bit;—do you know the country about Gilgandra? Yes.

4301. What do you think of a line striking in at Gilgandra instead of Wellington;—it would shorten the distance very considerably? Although I know the country about Gilgandra, I do not know the route which a railway would take.

4302. If you will look at the plan, you will see that it would considerably straighten the line? It would.

4303. But do you know the country very well? I know the country about Gilgandra, and between Dubbo and Gilgandra, but not this cross-country between Gilgandra and Curlewis.

4304. There has been a suggestion to run a line from Curlewis to Gilgandra, which would considerably shorten the distance;—do you think that would be as convenient? I could not say, because I do not know the country.

4305. It would be a little longer round for travellers; but it would be a much shorter line to construct? That would be a line from Curlewis to Gilgandra, and from Gilgandra to Dubbo.

4306. Yes, of course, the line from Dubbo to Coonamble is not constructed yet; but it is likely to be built shortly? Yes; but that leaves out the question of the extension to the southern line.

4307. What is your principal recommendation in favouring this line, what advantages do you think would be gained by it chiefly? I have read a large amount of the evidence which has been given to the Committee, and I agree with a number of the witnesses in the reasons which they give in favouring this line, which are all summed up by, I think, Mr. Jones, in this way, that there would be a large amount of traffic from starving stock in times of drought—and there is no doubt that the railway would develop a large amount of traffic—and that there would be a largely increased amount of agriculture.

4308. Do you think it would be likely to induce much passenger traffic? I think that would have to come.

4309. It is connecting, of course, two main lines? Yes; and there is the fact that it shortens the distance to Melbourne, Queensland, and South Australia, which, I think, justifies one in saying it is a national line, especially if you extend it to the Southern line, and make that connection to Young, taking in Parkes, Forbes, and Grenfell.

4310. You are in favour of the construction of this line, but you prefer to connect with Dubbo in preference to Wellington? Yes.

4311. *Mr. McFarlane.*] Is there much traffic at the present time between Murrungundi and Dubbo? I think there is a good deal of traffic.

4312. As regards the settlement you spoke of, which town do the settlers mostly trade with, or send their produce to—Dubbo or Wellington? I believe they do the greater part of their trade with Dubbo. I know many people who bring their produce to Dubbo, and do their business with Dubbo.

4313. Would that produce be for Dubbo alone, or would it go there for transmission to some other market? I could not say. Under certain conditions they might be sending it further west, or down the line.

4314. The question whether, in times of drought and so forth, the bulk of that traffic coming to Dubbo along the proposed line would be sent towards Sydney, or would go in a westerly direction, would have rather an important bearing as far as Dubbo is concerned in this inquiry? I think that is a question of conditions obtaining at the time.

4315. In times of drought, I suppose the tendency would be to send out westerly? Yes.

4316. Is there much wheat grown in the locality you are speaking of between Dubbo and Murrungundy? There is a good deal of wheat grown, and there will be more grown.

4317. Is that wheat grown for the Sydney market, or is it sent to Dubbo to be milled? At Dubbo there is a large mill to which, I daresay, some of it has gone, and some of it may be sent on.

4318. In receiving goods by the main line, do they receive them through Dubbo? I think so. Their trade relations, as far as I know, are with Dubbo.

Thomas Brown, Esq., M.P., sworn, and examined:—

4319. *Mr. Watson.*] Do you know the proposal before this Committee to construct a railway from Wellington to Werris Creek? Yes.

4320. Will you favour the Committee with a statement of your views on that proposal? I may inform the Committee that I became interested in this matter about three or four years ago. The Condoulin electorate, I may premise my remarks by stating, is rather an extensive one. It goes to within 7 miles north of Parkes, joins the Harvey Range, runs out in the direction of Dubbo, and comes within 2 miles of Narramine, and west towards Nymagee, and on to the Lachlan. Between Parkes and Dubbo there is a considerable amount of settlement, mining and agricultural, and an agitation was started there to get the benefits of railway communication by the extension of a line from Parkes to Peak Hill. In dealing with this matter, I found that there was a disinclination on the part of the Department, and on the part of the Railway Commissioners, to work short spur lines such as that would be, being a line of 30 miles. I also knew that some years previously there had been an agitation to connect all these main trunk lines by an inland link line, as it is termed. I thought this agitation had practically been dead, for several reasons, for some years, and I considered that it would be a good idea to revive it—that the time was opportune to do so. At the deputation which I introduced to the then Minister for Public Works, Mr. Young, it was asked for by the Peak Hill Railway League, and they simply confined themselves to asking for an extension to Peak Hill from Parkes; but I had induced several other centres, such as Parkes, Alectown, McPhail, Tomingley, and Narramine to join in this deputation. The Minister's reply to the Peak Hill representation was not very favourable, for the reasons I indicated; but upon a wider scheme being put before him he intimated that he thought it was one that he might give consideration to. Subsequently I had considerable correspondence with the Department on the matter as the outcome of Mr. Jones' report, made, I think, in 1891. I first placed before the Minister the desirableness of constructing a line from Parkes to Dubbo, and from Dubbo on to Werris Creek; but I found there was a difficulty with respect to the country lying between Tomingley and Dubbo. It is rather broken country; it is not hilly country. What are known as the Sappa-Bulgas cross this line of country. It is a continuation of a broken line of country extending from between Parkes and Molong out, forming the Harvey Range for a part of the way, and, as it gets further out, it tails off, or levels down across the Western railway between Narramine and Dubbo, and goes on towards Gilgandra, out in that direction. As I have described, this country is rather poor, and, whilst it presents no very great engineering difficulties, it is an expensive piece of country, and that induced me to suggest to the Department the advisableness of carrying the railway to Narramine. The country between Tomingley and Narramine is splendid agricultural country, being level all the way, with no engineering difficulties whatever. My first proposition on that was to go to Narramine, and thence in a direct line to Werris Creek; but it was pointed out to me that a considerable expense would be entailed in bridging the Macquarie and ana-branch—the Coolbaggie, I think, it is called. That induced me to submit to the Department the desirableness of using the present line between Narramine and Dubbo, and extending from Dubbo to Werris Creek. The Member for Dubbo, Mr. Phillips, and several residents of Dubbo, joined in that proposition, and it was before the Minister, Mr. Young, and also his successor, Mr. Lee, and we understood—at least I understood—it was a likely line to be submitted by the then Government. No doubt the Wellington-Werris Creek extension, as it was an alternative or rival scheme to this one previously, was also considered in this connection. As soon as the present Government came into office, Mr. O'Sullivan announced his intention of submitting the Wellington to Werris Creek extension, although he indicated to Mr. Phillips and myself in the House that if there was any evidence brought which could show that the other line was a better line, it would be open to this Committee, and afterwards for the House, to consider that. That is pretty well the extent of my connection with this proposal. I am very well acquainted with the country lying west of Dubbo and Parkes and Forbes and all through that way; and I have some slight acquaintance with the country round Mudgee, round Dubbo, and round Wellington; but my personal acquaintance with the principal part of the country traversed by this proposal is very limited. It is more a matter of what I have gathered by conversation with people who have lived there and travelled over that country. I think, in considering an extension of this kind, consideration should be given to the question of how it will serve intercolonial interests, also to the question of what advantages it may offer in times of warfare, in providing safe means of moving troops from one portion of the Colony to the other; and, further, to the question of how, as a developing line, it will open up the country lying between these branch lines, and acting as feeder to these branch lines in different directions. With respect to the national aspect of this question, a line constructed as proposed would have the effect of shortening the distance between Brisbane and Melbourne by about 150 miles, I think; and between Brisbane and Adelaide, by 500 miles, I understand. As the populations of the colonies increase, and now that Federation is an accomplished fact, this should be kept strongly in view. One great purpose it will serve, no doubt, will be to facilitate

the rapid transit of European mails, which is a matter of very great consideration; and (probably it can serve that purpose as far as Adelaide is concerned; but in the event of this transcontinental railway extension being made which is spoken of, it will even afford greater facilities in connecting the different capitals by way of Broken Hill, and Cobar, and Dubbo, or by way of Broken Hill and Condobolin, if that line be taken in hand. Then, with respect to the military advantages, whilst it may be contended that there is no apparent need for that, there is no certainty as to when that need may arise, and when it does arise it is too late then to prepare for it. If other advantages are sufficient to induce the construction of a connecting link like this, which may not be all that may be desired, this should have some weight in considering these other advantages. So far as our communication is concerned between Newcastle and Sydney, it lies practically along the coast, and is liable to be intercepted by an enemy at several points, and particularly where the line crosses the Hawkesbury. This proposed link-line would obviate any disadvantage arising from that, and would enable the troops to be shifted from any one point in the colonies to another, very readily and very safely. I think that is a point which might well receive consideration. Now, with respect to the possible developments to arise from the construction of a line of this nature. At the present time all our railway systems converge to Sydney. There is no other means of railway communication between the Northern main trunk line and the Western line. Between the Western line and the Southern line there is a connection by way of Blayney and Harden. The result of this centralisation is that there has not been that amount of intercommunication between these several districts which otherwise would have taken place, and which will take place if this connection is made. The distances between them are very great, and the difficulties of travelling over these distances, from the absence of proper roads and so forth, are also very great; and between these main trunk lines, as your evidence discloses, lies good agricultural country that could be opened up by an extension such as this. If that agricultural country were opened up, this connecting link would act as a feeder to the main trunk lines, both in the direction of getting produce to Sydney and also in the direction of taking produce further west, or north, or south, as the case may be, and also in shifting stock. The possibility of opening up this country can only come about by railway extension, and the question is whether it is advisable to make that extension on the same plan as the present extensions have been made—that is, intersecting the country at right-angles, or by a cross-line of railway. I think the cross-line of railway has much to commend itself in preference to continuing the policy of extending the lines at right-angles from Sydney, or the junctions of railways leading to Sydney. After you get over the high broken country caused by the Dividing Range, you get into flat, level country. It tails off, and you get into what is known as the wheat zone of the Central Division, extending, you may say, from the Murray right through to Young, Forbes, Parkes, Peak Hill, and Dubbo, and on towards Werris Creek. In addition to the wheat-growing capabilities of this country there are also mineral belts intersecting it in the line of this proposed railway. There is a belt of mineral country extending from Young, or even from further south, but for the purposes of this connection we will take it from Young, through Grenfell, Forbes, Parkes, Allectown, Peak Hill, McPhail, and Tomingley. It may extend further north, though so far there has been no development; but there has been sufficient development at these places I have named to show that it is likely to be a permanent belt of mineral country. So far, the principal mining they have done has been largely alluvial, and that has been practically worked out, but attention is now being given to the lodges and the reef formation. I might say that one reason why the development in these respects has not been carried to the extent to which it might have been done is that the country is peculiar, in that the mineral formation lies in broken belts, and it is possible to get on one of these formations and have very good returns, and for it to suddenly cut out with very little indication of a continuance. That has led many miners to suppose that they have got to the end of it, but later prospecting shows that that is not so, and that there is every indication to point to the fact that this is a permanent belt of mineral country. Another thing I would like to point out in connection with this mining aspect is that in the line of country, about Peak Hill at any rate, after you get below a certain depth you come to extensive bodies of ores of rather low grade, but very refractory, and the trouble has been to treat them; in fact, up to very recently there has been no payable method known to those who were working the ores by which they could be treated. But Mr. Taylor, who is well known in the Mines Department, has taken the Peak Hill property in hand, and has introduced some new and later scientific methods of treating the ores, and I understand from those who are interested in the mines there that the experiments—for they can only be called experiments so far—conducted under his supervision have proved eminently successful, and that there is every hope now that this problem will be solved. If it is solved it will mean a very extensive mining development, which will bring considerable carriage to the railway, because it is a development which can only be carried on by means of smelting, and the carting of matte and so forth backwards and forwards on the railway, or a mining development very much similar to that which obtains at Cobar, and which has resulted in making the Cobar extension payable. That is one aspect which, I think, should be taken into consideration in dealing with lines of this nature. Now, there is this question,—Which is the best point on the Western line to make this connection from—Wellington or Dubbo, or some other point? I am satisfied that if a connection is made with Wellington it will serve the interests west, which should be taken into consideration, and also the general interests very much less than a connection with Dubbo, or a connection with a point even further west from Dubbo. My reason for expressing that belief is that a connection with Wellington will mean that the other line—a line lying further west, extending between Dubbo, and Parkes, and Young—will be largely cut out, and it will mean the concentration of traffic lying further north, particularly out towards Werris Creek and beyond that on the main Western line now as far as Blayney, and absolutely from Blayney across to Harden, and that way. I would like to point out to the Committee what this will mean. It will mean that the traffic in using this line between Wellington and Blayney, and between Blayney and Harden, will have to incur very serious grades, which is always a great advantage in the cheap and efficient working of traffic. I have some information here relating to this matter. I do not give it as being absolutely correct, but the Committee can check it with the official information obtainable from the Department; and if it is checked, I think you will find that it is a fairly correct statement of the position. West of Narramine the country is very flat, and the grades are 1 in 80, and I think it is only at very few points where it does come to 1 in 80; the general ruling grade is greater than that. Between Narramine and Dubbo the grade increases, because of that patch of broken country that I indicated as extending from east of Parkes out along the Harvey Range, and the Sappa-Bulgas, and on that road. The result is that an engine can draw sixty vehicles over a line west of Narramine, but

from

from Narramine to Dubbo a reduction has to be made to forty vehicles, though the difficult country between Narramine and Dubbo is not very considerable, and I understand that the Railway Commissioners are now reducing it, and that the line west from Nyngan may be reduced to a uniform grade at a very little cost.

T. Brown,
Esq., M.P.

19 July, 1900.

4321. *Chairman.*] One in 70 is the heaviest grade there? Yes; that from Dubbo to Wellington is very much similar. I think the same train-load can be taken, but from Wellington to Mullion Creek, I am informed, there is to be found the roughest and most difficult patch of country on the Western line—say, west of Bathurst. The ruling grade there is 1 in 40, and the engine-load, I understand from information I have received from the Department, is nineteen trucks, and from Mullion Creek to Blayney it will be increased to forty-three trucks, for the ruling grade there is better. But I understand that the undulating nature of the country over this length between Wellington and Mullion Creek is such that it cannot be hoped to reduce it to anything approaching the grade west of Narramine, except at very great cost; and that is a matter which should be taken into consideration. Then, again, on the Blayney and Harden line I find that the ruling grade is also about 1 in 40, and that the train-load is eighteen trucks, and that extent of country through there is also very undulating, carrying those very heavy grades, which means that their reduction must cost an immense sum before they could be brought to that point which will approximate to the country west of Narramine. Against that, supposing this connection is made which I have advocated, carrying the line to Dubbo and thence to Narramine, and from Narramine across through Peak Hill to Parkes, utilising the line already constructed from Parkes to Forbes, and carrying an extension across from Forbes to Grenfell, which would serve for present purposes at any rate, you will get a grade quite as easy as that west of Narramine, because you are there in a flat country. That will mean that, having carried your connecting link from the Northern line across to Dubbo, by adopting this extension further west you would have a very easy grade; whereas if you constructed the line from Werris Creek to Wellington, as proposed, you would have these very heavy grades which I have indicated, and which the country can only hope to eliminate at a very great expense, amounting, I suppose, to more than the expense of constructing this other, and little longer, line I have indicated. Besides, as I have stated before, the possibilities of agricultural development, and of mineral development, will go a long way, if not wholly, towards meeting the cost of the construction of this line itself. I believe it will meet the cost of constructing it at a very early date, because the country between Parkes and a point from Tomingley to Narramine has practically only been settled within the last fourteen years, and the settlement has been very rapid, and has yearly become closer and closer. The development in the direction of mining, as well as in the direction of wheat production, is very great. I know that in the country lying west of Peak Hill, extending out to Bullock Creek, there is now a considerable wheat production, and that the farmers, although they are removed from railway facilities to distances varying from 40 to 60 miles, have this year shipped their wheat to London, and sold it there, as the most profitable market for them. They consider they have done reasonably well; they have done better by shipping to London than by selling in Sydney, so far as the returns enable them to judge. That is being done at the present time, and this cross-country railway will very materially assist in developing that country on the lines I have indicated. I do not think there is much more that I could add to my statement as showing my reasons for supporting this other extension. Since this matter has been brought up, I have given some little consideration to the question of making a connection between Curlewis and Gilgandra, and I think there is a lot that can be said in favour of that connection. First of all it will mean very much less cost, because the construction of the line between Gilgandra and Dubbo is already authorised, and that can be used. Then, again, the country that is proposed to be served largely by this connection between Werris Creek and Wellington will either be served by this other connection further north, or if not served by that connection, can be better served, in my opinion, by carrying the line from Mudgee on towards Coonabarabran to junction with the cross-line at some point where it will anticipate this extension out. That will be readily seen, I think, from your chart, because supposing you carry the line from Werris Creek down to Wellington, as you propose, from about Cobborah to Wellington you are running at a very sharp angle on the proposed Mudgee extension, and one would very largely entrench on the other; whereas if this other line were constructed, if it were sent further west or north-west, there would not be that competition between the Mudgee extension and the link-line; it would intersect at right-angles, and this through line would also serve the Dubbo interests, and could still be made the link-line by carrying it on to Wellington, and on through there. It would certainly have the disadvantage of making the journey longer; but against that, there would be the reduced cost of construction, and also the intermediate country to be served. It would better serve the intermediate country, I think, lying between Dubbo and Wellington, by the considerations I have indicated, than an extension from Mudgee on towards Coonabarabran. So far as I am acquainted, there has been some movement in the direction of stock and fodder to the northern districts in times of drought; but the facilities have not been such as to invite any very large traffic in this direction. In 1898 there was a very severe drought up in the northern parts of the Colony—from Narrabri up towards Moree, and out that way—and very heavy losses in stock resulted. When that drought broke up there was a demand for stock for restocking purposes. Several buyers came down into the Forbes and Condobolin districts with a view of purchasing stock there; but they informed me that they were not able to make any purchases—not that the stock there did not suit them, not that the prices did not suit them,—but because it was difficult to get stock to their runs or farms out in the north. The dry state of the country made it impossible to travel stock across country from Dubbo through there at that time, and the long distance from Forbes or Parkes to Sydney, and thence back to these points I have indicated, debarred re trucking, and little or no trucking was the outcome of that condition. If this line had been constructed then, I am satisfied that a considerable shifting of stock would have taken place for the purposes I have indicated. Of course, there is always this liability in the west of a general drought and a partial drought. Very often, when there is a great scarcity in the central part lying out west from Dubbo, and west from Forbes and Parkes and Condobolin, there may be a fairly good season south, or a fairly good season north, and a connecting link line, such as this, would serve a good purpose in either shifting starving stock to places where there was grass, or in bringing fodder to them. I think that is all I can place before the Committee that seems to have any bearing on this question.

4322. *Mr. Watson.*] Your contention, then, is that the line from Parkes to Narramine is justified on account of the good country through which it would pass? Yes; it would pass through level country—
through

T. Brown,
Esq., M.P.
19 July, 1900.

through country that is splendidly adapted for wheat-growing. The undulating country is practically identical right through. There is the same class and the same character of country. There has been no proper survey made; but I asked Mr. O'Sullivan, the present Minister for Public Works, to give me an estimate of the difference in cost, and, as the result of exploratory surveys, he informed me that the distance between Dubbo and Parkes would be about 74 miles, and that the line is estimated to cost about £256,000; and that the distance between Narramine and Parkes is about 62 miles, and the line is estimated to cost £212,900, showing a difference in length of construction of $11\frac{1}{2}$ miles, and a difference in cost of £43,100. I am inclined to think that is the maximum—that, when the surveys come to be made out, the cost of the Narramine-Parkes line will be less than that—because it is very flat country.

4323. *Mr. McFarlane.*] Is it flooded country? No flooded country. The country between Narramine and Alectown, by Peak Hill way, is very flat. The country between Alectown and Parkes is a little undulating; it is a little heavier country. It is not hilly, with one or two exceptions, and that is taken into consideration in the Dubbo estimate.

4324. *Mr. Watson.*] That is at the rate of £3,500 a mile, which is rather heavy? I am inclined to think the Department's estimate is the maximum. I think there are three small watercourses between Peak Hill and Narramine, and one or two between Peak Hill and Alectown, but there are no engineering difficulties connected with them at all; they are very narrow, being not more than 20 feet across.

4325. You think, then, it is likely that, within a reasonable time, a line will be constructed between Narramine and Parkes, or somewhere in that direction? I do. I understand that Mr. O'Sullivan, the Minister, has that under consideration now; in fact, I introduced a deputation to him in October last, since this matter has been remitted to the Committee, and he promised to remit this other line to the Cabinet for reference to Parliament and to this Committee on its own merits.

4326. Your contention is that the Committee, in arriving at their decision on a cross-country line, should keep that extension towards Parkes in view all the time? Yes; for the reasons I have indicated.

4327. And, making any cross-country line, so that it should harmonise with that extension? Yes.

4328. Assuming that you had a cross-country line either from Curlewis or from Werris Creek, which do you think would be the general direction of stock and other traffic;—would there be a necessity in regard to stock to get east or west when they arrived at the Western line, say at Dubbo or Wellington;—suppose they went to either point, which would be their objective, east or west, suppose they were coming from Werris Creek? That would largely depend on circumstances. If there was a severe drought out west, the tendency of stock would be to go east; then, when a better season came, or a change came about, and there was feed out in the western parts, they would travel back again.

4329. Taking the stock coming the other way, from which direction would that cross-country line be mostly used to draw stock—from east or west? I am inclined to think it would draw the most stock from the west, because the west is more liable to drought than the eastern portions.

4330. The presumption is that it would suit the stock traffic best at that rate to have a connection as far west as possible? Yes.

4331. Do you think that would operate equally well in regard to the agricultural produce that came off the country through which this line would go, the objective there being the sea? I think it operates similarly with respect to agriculture, but not to the same extent. The further east you go, the more broken country you come upon, and hence the rainfall is larger. The area of country available for agricultural purposes is not as large as the area of country lying further west, and you have less broken country, and hence you have a lighter rainfall; you have good agricultural country, and the wheat production largely depends on the season. A very wet season is a bad wheat season in the Eastern districts, and a drier season is a good wheat season east, and a bad one west.

4332. If you have an ordinary season in the country lying between Werris Creek and Dubbo or Wellington, whichever objective you have, the wheat that is taken from there will require to be taken to the seaboard in as short a distance as possible? Yes.

4333. Do you think the taking of the line further west from a point of junction with the Western railway will be any great disadvantage to the wheat-growers on the route? I think the wheat-growers lying between Wellington and Werris Creek would be best served by the extension from Mudgee.

4334. Would not that proposition be rather against a cross-country line in the meantime? But then, again, when you go out a little further west, you get a certain area of country served by that cross-country line, but lying nearer to the seaboard from, say, Werris Creek. The wheat on that route would travel *via* Werris Creek towards the seaboard. Then, coming further west you get another trafficable area of country which will be served by this cross-country line, but the nearest point to the seaboard will be *via* Dubbo, and it will travel *via* Dubbo. It will take the nearest and the cheapest route.

4335. Do you think, if a cross-country line were made from Curlewis to Gilgandra, and the Mudgee line extended in the direction of Merrygoen, and possibly towards Coonabarabran in the same way, there would be sufficient traffic over both lines, including the cross-country and local traffic? I do not know that I am competent to give a reliable answer to that question; but I would be disposed to think so, because there is a big belt of country lying between Mudgee and this point of junction which can only be served for wheat-growing purposes—and I understand it is very good wheat-growing country—by an extension that way. The effect of that extension would be to increase the wheat production within the sphere of that line, whereas the effect of the cross-country line would be to increase the wheat production within its particular sphere. Of course, there would be a point, supposing they joined, where both would operate one against the other, and no doubt, in that case, the Mudgee extension would have the preference, because it would mean the shortest route to Sydney.

4336. That is, as far as wheat is concerned? Of course, the wheat-producing area does not extend any very great distance from a railway. Whilst you have wheat-producers growing wheat at 40 or 60 miles away, they are very heavily handicapped. Within about 20 miles is a fairly reasonable distance.

4337. *Mr. Levien.*] You would not think it would pay them to take wheat 60 miles? Wheat-growing at a greater distance than 60 miles is made payable by being combined with pastoral pursuits, sheep-farming, and so forth, and it is found, out west anyhow, that those holders, large and small, who combine agriculture with grazing stand better. The experience out west of Peak Hill has been that very often a very bad stock-year is a fairly good wheat-year, and *vice versa*. That has occurred within the past two years. The year before last was a very bad stock-year, and a fairly good wheat-year.

4338. How far are they off the train? There are settlers at Bulbodney who are combining wheat-growing with sheep-farming, and they are 75 miles from the nearest train point.

4339.

4339. Does that pay them? They are adopting that as a means of making a living, and I have been told by settlers who are a considerable distance away that in the last year they grew wheat and sent it to Sydney, and if they had had it on their farms when the bad part of the season came later on, they could have made more money out of their wheat for stock-feeding purposes than they could have got for it in Sydney.

T. Brown,
Esq., M.P.

19 July, 1900.

4340. *Mr. McFarlane.*] What would the carriage rate be for 75 miles? It varies; it is pretty considerable. In the drier time it is less than in the wet time. Of course, at present there are farmers out there with wheat on their hands who would be very glad to get it into market; but it is impossible for them to get it in, because the roads are so bad.

4341. *Mr. Hyam.*] Is there not some idea of constructing a line from Bogan Gate to the Bullock Creek? Yes.

4342. That is a line approved of by the Commissioners, I believe? I understand it is. It is an agricultural line.

4343. Is there not a prospect of that line joining with the Western line somewhere about Nyngan? Possibly; the present proposal is only to Buldodney.

4344. That is Bullock Creek, I presume? No; Buldodney is a settlement about 40 miles further north than Bullock Creek.

4345. How far is Buldodney from Nyngan? About 75 miles, I think.

4346. I thought there was some idea of connecting Bogan Gate and Nyngan? At present there is a petition amongst local settlers further on, asking for an extension from Trangie to Dandaloo, which will possibly mean a connection with Buldodney, which is about 20 miles from Dandaloo.

4347. Do you not think that would bring the line from Parkes to Narramine and the line to Bullock Creek rather close together? No.

4348. It would come through Trundle? It would. The line from Parkes to Narramine is almost a due north and south line. The line that you refer to—Bullock Creek to Buldodney—starts on the Condobolin-Parkes line, about 20 miles west of Parkes, and it runs in a south-westerly direction. The nearest point between these two points is at Bogan Gate and at Parkes, and the further you travel along the further apart they get.

4349. *Mr. Watson.*] What is the maximum distance they keep apart? From Trundle across to the nearest point of the Parkes-Peak Hill line would be, at the least, 40 to 45 miles.

4350. *Mr. Hyam.*] Trundle is about 35 miles from Parkes? They generally speak of it as about 40 miles.

4351. In districts where agriculture or mixed farming is carried on, how close do you think these lines running parallel to each other should be kept apart? I should say that lines of this nature may be constructed profitably at an average distance of about 60 miles. If built further than that apart it would leave too big a distance towards the centre point of the road to work it profitably.

4352. You think a man can grow wheat and cart it to a railway station or market 30 miles away? I think so. Some of the men out there are carting their wheat 60 or 70 miles; but, of course, they are largely induced to go in for wheat growing for the purpose of assisting the stock, and also with the view of railway extension.

4353. Do you not think the railway, if it came from Curlew to Gilgandra—considering that the Gilgandra to Dubbo line is sanctioned—would be a cheaper and better route than the one proposed from Werris Creek to Wellington? I certainly do.

4354. Do you know the country between Curlew and Gilgandra? No. I only know the country from information I have gathered from those who produce, and ought to know it well from travelling over it. I do not know much from any personal experience I have had. The reason why I mentioned that extension was, not so much from the supposed nature of the country, but because of the lesser cost of construction and the possibilities of serving a certain part of the country by means of a connection from Mudgee out.

4355. With these cross-country railways made, I suppose it would throw a great deal more land into cultivation? Speaking from my own knowledge of the country between Nyngan and on towards Grenfell, it would, and I should suppose it would have the same effect with respect to the country further north. Of course, that largely depends on the fitness of the country for agricultural purposes.

4356. *Chairman.*] To sum up your evidence, it means that, given the necessity of constructing this line, its ultimate connection with the Western line should be decided upon the question of which direction will, in the future, be best to extend it to the south-west? That is one of the points.

4357. And you think, if it is to be extended to the south-west, a connection with Dubbo would more easily lend itself to the development of that south-western country than a connection with Wellington? Yes; I am satisfied it would more readily lend itself to the development of the country, and that it would better suit the traffic interests beyond, because of the easier grade which may be obtained in that new connection.

4358. *Mr. Levison.*] Do you know anything at all about the country between Werris Creek and Wellington? I have been a short distance out from Wellington.

4359. How far out? To Bodangora.

4360. Have you ever been to Werris Creek? No.

4361. You know nothing about the country from Werris Creek out? I do not know the country at the Werris Creek end.

4362. You know neither one point or the other, and yet you favour the line? My reasons for favouring the line are not so much the immediate country lying between the two points as other considerations.

4363. Do you know anything about the country between the two points? I know the country round Wellington, and also round Dubbo.

4364. Do you know anything of the country between Werris Creek and Wellington? Only that part of the country near Wellington.

4365. How far out from Wellington? I suppose I have been out 10 or 12 miles.

4366. After you get that distance, you do not know whether it is black-soil country, loamy country, or sandy soil; or whether there is scrub or anything else;—you know absolutely nothing of the country itself between those two points, except for 10 or 12 miles out of Wellington? Not as the result of personal knowledge.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PARLIAMENTARY STANDING COMMITTEE ON
PUBLIC WORKS.

REPORT

TOGETHER WITH

MINUTES OF EVIDENCE AND PLAN,

RELATING TO THE

PROPOSED RAILWAY

FROM

NARRABRI TO WALGETT, WITH BRANCH TO
COLLARENDABRI.

Presented to Parliament in accordance with the provisions of the Public Works Act,
51 Vic. No. 37.

Printed under No. 13 Report from Printing Committee, 27 September, 1900.

SYDNEY: WILLIAM APPELATE GULLICK, GOVERNMENT PRINTER.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

- * The Honorable ANDREW GARRAN, LL.D., Vice-Chairman.
- * The Honorable WILLIAM JOSEPH TRICKETT.
- The Honorable PATRICK LINDESAY CRAWFORD SHEPHERD.
- * The Honorable SOLOMON HERBERT HYAM.

LEGISLATIVE ASSEMBLY.

- * WILLIAM THOMAS DICK, Esquire, Chairman.
- JOHN CHRISTIAN WATSON, Esquire.
- ROBERT HENRY LEVIEN, Esquire.
- JOHN MCFARLANE, Esquire.

[* On 14th June, 1900, the Honorable WILLIAM JOSEPH TRICKETT, having accepted the office of Chairman of Committees of the Legislative Council, retired from the position of Chairman and a Member of the Committee. Mr. WILLIAM THOMAS DICK, Vice-Chairman, was elected Chairman in the place of Mr. TRICKETT, and the Honorable ANDREW GARRAN was chosen as Vice-Chairman. On 4th July, the Honorable SOLOMON HERBERT HYAM was elected to the vacancy on the Committee caused by the resignation of Mr. TRICKETT.]

INDEX.

Report.
Minutes of Evidence.
Plan.

LIST OF WITNESSES.

| | PAGE. |
|---|----------------------|
| Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works | 1-6 |
| Hugh McLachlan, Secretary to the Railway Commissioners | 6-9 |
| John Harper, Chief Traffic Manager, Department of Railways | 9-13, 92-94, 126-129 |
| Albert Ernest Collins, storekeeper, and Mayor of Narrabri | 13-15 |
| Walter Scott, Crown Lands Agent and Clerk of Petty Sessions, Narrabri | 15 |
| John Stoltenberg, farmer and grazier, Narrabri | 16 |
| John Butler Brake, farmer, and Chairman of the Farmers and Settlers Association, Deep Creek | 16-18 |
| Richard Ford Jenkins, Road Superintendent, Narrabri..... | 18 19 |
| Arthur Herbert Farrand, Inspector of Stock, Narrabri | 19-21 |
| George Gregory, senior, farmer, Narrabri | 21 |
| Herbert Leigh Walker, auctioneer, Farmers' Union, Narrabri..... | 21-22 |
| Burnett Morris Cohen, grazier, near Narrabri | 22-23 |
| Charles Alexander Ross, Member of the Local Land Board, Narrabri | 23-24 |
| Edward Hart Wall, grazier, near Narrabri | 24-25 |
| Theodore Morath, saw-mill proprietor, Narrabri..... | 25-26 |
| Charles Martin, forwarding agent, Narrabri West | 26 |
| John Bissett Brodie, station manager, Boolcarrol | 27-28, 115-116 |
| Charles Wall, hotel-keeper and grazier, Narrabri | 28 |
| Albert Robert Stafford, storekeeper and saw-mill and flour-mill proprietor, Narrabri | 29-30 |
| Andrew Brown, farmer, near Narrabri | 30 |
| John Lehaine, junior, grazier, near Narrabri | 30-31 |
| John Riddle, Member of the Local Land Board, Narrabri | 31 |
| John Gately, storekeeper, saw-mill proprietor, and Mayor of Narrabri West | 32-33 |
| Charles Parker, hotel-keeper, Narrabri West | 33-34 |
| Lewis Snelling, timber contractor, Narrabri West | 34 |
| John Joseph Morris, carrier, Narrabri West | 35 |
| John Goodyer, hotel-keeper, farmer and grazier, Narrabri West..... | 35-36 |
| John Langley, saddler, Narrabri West | 36 |
| Laurence Brennan, pastoralist, Wee Waa | 37-39 |
| Stephen Dempsey, selector, Pilliga..... | 39-41 |
| Walter William Richard Holcombe, grazier, Weetawaa | 41-42 |
| George McFarlane, grazier and farmer, Sandy Hook | 42-43 |
| William Hockan, grazier, Rossmore | 43 |
| Joseph Wall, grazier, Apple-tree Chump | 43 |
| Albert Coppleson, storekeeper, Wee Waa..... | 44-45 |
| Ernest Albert Anniversary Holcombe, settlement lessee, Wee Waa | 45-46 |
| Arthur George Lane, homestead selector, Wee Waa | 46 |

| | PAGE. |
|--|----------------|
| Charles Peter O'Rourke, hotel-keeper, Wee Waa | 46-47 |
| Archibald MacKenzie, grazier, Wee Waa..... | 47 |
| Sydney Powell, grazier, Pilliga | 47-48 |
| Charles Kelaher, grazier, Pian Creek | 48-49 |
| Robert Darvall Barton, grazier, Burren | 49-52, 118-121 |
| James Cousins Duncan, hotel-keeper and grazier, Burren..... | 52 |
| James Joseph Burrell, settlement lessee, Merrywinbone | 52-53 |
| Gerard Loder Herring, grazier, "Rose Lea" | 53 |
| Alexander Donaldson, settlement lessee, Merrywinbone | 53-54 |
| William Cussen Cormie, grazier, Mercadool and Merrywinbone | 54 |
| William Green, selector, Burren | 54 |
| Edmund Brennan Loughnan, J.P., Honorary Secretary, Railway League, Collarendabri..... | 55-57 |
| Stanley James Greenaway, settlement lessee, Oreel (Merrywinbone) holding, and representative of the Thalaba Farmers and Settlers Association | 57-58 |
| Joseph William Cook Langhorne, grazier, Oreel (Merrywinbone) holding | 58-60 |
| Charles Edward Brown, homestead lessee, Bundaborina holding..... | 60-61 |
| Alfred Blomfield, homestead lessee and selector, near Collarendabri | 61 |
| Francis Kirby, grazier, near Collarendabri | 61-62 |
| John Francis Kirby, grazier, near Collarendabri..... | 62-63 |
| Wyndham Dallas Bruce, homestead lessee, Gundablue holding | 63-64 |
| William Henry Wordsworth, J.P., storekeeper, Collarendabri | 64-65 |
| Charles Seymour, hotel-keeper, Moongulla Bore, Angledool Road | 65 |
| Thomas Clarke, J.P., Secretary, Railway League, Walgett | 65-69 |
| Isaac Collins, sheep farmer, near Walgett..... | 69-70 |
| Horatio William Smith, selector, near Walgett | 70-71 |
| Charles Speight Haigh, storekeeper, Walgett..... | 71 |
| John Young Bell, grazier, near Walgett | 71-73 |
| Robert Moyse, Inspector of Stock, Walgett..... | 73-74 |
| Abraham Falstein, storekeeper, Walgett | 74 |
| Robert Henderson Duncan, homestead lessee, Narran Point, near Walgett..... | 74-75 |
| Charles Neam-Vaughan, storekeeper, Walgett | 75-76 |
| Andrew Essex Scott, pastoralist, Gingie | 76 |
| George Matthews, grazier, near Walgett | 76-77 |
| Charles Edward Colwell, settlement lessee, near Walgett..... | 77 |
| William Vanstone, hotel-keeper, Walgett | 78 |
| Terence Francis Fagan, coachbuilder, Walgett | 78 |
| Archibald Edward Park Skinner, stock and station agent, Walgett | 78-79 |
| George Charles Arthur Cobb, forwarding and coaching agent, Coonamble | 79-80 |
| Donald Fletcher, President, Coonamble section, Dubbo-Coonamble Railway League, Coonamble | 80 |
| Thomas William Medley, Inspector of Stock, Coonamble..... | 81 |
| William Podley, cordial manufacturer, Coonamble..... | 81 |
| Henry Lyons, representative of Wright, Heaton, & Co., Coonamble | 81 |
| Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works | 81-82, 120-130 |
| Thomas Henry Hall Goodwin, Esq., M.P. | 82-85 |
| Bishop Lyne, Conditional Purchase Inspector and Forester, Narrabri | 85-87 |
| Wallace Webster, Conditional Purchase Inspector and Forester, Walgett | 87-92 |
| Henry Chamberlaine Russell, C.M.G., Government Astronomer | 94-95 |
| Charles Edward Rennie, Chief Draftsman, Department of Lands | 95-96 |
| The Honorable George Frederick Earp, M.L.C., President of the Chamber of Commerce, Newcastle | 96-100 |
| Samuel Chft, pastoralist, East Maitland | 100-102 |
| Henry John Adams, pastoralist, West Maitland | 102-104 |
| Edward Peter Capper, merchant, West Maitland | 104 |
| Sheldon Western Chadwick, journalist, Newcastle | 104-105 |
| William Bethel Sharp, shipping agent, Newcastle | 105-106 |
| Henry Deane Walsh, M.I.C.E., District Engineer, Harbours and Rivers Branch, Department of Public Works, Newcastle..... | 106-107 |
| Michael March, wool manager, Dalgety & Co., Limited, Newcastle | 107-108 |
| James William Boulbee, Superintendent of Public Watering Places and Artesian Boring, Department of Public Works | 108-110 |
| John Kenneth Mackay, grazier, Gunnedah | 110-115 |
| Robert Edward Jones, M.I.C.E., District Engineer, Roads Branch, Department of Public Works | 116-118 |
| Charles Binnie, grazier, Spring Ridge, near Quirindi | 121-123 |
| William Henry Hall, Sub-Editor, Statistical Year Books, Government Statistician's Department | 123-125 |
| George Charles Yeo, Draftsman, Stock Branch, Department of Mines and Agriculture | 125-126 |

PLAN.

Narrabri to Walgett, and branch to Collarendabri.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM NARRABRI TO WALGETT, WITH BRANCH TO
COLLARENDABRI.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Narrabri to Walgett, with branch to Collarendabri," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provisions of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

PROCEEDINGS LEADING TO THE PRESENT PROPOSAL.

1. The question of railway connection between Narrabri and Walgett, the Committee are informed in the official statement put before them, has been before Parliament and the country for many years, the movements in favour of it having commenced in the year 1880. The country which the line would serve is described as one of the finest pastoral districts in the Colony, and includes a large area of good agricultural land. But both graziers and farmers have hitherto laboured under great disadvantages, through having no means of conveying stock and produce out of the district except at much loss and inconvenience, as there are practically no metalled roads owing to the difficulty and great cost of making them. In exceptionally favourable seasons the district has the advantage of water carriage by means of the Darling and Barwon rivers, but such favourable conditions are so intermittent and uncertain that for all practical purposes this mode of traffic may be left out of consideration. The suggestions as to the route for the railway have been many and various, including a line from Nevertire *via* Warren and Coonamble, from Dubbo *via* Coonamble, and from Mudgee *via* Coonamble. In 1897 a line of railway from Narrabri to Pilliga, and a line from Woolabra to Collarendabri, were referred to the Public Works Committee, who dealt with the former as a railway from Narrabri to Walgett, and, though negating both, suggested a railway from Narrabri to Eurie Eurie, and, if necessary, thence on to Walgett, and a railway to Collarendabri from a point on the Narrabri-Eurie Eurie line about 315 miles from Newcastle. These suggestions placed the route of the two lines to the north of the Namoi River, and left the township of Wee Waa some 8 miles distant from the nearest possible railway station, a circumstance that led to representations from the residents of Wee Waa and the surrounding districts, which resulted in the Minister for Works approving of the line keeping to the south side of the Namoi as far as Wee Waa, and the submission of the present proposal to the Committee.

DESCRIPTION

DESCRIPTION OF THE LINE.

2. Commencing at the west end of the Narrabri West Railway Station, the line would proceed more or less parallel to, and south of, the Namoi River to Wee Waa, where it would cross the river, and follow a course generally parallel to Pian Creek to within about 20 miles of Walgett, where, after passing through Eurie Eurie, it would terminate at the northern side of the Namoi River about a mile and a half from the town, and 356 miles 72·45 chains from Newcastle.

The branch to Collarendabri would leave the line at Burren, 50 miles 23·186 chains from Narrabri West, and proceed north-north-westerly to Thalaba Creek, and thence, after crossing the creek, follow generally the county boundary between Denham and Banarba, and, crossing the Barwon River, reach Collarendabri at a distance of 353 miles 38·90 chains from Newcastle.

The country traversed by both lines is flat, and the works would be light with easy grades, but a bridge of considerable size would be required over the Namoi River at Wee Waa, and some heavy work of the same kind would be necessary at the end of the Collarendabri branch line in crossing the Barwon River and its confluents. The latter works could be avoided by terminating the line, for the present, about 11 miles short of Collarendabri. To save expense the level parts of the line, more especially near the Namoi River, would be so constructed as to be below extraordinary flood level.

RAILWAY COMMISSIONERS' REPORT.

3. The Railway Commissioners, who traversed both routes, state, in their report, that having regard to the character and prospects of the country, both districts are deserving of railway communication; but, in their opinion, the best interests of the producers and of the country generally would be served by connecting Walgett with Coonamble, as they recommended in 1889, and constructing the line from Narrabri to Collarendabri *via* Wee Waa. They estimate the annual cost of both lines at £26,836, which comprises £13,966 interest on capital outlay at 3 per cent., and maintenance, traffic, and locomotive expenses £12,870; and the traffic revenue at £13,014—merchandise and live stock £8,779, and passengers, parcels, mails, &c., £4,235. The estimate of cost, however, is based on the price of rails being £5 5s. per ton. Taking the price at what it is now, £7 10s. per ton, the annual cost would be £27,975—interest on capital, £15,105, and maintenance, traffic, and locomotive expenses, £12,870—and the difference between that amount and the estimated revenue, £14,961.

ESTIMATE OF COST.

4. The estimated total cost of the line from West Narrabri to Walgett, the price of rails being calculated at £7 10s. per ton, is £316,286, or £3,019 17s. 8d. per mile; and of the branch line to Collarendabri, £187,273, or £3,669 11s. 6d. per mile.

The estimates of cost of construction have been prepared by the Engineer-in-Chief in sections, as some parts of the line are more expensive than others. The line from Narrabri to Walgett, for the first 29 miles 60·82 chains, is estimated to cost £3,018 per mile; for the next 20 miles 42·366 chains the cost is £2,860 per mile; and for the remainder of the distance, 54 miles 36·269 chains, £3,081 per mile. The estimate in connection with the first 31 miles 52·70 chains of the branch line to Collarendabri is £2,729 per mile; for the next 8 miles 38·02 chains, to what is designated in the evidence and on the plans as point A, situated on the near side of the Barwon River, opposite Collarendabri, £4,988; and for the last portion of the distance, 10 miles 72 chains, £5,375. The expensive nature of this last section is due to the liability of the country in the locality to floods, and the necessity for heavy bridge work over the Barwon River.

THE

THE COMMITTEE'S INQUIRY.

5. In the inquiry carried out by the Committee they took evidence in Sydney, Narrabri, Narrabri West, Wee Waa, Burren, Collarendabri, Walgett, Coonamble, and Newcastle. Four members of the Committee left Sydney to examine witnesses in the country, and to inspect the land along and in the vicinity of the proposed lines. Their inquiry was opened at Narrabri on the 18th May, and continued there, and at Narrabri West the following day, a large number of witnesses giving evidence.

On 21st May the Committee, accompanied by an engineer from the Railway Construction Branch, Department of Public Works, left Narrabri, and, dividing into three parties, in order to see as much as possible of the land along and in the neighbourhood of the route, travelled to Wee Waa, where they arrived at 3 p.m. Half an hour later they met in the local court-house, and sat examining witnesses, with an interval for tea, until a quarter-past 9 p.m. At 8.30 the following morning the Committee left Wee Waa for Burren, a distance of 25 miles. Rain had recently fallen, and more threatened, with the prospect of bad roads across the black-soil plains. Dividing again, two members of the Committee proceeded to the north side of the Namoi River to examine some of the country along the route for a railway from East Narrabri, between Wee Waa and Tulladunna, while the two other members visited Sandy Hook and a number of homestead selections between Wee Waa and Pilliga. Burren Station was reached by one portion of the Committee at 7 p.m., the other members, in consequence of rain and the bad condition of the roads, being detained at Rossmore, where they arrived at 6.30 p.m. The following morning a number of witnesses were examined at the "Burren Hotel."

Burren being near the point of junction of the proposed railways, the Committee again divided, and the roads being practically impassable to vehicles, Mr. Dick, Mr. Watson, and Mr. McFarlane proceeded on horseback to Collarendabri, *via* Merrywinbone, to inspect the route of the proposed line to that town, and to take evidence, while Mr. Shepherd, accompanied by the railway engineer, travelled by special coach to Walgett, in the vicinity and along the route of the Narrabri-Walgett line.

Following the route of the railway to Collarendabri, Mr. Dick, Mr. Watson, and Mr. McFarlane travelled through Burren and Merrywinbone holdings to the "Avondale Hotel," 20 miles from Collarendabri, where they arrived at 5.30 p.m. Mr. Shepherd, leaving Burren, kept about 8 miles to the north of the surveyed line to Walgett, crossing the route of the branch railway to Collarendabri at Old Burren, and thence proceeding to Gorian station, 12 miles from Burren, where he arrived at 5 p.m. The following day the Collarendabri portion of the Committee, keeping to the travelling stock route, which is also the route of the proposed railway, reached Collarendabri at 2 p.m., and the same afternoon examined a number of witnesses, and inspected the site for the railway bridge over the Barwon River, about 2 miles above the town, and that of the station yard. Mr. Shepherd, leaving Gorian at 9 a.m., and travelling from 2 to 6 miles from the route for the railway to Walgett, reached Cryan station, 14 miles from Gorian, at 5.30 p.m. On Saturday, 26th May, evidence was taken from witnesses at Collarendabri, and Mr. Shepherd, continuing his inspection of the Narrabri-Walgett route, travelled from Cryan station close to and along the route to Walgett, where he arrived at 10.30 p.m. On Monday, 28th May, he was joined at Walgett by Mr. Dick, Mr. Watson, and Mr. McFarlane, who travelled from Collarendabri *via* Mercadool and Eurie Eurie. The following day, evidence was taken from a large number of witnesses at Walgett, and the Committee then left for Coonamble to obtain evidence with regard to connecting Walgett by railway with Coonamble, as suggested by the Railway Commissioners.

INSPECTION OF THE COUNTRY.

6. The inspection of the country between Narrabri and Wee Waa showed the Committee that the land was very suitable for carrying sheep, with a fair proportion fit for agriculture. Those members who visited Sandy Hook and some homestead selections between Wee Waa and Pilliga, found, on one selection, hay

hay from a crop that they were informed had yielded about 3 tons to the acre; on another a considerable area was under cultivation; and on a third a crop of wheat was growing very satisfactorily. From about 10 miles from Wee Waa, towards that township, a number of holdings, averaging about 600 acres each, had recently been taken up on each side of the "Cleared Line" or main road.

Wee Waa appeared to the Committee to be a township deserving of consideration in relation to any railway proposed to be constructed in its direction. Compared with most country townships it is of considerable size, with a population of something over 700, and it is an important business centre. The inspection of the country between Narrabri and Wee Waa convinced the Committee that the route on the south bank of the Namoi was preferable to that on the north bank, for on reaching the northern side of the river it was found from the flood marks on the dead timber that, with the exception of the land on the banks of Tulladunna Creek, which is a little higher than any other, the country for some miles northwards past Tulladunna is subject to flood, and that to give Wee Waa access to a railway station in the neighbourhood of Tulladunna Creek would necessitate the construction of at least two bridges, and a viaduct, over the creek and a large warnambool. On both sides of the river, in the neighbourhood of Tulladunna, the land, in regard to the nature of the soil, is similar in character, but on the southern side it is a little higher and not so subject to flood.

Between Wee Waa and Burren the country consists chiefly of black soil plains, valuable as pastoral land but not so suitable for agriculture. In places grapes can be grown easily and of excellent quality. The average sheep-carrying capacity of the land is a sheep to three acres.

For the first few miles beyond Burren the land is subject to flood from the overflow of Burren Creek, and from that point onwards, to Walgett or Collarendabri, the country may be described as first-class pastoral land with patches suitable for agriculture, if the rainfall could be relied upon. A large proportion of the land may be said to be very suitable for orange and vine culture. Agriculture, as far as it has been tried, has produced fairly good results, but nothing beyond that required for home use has been attempted. The wheat grown has been cut for hay. The irregular nature of the rainfall—common to this part of the Colony—makes cultivation very uncertain. One season may show a satisfactory result, while in another the wheat is pinched off and comes to nothing. Irrigation with artesian water is talked of, and, in the neighbourhood of bores which are supplying water, is now being carried out. This may give an impetus to cultivation sufficient to place it on a permanent footing. The whole of the country affected by the two proposed railway lines is within the artesian area, and while, in the districts which would be served by the railways, there are several Government bores in existence, a number of others are about to be put down.

LAND AREAS AFFECTED BY THE PROPOSED RAILWAYS.

7. According to the figures placed before the Committee by the Chief Draftsman of the Department of Lands, there are, within a distance of 20 miles on each side of the line to Walgett, 1,165,000 acres of alienated land, 463,700 acres of reserves, 491,000 acres of settlement and homestead leases (which include 192,300 acres, homestead leases, Western Division), and 774,800 acres of Crown lands. Of the Crown lands, the tenure of leasehold areas expired in relation to 81,600 acres in July last, that of 19,000 acres will expire in December, 1902, and that of 79,000 acres in 1918. Under occupation license 353,900 acres are held, and 241,300 acres are untenanted.

Among the reserves is one large forest reserve comprising 98,000 acres, south of Narrabri, and on the border of the area influenced by the proposed railways.

The areas of land in connection with the branch line to Collarendabri are given as follows:—Alienated land, 412,700 acres; reserves, 103,600 acres; settlement and homestead leases (including 167,160 acres, homestead leases, Western Division), 270,200 acres; and Crown lands, 203,000 acres. Of the leasehold areas, the

the tenure relating to 22,000 acres, in the Central Division, expired in July last, and that of 128,000 acres, in the Western Division, will expire in 1918. 53,000 acres are held under occupation license. No land within the area is untenanted.

Taking the two lines together, the leasehold areas which have recently become available for settlement, and those which will be available in 1918, amount to 329,600 acres.

TRAFFIC PROSPECTS.

8. The traffic prospects in connection with the two lines are, in the opinion of a majority of the Committee, satisfactory. The estimate of the Chief Traffic Manager, upon which the Railway Commissioners base the figures in their report, gives the traffic on both railways as amounting to £13,014, of which sum he expects £7,681 to come from the Collarendabri branch. The details are:—

| | | | | | | | |
|---|-----|-----|-----|-----|-----|-----|---------|
| Proposed railway, Narrabri West to Walgett, with branch to Collarendabri. | | | | | | | |
| Wool, goods, and stock | ... | ... | ... | ... | ... | ... | £8,779 |
| Coaching, mails, &c. | ... | ... | ... | ... | ... | ... | 4,235 |
| Total | ... | ... | ... | ... | ... | ... | £13,014 |
| Proposed railway, Narrabri West to Collarendabri, leaving Walgett out of consideration. | | | | | | | |
| Wool, goods, and stock | ... | ... | ... | ... | ... | ... | £5,494 |
| Coaching, mails, &c. | ... | ... | ... | ... | ... | ... | 2,187 |
| Total | ... | ... | ... | ... | ... | ... | £7,681 |

Statistics supplied by the Stock Branch of the Department of Mines and Agriculture represent the number of bales of wool produced in the district in 1898 to be 37,770, and the traffic in stock through Walgett and Collarendabri, in the same year, as 720,000 sheep and 41,500 cattle.

It is very probable that the official estimate will be found considerably below the actual traffic. At least it is noticeable that it exceeds the estimate of working expenses, and that is a feature which the Railway Commissioners regard as justifying them in approving of the construction of both the railways. Railway communication will considerably diminish the losses of stock from drought, for sheep can then be easily removed to New England and other localities where feed is procurable, and with the saving of stock the production of wool and the sending of fat sheep to market must largely increase.

A railway through the district during the last two or three years would have saved large numbers of sheep which, through the want of means for removing them or for getting fodder to them, died. Unless in a good season, it is impossible, under present circumstances, to send sheep to market or to other districts, and the evidence forcibly points to a considerable railway traffic in this direction. Increased production, as well as the carrying of passengers and goods, will also result from the closer settlement which the construction of the railways will assist in bringing about.

OUTLET FOR THE NORTH-WEST BORDER AND SOUTHERN QUEENSLAND TRADE.

9. Nothing appears more certain from the inquiry than that the proposed railways will draw traffic from a considerable area of the north-western border districts of New South Wales and from a large part of Southern Queensland, the natural outlet for the trade of which is Narrabri or Moree. The Southern Queensland traffic will be the more assured from the fact that the Queensland Government has removed the export duty upon wool grown within 30 miles north of the New South Wales border.

THE DISTRICTS TO BE SERVED.

10. The part of the Colony which would be more or less within the influence of the proposed railways extends north and north-west as far as Mungindi, Goodooga, and Angledool, near the Queensland border, and comprises some of the finest pastoral land, especially for fattening purposes, in New South Wales. That portion of the land which has been alienated has been well improved, and all of it, in ordinary

ordinary seasons, produces large quantities of wool and fat stock. In the hotter months of the year the climate is severe, but the winter, the early spring, and the autumn are described by residents as perfection. The want of rain is sometimes injurious to the occupiers of the land, but the district quickly recovers from the effects of a dry season. Between Narrabri, Walgett, and Collarendabri the records of the Government Astronomer show the annual rainfall to be from 26 to 27 inches at Narrabri to between 19 and 20 at Walgett and Collarendabri. West of Walgett the country is more subject to drought than to the east. The stock in the district at the present time, within the area that would be affected by the railway from Narrabri to Walgett, taking the Departmental figures for 1898, is given as 1,538,000 sheep and 17,133 cattle, and within the area affected by the line to Collarendabri, which would include a portion of that to which the Narrabri-Walgett statistics refer, 980,000 sheep and 14,000 cattle. These figures do not represent the full carrying capacity of the districts, but only the stock which have survived the effects of the recent severe drought.

CONDITION OF THE PEOPLE.

11. The condition of the people in the districts to be served furnishes a strong reason for providing them with railway facilities, if it can be done with any prospect of the lines producing a fair return from the expenditure. Cut off, as they are, by a distance of over a hundred miles from the nearest railway, with practically no roads, and subjected to a trying climate, they live under circumstances of considerable discomfort and hardship. Owing to the climate, the storekeepers find it impossible to keep large stocks of perishable articles, and they cannot renew their stocks quickly because of the difficulties experienced by teams in travelling over the roads. In dry weather it has taken teams from six weeks to two months to reach Walgett from Narrabri, and in wet weather they cannot travel at all. There is consequently, at times, in the towns and on the stations a condition of things bordering upon that of famine.

Progress of any kind is much hindered, for there is nothing to encourage the settler to do more than is necessary for him to obtain a living. If he send a lot of fat sheep to find a market, they fall away in condition so much that they become stores by the time they reach their destination. His wool may be stuck up on the roads or stranded in the river for weeks or months. If he were to attempt agriculture or fruit-growing upon anything like a large scale he could not get his produce away. Outside his own energies there is nothing to stimulate him to improve his position or assist in the progress of the district. The estimated population which would be affected by the railway to Walgett is 6,240, and that by the line to Collarendabri 2,060.

CLOSE SETTLEMENT.

12. Most of the holdings in the Walgett-Collarendabri districts are large, but the smaller ones are increasing in number, for as the tenure of the leasehold areas expire the land is readily taken up in settlement leases. The area of 2,560 acres, without railway communication, is regarded by some persons as rather small to permit of profitable occupation under the climatic and other conditions which surround the settler in this part of the Colony, and an increase to 5,000 or 6,000 acres is considered to be advisable. Small areas and little or no capital mean, it is said, an early abandonment of the holdings, or their sale, the latter proceeding bringing about what settlement leases are intended to prevent, viz., the aggregation of land into large estates. With railway facilities, however, the smaller area should be profitably worked.

SHORTENING THE COLLARENDABRI BRANCH.

13. The possibility of terminating the Collarendabri branch line for the present at point A, and thereby saving the cost of constructing 10 or 11 miles of the most expensive portion of the railway, is a matter that the Committee think should receive consideration. The idea of stopping there is not favourably viewed
by

by the people of Collarendabri, who naturally wish the railway to be constructed to the town, but except in very wet seasons the shorter line would meet traffic requirements, and in time of flood the interruption—which would relate chiefly to stock movements—would only be temporary. The saving effected would amount to £58,591.

COONAMBLE TO WALGETT.

14. The route for connecting Walgett with Coonamble by railway provides for a line about 69 miles in length, and is a continuation of the surveyed and authorised line from Dubbo to Coonamble on the western bank of the Castlereagh River. After passing Coonamble and crossing the river a few miles beyond the town, it follows the high country between the river and Bullarora Creek, and goes through Bullarora station until it crosses the creek. From that point it proceeds direct into Walgett, terminating on high ground between the cemetery and the town. The estimated cost of the line by this route is £222,000 or £3,212 per mile, a high rate, due to the extent of flooded country that has to be crossed and to the expensive character of some of the bridges required. For this railway connection neither the people of Walgett nor those of Coonamble show any noticeable desire, and the inquiry carried out by the Committee does not represent it as preferable to the proposed line from Narrabri West. For 25 or 30 miles beyond Coonamble the country will be served by the Dubbo-Coonamble railway, and further out, according to the evidence, the traffic would most probably go to the Great Northern Railway, upon which the rates for wool are lower than those on the Western line. The distance from Walgett to Sydney, *via* Coonamble, is 15 miles shorter than that *via* Narrabri, but the cost of constructing the two lines, Coonamble to Walgett and Narrabri West to Collarendabri, would be £54,238 higher than that of constructing the line from Narrabri West to Walgett with a branch to Collarendabri, and the length of line to be constructed would be 14½ miles greater, as will be seen from the following figures:—

Cost of Construction.

| Narrabri to Walgett, with branch to Collarendabri. | | Coonamble to Walgett, and Narrabri to Collarendabri | |
|--|----------|---|----------|
| Narrabri to Walgett | £316,286 | Coonamble to Walgett | £222,000 |
| Branch to Collarendabri | 187,273 | Branch to Collarendabri | |
| | | from Burren Junction ... | £187,273 |
| | £503,559 | Narrabri to Burren Junction | 148,524 |
| | | | 335,797 |
| | | | £557,797 |

Mileage.

| | miles | chains. | | miles. |
|----------------------------------|-------|---------|-----------------------------|--------|
| Narrabri to Walgett | 101 | 59.45 | Coonamble to Walgett | 69 |
| Less Narrabri to Burren Junction | 50 | 23.18 | | |
| | 54 | 36.27 | | |

CONCLUSION ARRIVED AT.

15. The Committee have arrived at the conclusion that it is expedient the proposed railways should be constructed. The chief matter to decide was the question whether the line to Walgett should go from Narrabri or from Coonamble. The Committee are of opinion it should go from Narrabri, for the reasons that the district will be better served by adopting that route, the existing drift of trade will be maintained, Walgett will be 87 miles nearer the seaboard than it would be by way of Coonamble, producers will be within easy reach of the large meat works at Aberdeen, and will have available to them as markets Maitland and Newcastle as well as Sydney, and the scheme can be carried out at much less cost than the other.

The Wee Waa route from Narrabri West is preferable to that on the north bank of the Namoi, from the nature of the country, the saving in distance, and the importance of Wee Waa itself; and there is no difference of opinion expressed in the evidence with regard to any other portion of the line to Walgett, except in respect of the arrangement by which the Walgett railway station will be situated

a mile and a-half from the town. That, however, is necessary to having the station site on land not subject to flood; to continue the railway into the town and erect the station there would cost, the Committee are informed, at least £25,000, and the station would have to be built on piles to raise it above flood-level.

Whether the line to Collarendabri should, for the present, terminate 11 miles from the town is a question, as already mentioned, worth considering; but, taking the two lines as a whole, the evidence, including that representing the opinions of the Railway Commissioners, is favourable to the construction of the railways as submitted; and in view of this, and of the results that have followed the opening of the Narrabri-Moree line, the Committee are of opinion that the construction of both railways may be safely recommended.

RESOLUTION PASSED.

16. The resolution passed is shown in the following extract from the Committee's Minutes of Proceedings:—

Mr. Levien moved,—“That, in the opinion of the Committee, it is expedient the proposed Railway from Narrabri to Walgett, with branch to Collarendabri, as referred to the Committee by the Legislative Assembly, be carried out as far as Walgett.”

Mr. Dick seconded the motion, *pro forma*.

Mr. Hyam moved,—“That the motion be amended by omitting the words ‘as far as Walgett.’” The amendment was passed on the following division, upon the question “that the words proposed to be omitted stand part of the motion.”

| | |
|---------------|----------------|
| Ayes, 3. | Noes, 4. |
| Mr. Shepherd, | Mr. Dick, |
| Dr. Garran, | Mr. Hyam, |
| Mr. Watson. | Mr. Levien, |
| | Mr. McFarlane. |

Dr. Garran moved,—“That the motion be further amended by adding the words ‘up to the point of the Burren junction.’”

The amendment was negatived on the following division, upon the question “that the words proposed to be added be so added”:—

| | |
|-------------|----------------|
| Ayes, 2. | Noes, 5. |
| Dr. Garran, | Mr. Dick, |
| Mr. Watson. | Mr. Shepherd, |
| | Mr. Hyam, |
| | Mr. Levien, |
| | Mr. McFarlane. |

The motion, as amended, was passed on the following division:—

| | |
|----------------|---------------|
| Ayes, 4. | Noes, 3. |
| Mr. Dick, | Mr. Shepherd, |
| Mr. Hyam, | Dr. Garran, |
| Mr. Levien, | Mr. Watson. |
| Mr. McFarlane. | |

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 19th September, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM NARRABRI TO WALGETT, WITH BRANCH TO COLLARENDABRI.

WEDNESDAY, 25 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Narrabri to Walgett, with branch to Collarendabri.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] I believe you attend to-day, not only in your own capacity of Engineer-in-Chief, but also on behalf of the Under Secretary for Works, who is unable to be present, and that you produce the usual official statement in regard to the proposed railway from Narrabri to Walgett, with the Branch to Collarendabri? Yes; I will read it:—

H. Deane.
25 April, 1900.

RAILWAY FROM NARRABRI TO WALGETT, WITH BRANCH TO COLLARENDABRI.

THE proposal before the Committee was referred by the Legislative Assembly on 12th December, 1899, for the Committee's consideration, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Narrabri to Walgett, with branch to Collarendabri."

The question of railway connection between Narrabri and Walgett has been before Parliament and the country for many years, the movement in favour of the connection having commenced in the year 1880.

The country which the line now proposed will serve has been recognised generally as one of the finest pastoral districts in the Colony, and as comprising a large area of the richest agricultural soil. But both graziers and farmers have hitherto laboured under great disadvantages through having no means of conveying stock and produce out of the district, except at much loss and inconvenience.

Practically there are no installed roads throughout the district, owing to the difficulty and great cost of making them through the heavy black soil. In times of drought teams suffer from want of water, while, on the other hand, even a moderate fall of rain renders it impossible for teamsters to travel until the roads are again dry.

It is true that in favourable seasons the district possesses the advantage arising from water carriage by means of the Darling and Barwon rivers, but such favourable conditions are so intermittent and uncertain that this mode of traffic may for all practical purposes be left out of consideration.

In spite of all such disadvantages and difficulties, the district has continued to grow in wealth and importance, and there has been, consequently, a steady agitation in favour of its being provided with railway facilities. From the year 1884 up to 1897 large and enthusiastic meetings have every now and again been held throughout the district, railway leagues have been formed at the various centres of population, and deputation after deputation has waited upon the different Ministers for Works, all with the object of obtaining the desired railway.

The suggestions as to route have been many and various, comprising, *inter alia*, a line from Nevertire *via* Warren and Coonamble, from Dubbo *via* Coonamble—which was the route recommended by the Railway Commissioners in 1889—and an extension of the Mudgee line, *via* Coonamble, to Walgett.

Finally, at the instance of Mr. Secretary Young, Parliament, in August and December, 1897, respectively, referred to the Public Works Committee the duty of considering and reporting upon the expediency of constructing—

- (a) A line of railway from Narrabri to Pilliga, and
- (b) A line of railway from Woolabra to Collarendabri.

These two proposals were in due course submitted to the Committee, who, after an exhaustive investigation and inquiry, both by the Full Committee and by Sectional Committees, came to the conclusion that it was not expedient that either of the proposed railways should be carried out. (*Vide* Reports dated 23rd June, 1898.)

The Committee, in considering the Narrabri-Pilliga line, dealt with it as a proposal to construct a railway from Narrabri to Walgett, as they could not believe it was ever seriously contemplated to stop the line at Pilliga for any length of time. They realised that the objective point must be Walgett, and that the construction of a line from Narrabri to Pilliga would certainly carry with it an extension to Walgett.

In order to clearly understand the course adopted by the Committee in dealing with these two separate proposals, it may be helpful to quote from the Sectional Committee's Report the following explanatory note:—

"It is usual, in dealing with any work referred to the Committee for consideration, to consider its merits without special reference to any other work; but in the two cases which have been referred to the Sectional Committee for inquiry, it was apparent to the Full Committee, before the local investigations took place, that the two works might possibly merge into one. This view was strengthened as the Sectional Committee obtained fuller information. They determined to consider the question of the development of the country which, possibly, would be affected by a line from Narrabri to Pilliga, and from Woolabra to Collarendabri, as being so intimately connected that it was possible to deal with the whole matter in a single report."

H. Deane.

25 April, 1900.

It will be seen from the foregoing extract that the general question of providing the Walgett district with railway facilities has already been investigated by a previous Committee. The conclusions they arrived at were embodied in resolutions passed by the Committee, as follows:—

- "(a) That, in the opinion of the Committee, it is not expedient that the proposed railway from Narrabri to Pilliga, as referred to the Committee by the Legislative Assembly, be carried out; but they suggest a route by which a railway would go from Narrabri to Eurie Eurie, and, if necessary, thence on to Walgett."
- "(b) That, in the opinion of the Committee, it is not expedient that the proposed railway from Woolabra to Collarendabri, as referred to the Committee by the Legislative Assembly, be carried out; but they suggest a route by which a railway would go from Narrabri towards Eurie Eurie, and, at a point about 315 miles from Newcastle, proceed in a north-westerly direction to Collarendabri."

The consolidated line thus suggested by the Committee would, as compared with the two separate lines submitted for their consideration, effect a saving of about forty (40) miles in length, and of a sum approaching £100,000 in cost of construction.

The route suggested by the Committee lay wholly to the north of the Namoi River, and thus left the township of Wee Waa some eight (8) miles distant from the nearest possible railway station. The residents of Wee Waa and surrounding district, being strongly opposed to such an arrangement, have approached the Minister on the subject, both by petition and deputation, and represented the injustice and injury which their district would suffer if the line to Walgett were to be constructed without taking Wee Waa on the route.

They have pointed out that the country on the northern side of the Namoi was, for a considerable distance out from Narrabri, already served by the Narrabri-Moree line, and consequently no new traffic would be gained on the north side; that the route *via* Wee Waa would tap great forests of superior iron-bark and pine timber, thus developing a large and permanent timber trade; that the line would be on high land, clear of all flood waters; that timber suitable for sleepers and gravel for ballast were obtainable close to the route; that it would be some 10 miles shorter than the route on the northern side; that the population along the south side of the river was steadily increasing; and that the line would follow the existing natural trade routes from Narrabri to Walgett and Collarendabri.

In view of these strong representations, the Minister approved that the line to be submitted to the Committee should be kept to the south side of the Namoi as far as Wee Waa.

3. The official description of the line is as follows:—
(Length—main line, 104 miles 59·45 chains; branch, 51 miles 2·72 chains. Estimated cost—main line, £316,286, or £3,920 per mile; branch, £187,273, or £3,670 per mile, exclusive of land and compensation.)

This line begins at the west end of Narrabri West station, at 252 miles 13 chains from Newcastle, and proceeds more or less parallel to and to the south of Namoi River to Wee Waa. Here it crosses the river, and follows a course generally parallel to Pian Creek to within about 20 miles of Walgett, where, after passing through Eurie Eurie, the line terminates at the northern side of the Namoi River, at 356 miles 72·45 chains from Newcastle.

The branch to Collarendabri leaves the line described at Burren at 302 miles 36·18 chains from Newcastle, and proceeds north-north-westerly to Thalaba Creek, after crossing which it follows generally the county boundary between Denham and Banarba, and, crossing the Barwon River, reaches Collarendabri at 353 miles 38·90 chains from Newcastle.

The country is flat throughout on both lines, and the works light with flat grades; but there is a considerable bridge required over the Namoi at Wee Waa, and some heavy work of the same kind at the end of the branch crossing the Barwon River and its confluent, which latter would be avoided if the branch were stopped for the present about 11 miles short of Collarendabri.

To avoid expense, the levels of parts of the line, more especially near the Namoi River, are kept below extraordinary flood-level.

The following is the report of the Railway Commissioners upon the proposed railway:—

Office of the Railway Commissioners of New South Wales, Sydney, 2 December, 1899.

Proposed Line of Railway, Narrabri to Walgett and Collarendabri.

In accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as follows:—

Distances and estimated cost (exclusive of land and compensation) furnished by the Engineer-in-Chief for Construction—

| | |
|---|-----------|
| 1. Narrabri West to Walgett, 104 miles 59 chains | £290,732 |
| With branch to Collarendabri, 51 miles 2 chains | 174,822 |
| | £465,554* |
| 2. Narrabri East to Walgett, 111 miles | £303,835 |
| With branch to Collarendabri, 51 miles 2 chains | 174,822 |
| | £478,657* |
| <i>Estimated annual cost—</i> | |
| 1. Narrabri West to Walgett and Collarendabri:— | |
| Interest on capital outlay at 3 per cent. | £13,966 |
| Maintenance, traffic, and locomotive expenses | 12,870 |
| | £26,836 |
| 2. Narrabri East to Walgett and Collarendabri:— | |
| Interest on capital outlay at 3 per cent. | £14,360 |
| Maintenance, traffic, and locomotive expenses | 12,870 |
| | £27,230 |
| <i>Estimate traffic revenue—</i> | |
| 1. Narrabri West to Walgett, with branch to Collarendabri:— | |
| Merchandise and live stock | £8,779 |
| Passengers, parcels, mails, &c. | 4,235 |
| | £13,014 |
| 2. Narrabri East to Walgett, with branch to Collarendabri:— | |
| Merchandise and live stock | £9,230 |
| Passengers, parcels, mails, &c. | 4,382 |
| | £13,612 |

The traffic estimate is based upon an extension of the through rates on all but special class traffic, and that of expenditure on a tri-weekly train service.

After having traversed both routes and given the most careful consideration to the proposal now before us, we consider that, having regard to the character and prospects of the country, both districts are deserving of railway communication, but would respectfully suggest that, in our opinion, the best interests of the producers and the country generally would be served by connecting Walgett with Coonamble and constructing the line from Narrabri to Collarendabri along the south bank of the Namoi River as far as Wee Waa, and thence across the river to Collarendabri.

In this connection we suggest the advisability of a reconsideration of the route after leaving Wee Waa, with a view to it being determined whether it is possible to make it more direct, and thus reduce the cost of construction.

It will be observed that the Railway Commissioners, while they consider the Walgett and Collarendabri districts entitled to railway communication, still adhere to the opinion they expressed in 1889, and recommend the connection of Walgett with Coonamble.

It is evident, however, that the great preponderance of local opinion is in favour of junctioning with the north-western line at Narrabri, which would provide direct communication with Maitland and Newcastle as well as with Sydney. Geographically the proposed line would seem to belong to the northern system, and Newcastle has always been regarded as the natural outlet and shipping port for all the northern and north-western parts of the Colony, while Maitland for the last fifty years has been their principal trade emporium.

* NOTE (on revision):—These estimates are with rails at £5 5s. per ton, and are therefore incorrect.

I have the original report of the Railway Commissioners and the books of reference and plans which I put in, and also the compilations of the parish maps. The longitudinal section is not quite finished.

H. Deane.
25 April, 1900.

2. Have you a statement in reference to the expenditure? I do not think you want an estimate of the line leaving East Narrabri. The one submitted is the West Narrabri line. It is a more costly line and longer than the other. This railway proposal is arranged in parts. The first part is from Narrabri West through Wee Waa, across the Namoi, to junction with a line running on the north side. Part No. 2 is that intermediate link up to the point where the line to Collarendabri branches off, and part No. 3 goes on to Walgett. Part No. 1 of the branch to Collarendabri, is that portion from the junction of the main Walgett line to junction with the line previously submitted from Woolabra. Part No. 2 goes from the same point to a point marked A on the near side of the river, opposite Collarendabri, where it is proposed to stop the line to avoid crossing the river. Part No. 3 is from point A to Collarendabri.

3. Do you hand in particulars of these lines? Yes; I hand in detailed estimates of the expenditure on the line starting from Narrabri West, and connecting with Walgett and Collarendabri. The line that I am proceeding to give the Committee an estimate of crosses the Namoi at Wee Waa, then junctions with the more northerly deviation, and proceeding to Walgett.

WEST NARRABRI TO WALGETT, *via* WEE WAA AND EURIE EURIE.—Part No. 1.

ESTIMATED cost of a single line of railway, 29 miles 60·82 chains in length, with 60 lb. rails. Ruling grade 1 in 100. Sharpest curve 15 chains radius.

New fastenings; new 4 feet 6 inch T.O.'s; $\frac{1}{4}$ ballast; sleepers, 2,464 per mile.

I will now read the estimate of the branch to Collarendabri:—

NARRABRI TO WALGETT.—BRANCH TO COLLARENDABRI.—Part 1.

ESTIMATED cost of a single line of railway, 31 miles 52·70 chains in length, with 60-lb. rails. Ruling grade, 1 in 100. Sharpest curve, 15 chains radius.

New fastenings; new 4 feet 6 inches T.O's.; $\frac{1}{4}$ ballast; sleepers, 2,464 per mile.

| Description. | Estimated Cost. | Average per mile. |
|--|-----------------|-------------------|

- H. Deane.
25 April, 1900.
- With regard to that portion of the estimate which is Part 2 to point A, 8 miles 38 chains in length, I wish to point out that the terminal station is included, because if the line stopped at point A all the terminal arrangements will have to be placed there.
4. *Mr. Watson.*] I do not quite understand these figures; Mr. Dick and I have been figuring out the increased price of rails, but the result we get does not tally with these figures;—I understand that £30 per mile must be added for an increase of 5s. in the price of rails? Yes.*
5. These estimates were originally based on rails at 5 guineas? Yes.
6. The difference between that and £7 10s. is 45s; that would mean £270 per mile multiplying 30 by 9? Yes.
7. The figures do not seem to be quite correct; for the 104 miles from West Narrabri to Walgett I make the difference over £28,000; the difference shown in these estimates between £290,732 and £316,286 is only £25,554;—there should be a greater increase in the cost than is represented by this £316,286? I will look into that. It looks as if there is something that requires explanation.
8. *Mr. Levien.*] The country up to Walgett is pretty level all the way? Yes; but you have to dodge about a good deal to keep on the driest ground.

THURSDAY, 26 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Narrabri to Walgett, with branch to Collarendabri.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan.
26 April, 1900.
9. *Chairman.*] The Railway Commissioners are favourable to this proposed connection with Walgett and Collarendabri? Yes.
10. Although at the outset it will involve a loss of nearly £14,000 a year? Yes. I think you have had the report of the Railway Commissioners on the subject, in which they say that, owing to the character and prospects of the country, both districts are deserving of railway communication.
11. Are they guided in that by the opinion that that country will very largely develop the population, and that its production will increase? They are guided to some extent by the country as it exists. There is considerable settlement and considerable trade there already.
12. Many lines involving a loss they do not recommend, but this they do recommend;—considering the loss which they have to face, how are they induced to recommend the line? On general principles. You will recollect when they first started by reporting on these new lines they made a report to the Committee, many years ago, in which they stated that if lines would pay working expenses, and afford reasonable prospects of development, they thought that, in the interests of the country, they were worthy of consideration.
13. And where the lines were not of too expensive a character as regards their formation? Yes; that report was practically on pioneer lines.
14. The Commissioners indicated by their report that there is a further connection to Walgett by way of Coonamble? Yes.
15. Would you give the reasons for that? Their recommendation in regard to the Coonamble to Walgett line is one which they have made consistently every time they have reported upon that district. One advantage to start with would be, that as you are getting a line to Coonamble you can reach Walgett with the least construction; I think the distance is only 68 miles.
16. Sixty-eight miles, as against 105 miles? Yes, so that the cost of construction would be considerably less; and they consider that a line by way of Coonamble would much better divide the country. They do not think that the line should be made from Narrabri to Walgett, and to Collarendabri. They would rather see the money spent upon a line that would better divide the country going up from the western side, that is from Coonamble. They think that that country will be opened up some day. They are hopeful of seeing a railway go from Mudgee.
17. As regards the character of the country, and its future prospects, I suppose that these two lines go through similar country? Practically through pastoral country. I believe Mr. Jones, the District Surveyor, when examined in regard to the proposed Pilliga railway, said his idea was that the Coonamble to Walgett country looked slightly better than the other. The Commissioners saw him in regard to the opening up of that western country, and that was the opinion they gathered from him.
18. Between the two projects there is this difference, that if a line came into Walgett *via* Narrabri West, it would have Newcastle as a shipping port;—if it came in by Walgett and Coonamble, it would come to Sydney as a shipping port? Yes.
19. Have you in your mind the two distances—Walgett and Newcastle *via* Narrabri, and Walgett to Sydney *via* Coonamble and Dubbo? The distances from Walgett to Sydney *via* Coonamble, and from Walgett to Sydney *via* Newcastle, would be about the same; but if they went to Newcastle alone the difference would be about 100 miles less to that port.
20. Are you able to say whether the bulk of the goods and wool from Walgett, at present, go to Newcastle, and are shipped from there? The greater portion comes by rail to Morpeth and Newcastle, then most of it comes on to Sydney.
21. By train? Most of it comes by sea.
22. It reaches Sydney? Yes.
23. I suppose they bring it from Newcastle by steamer because it is cheaper than bringing it by rail? Yes.
24. Even with the extra handling involved? Yes.

25.

* NOTE (on revision).—The totals are correct; the difference of 5s. per ton is under £30.

H.
McLachlan.
26 April, 1900.

25. Then, if we come from Walgett by Coonamble and Dubbo to Sydney, would that entail a heavier amount of freight for wool than is charged at present by way of Newcastle? I am not quite sure. I do not know that there would be very much difference. I may say roughly that the distance from Sydney to Walgett *via* Dubbo and Coonamble, is about 448 miles, and the distance from Walgett to Newcastle is about 355 miles.
26. Why do you favour the connection by way of Coonamble? For the reason I have already mentioned. In the first place you would save a great deal, as far as construction is concerned, the distance being so much shorter, if you make the line to Coonamble. Then the Commissioners think that it opens up the country better, and as a matter of fact the bigger part of the trade, although it may go to Newcastle or Maitland, is really to and from Sydney.
27. Then, with regard to the Collarendabri connection, have you any decided opinion as to whether it would be better to go on from Walgett to Collarendabri, or to make a connection from Narrabri to Collarendabri? The Commissioners' idea is that it would be better to go from Narrabri to Collarendabri.
28. That is a part of the country which should be connected by way of Walgett? Yes.
29. If we were to make a connection with Walgett by way of Coonamble, would it not be practicable to make a connection from Narrabri to Collarendabri—a more straight line than is indicated on the map? Yes; the Commissioners recommend that. They say, "We suggest the desirability of the reconsideration of a route leaving Wee Waa, with a view to being determined whether it is possible to make it more direct, and reduce the cost of construction."
30. Then that means really that the bend in the Collarendabri connection is necessitated by the present proposal by reason of its being the fork that goes off to Walgett—if that were done away with it would make it more direct? Yes.
31. If that line from Narrabri to Collarendabri were constructed, would it be a competitor to any great extent with the Moree line? Yes, it would get some of the business that goes to Moree. Still, the Commissioners would not like to say that that the district should not have a railway.
32. Is it a wide stretch of country which has long been regarded as worthy of better communication? Yes; there is a very big pastoral district around Collarendabri, and there is very good pastoral country to the north.
33. We have before us a proposed connection with Pilliga: I suppose that, with a direct line from Coonamble to Walgett, that place would be left out in the cold, would it not? Yes. The Commissioners in 1895, I think, in looking at the merits of Pilliga, could not recommend it for railway construction on its merits.
34. Any of these projects starting out from Narrabri in that direction, have they not generally had Walgett as their objective? I think so; even though Pilliga was spoken of as a terminus, I think it was with the idea of getting on to Walgett.
35. Looking at the map, it would seem that it would be a considerable advantage if we could straighten that line from Narrabri to Collarendabri? Yes; the Commissioners think so.
36. Do you know whether if this line went more to the north, and avoided that curve, you would get into a better class of country for construction? I could not say that. As far as the bend is concerned, I do not think that would matter much. The extra cost in connection with the line to Collarendabri is due to the expensive nature of the work within 10 miles of the town, which would be common to both. A lot of flood country has to be crossed. That is the reason why the Commissioners recommended that the line should go to Wee Waa; it was to avoid the flood country on the northern bank.
37. This line of railway is regarded as one of our light lines, but its cost of construction averages £3,675 a mile;—that is rather a large amount? Yes; that is due, I believe, largely to the 10 miles near Collarendabri, and the Commissioners, when reporting on the line originally, suggested that it might be wise to stop short of that 10 miles to avoid the flooded country.
38. But even on the main line the cost is estimated to be £3,020 a mile;—we were hoping to get these surface lines constructed at a cost of something over £2,000 a mile; but the main line seems to be a little beyond the estimate for a surface line? It is a matter for the engineers to explain. Probably the high cost is due to the flooded country.
39. The line from Narrabri to Moree is of the same character as the contemplated lines to Collarendabri and Walgett, is it not? With this exception, that you have more flooded country to deal with on the line to Collarendabri.
40. The Narrabri to Moree line was started as a surface line;—has it been necessary to spend very much in the way of ballasting and improving that line since it was first constructed? We have spent some money on increased waterways and in strengthening the line. I think that in one case about £4,000 was spent.
41. You have not in your mind how much per mile has been spent in improving the character of the line? No; but I can get that information.
42. You say that this country between Narrabri and Collarendabri, and Narrabri and Walgett, is country more liable to floods than that from Narrabri to Moree? I think that would be the explanation of the increased estimate.
43. *Mr. Dick.*] Do you keep any return of the destination of the wool after it arrives at Newcastle? No, of course we know where it comes from, but not exactly where it goes to.
44. You have no record of the quantity sent straight away from there to the home market, or to Melbourne or Sydney? I know that the direct shipments from Newcastle in 1898-9 amounted to 47,000 bales.
45. Has that trade been increasing during the past few years? No; it has been decreasing. In 1892 and 1895 the quantity exported from Newcastle was 58,000 bales. In 1898-9 the quantity was 47,500 bales; so it is rather a diminishing quantity.
46. That reduction would be largely due to the persistent drought? No; I think it is due to the wool sales being held in Sydney.
47. Could you give us the quantity of wool sent away from Sydney? No. The quantity sent from Sydney would be larger, but, perhaps, that would not be a fair comparison, because the extension of the railways would bring more to Sydney. Last year there was a falling off, but the year before there was an increase. If you take 1894 as against 1899, I think you will find a big increase, due, to some extent, to the extension of the railways. We had a decrease of 80,000 bales this season; that is spread over the whole system, and included the three seaports, Morpeth, Newcastle, and Sydney.

H.
McLachlan.
26 April, 1900.

48. Could you supply us with figures as to the inward trade to the north—Narrabri, and places like Walgett and Collareendabri? I can tell you the total receipts at those three stations. The quantity of wool received at Darling Harbour last year was 418,000 bales; at Newcastle, 63,000 bales; at Morpeth, 82,000 bales. Practically, the whole of that Morpeth wool would come to Sydney. Last year 10,000 bales were sent from Narrabri to Morpeth, the exact figures being 10,990. That is for the six months ending 31st December, practically covering the wool season. During the same time the quantity received at Newcastle, from Narrabri, was 6,968 bales.
49. Have you any figures in regard to the inwards traffic from Sydney and Newcastle to that district? Roughly, the inward traffic for three months into Narrabri was from Sydney, 344 tons, Newcastle, 347 tons; Morpeth, 490 tons. The bulk of the trade, although going to northern stations comes from Sydney.
50. Would that Morpeth business come from Sydney? It would practically; there might be some fodder included in it; but, I think, the greater part of it would be Sydney business.
51. There seems in that district, not only according to the report of the Railway Commissioners, but also according to the deputations that periodically come from there to Sydney, to be a general consensus of opinion amongst the people that the railway connection should be made with the Northern line;—do you think that much weight should be attached to that as indicating the course that trade is likely to follow? As far as Newcastle and Maitland districts are concerned, I know that the people there strongly urge a connection from the north. Narrabri is rather indifferent as to the connection. I saw one report on a meeting held there in which they did not seem to be anxious at all to have the line extended, and Walgett, I understand, would be quite satisfied to have the connection from either point.
