3007. An extended tram service would supply the need, probably, of the whole of the citizens; trams might be run along Sussex-street, Clarence-street, Pitt-street, Castlereagh-street, and Elizabeth-street, and then the whole of the city would be pretty well served? But suburban railway travellers, when they come into town, do not get out, very much, until you get to Market-street. The great majority whether they come by steam-tram or by the electric tram, go, at any rate, as far as the Town Hall by the electric tram, and as far as Market-street, by the steam-tram. The greater number of daily travellers must go as far as Market-street, at least; and therefore if you can provide from Market-street to Hunter-street, and from Sussex-street to Park, you provide for nearly all the daily travellers—there is no doubt about that.

3008. What time do you consider that you would save by going to King-street, and walking to your place of business from King-street, in preference to going along George-street by tram to the point nearest to your place of business and walking from there? I do not think that I should save a great deal of time,—perhaps from five to seven minutes. But to my mind it is not simply a question of time only, it is also a question of comfort and convenience. I may say that my two sons, who are in business with me, walk to the station at Redfern, and they get there as soon as I do, although I take the electric-tram, and we leave our office together.

3009. There is another consideration in regard to the western proposal, and that is, that it is almost a direct line to Dawes' Point, from which it is proposed some day to throw a bridge over the harbour? Yes, that an advantage.

3010. You think that would be something in favour of that proposal? I think it would be greatly in favour of it, because it would relieve the traffic on the main line from Strathfield if people from the Northern line were to come from North Shore and to Sydney in that way. I should like to accentuate the fact that personally I find it exceedingly inconvenient and unpleasant now to get to the railway station at Redfern. A great many persons walk who would ride by the railway if it were brought right into the city. I should, of course, prefer it to come to the George-street Markets, but if it were to come to King-street I believe that all my friends who walk now would pay the additional fare gladly and take their tickets to King-street.

3011. *Dr. Garran.*] But supposing there were a tramline laid down in Kent-street or Sussex-street, and trams ran thence to the railway station, would not that suit you;—would you not in preference get into a tramcar in Kent-street and go straight to Redfern? I think it is possible I should. But I think the majority of business men would not prefer going by tram, which stops frequently, but would prefer going to the terminal station and going straight away by train.

3012. *Mr. Shepherd.*] Do you not think that the crowding of the trams shows their popularity? Well, you can create traffic. I was a month at San Francisco about a year ago, and there they have trams in almost every street, and they give transfer tickets; and in the morning and the evening, when business men are travelling, the trams are crowded, and you often have to wait for following trams. On public holidays they are crowded in the same way. It is a difficult thing to overtake the amount of traffic you create.

3013. *Chairman.*] You have travelled a great deal, have you not? Well, I have travelled a little.

3014. Did you come across any places similar to Sydney, where there is such inconvenience as exists at Redfern, with thousands of suburban passengers coming into Sydney and going home every day, and having to finish up their journey by means of a tram service? No; I did not. But I think our railways are exceedingly well managed.

FRIDAY, 23 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDSAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Alexander Gerard Ralston, Mayor of Burwood, sworn, and examined:—

3015. *Dr. Garran.*] You reside at Burwood? Yes.

3016. You are Mayor of the municipality there? Yes.

3017. I presume that you have frequently had under your consideration the policy of extending the railway into the city? I have frequently. I have lived at Ashfield, Croydon, and Burwood ever since 1874, and the necessity of extending the railway into the city, both as a matter of safety and as a matter of convenience, has been often brought before me.

3018. Did you find the inconvenience diminished since the George-street tram was established? As far as we people who have offices in Phillip-street are concerned, it is more inconvenient since the George-street

A. G. Ralston.
23 Mar., 1900.

A. G. Ralston. street tram was put on, because we have to go through the subway at Redfern and wait for a steam tram, or otherwise we have to go long George-street by the electric tram to King-street and wait for a cable tram there, or walk up King-street.

23 Mar., 1900.

3019. Then those in the eastern part of the city—what we may call all the professional people—are rather worse off now than they were before the electric tram was established? Decidedly so.

3020. It was stated in evidence by one of the Government officials—I think Mr. Kneeshaw—that going down that ramp at Redfern and under the causeway did not in any way add to the inconvenience of passengers? It means a delay of at least five minutes as a rule, and sometimes seven or eight minutes, which is a very serious matter to business men coming in in the morning.

3021. Does the steam tram now meet all the business trains that come in in the morning? I understand that it is supposed to meet them up till 10 o'clock; but as a rule we have to wait until two electric trams have gone by, and then the steam tram comes along.

3022. Then you lose something like five minutes more than you used to do? Certainly, five minutes.

3023. And all the business men that you know of look upon it as a matter of great importance to keep their seats in the trains and be brought right into the city? Yes; we regard it as a very important matter.

3024. When this question was first mooted the Hyde Park scheme was practically the only scheme before the community, was it not? I believe so.

3025. And that received almost an unanimous endorsement in the western suburbs? I think so. Very few people were against it, so far as I could find out.

3026. But was that on the ground that they looked upon that as the best possible scheme, or as the only practicable one? We regarded that as the only practicable scheme.

3027. You have never had the question put before you as to whether an eastern route or a western route would accommodate the most of your people? Well, since the other schemes were brought before the Government we have, more or less, considered the matter; but I think the great majority of the people are still in favour of the Hyde Park scheme.

3028. It has been put before us that the Hyde Park site would suit the people who attend the law courts, or go to Parliament House, or the principal hotels, or many of the clubs, but that it would not suit the majority of the business people whose places of business lie either in George-street or to the west of it? Well, as to that I can hardly say. Perhaps some of them are better served since the George-street electric tram was put on, but until that tram was put on, certainly, they were very badly off.

3029. The evidence before us is to the effect that the George-street electric tram has captured four-fifths of the railway business that used to go on to the steam tram in Elizabeth-street? As to that, I would not like to say anything. I think that the officials at the station could speak about that better than I can, but I should not have thought that it had captured such a large quantity.

3030. Fourteen out of fifteen, Mr. Kneeshaw says? There is this, too: the electric tram is very slow compared with the train, and I think that the people would prefer a train to take them and set them down at Hyde Park.

3031. If a route through the western portion of the city down to Circular Quay could be established, which would not be materially more expensive than the Hyde Park route, do you think that the majority of the people of the western suburbs would prefer a western route or an eastern route through the city? I should not like to express an opinion upon that.

3032. You do not think that has been thoroughly discussed? No, I do not think so.

3033. They are hot about the Hyde Park scheme because they want some scheme carried out? Yes; and that struck us as being the only scheme likely to be carried out.

3034. But supposing that Hyde Park had been fully built upon instead of being an open square, and that it would have been necessary to resume all the land required for a terminus there, do you think that that site would have been selected as the best central site for the whole of Sydney? I presume not; but I think that, probably, the King-street site might have been. It seems to me that to go to about that place is to go to the backbone, as it were, of the two divisions of the city. At present one part—that is the part towards Darling Harbour—has been more developed in a business way, but it seems to me that ultimately the Woolloomooloo side must be equally developed.

3035. Is it not a fact that the professional side is more on the east, and the mercantile side is more on west? Yes; that is so at present.

3036. And, I suppose, you have about an equal number of mercantile and of professional people in the western suburbs? Yes; I think we are about equally divided.

3037. Do you think if the tram-lines into the city were still further multiplied there would be any necessity to take the railway into the city? I think we ought to have the train right into the city. I do not think people should be asked to make the changes they now have to make. As the suburbs increase we have to go either further along the railway line or further away from it, and we do not mind losing a few minutes at that end, but we do object to losing time at both ends.

3038. The scheme that you rather prefer—which is the scheme before us and which we call No. 10—takes less of Hyde Park but more of private property, and the consequence of its taking more of private property is that the cost amounts to £1,500,000; now we have understood that all the people of the western suburbs, or at any rate all the first-class passengers, would be quite agreeable to having one penny extra per journey put on to their tickets; but, would they be willing to have 2½d. or 2d. put on for this more expensive scheme? I do not suppose they would mind very much 2d. or 2½d. first-class so long as they get the extension, but they would prefer, of course, to pay no more than necessary.

3039. But you see, that the difference between the cost of the Railway Commissioners' scheme and the cost of this substituted one is very great? Yes; I see that.

3040. And the Railway Commissioners estimated only a moderate profit on their investment, and if that investment is to jump up to £1,500,000 they will, in order to get a sufficient return, require to increase the fare for all classes of traffic? Yes.

3041. And you must remember that the second-class passengers will always have the option of going on the rival tram line which the Railway Commissioners will run through the city in opposition to their own railway? Yes.

3042. Do you think that the second-class passengers would pay ¾d. or 1d. more per journey? I doubt if they would.

A. G. Ralston.

23 Mar., 1900.

3043. To save $\frac{1}{2}$ d. they would put up with the changing from the train to the tram? Yes.
3044. I suppose that many of those second-class passengers are people who are engaged in shops or factories, and whose earnings are very small? Yes, and I do not think that time is of so much consequence to them as it is to the busy mercantile man or the busy professional man.
3045. Therefore, the calculation of the Railway Commissioners, which included passengers of both classes, might come a little short if we had to increase the fares for all classes? Yes.
3046. Do you think it would? Yes, I think it would.
3047. We have to take that into consideration now;—when that calculation was made the George-street tram was not running, and the George-street tram has surprised everybody, Government officials included, by its extraordinary popularity;—I suppose you have noticed yourself how crowded it is? Yes, I have.
3048. So crowded that the Government officials want very much to get rid of the railway traffic on it altogether, and apparently one of their strong arguments in favour of bringing the railway into the city is that the pick-up traffic alone would be quite sufficient for the electric tram? There would be ample traffic for the electric tram even if the railway were brought into the city, and the railway would also pay with a reasonable increase of fare.
3049. Are you one of those who think that the railway line should extend to North Shore some day? I think it should, some day.
3050. It has been pointed out that this scheme does not lend itself very well to a North Shore extension? I do not think that is a matter that ought to be considered at the present time. It seems to me that we shall probably require a route all round Darling Harbour ultimately, and that might connect with the North Shore line.
3051. If we make a shore line for accommodating the wharf traffic, it has been pointed out that we cannot get the elevation we want for crossing the harbour, and all the schemes before us which include a North Shore connection run along the ridge more or less on the line of York-street, in order to get the necessary elevation;—therefore your idea about going round the wharfs would hardly be good for a North Shore railway? Of course, I am not a practical man in these matters, but I do not see why this line should not ultimately join the North Shore line if necessary by an elevated railway road, something like the connection between Spencer-street and Princes Bridge in Melbourne.
3052. But the difference between the two levels there is not very considerable? No.
3053. A short viaduct connects those two lines? Yes.
3054. But a line of that sort would not enable us to go over the harbour at a height of 160 feet; that is the difficulty;—if we had to cross the harbour on a low-level, another line would do, but it is the necessity of having a line not less than 160 feet clear overhead, which makes it necessary to get up so high? Yes.
3055. Your office is in Elizabeth-street, is it not? At Wigram Chambers, Phillip-street.
3056. You cannot speak then on behalf of people whose business is in Clarence-street or Sussex-street, or down by the wharfs—as to whether this would suit them as well as would a station at Wynyard-square or the Victoria Markets? No, I cannot.
3057. You have not heard business people speak on that subject? I heard them before the alternative schemes were proposed, and they were nearly all in favour of the Hyde Park scheme, regarding it as the only practicable scheme.
3058. The Railway Commissioners' scheme was put down at £560,000, without any payment for land? Yes.
3059. Then Mr. Eddy proposed to charge £100,000 to the Railway Commissioners for the land, making the estimate £650,000; then it has been pointed out to us by valuers that the real value of the land proposed to be taken is certainly not less than £200,000, without reckoning anything for the intersection of the south-western portion of the Park;—do you not think that if anything is given for that land the full value of it should be given? I really do not see the necessity for that. It is all Government property from one point of view or the other, and I do not see why you should consider the value of the land unless the money given for it is to be used for some other purpose.
3060. We suppose that the money paid for it is to be used to give an equal value of open air spaces in some other parts of the city? I understood that £100,000 was to be devoted to turning the Devonshire-street cemetery and other land near there into a park.
3061. That was one suggestion; but the Government have the idea that that cemetery land is to be the future site of the great central station for Sydney, because it contains twice the area that could possibly be taken out of any available site in Sydney itself; you, knowing the cramped position of Sydney, and the value of land, will see that it would be very difficult to get 22 acres anywhere in Sydney for a great central station, and they can get 22 acres there, and as the commerce of the Colony grows, decade after decade, the need for space at the great central station will grow too, and this corner of Hyde Park would not be sufficient;—do you think it would? I daresay it would not—I mean not for the main central station.
3062. Then do you not think that it would be reasonable to pay the people the value of the land taken from them, and for that money to be used to purchase land for a similar purpose where it is actually more wanted? I do not know any places where it is really wanted. It seems to me that there are plenty of open air spaces about Sydney—there are plenty in the neighbourhood of Redfern, and plenty up at this end.
3063. Will you tell me how many there are in Ultimo and Pyrmont? I am not acquainted with those places.
3064. How many are there in West Sydney altogether? I suppose they are very small ones; but there is Wynyard-square and Flagstaff Hill. I suppose that is about all.
3065. And a little space—the triangle—near St. Phillip's Church, and a small one somewhere else;—do you not think that, if a quarter of Hyde Park is taken, it would be reasonable that the city should get the value of the money in air spaces elsewhere? Now that you put it to me in that way, perhaps it is a reasonable thing.
3066. That would raise the cost of the Railway Commissioners' scheme to £760,000;—supposing it were feasible to get a West Sydney line for £800,000 or £900,000, do you think that that would be a reasonable price to pay for it? It is very hard for me to go into the question of figures. One requires to know what interest the investment would be expected to bear, and what probably the revenue would be.
3067. Do you not think that a line running through West Sydney, and having a station at the Town Hall, another station at Wynyard-square, and another at Circular Quay, would carry a large traffic. It undoubtedly would carry a large traffic.

3068.

- A. G. Ralston. 3068. Quite as large as any line to the east? I do not think that it would carry a larger traffic, and I do not think it would be so convenient ultimately.
- 23 Mar., 1900. 3069. Do you not think it is rather important to connect with the ferry traffic at Circular Quay? I do not consider that that is of great importance. The people who use the ferry coming from the other side of the harbour are not people who would use the railway very much, whilst people coming in by train, if they want to go to the ferries, have plenty of time. The main object of bringing the railway into the city is to convenience the great majority of business men who come in day after day.
3070. Do not many business men live at North Shore? Yes; but they would come by ferry, and would not take the train to the centre of the city; they would take the tram in preference.
3071. They take the tram now? Yes.
3072. The ferry puts them down at a part of the city which is distant from their places of business? Yes; if you can get one means of conveyance to within a reasonable distance of your place of business, that is the best possible thing, but in that case you cannot expect to get one such means of conveyance.
3073. Mr. Deane has a scheme for connecting the North Shore with this scheme, but it means going out and making a large circle, and then coming back to Observatory Hill, thus making the distance as far as if you came from Redfern itself to Observatory Hill; that would be very expensive, and no shortening of the line;—therefore, it appears that this scheme does not lend itself so well to a North Shore extension as one with a station at Wynyard-square? Is it considered necessary that a North Shore extension should join on to this extension.
3074. To make a complete scheme of it, it would be? I do not see that that is a matter of urgent necessity.
3075. Otherwise you would have to have a second station in Sydney for the North Shore traffic? Well, if that were cheaper and more convenient, I do not see why that should not be done.
3076. It would be a great convenience to enable all the North Shore people to go to the railway station straight, if they wanted to? I doubt if there would be very many who would want to travel that way straight through.
3077. Mr. Dick.] Mr. Kneeshaw, the Traffic Superintendent of the Tramways, had a count made at the railway station, with this result: That out of the total number of people daily arriving at Redfern, and going from Redfern into the city, 55·8 per cent. went by the electric tram and 4·8 per cent. by the steam tram; or, in other words, out of every thirteen persons conveyed by tram, twelve went by the George-street line and one by the Elizabeth-street line;—does not that suggest that any extension of the railway along the Elizabeth-street route—as placed before us now and before the last Committee—would not convenience the majority of the people who desire an extension? No; I do not think it indicates that. I think that the falling-off in the traffic of the steam trams is a good deal owing to the inconvenience of them at present, as I explained at the commencement of my evidence.
3078. But there is such a wide difference between the numbers carried on the electric tram and those carried on the steam tram? Yes, there is. Besides, there is no doubt that all the people who go in the tram would not necessarily all go in the train; and a good many people who walk would continue to do so, even if there were a train.
3079. But those figures only include those who actually use the tram;—does it not, at any rate, suggest that an extension further west would convenience a greater number than the present proposed eastern extension? Perhaps from one point of view it does; but I think that ultimately, when Woolloomooloo is used as a business part of the city, as it will be, you will find that as many people will be inconvenienced by the eastern line as would be by the western—more perhaps.
3080. Under present conditions you do not think that the eastern line would suit so many as the western line? I cannot make that admission.
3081. Mr. Watson.] You laid some stress upon the possibilities of business extension in Woolloomooloo? Yes.
3082. Are there any indications of that at present? I think so. I think that the building of new wharfs and jetties by the Government, and the question that has arisen about resuming land for further wharfs there, show that. I also think, from what I have heard, that there is more demand for land there than there has been for some time past.
3083. But, as far as retail business is concerned, the tendency seems to be to extend in the direction of Newtown, and so on—further away from the wharfs, does it not? Yes; there is no doubt about that.
3084. Are there any indications of the wholesale people shifting their centre of operations? From what I have heard from various sources, I fancy there is. I happen to be interested in a large property in William-street, Woolloomooloo, and we have had several queries about it lately. Some little time ago, at the time of the bank failures, it was practically unsaleable. It is a trust estate, and, within the last twelve months, we have had three or four people looking after it, and I know that one person wanted it for a warehouse.
3085. Mr. Shepherd.] Do you see plan No. 3? Yes.
3086. Looking at the proposed site for the station at Hyde Park, and the George-street Markets, which do you think would serve the largest number of the day population of Sydney? Do you mean as a mere matter of present convenience?
3087. For the convenience of the day population of Sydney—that is, those who come in from the suburbs every day to business? I will admit, of course, that the George-street Markets are nearer to the present centre of the city as it lies at present; but if the city extends it seems to me that it must extend eastward, and then the Hyde Park site would be nearer the true centre.
3088. Of course, the great object is to serve the largest number of railway travellers;—I suppose you will admit that? Yes.
3089. I think it will be admitted that the George-street Markets are nearer to the centre of the day population of Sydney than being on the extreme edge of it? Yes.
3090. Because, whatever may happen, the Park and the Domain will never be built upon, and if you look at the plan you will see what an enormous space there is—the space coloured green—which will always remain vacant, as it were—that is, the Domain and Hyde Park? The view I have always taken is that Woolloomooloo will be just as big a business centre as Darling Harbour, and it seems to be that things are indicating that. Darling Harbour is cramped, and cannot expand further conveniently. I admit that the George-street Markets are the centre of the city as it lies at present, but you have not sufficient space there for a station, and you want to serve the city as a whole.

3091. As far as space is concerned, we have expert evidence to show that there is ample room in the basement of the George-street Markets for a station—much larger than many of the London stations? Surely not for a terminal station.

A. G. Ralston.
23 Mar., 1900.

3092. It will not be a terminal station;—there is a proposition to go to the George-street Markets and make a station in the basement there, and then to go on to Wynyard-square, and from Wynyard-square to Argyle-street, and from Argyle-street to Dawes Point;—you can see that this is a scheme intended ultimately to cross the harbour? Yes.

3093. I suppose you will admit that a scheme that would admit ultimately of an extension to North Sydney ought to have some consideration? Yes, certainly.

3094. If we go to Hyde Park it will be much more difficult to go on to North Shore; the other plan shows a scheme of getting to the point from Hyde Park—that is, to go back to near Liverpool-street and take a long curve—nearly a mile out of the way to get to that point; that would indicate the inconvenience of it;—at all events, considering the present position of the city, you admit that the George-street Markets site is more central than the Hyde Park site? Yes.

3095. And also that there is an advantage in going in a direction that will ultimately admit of crossing the harbour, which that scheme would do? I decline to enter into a question as to the relative advantage of connecting with the other side of the harbour according to that scheme and according to the Hyde Park scheme. I have not considered that matter sufficiently.

3096. You have probably not heard of that scheme before? I did see something about Mr. Norman Selfe's scheme.

3097. You have evidently given the whole matter some consideration—you have taken an interest in it? Yes, from the point of view of our own safety up the line, for some time. Any one who saw the people who were injured in the 1894 accident would take a strong interest in the matter on the point of safety, and it seemed to me that the only scheme possible on the grounds of expense and practicability was the Hyde Park scheme, and that is why I am so strongly in favour of it.

3098. I suppose you do not think that the extra expense of one scheme compared with the other ought to be taken very largely into consideration, if the convenience of the public is largely increased? No; but the view I take is that the public will be sufficiently served by the Hyde Park scheme—so much so that the big difference in the cost is a matter of great consideration. You must weigh the difference of cost and the balance of convenience against each other. If the inconvenience is very slight and the difference in cost is very great, you should put up with that which is slightly inconvenient.

3099. Do you think the scheme which has been laid before us is the most practicable one;—you will notice that Elizabeth-street is blocked, a considerable portion of the Park is taken up, and there is a long circular line from King-street down to the back of the Art Gallery, $8\frac{1}{2}$ acres being taken out of the Domain? Yes; I see that.

3100. Do you think that is an advisable thing to do;—there is a mile from Hyde Park around to the back of the Art Gallery which is absolutely barren of traffic, and which would take twelve minutes to go through and back again, which would mean twelve minutes loss of time for every train that would come in? Taking the view I do about the extension of the city, I think the railway should be somewhere about there. In my opinion the Hyde Park scheme is a long way the more preferable. I would much prefer not to see any part of the Domain taken. I would rather see the whole of Hyde Park taken than any part of the Domain, which, in my opinion, serves a much more useful purpose than does Hyde Park.

3101. Well, this scheme takes about $8\frac{1}{2}$ acres out of each;—now, with regard to tram accommodation, you say you have been a good deal inconvenienced by the taking off of the Elizabeth-street railway tram? Yes.

3102. That is, of course, one view of the matter; but if your office were west of George-street do you not think that you would take the George-street tram in preference to the railway tram to the top of King-street? Certainly.

3103. The trams we know are now inconveniently crowded, but if there were a large extension of the tram system by running trams down, for instance, Pitt-street, Castlereagh-street, and Elizabeth-street, do you not think that would largely convenience the Sydney population? I think that will have to come in any case some day; but I do not think that that ought to prevent the extension of the railway.

3104. Are you aware that the proposed extension of the railway to King-street does not provide for any intermediate station? I saw something about that, but I also saw a proposal for a station at Liverpool-street.

3105. There is no station proposed officially at Elizabeth-street; it is intended that the train should run right through from Redfern to King-street;—seeing that the whole of the passengers leaving Redfern by train would be put down at King-street, how much of the city do you think that would conveniently serve? It certainly would not serve so conveniently as if there were a stopping-place also at Liverpool-street. But I suppose it would serve conveniently—although not very conveniently—all the Woolloomooloo side of the city. It would also serve the people who had to go to the ferries. It would serve them conveniently, and it would also serve all the people lying between wherever the railway is to be and over towards the Domain and the Gardens; it would also serve, I think, all the people down to Pitt-street, at any rate, on the west side.

3106. How far do you think it would serve people on the south? I think it would serve the people conveniently as far back as Park-street, and probably as far as Liverpool-street. It would be preferable to get out at King-street and walk back on a level instead of getting out at Redfern and walking uphill.

3107. But do you not think that people would be more inconvenienced if they were set down by the tram at the corner of George-street and Liverpool-street;—do you not think that that would be preferable to going by train to King-street, and then walking back to Liverpool-street? It would certainly be more convenient, in one respect; but that would be counterbalanced by having to change from the train to the tram at Redfern.

3108. Well, the question is generally a matter of time;—do you not think it would take a longer time for persons who go to King-street by train, and then walk back to Elizabeth-street, than to go in by the tram? That is a matter one could test very easily with a watch. The trams are very slow with all their stopping-places.

3109. The number of stopping-places is where the convenience comes in, because in that case everyone is deposited near his place of business, and if there were a multiplication of these trams, we would have them

A. G. Ralston. them running down each street;—do you not think that that would be more convenient to everyone whose business was south of Market-street, or even at Market-street—do you not think that a person would rather come in by tram and be dropped at Market-street, than go to King-street by train and walk back? I do not know; it is a good deal a matter of choice, I think. Some people would prefer one, and some the other. I would rather get out at King-street and walk than change into a tram and get out and walk again.

23 Mar., 1900.

3110. We are talking about convenience? You generally do what is most convenient to you.

3111. You still adhere to your opinion that the Hyde Park scheme is the most practicable? I think it is.

3112. *Mr. Levien.*] You have considered all the schemes? I cannot say that I have gone into them elaborately, but I have seen the various proposals. I have read them as they appeared, and it seems to me that, on the question of expense, and the question of ultimate convenience, and the question of safety, the Hyde Park scheme is the best one.

3113. As far as you are concerned, dropping you at King-street would be more convenient than dropping you in any other part of the city, considering your professional avocation? I have really not gone into the matter from that point of view.

3114. But is it not so? There is no doubt that it would be more convenient to me personally.

3115. You looked at the matter in that way, did you not? I do not think I did; but from a broad point of view—not to serve the present city, but the future city. I have been living along the railway line ever since 1871, and have seen how the population has grown, and how the train and the tram traffic has increased, and if the traffic goes on increasing in the same way you will have to provide for it to a greater extent than you could by putting trams down all the streets.

3116. *Chairman.*] You ride, I suppose, from Redfern to King-street in a tram? As a rule, I do.

3117. What is your observation as to where most of the people alight in the morning when you come in? I think most of them alight at King-street. A good many get out at Market-street; but I think most of them alight at King-street.

3118. Do you mean by the steam tram? Yes. As regards the electric tram, I think that passengers keep dropping out all along. I have not noticed a great number get out at King-street, except, perhaps, men in my own profession, doctors, and Members of Parliament, who, I have noticed, go up King-street by the cable tram.

3119. Are you aware that the Tramway Superintendent has sworn that of the passengers by the electric trams, 90 per cent. of those who come from the railway station by those trams are still in them when they reach Market-street, and 80 per cent. are still in them when they get to King-street;—you have no reason to doubt that statement? No, certainly not. I take it that there will be a speedy service of trams to the station wherever it may be, and so you could take your choice of getting out at Redfern and coming down by tram, or getting out at King-street and walking back. I will undertake to say that more people would go along by train into King-street and take the cable tram down King-street towards Darling Harbour, if they had to go that way, than would take the electric tram from Redfern, if they had the choice.

3120. *Mr. Watson.*] You say that supposing the proposed railway were constructed to King-street there would be more people go that way, and thence by cable tram down in the direction of Darling Harbour, than would get out at Redfern and go by electric tram to the same spot? Yes; if they had their choice of the two things, they would use the railway. Any of us who have lived in the suburbs for any time would prefer to be carried by the railway as far as possible.

3121. Because of the extra speed, I suppose? Yes.

3122. *Mr. McFarlane.*] The people to whom you refer as going to Darling Harbour would have to pay an extra penny in taking the cable tram? Yes; I think that if the steam trams were run more conveniently and more regularly a larger percentage of the people would go in them. People going to Parliament House, or people going to Castlereagh-street, get on the electric tram at Redfern, because it goes straight away, and then they have either to walk up King-street or take the cable tram. I have done that over and over again, not from choice, but because it is the quickest way, though an inconvenient one. That will, perhaps, account for so many persons now going by the electric trams.

Richard Watkin Richards, City Surveyor, sworn, and examined:—

R. W.
Richards.
23 Mar., 1900.

3123. *Mr. Watson.*] Have you been requested by the City Council to represent them, or to give evidence here to-day on their behalf? I have been told by the Mayor and the Town Clerk to appear and to state that any evidence I may give would not commit the City Council in any shape or form, either as regards opinion or judgment. The Mayor, beyond that, said that I was to oppose any scheme that would affect the rights of the City Council over the streets, and that in the event of the streets being disturbed or affected, or occupied in any way, to what they considered to be the detriment of the citizens, or of themselves as a body, they would expect compensation therefor; also that, in the event of the railway being constructed over or upon the streets of the city of Sydney, they would expect it to be rated as a city property.

3124. *Dr. Garran.*] Did that question apply as to under the streets as well as to over them? Under or over.

3125. *Mr. Watson.*] As to the railway property being considered subject to rating, I presume that the City Council wish that to apply to premises that may be erected on land other than within streets? That is so.

3126. The City Council now desire that all railway property within their limits should be subject to rating? That was the Mayor's instructions to me. Beyond that I have received no instructions whatever.

3127. It seems that you are not here in pursuance of an invitation extended by the Committee to the City Council to give evidence on the scheme for city railway extension generally? No.

3128. They have not, so far as you know, authorised anyone to speak on their behalf in regard to that? No; I have had no instructions beyond what I have stated.

3129. And your evidence, as far as it is official, is restricted to the question of encroaching upon streets or other city property? Quite so.

3130.

R. W.
Richards.
23 Mar., 1900.

3130. Coming to that aspect of the matter, have you had any opportunity of studying the schemes, official or otherwise, that have been laid before the Committee? No; I have not. But this morning I saw the plan of the King-street scheme.

3131. Looking at this wall map of the original St. James' Road scheme, which took in a large portion of Hyde Park, and comparing it with the King-street scheme, as shown on the other map, which do you think would give the least interference with the roads or streets of the city? The St. James' Road scheme does not appear to seriously interfere with the streets. So far as the King-street scheme is concerned—starting from Redfern, crossing Devonshire-street, traversing the Benevolent Asylum grounds, crossing Belmore-road, passing through Belmore Park, and crossing Elizabeth-street at Foster-street, and then by curves crossing Campbell-street and lanes to Goulburn-street, going through properties between Nithsdale-street and Elizabeth-street, and tunnelling under Elizabeth-street, and thence going along the western side of Hyde Park to Park-street—I do not consider that the public ways are affected by the route thus far.

3132. It is proposed to make a deviation at Goulburn-street—which is tinted red—owing to the difficulty of crossing Goulburn-street at a sufficiently high level; it is proposed to divert Goulburn-street further south, and make a crescent of it:—would that qualify your previous statement that the route did not materially interfere with any streets? That is of no moment at all.

3133. *Mr. Leven.* Apart from the instructions you have already received from the Town Clerk and the Mayor, will you be prepared to give us your individual opinion as to the best line that we ought to construct for the city railway? Personally, with pleasure; but officially, I would not care to give it without the consent of the Mayor and Council in writing.

3134. Supposing a question were to be asked you by Mr. Watson, you would decline to answer a question as to which is the best line unless you were to get special instructions to do so? Yes, I would.

3135. Then your opinion will be given only according to the limited instructions you have received from the City Council as to what they think advisable? I would not mind giving my own opinion as far as I consider I would be safe within their criticism.

3136. Your evidence would be limited evidence, and not a free expression of your opinion, as well as indicating the lines suggested by the City Council? Quite so. I can say that the city railway extension, according to one or two of the suggested schemes, means a city improvement.

3137. *Mr. Watson.* And to that extent, of course, it would affect the City Council? Certainly.

3138. You said that from what you had seen of the plan respecting the King-street scheme, as far up as Park-street, you did not think it would materially interfere with the streets of Sydney? That is so. From Park-street northerly it is proposed to take in the whole width of Elizabeth-street and a portion of Market-street. That I do not think is a serious inconvenience; but I believe in view of the attitude of the City Council in regard to city matters recently they would expect compensation for such a resumption of Market-street, and also full payment, with interest added, for the cost of construction of each of those streets.

3139. But if there is no longer a frontage to be served by those streets where does the claim of the City Council to compensation come in:—I could understand their claiming compensation if another street were to be created in lieu of those portions that were taken, and thus causing the City Council to expend a large sum of money, but when they are not asked to incur any other liability in lieu of the streets taken over, can you give a reason why they should be compensated? They would certainly expect to be paid—take Market-street by way of example—for the paving of the footways, the kerbing of the street, and also the wood-paving, together with interest on the money expended on those improvements.

3140. On what ground? On the ground of the expenditure incurred in those works.

3141. The City Council, I presume, incur certain expenditure on streets, looking to the rates from the properties immediately contiguous to the streets to recoup them? Quite so.

3142. Well, if by the rating of the railway property they are reimbursed each year, the rates that they lose, by the abolition of those streets, then they will have no loss? I should not think they would. In giving that evidence I am mindful of the case in connection with the Railway Commissioners where a street was resumed, and we lodged a claim for the fee-simple. That was rejected, but the cost of the construction of the street was paid.

3143. But at the present time the property of the Railway Commissioners is not subject to rates? Just so.

3144. So that it would seem fair in that case that there should have been some repayment to the City Council for the expenditure they had gone to, as they were robbed, practically, of any chance of recouping themselves? That is so.

3145. Has the City Council expressed any opinion as to the desirability or otherwise of rating railway property? The City Council has not.

3146. I think you said earlier that it was their desire that railway properties should be rated? Yes. I may say that some years ago the Railway Commissioners erected a building that was contrary to the Building Act. The City Council took counsel's opinion as to the law on the point—whether we could force the Railway Commissioners to adhere to the Building Act or not—and counsel's opinion was given that the City Council had no power in the matter. I refer to those buildings opposite the General Post Office.

3147. Assuming that the City Council got power to rate the railway property which would be created by this King-street scheme, do you think that they would then be willing to forego any claim for compensation such as you have mentioned? Yes, I think so.

3148. Can you offer an opinion as to what basis that rating would be made upon? I fancy it would be at per mile—the value of a mile of construction.

3149. Taking a percentage on the capital cost of the work? Yes.

3150. What percentage, roughly, do you think would be necessary to yield a revenue to the City Council equal to that of which they would be deprived by the resumption? I cannot say.

3151. You have not gone into that? No. That would be rather a matter for the Treasurer or Town Clerk. I am not a financial officer.

3152. A portion of this scheme, or a subsidiary part of it, is to extend from King-street right through into the Domain; the first portion by tunnelling, and, in the Domain, after getting some distance into it, by open cutting to a carriage shed at Sir John Young's Crescent,—would that have any objectionable features from the City Council's point of view? None whatever.

3153.

R. W.
Richards.
23 Mar., 1900.

3153. Are there any other aspects of street disturbance you think it necessary attention should be drawn to? No; I do not see any by that scheme.
3154. Does the City Council regard itself as in any way interested in the parks within the city boundaries? Yes. In 1897 the question of taking portion of Hyde Park for city railway extension was submitted to the City Council. Five of the aldermen voted in favour of the land being given, and the remainder of the aldermen voted against it.
3155. So the consensus of opinion in the City Council was against any interference with the Park? Yes; and I think that is the opinion still.
3156. Although the City Council are not trustees, in the technical sense, for these parks, they, as representing the citizens, consider they have some interest in their preservation? Quite so. Two of the city aldermen—one representing Macquarie Ward and the other Bourke Ward—are trustees of Hyde Park.
3157. But, officially, the parks are not under the control of the City Council? No.
3158. Do you care to express any opinion as to the relative value of the St. James' Road scheme and the King-street scheme, from the point of view of park disturbance? The St. James' Road scheme seems to take a greater area of the Park, and to affect the Park to a greater extent.
3159. But it has been pointed out that the King-street proposal would involve the sacrifice of a larger total area of park land, though not perhaps in one block, than the St. James' Road scheme would? Yes, there is that in it, certainly.
3160. Can you offer any opinion as to the relative value of the parks from the point of view of acres, of public health, of convenience, and of comfort;—comparing the Domain with Hyde Park, would there be any difference in their value to the citizens, and if so, which would be the more valuable? I would not care to offer an opinion upon that.
3161. Do you think that the feeling would be in favour of preserving both of them? Yes, from a sentimental point of view; but, so far as public health is concerned, I do not think that the interference would be very serious.
3162. I do not know whether you have had any opportunity of looking into Mr. Norman Selfe's scheme? No, I have not.
3163. Even within the limit of your instructions, you have not gone into any of the other schemes that have been suggested? No, I have not.
3164. Do you care to express any opinion on the general question? Not beyond saying that, in my opinion, it is desirable to extend the railway into the city.
3165. Do you feel competent to express any opinion as to which is the more desirable route? No.
3166. There is, perhaps, one matter you may be willing to give an opinion upon, and that is this: Mr. Norman Selfe has made a proposal which involves taking the basement of the Victoria Markets for a wayside station for city railway extension;—can you offer any opinion as to either the desirability or the practicability of that? I would not care to do so, for the reason that the Queen Victoria Markets have already given the City Council enough trouble, and there is a great diversity of opinion as to their usefulness.
3167. *Chairman.*] With regard to the portion of the city where streets are to be intersected and partly resumed, and property resumed, from the Belmore reserve up to Liverpool-street, can you say, as City Surveyor, and having a knowledge of that part of the city, whether it would not be a very good thing if that part of the city, especially the locality known as Wexford-street, could in some way be done away with by resumption? From every point of view, if the whole of that area bounded by Macquarie-street, Campbell-street, and Foster-street, and by Elizabeth-street on the west, were resumed, it would be a city improvement of infinite value. It would give an opportunity of removing squalid tenements and reconstructing that part of the city which is very awkward in its configuration. That, I believe, the City Council would hail with pleasure.
3168. So that, as regards that particular portion of the street and land resumption, you think this is a very desirable route? Yes.
3169. I suppose what you really mean is that, in addition to the necessary width of resumption for the purpose of the running lines, it would be well if the Government could extend their resumptions there a little, so as to improve the whole locality? Quite so.
3170. But even a partial resumption would have a good effect? Yes.
3171. We received a letter on the 10th February from the Town Clerk, to this effect:—

Extension of Railway into the City.

Dear Sir,

Town Clerk's Office, Sydney, 10 February, 1900.

I am directed by the Right Worshipful the Mayor, Sir Mathew Harris, M.P., to say that he has been naturally expecting to be recognised or consulted in some way by your Committee during their deliberations on the subject of the extension of the railway into the city; and although he has no reason to think that they would so far overlook what is due to the city in this respect, he thinks it well that you should be reminded, least possibly the matter be overlooked,

The Right Worshipful the Mayor is prepared, if necessary, to give evidence before the Committee; but he takes it for granted that the opinion of the City Council will be sought before a decision is arrived at, for from the plans from time to time made public it would seem that this scheme will take over, or at least seriously interfere with, city streets, which have in themselves involved large sums in capital cost, and in case of resumption would have to be replaced at very great expense.

I am, &c.,

ROBT. MACE. ANDERSON,

Town Clerk.

The Secretary, Public Works Committee, care of Parliament House, Sydney.

That letter was acknowledged on the 16th, and the Mayor was informed that the Committee intended to invite the opinion of the City Council in connection with the matter; beyond an expression of opinion such as you have given to-day, have you received any instructions from the City Council to examine the various plans which are now before the Committee, with a view of giving evidence as to which is the best route? No; I have not.

3172. And I suppose you have not examined the plans? No: not beyond looking at two this morning.

3173. *Dr. Garran.*] You know the large number of cabs there are at the Redfern railway station? Yes.

3174. It is proposed by the Railway Commissioners to bring the long-distance traffic into Hyde Park as well as the suburban;—would that involve a large number of cabs being collected around King-street? Yes; I expect it would.

3175. Have you given any attention to the accommodation for those cabs on either of the two Hyde Park schemes? No. At the present time there is a cab rank at Hyde Park accommodating, I should think, more

more than 100 cabs. In the event of a rush of traffic there would be accommodation by using St. Mary's Road; but that would be rather inconvenient, because the gradient is rather a steep one.

3176. You know that under the scheme before us Castlereagh-street is to be a little widened; but do you think that, with a double line of trams running along Castlereagh-street, there would be room there for a cab-stand as well? That street is 42 feet between the kerbs. There would be room for a cab-rank on the eastern part of the carriage-way of Castlereagh-street, as widened on the plan.

3177. One of the Government witnesses suggested that an overflow stand for cabs should be in Phillip-street;—would there be any inconvenience in that? No.

3178. That would be nearer than St. Mary's Road? Yes; and more convenient by reason of the gradient.

3179. You do not think there would be any difficulty in accommodating the cabs? I think not. At the present time, in Devonshire-street, the cabs file from the railway gates to Castlereagh-street, and sometimes from Devonshire-street and Castlereagh-street to Cleveland-street; so that dispels the idea of the danger of having a cab-rank adjacent to a double line of tramway in a 42 feet roadway.

3180. But is not Devonshire-street really crowded now with the cab-stand, and the tramway, and the general traffic? Yes; but there is a cab-rank there, and it is worked.

3181. You are quite aware, I suppose, that Devonshire-street will have to be very much altered? Certainly; in the event of railway extension.

3182. It must be lowered at least 9 feet, and that would interfere with the drain which is underneath it? Yes.

3183. Some of the schemes proposed to block Devonshire-street altogether as a public highway, leaving it only for the railway service;—is there any objection to that? Yes; that is rather serious.

3184. It is proposed to make a substitute—either to make a deviation round by Belmore-road, a continuation of Castlereagh-street, or to make a new street under the railway opposite the junction of Pitt and George streets where the Police Station was? I should think the Castlereagh-street extension across the burial-ground would be preferable.

3185. Because it would not break the block of land? Quite so.

3186. You do not think there would be any great objection? No; provided that one or other of those roadways were substituted.

3187. Traffic going down Devonshire-street and coming to the city would be just as well accommodated by Belmore-road as by keeping on straight in Devonshire-street? Yes.

3188. And any traffic going the other way could take Cleveland-street? Quite so.

3189. So you see no objection to blocking Devonshire-street? No; provided that such an alteration were made.

3190. It is, of course, proposed that Belmore-road shall be widened? Yes.

3191. There is another scheme before us relating to the building of a new central station on the Benevolent Asylum site; have you formed any opinion about the policy of that? No; I have not.

3192. It would in no way be injurious to the city? I think not.

3193. The general opinion of the experts is that we cannot, without very great expense, make the present station-yard really a good one? I am of that opinion too.

3194. And that by crossing Devonshire-street we have 22 acres available altogether on which we can have a station that would last for all time;—you think that? Yes, I do.

3195. Is there any other place in Sydney where you could get 22 acres? I do not know of any.

3196. Even if we were to adopt the Hyde Park scheme, Mr. Eddy thought it would last only for twenty years? Yes.

3197. Would you like to see another quarter of the Park taken then? I would not.

3198. You think that a quarter of the Park is as much as ought to be taken? Yes, if taken at all.

3199. You think no more should be taken? Yes.

3200. Mr. Eddy was of opinion that if we wanted more space twenty years hence we must look elsewhere for it? Yes.

3201. Well, where is "elsewhere"? Government House domain.

3202. Is that central? It would not be as central as Hyde Park.

3203. Do you not think it would be more likely that we would have to go to the west side of Sydney? Probably, yes.

3204. And if we have to go to the west side of Sydney, will not land there be dearer twenty years hence than it is now? Certainly.

3205. And a western railway to go to the North Shore would be a more costly job to make than now? Yes, certainly. I may say at once that, in my opinion, any city railway extension should provide for connection with North Sydney.

3206. And do you think that it should also provide for a connection with the eastern suburbs? Yes; I do.

3207. Any scheme that lends itself to those two extensions would have something in its favour? Certainly.

3208. Do you think the Hyde Park scheme lends itself well to a North Shore extension? I do not see any engineering difficulty in it.

3209. Which way would you propose to go? That would require more consideration than I have given it.

3210. There is some difficulty in the way of tunnelling under the harbour, partly because we are not deep enough at Hyde Park, and we should have to get under very valuable properties, and perhaps cross the Tank Stream; and Mr. Deane's scheme is to go out of the station, and with a curve come back, and that would make the length of the line as far as going from Redfern straight to Wynyard-square, and as costly? Yes, I see.

3211. Do you think, on the whole, that a railway on the west side of George-street would accommodate as many people as one on the eastern side of it? No, I do not think so.

3212. You think that the Hyde Park station site is more central than a station at the Victoria Markets would be? Yes.

3213. Accommodate more people? I think so.

3214. We have had one scheme before us with a station opposite the Town Hall, another at Wynward-square, and another at Circular Quay;—would those three stations accommodate the bulk of the people? I do not think so.

R. W.
Richards.
23 Mar., 1900.

R. W.
Richards.
23 Mar., 1900.

3215. Whom would they leave out? I fancy they would leave out the people of a good number of the southern suburbs—I mean Stanmore, and places in that direction.
3216. But they are not city residents? The residents of those districts have, of course, their business in the city, and I take it that most of them would be better served by the King-street scheme than by such a scheme as you speak of, although the Town Hall is practically standing on the centre of the city.
3217. The people who would be put down at the Town Hall would be very numerous? Not such a number, I should take it, as those who would be put down at Hyde Park.
3218. Now suppose we had a station at Wynyard-square as well as at the Town Hall, which would unload the most passengers—the Town Hall or Wynward-square? The Town Hall, I should think. The people alighting at Wynward-square would not be many of those who would go to the east, whereas the Town Hall station would empty its people to the east.
3219. Do you think it of no importance that an extension of the railway into the city should connect with the ferry traffic at Circular Quay? No; because I think that any city railway extension scheme should provide for getting over Circular Quay to connect with North Sydney.
3220. You do not think that the ferry traffic at Circular Quay is very important? It is important as it is; but it is not important, I think, in considering a city railway extension, because it is fairly well served by the tramway service now.
3221. You think the electric tram now does all that is wanted? I think so. It is a quick and a convenient service.
3222. I presume that you, in consonance with many others, are a little surprised at the enormous traffic on the electric tram in George-street? I have been.
3223. Is that any inconvenience to George-street? We anticipated a great deal of inconvenience, but so far as I am concerned officially, I have not experienced much.
3224. One witness—a professional man, too—said that any man going into George-street now takes his life in his hand;—do you think so? No, I do not. What does he mean?
3225. That it is dangerous to cross the street on account of the tram traffic? I do not think that is correct.
3226. Do you think that a similar tram service in other streets would be inconvenient to the citizens? No; I think it would be a very great convenience to the travelling citizens.
3227. Well, suppose there were half a dozen of them in the different streets of Sydney, all going to Redfern, do you think that that would supersede the necessity for extending the railway line? No, I do not think it would.
3228. You think that nothing will supersede the extension of the railway line? I think not.
3229. Where do you yourself reside? At Randwick.
3230. In the way of a railway, you would be served only by an eastern suburban line? That is all.
3231. Do you think that the present connection with Randwick gives you fairly adequate accommodation? "Fairly adequate" would about describe it; but we want it better.
3232. It is not good enough? No; but the Randwick people have asked for too much at times, and we are getting little by little, and the complaints are fewer now than they were some time ago. I think the Commissioners serve us very well indeed.
3233. Then you do not think that, at present, there is any need for an eastern suburban railway line? I would not say that.
3234. If we had an eastern suburban railway, would it not kill the paying character of the present tram service? No; I really think that as our population increases one would help the other. As commercial speculations, their time-tables would have to be arranged so as to work in with each other.
3235. We have it in evidence that the electric trams in George-street have robbed the railway trams in Elizabeth-street of an immense proportion of their traffic? Yes.
3236. Is that not because the George-street line puts passengers down nearer to their places of business? That would be the logical conclusion.
3237. You think it must be that? Yes; regarding railway traffic and tram traffic, it might be interesting to get a comparison between the Newtown and St. Peter's tram traffic and the railway traffic between Sydney and those places.
3238. The trams seem to pick up the people who live along the sides of the streets? Yes.
3239. The railway stations are not nearer than three-quarters of a mile apart, and people prefer to get into a tram that passes their own doors than to walk three-quarters of a mile to a railway station? Yes.
3240. And if they come in by railway they are put down at Redfern, and have at present to pay 1d, and used to have to pay 2d. for a tram into the city; therefore we cannot very readily compare the railway and the tramway traffic? No.
3241. All we do know is that the trams live in spite of the railway? Yes.
3242. If we were to make a railway to the eastern suburbs, do you think that the trams there would still live? Yes.

TUESDAY, 27 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDSAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined—

H. Deane.
27 Mar., 1900.

3243. *Chairman.*] I understand that you have considered pretty fully Mr. Norman Selve's scheme for an extension of the railway into the city, and also Mr. Greenwood's scheme for the same purpose, and that you have prepared a document giving your views on both of those proposals? Yes.

3244.

3244. Will you kindly read it to the Committee, taking Mr. Selvo's scheme first? Yes.

H. Deane.

27 Mar., 1900.

Mr. Norman Selvo's Scheme.

I HAVE gone very carefully into this matter, and have considered Mr. Selvo's plans and estimate. Mr. Parry has assisted me very largely in coming to my conclusions, especially those connected with traffic. Mr. Selvo divides his proposal into three sections—the first being the section of the city railway proper between Redfern and "The Rocks"; the second, comprising alterations between Eveleigh station and Devonshire-street; and the third being improvements at Redfern, and an enlarged terminus there. For convenience, I will take section 2 first.

Section 2.—This would necessitate the reconstruction of Wells-street bridge and the Eveleigh platforms in part, because the alteration to the gradients involved in passing the lines to the terminus over the descending lines to the city commences some distance along the platform from Wells-street.

Mr. Norman Selvo starts raising the long-distance lines in Eveleigh station which run into the terminus at Redfern, in order to get his city lines, of which he has four, and the Darling Harbour lines (two), to descend and pass underneath the long-distance lines, and go out through the George-street bridge. This section shows what is done.

3245. *Mr. Dick.*] We understood, both from Mr. Norman Selvo's plan, attached to his pamphlet, and from his personal description when going over the proposed route, that his city extension started at Eveleigh, and kept entirely to the west of the present lines until reaching the station yard about the Mortuary? That would be perfectly impracticable, because it would simply carry the quick trains into the City, leaving the slow trains on the eastern side to go into the Redfern terminus, the quick trains being on the western side.

3246. Is not a change in the character of the lines possible, in order to meet that difficulty, by putting the quick trains on the other side? Yes, if you reverse the whole policy of the Railway Commissioners in that respect, by starting right away from Homebush and Strathfield and reverse things; but I do not think it is possible. It would mean a considerable amount of expense, and an entire alteration of the existing order of things; but I think it is scarcely possible, because those lines have been evidently arranged on the one side for the slow traffic, and on the other side for the quick traffic, after very careful consideration, and the connections have been made to suit.

3247. *Dr. Garran.*] Would it not be possible to turn the the quick lines to the eastern side line just as easily as the slow lines—to cross over? I am dealing with Mr. Selvo's scheme; I am not working out a scheme for Mr. Selvo.

3248. You said, I understood, that it would be impossible to turn the quick lines to his city line? Oh, no.

3249. Well, if you were to turn the quick lines to his city line, the quick trains could go into the city by his line? But what about the slow trains.

3250. The slow trains could go too? But how would you get into the terminus. You want to do three things: to get some of the trains into the city, to get some of the trains into Redfern terminus, and you have to cross them over one another, because they are otherwise on the wrong sides.

3251. The points can be arranged as the trains come up, whichever way you want the trains to go? But not according to Mr. Selvo's plan. You cannot do it on that plan, because as soon as he leaves Eveleigh station with the city lines, he is in cutting, descending so as to get his grade of 1 in 73, and therefore no intercommunication between the lines north of Eveleigh station could possibly take place.

According to the section submitted, it would appear that the bridge would have to be raised about 6 feet. Cleveland-street bridge would also have to be constructed at a higher level, and the approaches raised. The altered grades lead into the Redfern terminus, and they would extend a considerable distance towards the station platforms, and necessitate the regrading and reconstruction of the whole of the goods and passengers sidings in Redfern station yard, and even then the working of the yard would be made very difficult.

Mr. Norman Selvo makes the end of his 1 in 70 grade, descending into Redfern terminus, about 320 feet from the end of where the platforms start. An inspection of his No. 6 plan will show that there being only about 320 feet of level, that is the only part where any connections can be made with the carriage-sidings and carriage-sheds; the lines from that point as they rise towards Eveleigh are therefore at a different level, and on a grade of 1 in 70, and it would be impossible to make the proper connections outside that length of 320 feet.

3252. *Mr. Watson.*] Assuming it to be difficult to make connections with the carriage-shed sidings, would it not be still more difficult to make connections with the goods-shed sidings, which are still further south in the station-yard? Well, just as difficult, except that I presume Mr. Norman Selvo intends his goods-sheds sidings to be continued through, along those blue lines on the plan. That is not very clear, but I think he intends to carry them at an unaltered level. He has, however, not connected them as required with the slow lines south of Eveleigh station.

3253. *Mr. Dick.*] Would that be a matter of serious moment if only long-distance trains came into the Redfern terminus? It is the opinion of the Railway Commissioners, and also my own opinion, that all the traffic ought to be kept together; but still it is a matter partly of opinion and partly of the expense of working.

The Chippendale School site would have to be resumed; also a portion of the Wesleyan Church. Considerable alterations would have to be made south of Eveleigh station, so as to make connection between the running-sheds and the new set of lines to the Darling Harbour branch; in fact, it is doubtful if the latter could be connected at all, or any of them satisfactorily. Extensive interlocking arrangements would also be involved. The line to the Mortuary station would be on a different level to the passenger and Darling Harbour branches, and must join the main lines at Wells-street instead of in the ordinary way. This would be most inconvenient in transferring engines and carriages between Redfern station and the Mortuary. The same difficulty would occur in connection with the city lines and the carriage sidings in Redfern yard. Connection in this case would be possible only south of Eveleigh station, and this would also apply to the transfer of goods traffic between Redfern and Darling Harbour, as there could be no connection between the Redfern and Darling Harbour branch, except south of Eveleigh. The whole of the signalling and interlocking arrangements in Eveleigh yard would have to be removed and remodelled. It is evident that provision must be made for storing suburban trains either south of Eveleigh, or somewhere on the new set of lines, as the space at Redfern could not be utilised, and the acre proposed by Mr. Selvo to be resumed from Goodlet and Smith's timber yard for shunting purposes would be useless for storing passenger trains. The estimate of cost for carrying out the works between Eveleigh and George-street bridge seems to be inadequate. The plans are not sufficiently definite in detail to allow me to check it with any accuracy. The ruling grade on this portion of the work being about 1 in 73 for 30 chains, this would control the loads of the trains, and as large sums of money have been spent to provide grades of 1 in 100 on the suburban lines, such expenditure would be partly wasted. It is clear that to work the city lines with a gradient of 1 in 73, either the train loads—that is, the number of carriages—must be reduced, or a completely different set of more powerful engines must be purchased for the purpose of taking the same length of train. In the first case the capacity of the line for taking traffic is seriously diminished, and in the second case expenditure is involved which is not provided in Mr. Selvo's estimate.

3254. *Mr. Watson.*] For the long-distance traffic it is proposed by Mr. Norman Selvo to start about 300 feet from the end of the platform with a grade of 1 in 70? Yes.

3255. And that continues, how far? About 1,600 feet; that is, nearly one-third of a mile.

3256.

H. Deane. 3256. Then you run down into Eveleigh station with a similar grade? Yes.
 3257. What effect would a down grade into the station, and an up grade out of the station, have on the long-distance traffic? The down grade into the station would not matter very much, except that the engine drivers would have to be very careful in applying brakes coming in. But a heavy, or comparatively heavy, grade going out of the station would be very objectionable. It would lead to difficulties in starting in bad weather, and it might limit the length of the train.

3258. To get the maximum of safety about a station, it is better to have, for some distance away from it, a line absolutely level? Yes; or to go into the station with a rising grade, which helps to stop the train, and to go out of the station with a falling grade, which helps to start the train. That is what is generally aimed at if circumstances permit; but a down grade into a station is scrupulously avoided. In the proposals that I have worked out for the city railway, I have a rising grade into the terminus, in each case, so that all trains would stop with less use of brakes, and in starting they would have a grade which would accelerate motion.

With regard to Section 3: the proposed plans for re-modelling the existing Redfern station by utilising existing platforms by extending them further north perpetuates present difficulties. Some of the proposals, as, for instance, the introduction of baggage and parcels offices under the station at Devonshire-street, would involve a very considerable lowering of the ground, and consequent expense. The whole design involves a very large expenditure in botching up defective arrangements instead of making a clean sweep, and laying out a new plan to suit modern requirements. The disturbance to the existing lines and platforms during the alterations would involve very great inconvenience and risk, and the whole of the signalling and interlocking arrangements would have to be removed and remodelled.

No. 1 Section.—As the present Redfern station would be entirely cut out of use for suburban and semi-suburban trains, passengers wishing to change to the main line would suffer very great inconvenience, which could only be met by stopping all long-distance trains at Eveleigh in order to enable them to change there.

Victoria Market Station.—The proposal to bring the railway into the basement of the Markets is quite impracticable. The space available is not sufficient for dealing with the large amount of traffic, and if the area covered is more than that at the Mansion House Station in London, it is to be remembered that the latter, though restricted, has been designed for passenger traffic, and is not a mere makeshift. It is to be observed, moreover, that the kind of business done at the Mansion House station is of a different character, and probably much simpler than that which would have to be dealt with at the Victoria Markets. Mr. Selge shows three lines of way coming into the Markets, one line brought under George-street, the ground being excavated for the purpose, and afterwards covered over. One platform is 460 feet long by 28 feet wide, with heavy columns along the whole length about 16 feet apart, and in the centre is a heavy mass of brickwork 63 feet by 10 feet, and only 6 feet from the centre of the rail of one line, which would be a most serious obstruction to passengers. About 72 feet of the northern end of the platform is rendered useless by the stairway obstruction. The other platforms are equally inconvenient. The adaptation of the Market basement for railway purposes would involve, in my opinion, most dangerous alterations. Those considered necessary by Mr. Selge, and which are probably all that could be done with any degree of safety, do not give widths to agree with standard practice. The trains have to pass through passages 12 feet in width, whereas 14 feet is the recognised minimum structural width; but in some cases piers would stand only 5 feet from the centre line of the rails, instead of 7 feet at least as they should. Brick piers are left standing on the platforms only 3 feet 6 inches from the edge, whereas it is looked upon as an indispensable condition in railway practice that no columns or piers should stand closer to the edge of the platform than 6 feet. Mr. Selge has not shown how access can be properly provided to the platforms, and it does not seem possible to make adequate provision to deal with the large crowds which at times must enter and leave the station. The question of ventilation is dealt with in rather an off-hand manner, and though it may be possible to provide sufficient fresh air in the station to prevent excessive inconvenience to passengers, it is very unlikely that it could ever be made a properly-ventilated and pleasant place to be in, especially as the railway approaching the station is in tunnel right up to the front wall of the Markets at the south end, so that the smoke would drift out of the tunnel into the station. I gather from Mr. Selge's evidence that he considered Mr. Rennie approved of his proposal to use the Markets; but I would point out that on page 1 of his report, dated 19th December, 1898, he says: "The basement of the new Markets, near the Town Hall, is entirely unsuited for a railway station, and it would be a piece of vandalism to appropriate it."

Mr. Selge proposes to extend two lines only for suburban traffic beyond the Markets, the other two lines which he shows on his plan being extended to the North Shore. I have no hesitation in saying that two lines are not sufficient to take the suburban trains through to the terminus. There are no shunting facilities by which some of the trains could be stopped at the Markets and sent back: and the question arises by which other way will it be possible for trains to be carried back. As a matter of fact, they would all have to be carried through, and, according to Mr. Selge's plans, on two lines of way. This is not a workable proposal, as trains coming on to the Market station would have in some cases to wait for one another and proceed in single file to Wynyard-square and "The Rocks." If four lines could be carried beyond the Markets right through, all necessary shunting could be done at "The Rocks," if a sufficient area of land were resumed for the purpose. This, however, would preclude any portion of Wynyard-square being used as a station for the lines from the North Shore, as it is not practicable to bring in a separate branch train service at this point; and it is to be remarked that Mr. Selge's plans show no terminal station for the North Shore traffic, and it may therefore be assumed that, if he has thought about it at all, he must propose to work it in connection with some of the suburban trains in a see-saw manner. This, I need scarcely point out, is unsuitable for several reasons, one of which is that the ruling grade on the North Shore line is 1 in 50, while the ruling grade on the western suburban line is 1 in 100. With regard to the two stations—Victoria Markets and Wynyard-square—which are no doubt otherwise suitably located, they would be open to the objection that passengers would have to ascend and descend considerable flights of steps. With regard to resumptions and interruptions to business, between Market-street and King-street, I cannot believe that Mr. Selge has not very much under-estimated the difficulty of passing under Lassetter's and other buildings, and has not under-estimated the damage that would be done to the businesses now conducted on those premises. I understand that he proposes to resume in its entirety the Kidman's buildings, and remove them so as to throw the lines open to the air.

It will be seen from the foregoing that I do not consider Mr. Selge's scheme practicable.

To summarise: Mr. Selge's scheme fails chiefly in the following particulars:—(1) The ruling grade is 1 in 73 instead of 1 in 100 as it should be. The alteration of grades between Eveleigh and Redfern causes a want of connection between city and suburban lines with Redfern terminus for the interchange of passengers. It causes difficulty in interchanging vehicles and engines between sidings and carriage-sheds at the terminus—(2) Darling Harbour lines; and (3) Mortuary station. It necessitates the reconstruction of the whole yard at Redfern. It renders impossible any proper connection of city lines and Darling Harbour lines with the engine running-sheds at Eveleigh. The Victoria Markets cannot be used as a station. With four lines to the Markets and two lines beyond, the traffic cannot be conducted satisfactorily."

Any one of the above objections is sufficient to condemn the scheme, as they cannot be got over without altering the essential character of the scheme. I am sorry to have to say this, because one cannot but recognise the immense amount of pains which Mr. Selge has taken in the preparation of his plans.

I have a statement here which Mr. Parry was very anxious should go into my report, and I propose, with your permission, to read it. It is evidence on Mr. Selge's scheme, but in part it applies also to Mr. Greenwood's. It applies to Mr. Greenwood's scheme only so far as his arrangements are similar to Mr. Selge's. There is nothing in it specially applicable to Mr. Greenwood's scheme. The following are Mr. Parry's views, which I entirely endorse:—

To separate the country trains from suburban trains, those from the country to terminate at Redfern, and the suburban at Market-street or Wynyard-square, would be very unsatisfactory, and give rise to much irritation to travellers. The only trains which can be considered purely country trains are as follows:—

	Down.	Up		Down.	Up.
Southern mails.....	1	1	Goulburn day train	1	1
Western „	1	1	Bathurst „	1	1
Northern „	1	1	Tamworth „	1	1
Melbourne Express.....	1	1	South Coast „	2	2

Of course this number is largely increased at holiday times, and even these in some cases do suburban work. All other regular trains do some suburban work, and to start them from and terminate at Redfern would be most inconvenient to passengers using them. H. Deane.
27 Mar., 1900.

All tourist trains to the Mountains and to Moss Vale are used largely by business men, who require to go direct to and from their offices and trains with the least delay in transit and without changing, so that the country trains ordinarily form a very small proportion of those to be dealt with; but at holiday times the number of country trains is considerably increased, and provision must, therefore, be made to meet the maximum traffic, for if the arrangements are insufficient to meet holiday requirements, then the whole system breaks down at the most critical time.

It must be clearly understood that whatever scheme is decided upon, accommodation must be made for dealing with the maximum holiday traffic, and not be limited to deal with ordinary every-day business.

The suburban traffic on these lines differs from most other places, as the very large population is settled in the various suburbs along the line to Homebush, and there are sufficient travellers to enable through business trains, morning and evening, to be run alternately direct to or from almost every station (each station, therefore, has its express service), instead of stopping at all stations, as is usually done at other places. This mixing up of through with stopping trains necessitates special arrangements at the terminal for dealing with the same, and for separating the passengers for the various localities.

The cost in working the traffic by running country trains to and from Redfern, and suburban trains to the Markets or Wynyard-square, would be very much greater than by dealing with the whole business at one terminal station. A large staff would have to be kept at Redfern to deal with the country trains, whereas if the whole of the trains were dealt with at one new terminus the same porters would be available to deal with the country and suburban trains, because the country trains chiefly arrive and depart at times when the suburban traffic is light.

It will be seen, in reply to Question 1660 of Mr. Selge's evidence, which is as follows, viz. :—

1660. "Do you think you have room under the Victoria Markets to deal with such a large daily traffic?"

He replied :

"It is a question I have not gone into very deeply for this inquiry, because you could not tell where it would lead you to." So that Mr. Selge admits he has not given the subject full consideration, and therefore his evidence could not be relied upon, especially in view of the fact that the proposal has been condemned by Mr. Rennick, the Engineer-in-Chief for Victoria, who was specially deputed by the Government to report on the scheme, in the following terms :—

"The basement of the new markets near the Town Hall is entirely unsuited for a railway station, and it would be a piece of vandalism to appropriate it, even were it well adapted for the purpose."

Vide clause 12, page 1, of his report, dated 29th August, 1899.

In addition to which the proposal has been condemned by the responsible officers of the Railway Department who have given evidence.

Again, in reply to Question 1662, as to dealing with the urban and suburban traffic at Victoria Markets, Mr. Selge stated : "You would deal there with at least twelve trains an hour each way; I think you could deal with twenty."

As no details are shown on Mr. Selge's plan as to the method he proposes for dealing with the shunting of the trains, it is impossible to say what could be done, but it is quite certain that the arrangements would be absolutely inefficient to deal with the business required to be done.

In consequence of the city lines and the lines to the Redfern terminus being on different levels, so that no connection can be made between the city lines and Redfern terminus, except at Eveleigh, great inconvenience would be experienced in transferring horse-boxes, &c., coming from the suburban lines to Redfern terminus to go forward by through trains from Redfern. This would also specially apply to horse-boxes coming from suburban stations by suburban trains to go forward on special horse-box trains from Redfern to races, such as Rosehill, Kogarah, and Canterbury.

Mr. Selge's proposals of terminus for the city extension are vague and indefinite. He refers to doing shunting at Goodlet and Smith's yard, and between the Markets and York-street, but it would be utterly impossible to shunt the trains on the area proposed to be resumed, and, therefore, absolutely necessary to go on to "The Rocks," and there provide shunting yard and storage accommodation for trains and engines, even though the eastern extension is made, because the passengers would require to arrive from and depart to the eastern and western suburbs at the same time, so that only a small proportion of the trains would require to make the circle, as it is termed; and as by the alteration of grades between Eveleigh and Redfern there can be no connection between the city lines and Redfern terminus, except at Eveleigh, the storage accommodation at Redfern station could not be utilised for storing suburban trains and engines owing to having to shunt to and from Eveleigh and Redfern to get to and from the city lines, so that storing accommodation must be provided on the city lines for carriages and engines for the suburban and semi-suburban service.

Mr. Selge, in reply to Questions 1594-5, says he would have more room at "The Rocks" for storing carriages than is provided by the Hyde Park or King-street schemes.

Now, it has been clearly pointed out that the Hyde Park scheme is not intended to provide storage accommodation, and six lines have, therefore, been provided so as to enable the engines and cars to readily run to and from Redfern where the storage room is provided; then, as regards the King-street scheme, the area at the back of the Art Gallery only provides for a portion of the cars and engines—a considerable portion would still have to return to Redfern to store under that scheme, to facilitate which six main lines are provided between King-street and Redfern. As Mr. Selge only proposes to resume $7\frac{1}{2}$ acres at "The Rocks," it is very clear the area would be insufficient. Mr. Selge has an alternative to provide 20 acres net.

There is no provision made for a proposal for terminal arrangements in the city stations for the North Shore line, when it should be constructed. This would be absolutely necessary to provide for, because the North Shore passengers would require to arrive at the same time as those from the eastern and western suburbs, and a large number of trains from each direction would require to terminate on arrival in the city, unless a great waste of train mileage were incurred by running trains from the city to the suburbs empty in the morning and back in the evening, for there would certainly not be passengers to travel in them.

In determining the area of land required for terminal and shunting yard, it is useless speaking of it in acres unless the shape of the area available is considered, for 6 acres in a suitable position may be of more utility than 10 of an unsuitable shape.

I must say, in regard to Mr. Selge's proposed terminal arrangements at "The Rocks," there is evidently sufficient ground to do anything you like. I have not criticised that as a site for the purpose. Regarding it as a matter of space, I am sure that plenty of land of the proper shape could be found. The only difficulty would be the resumption, whatever that might be, and the extraordinary difference of level that there is between one side and the other.

3259. *Chairman.* You have also, I believe, prepared your comments on Mr. Greenwood's scheme? Yes.

3260. Will you kindly read them to the Committee? Yes.

Mr. W. Greenwood's Scheme.

In answer to Question 1847, Mr. Greenwood says that from Redfern to Circular Quay there would be provision for four lines of road, and two to the eastern suburbs, and later on he says from Redfern to Wynyard-square there would be four lines of way, and on to the Circular Quay, and on the suburban line, two lines of way. I would point out that he only shows four lines of way running parallel to one another as far as Bathurst-street. From there two roads rise in order to get to the North Shore, and two descend so as to get to the Circular Quay. The plan and section show this latter arrangement, which, therefore, may be taken to be his matured proposal. His estimates are not by any means clear, and those made for the same works at different portions of his evidence differ to some extent from one another. With regard to cost, Mr. Greenwood has, in my opinion, seriously under-estimated. He reckons, for instance, that the lines along York-street can be done for £50 a yard for the double road. I think he will find, taking all things into consideration, that that amount will be nearly doubled. The location passing the Town Hall and Markets, so as to get a through connection between York-street and George-street, is an impossible one. It is, at any rate, one that should not be attempted, as the risk to the buildings would be too great, and the curvature involved would be very objectionable. The idea of passing

H. Deane. 27 Mar., 1900. passing one line over another would lead to very serious difficulties. Mr. Greenwood has grades of 1 in 60, and 1 in 66. This would seriously limit the train-loads and involve—as in the case of Mr. Selve's scheme—more powerful locomotives, the objection against Mr. Greenwood's proposal being still greater than against Mr. Selve's, because his grades are worse. The location of the Circular Quay station is a most objectionable one. Mr. Greenwood says, in answer to Question 1894, as to the space taken up between the Custom-house and the other side of the Quay, that there would be practically none. I have shown on a plan the space that would be taken up, and it will be seen how serious the interference would be for the ordinary wheel and passenger traffic, and it would render the completion of the tramway system, as sketched out on the same plan, impossible.

Mr. Greenwood shows four lines parallel to one another as far as Bathurst-street; but although this is the case, the manner of the continuation of them prevents any shunting taking place at Bathurst-street. Consequently, it may be looked upon that two lines of way are intended for the North Shore connection, and two lines of way for the western and eastern suburban combined. Two lines of way are not sufficient to work the suburban traffic. There are trains from Parramatta, others from Homebush, others from Ashfield, others from Hurstville, others from Belmore, besides those from Hornsby, Penrith, and Campbelltown. There are also the Mountain and Moss Vale trains, and all those would have to come into the city. Some of them are fast trains, and some slow. Mr. Greenwood says they must be all slow trains through the city, so that the fast and slow trains would have to wait on one another at Redfern, so as to go in single file into the city. There are no terminal arrangements. If the line is made—as it must be made—into the city first, the eastern suburban line being left for later completion, something in the way of terminal arrangement is necessary. I understand that Mr. Greenwood does not consider it is necessary, and would merely shunt the trains beyond the station at Circular Quay and run them back—that is to say, he would run them back in the order in which they came. There would be no waiting for time and no re-arrangement to suit time for starting. In fact, they could not work to a time-table at all. Mr. Greenwood's stations at Wynyard-square and Circular Quay are open to the objection that there is not proper room for access or space for offices, and the Wynyard-square station is also objectionable on account of the depth below the surface. As regards the depth at which the Circular Quay station is situated, it would be a very difficult matter to make it watertight, and it would in any case be a costly operation. The use of concrete alone would not effect this, but some waterproof material in layers—as was adopted at Boston, U.S.A.—might answer the purpose. In order to reduce the objection as to length of tunnel, Mr. Greenwood makes his line open to the air, except between Bathurst-street and Wynyard-square—that is about half a mile—and he is of opinion that the ventilation would not be bad, because he says the time occupied in travelling cannot possibly be a minute in this case. (See answer to Question 2038.) The average speed between these two stations might possibly be 12 miles an hour, not more, or a mile in five minutes. The passage through the tunnel would, therefore, take two and a half minutes at least, and the tunnel would not have time to clear itself during those times of the day when traffic was heavy.

Mr. Greenwood's is a most unsuitable scheme, and, with the location and levels given, is not capable of improvement.

WEDNESDAY, 28 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIER, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane. 28 Mar., 1900. 3261. Mr. Shepherd.] I think you said, yesterday, that there would be great difficulty in crossing the lines at Redfern station, according to Mr. Selve's scheme? There is no difficulty about crossing the lines. Mr. Selve does that in a satisfactory manner, so far as the mere crossing of the lines is concerned, but it leads to other difficulties, which are very serious.

3262. The way he described it to us was that his proposed line did not touch the Redfern lines at all after leaving Eveleigh—that he kept on the west side of them all the way down? It does not touch, and that is one point that I object to. Some of the lines descend, and the others pass over those lines. There are no means of connecting them after they leave Eveleigh.

3263. The only crossing he mentioned to us was near the Cyclorama, and that was where his line was to run under the present Darling Harbour line? His evidence, and plan No. 6, and section which is marked 8, shows clearly what he intends to do.

3264. And you think it would cause inconvenience to passengers if the suburban and the through traffic were to be divided in the way he proposed? I pointed out, in my statement, what the inconveniences would be. There would be the inconvenience due to the non-possibility of interchange of passengers at the terminus. The other inconveniences are mostly due to traffic considerations.

3265. Then, in regard to the George-street Market station—you seem to think that that is an impracticable scheme? I am sure of it; there cannot be any doubt whatever about it. I mentioned how very great the alterations of the basement of the markets would be. I think that I might recommend the Committee to call Mr. McRae, the architect who designed the building, and see whether he would approve of the piers, as the supports of the dome and the end, being cut away in the way indicated by Mr. Selve.

3266. Dr. Garran.] I gather from your criticism yesterday that you think that a disadvantage in Mr. Selve's scheme is that his extension does not go through the present station-yard at Redfern? Yes.

3267. And I presume you think that any extension should go through that station-yard? Yes.

3268. Not to do so would involve a great deal of complication and useless expenditure in the present yard? Yes; it would upset existing arrangements altogether, and the use of the carriage sidings and sheds.

3269. And involve, probably, a second station, and a dispersion of quarters, which would mean expense without any profit? The separation of the traffic is a point of which the Railway Commissioners make a great deal.

3270. Admitting all that, is there not something to recommend Mr. Selve's proposal, to begin your manipulation of the cross-over roads further back than you do at present? No; I think it would be a mistake.

3271. You have explained to us—and Mr. Parry has done so in greater detail—that your present trouble at Redfern arises from the shortness of the distance between the northern end of the tunnel, and the southern end of the platforms? Yes.

3272. Because you have scarcely room there to get in your cross-over roads, and your various points? Yes.

3273. Why not get over that difficulty, then, by lengthening the distance? I quite agree with that.

3274. If we were to begin the cross-over roads the moment we leave Eveleigh, we should then have quite as much room between Eveleigh and the northern end of the tunnel as we have now between the tunnel and the end of the platforms? Yes; but that is the wrong way to do it. The proper way to do it is to bring the station forward—not to run those points back. H. Deane.
28 Mar., 1900.

3275. I know that has been proposed; but, have we not a method for crossing the roads and lengthening these platforms to the south, by pushing the whole arrangements for your interlocking further south? No, it will not do to follow Mr. Selfe's scheme of lowering the lines.

3276. I am not talking of the lowering—I am putting that out of sight—I am merely speaking of pushing all the interlocking arrangements further back to the south, so as to make the present station-yard at Redfern more available than it is? If you were to do that, without putting the other lines down in such a way that you could not keep up a connection with them, it might serve the purpose; but then you would be under the disadvantage that you would have to take up and renew the whole of the station-yard.

3277. I quite admit that; but, if you say that the whole of the station-yard is unsuitable and dangerous, it is time we should take it up? No. The proper and least expensive way to do it is to extend the present station across Devonshire-street.

3278. Then, you face the whole of the expense of arching over Devonshire-street;—would that be less than the expense of merely altering these points? Yes. It is considerably simpler and very much less in cost; there cannot be a doubt about that.

3279. Then even though you could alter the points, as I suggest, and take them more to the south, you distinctly say that, having the land across Devonshire-street available, that is a cheaper and better method? Yes, and the safest. The other is absolutely dangerous, and would be very much more costly, because you would have to have a lot of temporary arrangements for running the traffic while you were altering some of the roads.

3280. That answer of yours involves building a new station-yard, to some extent, north of Devonshire-street, at once? If Redfern remains merely a through station, you do not want to make any material alteration.

3281. But we are told that Redfern must remain a station for very long trains, such as those that go away on holidays? That is, supposing that it is to be a terminus. If Redfern remains as a terminus, a complete alteration has to be made. If it remains merely as a wayside station, very little alteration is required to be made. That will be seen in the details of my estimate.

3282. We have been given to understand that if either the King-street plan, or the St. James' Road plan, is adopted, good as it may be for ordinary normal traffic, it will not be good enough to take the heavy holiday traffic in addition, and that would have to be accommodated at Redfern;—you know that some of the longest trains we send away are holiday trains? I think that you are mistaken about that in some way. I would like to have a reference made to the evidence given on that point.

3283. *Chairman.*] Mr. Parry did give some evidence on that point? Yes; but not to say that a radical alteration would be necessary. You could easily lengthen the platforms if you were to go up to Devonshire-street.

3284. *Dr. Garran.*] Are we to take the view of the present station, that we cannot economically improve it by shifting all the points? As a terminus—yes; but I will not agree with it in any other way.

3285. Then, if we do not continue it as a terminus, we need not cross Devonshire-street with platforms at present? I do not think you need.

3286. Simply taking the travelling lines over? Yes.

3287. And we should need no more expenditure north of Devonshire-street than is necessary for extension into the city? There would be some little alteration necessary at Redfern. There would be eventually some re-arrangement, but it would be of comparatively a trifling character.

3288. If we once begin to arch over Devonshire-street to carry your six lines of rail across, do you not think that there will be an irresistible temptation to the traffic managers to lengthen those platforms at once? If they have all the platforms as they want them, I do not see there is any necessity to do it. I do not think that the traffic officers would want to expend more money than is absolutely necessary.

3289. No, but they like all the convenience they can get? Yes, but they would not want to make more alterations than are necessary, because alterations mean inconvenience.

3290. I can understand that they do not like to ask for expenditure unless they cannot possibly help it? They do not like alterations because they mean temporary inconvenience,—and very often very serious inconvenience.

3291. But merely lengthening the platforms would not alter the signals, and so on? No. But if you can get rid of the terminal traffic at Redfern, you can lengthen the lot of those platforms, by bringing them right up to Devonshire-street, without any serious expense.

3292. Do I correctly understand that it is your own personal opinion, as an engineer, that the long-distance trains ought to go into Sydney, if we make this extension? Yes, I think it is a desirable thing to bring them all into King-street.

3293. As regards the long-distance trains, that come in from Melbourne, Queensland, and Bourke, what proportion of the passengers do you think would be left in those trains after they left Redfern to come into the city? I think that they would pretty well all come into the city—they would all come to the terminus.

3294. Even although there was plenty of time for them to get out at Redfern, and take cabs for their luggage? I think so, because the conveniences at a terminal station are so much greater for handling luggage.

3295. Do you think that a gentleman going, say, to Waverley or Bondi, instead of getting out at Redfern, and taking a cab from there to the east, would come all the way into King-street? I do. The distance to either Waverley or Bondi is practically as short from King-street as it is from Redfern, unless you open up some new and wide thoroughfares; it is just as easy, in fact easier. There are better roads out from Hyde Park than there are from Redfern.

3296. Then, you think the effect of bringing the long-distance trains in will be that they will bring the passengers with them? Yes.

3297. And you have not any fear that the bringing in of these long, lumbering trains into Hyde Park will block your suburban traffic? No. I think that the accommodation which it is proposed to provide will be quite large enough.

3298.

- H. Deane. 3298. You would be content to give the accommodation provided for in either of these two schemes? Yes.
- 28 Mar., 1900. 3299. You think the traffic could be worked as comfortably as it is now at Redfern? Very much more. Either of these two schemes has a very much better station than the present Redfern station. All the platforms are long platforms, at which trains of full length could be docked.
3300. And if either of these two Hyde Park schemes is carried out, do you think that there will then be any necessity for a central station at the Benevolent Asylum? No.
3301. Never? No.
3302. However the traffic may grow, this area of 10 acres will be quite enough for everything? Yes; I believe that it will be quite sufficient.
3303. Well, you told me the other day that 22 acres of the Benevolent Asylum site would not be too much, looking at the future? In that, I did not suppose that that was all to be covered over with platforms. Of course, there are other conveniences which railway working requires, such as storage, sidings, and sheds, which the surplus ground could be used for.
3304. But if you were planning a central station, intended to last for all time, would you not like to have room for all those superfluities? If you could get them there, close alongside, it would be very much better; but as we cannot, we have to do without.
3305. Could you ever get them at Hyde Park without taking in more of the park? No; and it would not be desirable to do that. I am quite sure that I should be the last to recommend it.
3306. What I want to get at is this: As we have this site between the present station and Belmore-road practically in the hands of the Government now, would it not be wise for the Government sacredly to keep that from being sold for any other purpose, and to reserve it for a possible station? I think it ought to be reserved; they ought not to dispose of it for any purposes other than railway purposes. I quite agree to that; but I do not see any necessity for reserving it for a station.
3307. Well, granting that the Hyde Park scheme will meet all our needs for the present—for East Sydney at least—is it not wise to look ahead, in a country like this, with its enormous possibilities for the future, and to keep sacred a site which, by the admission of all engineers, is the finest site we can now get in Sydney for a great central station? I should not oppose the reserving of it; I think it would be a very wise thing to do, but not with the view of making a station there, but with the view of utilising the ground in some way for the purposes of the railway.
3308. Then you do not think it will ever be wanted for a railway station? Well, I am very doubtful indeed about it. A little bit might be wanted for a station; but I do not think so.
3309. You have criticised, unfavourably, the two western proposals that have been put before the Committee;—have the Government ever definitely proposed any West Sydney line at all? Yes, a great many years ago they did; but the requirements of traffic were not so well understood at that time, I suppose.
3310. Is it a line that you would recommend now? No.
3311. Is it shown on any plan we have before us? Yes. It was dealt with by the first Royal Commission; it is scheme "L."
3312. There is a line marked on the plan attached to that Royal Commission's report,—going just west of the Markets and the Town Hall;—is that the route? It goes between Kent-street and Sussex-street; it goes all the way round by Miller's Point to what used to be the Naval Depot.
3313. Then that is not this plan, it is another? There is one I suggested myself, going into Wynyard-square with a loop.
3314. Was an estimate ever made of the cost of that line? If it was made it was submitted to the Commission at that time.
3315. There is this one, but this is not the one you refer to, because this goes under York-street from the Markets? I am not sure whether this is not the one.
3316. Here is one going round Dawes' Point? That is scheme "L," laid out under instructions from the Government.
3317. Do you know if any estimate was ever made of the cost of any of the western schemes submitted by the Government? I fancy, so; but in order to ascertain, I would have to refer to the Royal Commission's Report—I mean the first Royal Commission which sat in 1890 or 1891.
3318. The reason I ask is that Mr. Rennick, in his report, seems to imply that if he could do it at an equal cost he would prefer a West Sydney line to an East Sydney line; but the cost seems to him to be prohibitory;—where could he have got that idea, except from some Government figures? He may have drawn that conclusion in considering the matter himself. I should like to say that, in response to the express desire of the Committee, I have written a report on that matter for the Committee; and I have a plan and a section showing what, in my opinion, can be done—not what I recommend, but what can be done.
3319. And an estimate of the cost? I have given an estimate of the cost of the works, but I am not prepared to give an estimate of the cost of resumptions, because it is rather a long matter.
3320. Has Mr. Sievers had it before him to make anything like an estimate? No. I think Mr. Sievers has been away, and it was only a few days ago that I was asked to prepare the report. I have also prepared a report upon a possible connection with North Shore.
3321. You object to the stiffer gradients on the line you were considering yesterday;—no doubt it is better to have a grade of 1 in 100 rather than a grade of 1 in 60, if you can get it;—but is a grade of 1 in 60 an unusual grade for a city line or a suburban line? It would be very objectionable on our working. There are certain conditions of load and speed. Some years ago the Railway Commissioners went to great expense to quadruplicate the lines, and lift the lines over, or take them under the cross-roads, as the case might be, and to abolish level crossings, and at the same time to give grades of 1 in 100, on the suburban line. There is only one exception, I think—a short distance of 1 in 90—and in the position it takes that is immaterial. All that expense would, as it were, be thrown away if, on an extension of the same line—with the same trains running over it—the grades were very much steeper.
3322. Are the present suburban engines—that is tank engines—equal to taking an ordinary suburban load up a grade of 1 in 60? That I cannot say. They might crawl up at a snail's pace; but I am not sure they would. The suburban engines take trains of eight or nine carriages along the Western suburban line, and on the North Shore line they take trains of five or six carriages—in this case up a grade of 1 in 50.
3323. The same kind of engines? I believe it is the same kind.
3324. Have you not some grades of 1 in 40 on the North Shore line? No—1 in 50.

3325. Then, are we to understand that the present locomotive engines on the suburban lines are fully tasked now? I should say that they are properly adjusted to load and speed, and if you put in steeper grades you would either have to reduce the load, or you would have to reduce the speed. H. Deane.
28 Mar., 1900.
3326. For that reason you think it is essential that any city extension should keep to a grade of 1 in 100? Yes, I do; I think it is very important.
3327. It was proposed, I think, by Mr. Eddy himself, once, to make an extension line from Hyde Park to Circular Quay, which was to be on a grade of 1 in 60? Yes; but afterwards he was very sorry that he had ever mentioned it.
3328. I believe that he withdrew it afterwards? He did. He regretted very much having mentioned it.
3329. If one of the proposed schemes that go round to the back of Parliament House, under the Domain, to Fort Macquarie, were carried out, we could get down to the water level with a grade of about 1 in 100, I suppose, by a route of that kind? I do not think you could get down to the water level; but I would not be quite certain. You could get down to a station about the level of the top of Albert-street, I think.
3330. You see that one of the defects of your Hyde Park schemes is, that they have no railway connection with the ferry traffic at Circular Quay, and there may afterwards come a proposal to extend; and both these schemes, we are told, would admit of extension underground? You could extend either of those schemes by extending the lines on the eastern side of the city.
3331. The eastern line, we are told, will go under King-street, and could go on to Circular Quay, if required;—in fact, No. 10 scheme goes out from the centre of the platform to make that long curve round to the Domain? Yes, that is arranged so that you could get four lines at least under King-street.
3332. Is that carriage-shed very much above high-water mark? It is above high-water mark.
3333. It is above what would be the platform of a station anywhere down there—for Woolloomooloo Bay? I should think it would be about 20 feet above; but I cannot tell exactly without referring.
3334. It is a descending grade on all that line? Yes.
3335. Do you know what the rate of descent is? I think it is about 1 in 60.
3336. You consider that the carriages running there will always be empty carriages? Yes.
3337. But if that should form part of an eastern suburban line, as we are told it will ultimately, you will have the eastern suburban traffic on it? Yes.
3338. And you will be running that on a grade of 1 in 60? I hope to have steeper grades on that eastern line when I make it.
3339. Then you will have to have shorter trains? No. I think it ought to be made an electric line, and that, having a completely new stock, you could do what you like, and save a lot of expense.
3340. In putting down Mr. Selfe's figures, you did not reckon into the credit of his scheme what he proposes to do, namely, to sell 2,000 feet of frontage to his new George-street? No, I did not.
3341. And you did not debit him with the capitalised value of £2,000 a year, which it is proposed he should give for space in the basement of the Markets? No. I did not. I did not pay very much attention to the estimates. I did not think that the matter of expenditure was so important a one as those other serious objections that I pointed out.
3342. Mr. Selfe also proposed to sell a portion of the cemetery site, but that would be common to any scheme? Yes; and I do not think it ought to be included, because, if you leave the terminus where it is, you can sell that land at any time, and make something out of it. You might go to St. James' Road, and might cut up the High School site and sell that, and credit that to the railway, because that would be a very valuable site if the railway were brought there.
3343. You have been to London within the last few years? I was there in 1894.
3344. Did you happen to visit either the Clapham Junction station or the Willesdon Junction station? Yes; I know them both. I know Clapham Junction very well.
3345. There is a remarkable involution of lines there, is there not? Yes.
3346. Do they not go over one another, and under one another, like snakes? Not at Clapham Junction; but at Battersea there is an extraordinary network of lines going over one another, and under one another.
3347. What grades do they have to submit to in doing that? I dare say that some of them are steep; but I would not like to say what.
3348. A constant suburban traffic is run over them? Yes.
3349. You do not know if their engines are more powerful than ours? No; I cannot give particulars.
3350. *Mr. Watson.*] I suppose the point of your objection to have steeper grades is, that it would render useless a portion of the expenditure already gone to on the suburban line? Yes; that is one thing.
3351. So it is not so much a question of what any particular engines can do, as it is a question of having an engine going over a certain distance at a slow speed when the engine would be wanted to go over the whole of the distance at a fast speed? It would affect the speed and the time of travelling, even supposing that the engine could take the load.
3352. The Railway Commissioners, I suppose, arrange their suburban traffic at present to go at a certain speed with a certain number of carriages, and a particular class of engine? Yes.
3353. And your contention is that it would mean a re-arrangement of the engines and cars, and that it would practically waste the money that has already been spent in lowering the grades on the suburban line? Yes. That would particularly apply, of course, to the steeper grades that have been suggested.
3354. *Mr. Dick.*] Do you know what grade there is from Erskineville station to the level of Eveleigh station? Well, there is a steeper grade there than on the western suburban line; but the engines on the Hurstville line do not take the same load. I think there are seven carriages there, as compared with eight or nine on the western suburban line.
3355. This diagram of gradients, submitted by the Railway Department, puts it at 1 in 60? I dare say it is.
3356. It is also 1 in 60 rising from Carlton up to Hurstville? Yes, I think it is.
3357. Can you state definitely what difference there is between the load which the same kind of engine takes on the south coast suburban district line, as compared with the western district line, as far as Strathfield? I cannot state definitely, because I have not the particulars here; but I could easily get them. I think I have the information in the office. I know that the trains are shorter on the Hurstville line than they are on the western suburban line, and they do not make as good time either.
3358. If any scheme for bringing the railway into the city were to have steeper grades than 1 in 60, would it be a serious interference with the present suburban line arrangements? It would be a serious interference.

- H. Deane. interference. It would not matter so much for the short Hurstville trains; but it would matter very much for the Homebush and the Parramatta trains.
- 28 Mar., 1900. 3359. *Mr. Watson.*] The greater part of the traffic is on the western suburban line? Yes; and those trains are longer.
3360. The main passenger traffic is by that line? Yes.
3361. *Mr. Dick.*] Do they use the same kind of engine on both lines? I think so. There are two or three kinds of engines used. Class "M" is the kind of which there are most. I think there are about forty of those engines; and there are two or three class "C" engines, which have been altered and made into tank-engines, to suit the suburban traffic. Tank-engines do not have a tender, but carry the water either alongside the boiler or over it.
3362. Do you think that the present proposal for bringing the railway in to King-street lends itself to a connection with North Shore? Quite sufficiently. I do not think that a connection with North Shore should necessarily be into that station at all.
3363. I merely wish to know if it would lend itself to such a connection? Yes; either by bringing the line right round and back on the western side, or by running down by means of a tunnel, and using electric locomotives.
3364. Right down, where to? Under the Harbour, to connect with the North Shore line at the head of Lavender Bay. There would be no difficulty about that. It is perfectly practicable, because it is similar to what is done in America.
3365. Failing that, it would be necessary to bring the line back over a curve, say, to Liverpool-street, in order to get on to the main ridge of the city of Sydney, and then go onwards to North Shore? But I would not recommend that the North Shore trains should be brought up to King-street on that line. I do not see why they should be.
3366. Where would you recommend they should be brought to? I would run them into Redfern.
3367. By what route? I mentioned a little while ago that I had prepared a paper on that subject. I would rather read that in its entirety later on, and then you will understand the position I have taken up.
3368. You say in the statement which you read yesterday that you have no hesitation in saying that two lines are not sufficient to take the present suburban traffic through to the terminus? Yes.
3369. A witness, whom we had before us, made this statement:—

At St. Enoch's station, Glasgow, there are, every working day, nineteen trains arriving in a space of forty-three minutes. That is on one pair of rails. That is at the rate of twenty-eight trains an hour arriving on one pair of rails, at a terminal station in Glasgow. This information is copied from the *Railway Magazine* for November, 1898. At the present time twenty-two trains arrive at Redfern on four lines of rails; but as a matter of fact, in Glasgow there are twenty-eight trains arriving in an hour, on one pair of rails, every morning in the year.

If that can be done there, do you think the same amount of work could be done, say, on Mr. Selfe's scheme? I do not know the arrangements at St. Enoch's station, Glasgow. I should require to see the plan, and also a description of the working, before I could judge or make any comparison. Besides, as regards working, I am not a traffic officer. I really only provide what I am asked to provide by the Railway Commissioners; I do not undertake any responsibility as regards traffic. I would suggest that you should give Mr. Parry notice of being questioned on the subject, so that he could look up the matter of St. Enoch's station, for there may be something there which is not made clear in that statement. I am afraid that the information is not very clear, for Mr. Greenwood was asked: "Is it a dead-end station?" and he said, "I believe so." If it were clearly described, I think he would have said either "yes" or "no." The best plan would be to get the *Railway Magazine* and see what information it gives on the subject.

3370. *Mr. McFarlane.*] There is a rumour that it is the intention of the Government to resume the eastern shore of Darling Harbour; in the event of that being done, how do you think it would answer for a city railway extension? It would be of no use for passengers.

3371. If that were resumed for an extension of the line from Redfern to Darling Harbour and Circular Quay, how would that, in your opinion, suit for passenger traffic? It would not suit at all.

3372. Do you not think it would suit? No; it is too far over, and not at all where passengers want to go. It might suit for a goods line, but that is a different question.

3373. If it would answer both for passengers and goods, would it not be desirable to construct a line there? I would not like to give a definite answer to that question without very careful consideration. Of course, a goods line might be made along there, and the same line might serve also for occasional passenger trains; but such a line would not serve for an extension of the railway into the city for passenger traffic for general and popular use. To run passengers close alongside Darling Harbour would not serve the general purposes of the city.

3374. Have you considered this view of the matter: if the Government were to resume that land, in any case, would it not be much cheaper to utilise part of that resumed land in the construction of the city line? Yes; but it would not serve the purpose of extending the passenger traffic into the city.

3375. Say, for instance, that there was a railway station at the foot of King-street, would that not be convenient to the great bulk of the people in the heart of the city? People would have to climb up over the hill.

3376. Well, that is not far from George-street? It is a good way up to that street. I go up it every day, but I generally take the tram.

3377. Well, in the event of that resumption it is more than probable that the Government would utilise the foreshore for the construction of wharfs? Yes.

3378. And then such a line would be very convenient for goods traffic? That is a matter for consideration, certainly.

EXTENSION OF THE RAILWAY INTO THE CITY. PROPOSAL FOR A WESTERN ROUTE.

At the request of the Committee, I have gone into the question of a practicable western side city railway scheme, and now submit what I think is really the only way of carrying out such a scheme, with a ruling grade of 1 in 100.

The long-distance traffic would have to stop at Redfern, and a station to accommodate it would have to be built at the Benevolent Asylum grounds. From there four lines would be extended over Belmore Park and over what is known as Paddy's Market, then, turning round, would pass over Pitt-street and George-street, as shown on plan, crossing over Sussex-street twice and dipping down with a grade of 1 in 100 to the corner of Kent-street and Market-street, and from there would proceed in tunnel to Wynyard-square.

At Wynyard-square an underground station could be provided with four platforms, provided the roads on either side of the square were tunnelled under. From here the lines would be continued to what Mr. Selfe calls "The Rocks," where storage and shunting sidings would be provided.

So far as I can see, this is the only practicable way of carrying out a western side scheme, with a ruling grade the same as on the Western Suburban line. This ruling grade is indispensable, as otherwise the trains would have to be shortened or a new set of locomotives obtained.

H. Deane.
28 Mar., 1900.

The accommodation suggested at Wynyard-square is all there is room for, but it is not really sufficient, and there would be great dissatisfaction amongst the public. If all the trains, excepting eighteen, *i.e.*, long-distance trains, are brought into the city, there will at times be a very large number of trains starting from or arriving at Wynyard-square station. This would have to be worked as a wayside station only—which means that trains for the suburbs after being made up at the terminal yard, instead of being allowed to stand at the platforms for ten minutes or more, could only be detained a short time to take up passengers and luggage.

I do not believe that the most perfect traffic arrangements would bring about a state of affairs satisfactory to the travelling public, and the scheme has the further drawback of not being capable of enlargement.

As regards cost, I should put that down at about £300,000, not including the station at Devonshire-street and not including the cost of land and compensation which would, no doubt, be considerable.

RAILWAY CONNECTION BETWEEN SYDNEY AND NORTH SHORE.

This should, I think, be treated as a separate matter. I see no reason why the North Shore trains should be brought to meet any city railway extension for the west, nor do I agree with the statement that no scheme for city railway extension would be complete without provision for a North Shore connection. I am convinced that each proposal should stand on its own merits, and a sufficient reason for that view is that the ruling grade on the North Shore line is 1 in 50, whereas that of the Western Suburban line is 1 in 100.

If, however, it were looked upon as a drawback to either the Hyde Park or King-street schemes, that no direct connection with North Shore over the harbour by bridge is practicable, I would point out—as I have pointed out before—that by running back to Liverpool-street and curving round to the west side of the city, that connection can be made.

On the other hand, by continuing two of the lines on the east side of the Hyde Park or King-street terminus, and dropping down with a steep grade, the railway could be run in tunnel under the harbour, and meet the North Shore railway at the head of Lavender Bay. This part of the line would be worked—as such a long tunnel should be worked—by an electric locomotive. Any statement that such a method is impracticable is met by the fact that on the Baltimore and Ohio railway electric locomotives are used to draw passenger and goods trains through a tunnel $2\frac{1}{2}$ miles long. This system is growing in favour, and electric locomotives are being largely ordered for similar purposes by other railway companies.

If a bridge connection with North Shore is required, I would propose the following route, which, although it involves a considerable amount of viaduct, is perfectly practicable:—

It seems to have been decided that the proper headway for a bridge is 180 feet above high water, and I have, therefore, assumed this to begin with. From the bridge, between Dawes Point and MacMahon's Point, the lines would drop down towards Sydney on the south side with a grade of 1 in 50, passing close to the Grosvenor Hotel, and raised about 20 feet above the street. Thence the line would run, still with a grade of 1 in 50, taking up a position either between Kent-street and Sussex-street, or, if allowable, in viaduct over the centre of Kent-street, and would follow in a straight line as far as Liverpool-street; after which it would curve to the left, and, passing over George-street, Pitt-street, and Belmore Park, would ultimately join the Redfern terminus. A station can be provided between King-street and Erskine-street at levels such that access could be given by means of a bridge to Clarence-street, without the necessity of steps or steep ramps.

The cost of such a railway, which would need only two lines of way, I have not had time to go into. Without sketching out the various details it would be impossible to give anything with accuracy. If thought allowable to go overhead along the centre of Kent-street, a large amount of resumption would be avoided, with its consequent expense. If, however, the route between Kent-street and Sussex-street is followed, there is a large number of expensive buildings abutting on either Kent-street or Sussex-street, which must be resumed.

I have here sections of those two lines. I wish to say that I do not recommend the Wynyard-square route. I do not think the city traffic could be accommodated there.

3379. *Chairman.*] In regard to the scheme which you have just read proposing a line by way of Wynyard-square as far as "The Rocks," you speak very disparagingly of a station at Wynyard-square? Yes. I do not believe that you could there get the accommodation that is required for a terminal station. Although it is not technically a terminal station—that is to say, there are not terminal docks—as regards traffic it is a terminal station, and at a terminal station you want to provide for trains to stop longer than if it were merely a wayside station, and that means that the platforms are occupied by trains for a longer period than the platforms are occupied by trains at a wayside station, and more of them are therefore required.

3380. And you want more space? Yes; and that is the opinion of the traffic officers.

3381. Therefore, from that point of view, Wynyard-square is not a desirable position for such a station? Yes; otherwise, of course, it is very central and convenient.

3382. As you say in your statement, the position is all that is required, but the accommodation is not the same? Yes.

3383. In your second statement just read, you refer to a possible line from Redfern by way of Kent-street to connect with a bridge to North Shore? Yes.

3384. You say that that can be obtained with a grade of 1 in 50? Yes.

3385. Well, all along you have objected to a grade of 1 in 50 in other schemes? Not for the North Shore traffic. I mentioned that. The ruling grade of the North Shore line is 1 in 50, therefore any extension of the North Shore line might clearly have a grade of 1 in 50 as well.

3386. Would you advocate two lines of railway passing through the city—one going through the middle of Wynyard-square, and the other two streets to the west along Kent-street? I do not advocate a city extension on the western side, but if a connection is to be made over a bridge with North Shore, I think the route I have indicated is the one to adopt, and I think that particular location over Kent-street on viaduct might be very suitable. If Kent-street were a street with dwelling-houses in it, I would not recommend it for a moment; but as there are only offices, stores, and warehouses there, I cannot see that there can be any objection to running trains overhead through the middle of the street.

3387. If that line of railway were constructed along Kent-street, you would have a station between King-street and Erskine-street? Yes.

3388. Therefore that station would serve a large number of people coming from the western suburbs into the city, and also people coming from North Shore into the city—to that part of the city—would it not? Yes; but the people coming from the western suburbs would have to change at Redfern.

3389. It would serve people coming to that part of the city? Yes.

3390. That being so, would it not seem rather ridiculous to construct also a line of railway to Wynyard-square so close handy? Yes; I think so.

3391. Therefore, if that Kent-street line were thought of at all, seeing that it would serve a large number of people coming to the western part of the city, would it not be better for the second line to go up more in the direction of Hyde Park, and serve the people who would want to go to that part of the city? Yes; I think so.

3392. That is if two lines were to be constructed? Yes.

- H. Deane. 3393. I understand that you have prepared these two schemes at the request of the Committee, but you do not urge their adoption? That is so.
- 28 Mar., 1900. 3394. You have had this question of a city railway under your consideration for a great number of years; you have been examined before the Royal Commissions and Public Works Committees over and over again; of all the schemes that have been put before us, which do you think is the most desirable to carry out at the present time? I adhere to the St. James' Road scheme.
3395. After that? Then either No. 4 or No. 10.
3396. Do you put No. 4 before No. 10? It would depend very much on the cost of the resumptions. I am not sure about the cost of resumptions in connection with No. 4.
3397. You put the St. James' Road scheme first? Yes.
3398. Then comes either No. 4 or No. 10? Yes.
3399. No. 10 being the King-street, or modified Hyde Park, scheme? Yes.
3400. And No. 4 being the scheme which goes towards Pitt-street, at the back of the Pitt-street frontages, and at the back of the King-street frontages? Yes.
3401. Those are the three schemes which, in your opinion, are the three best? Yes; I do not think there can be any doubt about it.
3402. *Mr. Watson.*] Is your preference for the St. James' Road scheme purely from an engineering standpoint, or from the point of view of economy, in view of the fact that the land is practically free—free of improvements anyway? I like it best from an engineering standpoint, because you have a direct run in. You have a fairly direct run in with the others. I do not know that it makes very much difference. But I like the terminal arrangement of the St. James' Road scheme very much better than the terminal arrangements of No. 10 scheme, and it avoids the necessity of that run round to the back of the Art Gallery.
3403. It has been suggested that by taking a slightly wider strip from Hyde Park you could avoid the necessity of an extension into the Domain in connection with scheme No. 10? Yes; that could be done by taking a very small extra strip, and covering it over again. I do not recommend that, but point out that it could be done, and practically the same amount of park would be open to the public as is shown on that plan.
3404. Assuming that a central station were built at Devonshire-street or Belmore-road, and that it was then found expedient to extend railway communication into the city, either by a circular or some other method, would electricity be practicable for the extension within a reasonable time? There would be no particular advantage in having electricity; it would mean changing locomotives.
3405. I want your opinion about the practicability within a reasonable time, with a central station at Belmore-road, of running all the suburban traffic by electricity, and including in the suburban traffic an extension into the city, by tunnel if necessary, also run by electricity? It would not be practicable without altering the whole of the suburban working.
3406. As a railway engineer, can you say whether there are any indications that electricity for suburban or concentrated traffic is within a reasonable distance of being brought into operation? Yes; it can be done. It is quite practicable.
3407. Assuming, then, that you had, within a reasonable time, the suburban traffic run by electricity, and a city extension for suburban traffic only, run in a similar manner, would it not then be possible to utilise tunnels to a much greater extent than is advisable with steam traction? Certainly.
3408. And that, meaning less resumption, would also mean a very greatly decreased cost for a city extension, would it not? I do not know that it would. I cannot say that going in tunnel would make it cheaper than going with a line exposed to the air.
3409. Well, although the actual amount of works would be larger, would there not be a great reduction in the cost of resumption;—you would not interfere with property to anything like the same extent by having a tunnel at a deep level as you would by having an open cut or viaduct? No; you could go under George-street if necessary.
3410. And that would mean a minimum amount of resumption? Yes.
3411. Is it not a fact that the greater portion of the cost of railway extension into the city is, except in the case of the Hyde Park scheme, represented by the cost of resumptions? Yes.
3412. And that could practically be saved if you were able later on to initiate an electric railway system for the city and suburbs? Yes. That is how I think an extension could be made in the future, if, say, the St. James' Road proposal or No. 10 proposal should prove inadequate. By that time electricity would, perhaps, have come to be adopted for suburban work, and it would be quite permissible to have an underground line.
3413. I think you said incidentally, a little time earlier in the inquiry, that it was your hope to use electricity for any eastern suburban extension that might be ultimately decided upon? Yes; I should certainly recommend that any new line, such as the eastern suburban, should be worked by electricity, because you could adopt steeper grades and sharper curves.
3414. Well, if it would be a good thing for that, would it not be equally good for any class of traffic sufficiently concentrated to permit of stationary power such as electricity being used? If the construction of the suburban lines were now being contemplated, I believe the question of using electricity would be very carefully considered.
3415. Do you think that the application of electricity is sufficiently advanced to make it within a reasonable distance as far as railway working is concerned? I am sure it can be done. There is a lot of suburban traffic in America worked by electricity—with the overhead wire.
3416. I understood that the conduit system had become very popular there recently? It is used in New York and Washington.
3417. Does it seem to answer, notwithstanding the severe winters they have? Yes, it answers very well; but it is more expensive than the overhead wire. However, in New York, they will not have the overhead wire, and in Washington it is forbidden, so they have to use the other. There is a new system coming on, by means of which the tunnel conduit would be avoided. The late Dr. John Hopkinson paid a great deal of attention to it, and was advocating it before he died.
3418. That is something different from either the overhead wire or the ordinary conduit system? Yes.
3419. *Dr. Carran.*] Is the part of Kent-street over which you would take that overhead line pretty level? It is not unsuitable for the purpose. There is one pretty good dip.

3420. You could get your grade of 1 in 100? There is no steeper grade than 1 in 100 between Redfern and a station at Erskine-street—at least there need not be.

3421. It would be on iron pillars, I suppose? Yes.

3422. With either that or the other line, could you not go nearer to the back of the Town Hall than you do? No; not to get the grade. The difficulty is in getting over one street and under the other with the ruling grade.

3423. Where would you have your passenger station—near the Town Hall on that line? I think it would be possible to make a station about there. There would be one at Wynyard-square, and there might be one somewhere near the Town Hall. It shows a grade of 1 in 100, dropping down from the crossing in George-street till you get to Market-street.

3424. You would not object to have a station on a grade of 1 in 100, would you? There are stations on worse grades than that. It is not desirable; but it could be worked. Very likely the grades could be eased a little so as to be made to suit.

3425. But on that plan you have not provided for any station near the Town Hall? No: I have not.

3426. In that case, there would be no station between Redfern and Wynyard-square? No; there would not be, but one could be arranged for if necessary.

3427. *Chairman.*] I suppose that in the scheme you read to-day, proposing to go to Wynyard-square, you have not provided for any connection with the eastern suburbs? Not from that one. It could be taken round the head of Circular Quay on viaduct; but I do not think that that is desirable.

H. Deane.
29 Mar., 1900.

THURSDAY, 29 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

3428. *Chairman.*] You were requested to supply certain information to the Committee? I was asked to ascertain how much extra width of land would be required in Hyde Park if the extension proposed to the back of the Art Gallery, in No. 10 or King-street scheme, were left out. The extra width required would be 60 feet. That would make a width of 140 feet to be taken off Hyde Park as compared with 80 feet in width to be taken off Hyde Park for No. 10 scheme as originally proposed, and as against 340 feet in width to be taken off Hyde Park for the St. James' Road scheme. There are two ways of doing it. The plan submitted shows a way of doing it with ten platforms.

3429. *Dr. Garran.*] On the plan before us the easternmost platform is 17 feet below the level of St. James' Road at that point; if you extend the station-yard 60 feet further to the east, then the easternmost platform will be still further below the level of St. James' Road? Yes; 2 or 3 feet additional at most, or about 20 feet in all. But the main approach to the station on the western side would be on the street level, and there would be no approach for vehicles on the eastern side. That is, of course, exactly the same as in the St. James' Road scheme. With regard to the front of the station in the No. 10 scheme, there would be no difficulty in arranging it on exactly the same plan as has been shown in the St. James' Road scheme, if that were preferred.

3430. *Mr. Watson.*] Would that additional width of 60 feet of Hyde Park be taken from Park-street right up, or would it be necessary only to take it for a portion of that distance? It would not have to be taken south of Park-street, but only between Park-street and St. James' Road.

3431. *Dr. Garran.*] Would you require to widen your bridge in Park-street? I scarcely think so. It might be necessary, but I do not think so. It might be necessary at the northern end for the branching of the lines towards those platforms on the east. But it would not make any material addition to the bridge.

3432. *Mr. Watson.*] I think you stated that the plan you have exhibited to the Committee shows that with the addition of the 60 feet you could make ten platforms? Yes, with a middle road in each dock.

3433. Ten platforms, with a middle road or refuge siding in each dock, would be equivalent to eleven platforms with only two or three middle roads? There would not be very much difference. I think that on the whole the eleven platforms would be preferred. I talked the matter over with Mr. Parry, and he thinks that the eleven platforms, as we had before, would be better.

3434. Of those eleven platforms, how many would have middle roads? Three.

3435. Supposing you wish to put in at King-street an arrangement of platforms similar to what was provided at St. James' Road, could you do that with the same additional width taken from Hyde Park? Sixty feet, yes. But there would be no cab road, as in the St. James' Road scheme.

3436. I mean as far as the working of the platforms and the accommodation is concerned? Yes, it would be the same.

3437. So, if an additional 60 feet in width were taken from Hyde Park, it would be purely a matter for your Construction Branch to arrange as to the manner in which you would fix the platforms, either ten with an additional number of refuge sidings, or eleven without those sidings? Yes.

3438. It would not affect the width at all? No; it would not affect the width. I have also studied the question of width supposing only the suburban trains were to be brought in. For that purpose I have shown on the plan four docks with eight platforms—that is to say, three double platforms and two single ones. In order to provide for future developments, each one of those docks has a third or middle road. That takes up exactly the same space as No. 10 scheme does—that is to say, it takes up 80 feet of Hyde Park; but it would leave the long-distance trains at Redfern—I mean those eighteen trains that were mentioned by me the day before yesterday.

3439.

H. Deane.
29 Mar., 1900.

- H. Deane.
29 Mar., 1900.
3439. *Mr. McFarlane.*] Would that necessitate an extension of the tunnel? No; that is without the tunnel.
3440. *Dr. Garran.*] Instead of the tunnel? Yes. I think that the avoidance of the tunnel in the present instance would mean that if at some future time—which I do not anticipate—the platform accommodation should prove to be inadequate, the facilities for bringing in and taking out the traffic could be increased by extending the tunnel.
3441. *Mr. Watson.*] If the scheme were extended by the additional width into Hyde Park, would it mean any material difference in the cost of construction to that point—that is, after subtracting the tunnel, and extension into the Domain? It would be very much less costly.
3442. How would it compare, in the matter of cost, with the extension into the Domain—for instance, what would be the cost of that scheme, with the additional width, to King-street, in addition to what it is now to King-street? I think that the additions to the King-street station, as suggested, by taking this 60 feet extra of Hyde Park, would cost about £35,000, and that would allow of the subtraction of the whole of the cost of extension into the Domain.
3443. *Dr. Garran.*] If you take that bit out of Hyde Park, and widen your station yard in that way, it will not necessarily involve your lengthening your buildings? No; I have not included that. It would only necessitate the widening of the roof over the platforms.
3444. Because if you were to lengthen the buildings, you would have to take down St. James' Church? Yes. But the buildings have already had sufficient accommodation provided for them, and I do not include that. I think that the £35,000 I have mentioned would well cover the difference.
3445. Then there would be a saving of over £200,000 by taking that extra piece of the Park instead of the Domain? Something like that.
3446. I should like to have a re-statement by you of the cost of the original St. James' Road scheme;—do I understand the Department still calculates that at £550,000, exclusive of the price for land in Hyde Park? The estimated cost for works was £550,000 originally. There would have to be added to that the £30,000 which the Railway Commissioners ask for, for additional station accommodation and offices. I think, further, that something ought to be added for the increase of prices at the present time.
- 3447-8. I want to get your up-to-date estimate of what the St. James' Road scheme would cost;—if we add the £200,000, which is estimated to be the full value for the park land to be taken under this scheme, that would bring the cost of St. James' Road scheme up to about £800,000? Yes.
3449. And that covers everything? Yes.
3450. Covers the cost of these buildings? Yes.
3451. And all the resumption between Belmore-road and Liverpool-street? Yes.
3452. That is the complete cost of that scheme? Yes.
3453. Everything told? I think so. It was £750,000, with all the allowances, before, and if you add £30,000, as I say, for extra office accommodation at the station, that makes £780,000, and if I am right in saying £25,000 for the increase in prices, that would make it rather over £800,000.*
3454. And your estimate for No. 10 scheme will include the increased cost for present enhancement of prices? Yes. The prices have been adjusted.
3455. *Mr. McFarlane.*] I think you said that in the event of additional traffic going to King-street it would be necessary to carry out the Domain tunnel? No. I only say it would be possible to increase the accommodation at the station—that is to say, to increase the facilities for working the trains by putting in that tunnel.
3456. I should like to know whether, in view of that increased traffic, it would not be possible to cope with it by extending the width of the proposed resumption of Hyde Park and making a couple of platforms underground for shunting purposes, leaving the surface of the Park intact, and not making the Domain tunnel? I do not like the idea of making platforms underground. You could open up the ground and roof it over again, but I think that, in working, the smoke would make it rather choky.
3457. Well, even without increased platforms, if accommodation were made underground for shunting purposes only, would that not, to a great extent, do away with the necessity of making the Domain tunnel? You want a good deal of room for shunting purposes, a good deal of width, and that would be very costly; in fact, I am not sure that you could do it altogether underground, because, where the roads diverge and cross one another, the required supports could not be put in, and there would be such a wide space to be covered over.
3458. Would not the making of that accommodation be less costly than the making of the tunnel, as proposed, in the Domain? I am not sure that it is at all possible: I do not think it would be practicable to make shunting room underground.
3459. I do not mean the making of a complete system of shunting underground, but to accommodate the increased traffic you were speaking of;—would it not be possible to make some provision to cope with that—it might be a very largely-increased traffic—in such a way as to avoid the necessity of making that long tunnel in the Domain? I should not like to say. I presume that you mean by running two or three roads out in tunnel so as to get the trains shunted.
3460. Yes? I think that what would be really required in the station would be more platform room. Of course, the object in making the extension would be to give more platform room by running the trains alongside off more quickly and allowing other trains to come in.
3461. I should like you to clearly understand that even in the event of making the proposed tunnel behind the Art Gallery, you would want the additional platforms you are referring to; if, owing to increased traffic, it were necessary to make those additional platforms, would it not be possible—instead of going that roundabout way, and making a tunnel, and taking a large portion of the Domain—to make provision for shunting purposes, in addition to the increased platforms, by tunnelling so as to have the shunting done at King-street or St. James' Road? I do not think it could be very easily done.
3462. Would it not be less costly than carrying a tunnel through the Domain? I scarcely think it could be done at all—that is, in a practical manner. You want a good deal of room. The space in the Domain would allow of a good many trains being run off and stood there while waiting.
3463. Would you not have to have additional platforms even if that tunnel were made? No. What I meant to imply was that if a project were worked out, such as we have at St. James' Road, with eleven platforms

* NOTE (on revision): Including £200,000 for the Park, instead of Mr. Eddy's £100,000, the total comes to £905,000. If Mr. Siever's recent estimated value of the Park, namely, £165,000, be taken, the total comes to £870,000.

H. Deane.
29 Mar., 1900.

platforms, or such as the modification which I suggested just now, and if at some future time those eleven platforms should prove to be inadequate—and I rather doubt if they ever would prove to be inadequate—then, by running a tunnel, and making sidings as proposed, at the back of the Art Gallery, the same advantage would be gained as if you were to add two or three more platforms.

3464. I understood you to say that by having the eleven platforms you spoke of, it would not be necessary to have the proposed tunnel in the Domain? No, it would not; that is quite correct.

3465. If those eleven platforms were to prove adequate for present requirements without that tunnel, would it not be possible to make provision for increased traffic in future by making additional shunting space by tunnelling further under Hyde Park adjoining the station? You could not make the adequate shunting space by means of tunnelling. You might make additional lines and platforms, but you could not make adequate shunting space in tunnel.

3466. If you could make additional platforms, will you explain how you could not make shunting space? Well, the platforms simply take up long strips of space, and you would be allowed to have columns along the centre of them, but for shunting purposes lines want to diverge, converge, and cross.

3467. What length would be required for shunting—would it exceed the length of a long platform? Yes; you would want more than that, because you would want not only the length of the train and a good clear length free of the train, but also length enough for the converging lines, probably a couple of hundred feet at each end at the very least.

3468. That is, a couple of hundred feet longer than a long train? Yes, at each end. An ordinary cross-over road takes up about 150 feet, and if you are connecting not merely adjacent roads, but also roads further back than that, it takes up a good deal more space; therefore, you might want at each end of your sidings 200 or 300 feet for the purpose of making proper connections.

3469. A very great objection is to the taking of any part of Hyde Park or of the Domain;—you have made provision with regard to Hyde Park, but if this tunnel, in view of increased traffic, is carried out, and takes up 7 or 8 acres of the Domain, there may be a very serious objection to that, and I was wondering whether it would not be possible to avoid that by making provision for the shunting by tunnelling? No. Adequate provision could not be made in that way, otherwise there would be no necessity to go all the way round to the Domain, but the shunting could be done in the tunnel itself.

3470. The great objection that I saw was, not the cost of the tunnel, but the taking up of such a large area of the Domain—it takes up 7 or 8 acres of the Domain? Yes, it does.

3471. You think it would not be possible to make a tunnel alongside the proposed platforms to accommodate the trains or make provision for shunting? No; it would not serve the same purpose. There was another point on which I was asked for information, and that was as to the reduction that should be made if four lines were to be constructed instead of six. The leaving out of those two lines would mean a reduction of £52,000.

3472. *Mr. Watson.*] Would the resumptions be smaller in that case? No. I do not think that they would be practically smaller, and I have not allowed anything for that.

3473. *Dr. Garran.*] Mr. Greenwood's scheme is free from an objection that you made to Mr. Selge's, because it goes through the Redfern station yard? Yes.

3474. In that respect it is preferable? Yes.

3475. Between the Redfern station yard and the higher ground on the other side of the valley, it goes on viaduct;—every scheme that must go through the station yard to get into the city must go on viaduct? Yes; that is correct.

3476. You cannot avoid that in any way? No.

3477. That will be common to all the schemes? Yes.

3478. Mr. Greenwood explains to us that, as far as Bathurst-street, he avoids all expensive buildings;—have you noticed whether that is so? I think he is right there.

3479. Then, excepting for the gradient, which he makes 1 in 60, you do not make any objection to his line up to the time he reaches Bathurst-street? No; excepting that he has only two lines instead of four.

3480. But although the suburban traffic takes four lines coming in—two fast and two slow—from the moment you begin to go on to your city extension the trains must all go at the same pace over that? Yes. I referred to that, if you remember, by saying that if all the traffic, fast and slow, is to go on two lines the trains will have to wait for one another at Redfern, and then proceed in single file along the rails.

3481. But the pace that they will go from the moment you leave Redfern will be the same pace for all the trains? Yes; but there will be inconvenient waiting.

3482. Do you mean to say that in the Railway Commissioners' scheme—where you have six lines of rails—your fast trains coming in will go faster over that bit of road than the slow trains coming in will? No; there are no intermediate stations there, but there are in Mr. Greenwood's scheme. If there were a station in Liverpool-street, the fast trains need not stop there, but the slow trains would stop there, and, therefore, the fast trains would be proceeding faster over that space.

3483. But we presume that if you make a city railway you will stop the trains at every station;—that is done on every city railway in the world? I do not think you need assume that for the quick trains that come in.

3484. Do you know a single suburban line in the City of London where the trains do not stop at every station in the city? I do not think there is anything quite on all-fours with this particular extension, but there are lines in London and elsewhere where the trains stop at some stations and run past others.

3485. That is going out of London? Going out and coming in.

3486. Within the city limits, on what you might call city extension, you want to stop your trains at every centre of population where you have made a station? With regard to London, I do not remember any line, except the Metropolitan, and Metropolitan District Railways, which has more than one station in the City of London; but when you take London in its larger sense, you will find that some stations are run past.

3487. And if we had a station at Liverpool-street, do you think that some of the trains would not stop there? I cannot say what the Railway Commissioners would find it desirable to arrange; I only say that it would be quite possible; and, so far as I see, it would be a satisfactory arrangement to stop the slow trains only at Liverpool-street, and to run the quick trains on right through to King-street.

3488. That means, then, that we are to go to all the extra expense of two additional rails simply to accommodate a few fast trains that come in, and save them one stoppage? No. We have four lines there, and it is intended to use two of those lines for the quick trains and two for the others, so you have them separated already.

3489.

- H. Deane. 3489. As far as Redfern you have, and you continue that separation simply to give the fast trains a fast pace also between Redfern and Hyde Park? Not so. It is to give extra accommodation, so that the trains should not have to wait for one another before proceeding on in single file to the city. There are so many trains coming in close together in the morning that they could not proceed on one line of rails without very great cause of complaint—that is, irrespective of speed.
- 29 Mar., 1900. 3490. I suppose that the Town Hall, other things being equal, would really be a good site for a passenger wayside station? For a wayside station, yes.
3491. It is very central for a large portion of the passenger traffic? I do not know about being central; of course, any station you like to make is central for a certain area.
3492. Well, the Town Hall is a centre for a very large portion of the city? I would not object to the Town Hall on that particular scheme.
3493. It is a very good site? Yes; if you want to have a number of stations, it is a very good site for one.
3494. I understand that you see a great difficulty in the double curve that Mr. Greenwood adopts to get from George-street into York-street;—do you think it is possible by any allowable curve to make that passage from George-street into York-street? I see no reason to depart from our ordinary practice, and that is not to have any curve sharper than 10 chains radius, and in the case of reverse curves, to have a transition in between them. In the case of any curve less than 20 chains, I invariably put in transition curves; and no line ought to be laid out, whether in the city or elsewhere, unless it is provided with that. You will remember in the old times on the mountains the discomfort there was from the oscillation of the trains passing from one curve on to another. That has been got rid of chiefly through the alteration of the curve so as to admit of transition curves. It has partly been improved, of course, by cutting out some of the sharper curves, and putting in curves of larger radius; but the chief cause of improvement is, undoubtedly, the introduction of transition curves. On the North Shore and Milson's Point line I have introduced the transition curves, and the curves there are 10-chain curves. I would not think of recommending any line to be made without proper transition curves.
3495. Have you any 8-chain curves on the North Shore line? No; they are 10-chain curves. The first proposal that was made was to have curves of somewhat larger radius—I think either 12 or 14 chains—and the grade was to be 1 in 40. I tried to get rid of that 1 in 40 grade, and succeeded in doing so by putting in 10-chain curves; but that is no reason why you should adopt 10-chain curves elsewhere if you can avoid them. I would not go sharper than 10-chain curves.
3496. Then, if the Government insist on 10-chain curves and transition, you could not get by Mr. Greenwood's route from George-street into York-street? I do not think you could, and I do not feel convinced that the way in which Mr. Greenwood has arranged his lines—the one to rise and the other to drop after leaving Bathurst-street—would give them sufficient clearance where they cross; I am quite open to conviction in regard to that, but it is for Mr. Greenwood to prove.
3497. If he were putting in only a single line, and leaving North Shore out of account altogether, there would be no objection to tunnelling under York-street? If the objection to a tunnel does not hold good.
3498. For the distance, that would be between Bathurst-street and Wynyard-square? About half a mile. I pointed out that it would take about two and a half minutes to run that distance, and the tunnel would not have time to clear.
3499. Would it be possible to put in ventilating shafts at the side of the road? They are not satisfactory, and would not be much good.
3500. Not if you were to have a fan constantly at work? You could do something with fans; but it would only be a mitigation of the evil.
3501. You see some objection to Mr. Greenwood's plan of one line climbing up over the other? Yes; I do not think that they would clear one another. I have not properly checked it; but I am pretty sure that they would not quite clear one another.
3502. Mr. Greenwood's explanation is that with one going down 1 in 60, and the other going up 1 in 60, there would be space enough from near the end of the platform in Bathurst-street to York-street for the one to get 16 feet over the other, or high enough, at any rate, for one to clear the other? Well, it would be a very tight fit.
3503. What would be enough for the headway—would 17 feet? It depends on the kind of construction. I daresay that with a couple of feet more you might do it. You could not do it with arches only. I think it would have to be with cross-girders and jack arches all the way.
3504. You see that Mr. Greenwood is trying to do with one line through West Sydney, what the plan you kindly brought us yesterday does with two lines; you have given up the idea of making one line serve for the West Sydney local traffic, and at the same time serve for the North Shore bridge, and you propose a line for each purpose? No, I propose more than that. I propose that the North Shore service should be carried on two lines independently, and that if the western suburban traffic must be carried in on the western side of George-street, there should be four lines for that.
3505. Did you state the minimum height for the underneath line, or rather between the two lines? The minimum height required is 15 feet, and you want something for construction. I daresay that with a system of girders you could do it in a couple of feet.
3506. That would be 17 feet? Yes.
3507. What I was remarking on was that Mr. Greenwood is trying the economy of killing two birds with one stone—that is, by making one line give the accommodation which the West Sydney people are asking for by giving them three stations, and at the same time giving the North Shore people what they are asking for by beginning to climb at the Town Hall until he gets high enough to go with his line over the proposed bridge? That is very false economy.
3508. You think it would be better to separate the two projects entirely? Yes.
3509. You think it would come cheaper in the long run? Yes. It would make Mr. Greenwood's scheme—always assuming you could get between the Town Hall and the Markets—a very much better one if he left out North Shore altogether for the present and took some other route for that.
3510. That could be done, I understood, and could be added in afterwards, but at very great additional expense;—it would be much cheaper to do it at once? But then you cannot serve the two purposes in the way that Mr. Greenwood proposes.
3511. You think, even if Mr. Greenwood's scheme be adopted at all, he should drop the North Shore element out of it for the present and make it simply a city extension on the western side? Yes.

3512. Then there would not be the same objection as you have to it now? I should have one objection less.
3513. You would not even then like the grades, the tunnels, and the passing between the Town Hall and the Markets;—those would be your three objections then? Yes.
3514. Then we get to Wynyard-square, where, in Mr. Greenwood's scheme, we have two stations—trying to serve a double purpose we have stations at two different levels;—do you see any objection to that? I do not see any particular objection to having stations at two different levels if you can give the accommodation required; but the objection still holds that you cannot do the suburban traffic on the lower pair of lines.
3515. It would only be a wayside station? Yes, I know; but I have shown, I think, that you cannot bring the suburban traffic in on a pair of lines.
3516. That objection applies to the whole of the line right through? Yes.
3517. Then, from Wynyard-square, Mr. Greenwood's scheme curves round and goes to Circular Quay in a cutting; Mr. Selfe's scheme curves round in a similar way and comes to Circular Quay with a viaduct;—do you think a viaduct is preferable to a cutting, or *vice-versa*? I think a viaduct is preferable to a cutting, if you must go that way. Mr. Greenwood's scheme, in my opinion, takes up too much ground at Circular Quay. I do not agree with him when he says that it takes up, practically, no ground there. That plan showing the area taken, coloured green, does not differ very much from Mr. Greenwood's plan. I made that from his description, before I had seen his sketches on the city maps, and there is not very much difference. Referring to the broader space between Pitt-street and Loftus-street, Mr. Greenwood brings his line up under Pitt-street, and places his station a little further to the west; the platforms, I understand, are carried under Pitt-street, and there might be a slight difference to the extent of a few feet in the location; but on the whole it is the same, and it is quite clear that the space taken up at the Quay is very serious indeed. Mr. Greenwood says that he would have a crossing over his railway opposite the Custom House. Well, he might have one crossing, or he might divide it into two, or do anything he likes; but he says himself that the rails would be only 13 feet below the wood-blocking. Therefore, his bridge over the railway there would be 4 or 5 feet above the surface of the street.
3518. Could he get over that difficulty by sinking his railway 4 feet deeper? Then he would have a steeper grade. He has a grade of 1 in 60 down from Wynyard-square. Mr. Greenwood's idea is to put ramps on each side, so as to carry the traffic to the level of Circular Quay. That road, with those ramps being raised above the surface of the Quay, would, of course, have to be protected by a low wall with a parapet, and that means that very much extra space is taken from the Circular Quay. Now in this map which I have submitted, and which is on the board, I have shown the existing tram lines and the future extensions down Loftus-street and Castlereagh-street, when it has been proposed to complete the lines which will be laid some day, and it will be seen that the railway very much interferes with those. Now, I take it that the tramway system is a system that has come to stay, and we must not have anything which would interfere with the tramway system. In my opinion we want both railway and tramway. We cannot do without the tramways, and we cannot do without a very considerable extension of the tramways, and those tramways along Castlereagh-street and Pitt-street, or wherever they come, must be connected with Circular Quay.
3519. *Mr. Watson.*] A viaduct would permit of the tramways being brought underneath? Yes; because the piers could be adjusted in position so as to suit.
3520. But in this case, with a line 13 feet below the street surface, you would have to bring your trams over by a bridge 3 or 4 feet higher than that? Yes; it would be necessary to have a bridge, and you could not drop down on the other side rapidly. You could not turn your trams round, as he proposes to turn his train traffic round—on a ramp; but those must go right through and curve round with easy curves to make a connection with the existing lines.
3521. *Dr. Garran.*] Then you think the interference with the roadway at Circular Quay would be so serious that it should not be entertained? Yes; unless the levels were altered so as to put that railway right down below, or raise it right above on viaduct, I think it should not be entertained; but apart from the interference with the tramway traffic, it is a general interference with the use of all that space at Circular Quay.
3522. Would not an elevated road on iron pillars, such as Mr. Selfe proposes, also interfere with the omnibus traffic on Circular Quay? Not very much, I should think.
3523. The omnibuses could not get underneath it very well, could they? Yes, if you made it high enough.
3524. Could the electric trams run underneath it? Yes. It is only a question of where you put in your posts; but I am not recommending any such scheme at all.
3525. I am only asking you whether an elevated road would offer less obstruction to the prospective traffic? I think it would be very much easier to arrange for an elevated road across the quay than for a sunken one.
3526. Could not Mr. Greenwood, coming in on an easier gradient, come in with an elevated road, if an elevated road were preferable? Perhaps he could; but I am afraid it would not be Mr. Greenwood's scheme. He says that he would not put his name to a viaduct.
3527. In order to get to the Circular Quay, Mr. Greenwood has to cross the Tank Stream;—do you see any difficulty at all in diverting that? I have not considered that point; that would be a difficulty, I should think.
3528. It would not be an unconquerable one, I suppose? I could not say until I had looked into that.*
3529. Then going beyond the station, Mr. Greenwood proposes to do his shunting in a cutting or tunnel running into the Government Domain as far as the stables;—do you think there would be room enough to do that? No, it cannot be done.
3530. Could he get over that difficulty by adopting Mr. Rennick's plan of running up by the side of the Government Domain where the row of trees is, and going on to Fort Macquarie, and doing the shunting there,—for his scheme would lend itself to that very easily? As I said before I do not think anything should be done that would affect the tramway extension, and I consider that Fort Macquarie is wanted for tramway purposes.
3531. Therefore you are jealous of letting the railway get possession of it? Yes.

H. Deane.
29 Mar., 1900.

3532.

* Note (on revision):—The difficulty is insuperable.

H. Deane.
29 Mar., 1900.

3532. Still he could get over the difficulty in that way? Supposing Fort Macquarie were not otherwise wanted, I daresay he could do something in that way.

3533. Do you think it would be a difficulty with regard to spoiling Government House grounds—I mean Mr. Rennick's plan? Yes; Mr. Rennick's plan would.

3534. It is the same thing practically; you think it would injure those grounds? Undoubtedly.

3535. Under the system under which the Governor here will be only a provincial Governor, Government House will, perhaps, not be regarded as so sacred a place as it is thought to be now? I think it would spoil one of the beauties of the harbour, and it is to be hoped, in the interests of the public, that even if there be no local Governor here, the Government will not allow that place to be spoiled, because it certainly is a beauty as you come up the harbour, which ought always to be preserved.

3536. All you would see would be the roof of a station; then Mr. Greenwood points out that coming in where he does, his line lends itself with great ease to an eastern suburban extension—do you admit that? Yes.

3537. Supposing the engineering difficulties you point out are conquerable, would not his plan of having a station at the Town Hall, and another at Wynyard-square, and another at Circular Quay accommodate a very large number of people? Yes; I think it would.

3538. Do you not think that that would be a line of access to the city that would enlist a great many votes on its behalf, other things being equal? Yes; that is assuming that it is a possible route, and not an impossible one.

3539. Assuming it to be possible the stations would be well located? Yes.

3540. Now as to the cost—Mr. Greenwood puts down what appears to be a very low figure;—do you think that he could do it for £730,000? I have mentioned one item of expense. I have not troubled very much about the estimate, because the objections to his scheme are so serious apart from the question of money. But I have noticed that Mr. Greenwood said that he expected that a tunnel for a double line of rails along York-street could be done for £50 a yard; and it is not my experience that it could be done for that.

3541. Do you think that one tunnel to carry two lines could be done for £50 a yard? No; that is what I mean. Mr. Greenwood says that a double-line tunnel could be done for £50 a yard, and I do not think it could. There are so many difficulties that would crop up in connection with that, even supposing you could get between the Town Hall and the Markets. When you get into York-street the relative levels of those two lines, and their relative alignment, make the construction so difficult that I am sure the cost would run into a figure very far beyond what Mr. Greenwood says; but, as I said before, I do not lay so much stress on the matter of cost as on the other objections.

3542. If it could be done for £800,000 it would be a very cheap line, would it not? I think it would—that is to say, if it could be done for £800,000 and serve its purpose; but it would never serve its purpose.

3543. If he were to leave out the North Shore line altogether, would that greatly mitigate the cost? I am not sure, but I think that the estimate that Mr. Greenwood gives there is for two lines of way only, and that it does not include the North Shore part. Mr. Greenwood says that from Redfern to the Circular Quay there would be provision for four lines of road; but in reply to Question 1847 he says, "From Redfern to Wynyard-square there would be four lines of way, and thence to Circular Quay and on the suburban line two lines of way," so it is not altogether as clear as one would like to have it. But if four lines of way are necessary at all, they are necessary to the Circular Quay, and under Mr. Greenwood's proposal it would be absolutely impossible to put four lines along Circular Quay, even supposing that the public permitted such a tremendous absorption of the Circular Quay as that would necessitate.

3544. *Mr. Dick.*] How does the amount of land taken at Circular Quay compare with that absorbed out of public streets and public parks, under No. 10 scheme? There is nothing of the public streets absorbed under No. 10 scheme.

3545. What about Elizabeth-street, from Park-street to King-street? Yes; Elizabeth-street is absorbed there. I understand that the city authorities have expressed themselves to the effect that they do not mind that absorption. I would recommend the Committee to ask them how they would treat an absorption of a similar area, or even half that area, on the Circular Quay. I think the Committee would find that a very different view would be expressed. The cases are not at all parallel.

3546. Why not? Well, it is quite clear that the taking of a portion of Circular Quay would be more objectionable than the taking of that portion of Elizabeth-street. Mind you, I am not approving of the absorption of any street; but if one street or the other is to be absorbed, I should say that the absorption of Elizabeth-street, between Park-street and King-street, would do far less damage than the absorption of that strip on the Circular Quay.

3547. You say we might ask the civic authorities their opinion about an absorption on Circular Quay;—is it a fact that they have no jurisdiction whatever over Circular Quay? I believe that the Mayor of Sydney's jurisdiction extends over Circular Quay. I should say that it does. I know that Circular Quay has been wood-blocked by the Government, but I fancy that the Mayor and the aldermen of Sydney would not relinquish their right to express an opinion about the taking of a portion of Circular Quay.

3548. *Mr. Watson.*] At any rate, they are interested in the traffic that goes over Circular Quay? Yes. I do not think that you would find that they would give up any right.

3549. *Mr. Dick.*] I am not sure whether yesterday you stated that the lines in Mr. Greenwood's scheme from Bathurst-street to York-street went in one instance either under the corner of the Markets, or under the corner of the Town Hall;—is it a fact that the lines, as proposed by Mr. Greenwood do go under either of those buildings? They encroach on the foundations.

3550. Of which building? Of both buildings.

3551. Does that mean that he would have to cut away either of those foundations to get the lines through? Yes; unless the location could be adjusted to what Mr. Greenwood says to keep clear of them; but I do not think it could, in fact, I am pretty well certain that it could not, under those conditions which I laid down a little while ago; and I do not think that any engineer not responsible to the Government, as I am, should lay down conditions and say what is a proper thing to do. I mentioned just now that a 10-chain radius was the minimum curve that should be used, and that there should be transitions in between, and under those conditions it is my opinion that Mr. Greenwood cannot put his line between the Town Hall and the Markets without disturbing the foundations.

3552. But if he violated the practice which now prevails in your Department in these matters he might do it? I do not know. He has not shown it on his plan.

H. Deane.

3553. Can you give us any idea as to the comparative loads which could be taken by the same class of engine over grades of 1 in 100, as compared with grades of 1 in 60? Roughly speaking, it is in proportion to the grade.

29 Mar., 1900.

3554. That would be an engine like the engine you mentioned yesterday—I think the "M" class? Yes. To run under the same conditions of load and speed you would want power in inverse proportion.

3555. *Mr. Levien.*] Where do you get instructions to draw plans for a railway like this;—do the Railway Commissioners direct in any way what course you should take, or do you act upon your own responsibility with respect to what you yourself consider to be the best and most economical line and the line you would recommend? It depends upon what my instructions are. In many cases, in regard to the city lines, I have been instructed to lay down lines on certain routes.

3556. Well, what were your instructions for this city line? Do you mean No. 10?

3557. No, any of them? Well, take No. 10. I was instructed by the Minister to lay down a certain line.

3558. Then, with reference to No. 10, you took your instructions directly from the Minister? Yes; and I worked out the traffic requirements with the assistance of the Railway Commissioners and their officers.

3559. Did you from any of the Ministers, or from the Railway Commissioners at any time, get instructions to exercise your own discretion in drawing plans for a line that you thought you could recommend to the Committee yourself? I have never been asked to choose a line myself.

3560. Not at any time? No. I should like to say, with regard to that, that I have always so far had a free hand in making suggestions—that no Minister has forbidden me to make suggestions with regard to routes.

3561. No, but he has given you directions;—as regards No. 10 scheme, did you get your instructions from the Minister, saying, for instance, "You shall commence at this point and finish at that point"? Those were the instructions. The details I had to work out.

3562. But you were to mind those two points—the starting point and the terminal point were under the direction of the Minister? Yes, and more than that. When I first submitted No. 10 scheme to the Minister I proposed to go as in the St. James' Road line across Goulburn-street, and then follow the same course until reaching Liverpool-street, and then cut across to Park-street, but I was told that that would not do.

3563. You were told by whom that that would not do? I think it was the Premier.

3564. The present Premier? Yes—that the location was not suitable; and so I had to work the other plan out. It has the advantage of taking a strip of the Park close alongside of Elizabeth-street, instead of a cutting alongside as in that plan; but it has other disadvantages which I have pointed out. But that is what was decided, and the Ministers decided on that route.

3565. Then No. 10 scheme is a Ministerial scheme? Exactly.

3566. Coming back to the first question I put to you, have you ever been instructed to have a free hand, and give your individual opinion as to which you think is the best scheme yourself? Mr. Young, and the late Minister, Mr. Lee, often asked my opinion.

3567. Have they ever given you instructions, saying for instance, "Mr. Deane, we want you to look into the city railway question, and give us your own opinion as to the best route to take"? No, they have never put it in that way.

3568. Your instructions are limited instructions? The first instructions that I had in regard to a city railway were to work out a scheme terminating at Park-street. That was submitted to the last Royal Commission, and then it was suggested that the line should go on to St. James' Road.

3569. But you have not answered my question;—I want to know whether you have ever had a free hand—for instance, "Mr. Deane, work out what you consider to be the best city railway, and which route it should take"; have you ever had a free hand in that way? I have never been hampered in any way.

3570. That is not the question;—have you ever had a free hand—for instance, "Mr. Deane, your instructions are to work out the best city railway, taking the best route you can"? It has never been put to me like that.

3571. Then there is no doubt you have been hampered by being restricted by some instructions being given to you in every instance? I do not call it being hampered.

3572. You do not call it being hampered;—it is simply obeying instructions; but they have not given you a free hand;—they have told you, "We want so-and-so done. Here is our starting point, and here is the terminal point, and you must prepare a scheme accordingly"—is not that it? Yes. I look upon it that the extension of a railway between points is, in the first instance, a question of traffic and accommodation, and it is for the engineer to see how that problem can best be attacked. The problem has been put to me to make a railway between certain points, and that problem I have worked out.

3573. If you had had a free hand, would you have adopted any one of those ten plans;—of any one of those schemes that you have submitted, would you, of your own free-will, say, "That is the line I would recommend"? Yes. I should choose the St. James' Road proposal.

3574. You would? Yes.

3575. If they had given you the freest hand possible, you would have said, "That is the one I propose"? Yes; that is the one; and I think I have a right to say that I had a good deal to do with the improvements to that scheme, and making it as good and as suitable a scheme as it is.

3576. You have given every consideration to every proposal that has been submitted;—now, if you were disinterested in giving your opinion, would you say that, in your opinion, the St. James' Road proposal is the best? Yes, I would.

3577. Putting aside your position as head of the engineering branch of the Railway Department, you would recommend that proposal? Yes.

3578. *Mr. Shepherd.*] Do you think that that is the best scheme that could be formulated, or, if you were asked to propose a scheme of your own, do you think that you would differ from that in any way? Except in minor details, I should not differ from it. I think it is a very good scheme.

3579. *Chairman.*] There is a question that Mr. Greenwood has asked me to put to you; in your written statement you say that Mr. Greenwood "reckons, for instance, that the lines along York-street can be done for £50 a yard for the double road"; Mr. Greenwood desires me to ask you what was the contract price

- H. Deane.
29 Mar., 1900.
- price for taking out the rock on the Darling Island branch, without explosives;—do you know that from memory? I do not remember exactly, but I think it was 4s. 4d. a cubic yard; and the contractors always professed that they lost over it.
3580. You say that they took it at too low a price? Well, they said so. I do not suppose they made much out of it.*
3581. *Mr. Dick.*] Do you remember all the Government schemes that were placed before the Royal Commission in 1891? Yes.
3582. Do you remember Government scheme "L"? Yes.
3583. Was that scheme prepared in your Department? That scheme was prepared under instructions. The instructions were, I think, from Sir Henry Parkes; but I am not sure.
3584. What was your opinion of that scheme? I did not like it. It is an unworkable scheme.
3585. It was prepared under instructions from Sir Henry Parkes? Yes.
3586. And you think it was unworkable? Yes. It was worked out in my predecessor, Mr. Whitton's time, but I do not think that Mr. Whitton himself liked it. Mr. Whitton's own recommendation was to utilise Hyde Park. This proposal was afterwards appropriated by the Railway Commissioners and called the Railway Commissioners' proposal.

John Parry, Out-door Traffic Superintendent of Southern Lines, Department of Railways, sworn,
and further examined:—

- J. Parry.
29 Mar., 1900.
3587. *Chairman.*] Mr. Deane, in giving his evidence, reviewing some of the suggested schemes for a railway into the city, handed in a statement beginning with the words, "The following are Mr. Parry's views, which I entirely endorse";—that document was, I understand, prepared by you? Yes; in conjunction with Mr. Deane's statement.

3588. And I suppose that that document correctly states your views? Yes. With the permission of the Committee, I should like to refer to certain questions and answers that have been given in the course of this inquiry, and to furnish some information in reference thereto. Turning first of all to Mr. Selfe's evidence, on page 72, question 1505, Mr. Selfe in paragraph 5 of his memorandum says:—

No single station or terminus outside the business quarters of Sydney can possibly be of such service to regular daily travellers as a series of stations distributed through those districts of the city where the business premises are situated. (Therefore a series of stations should be distributed through the city in any scheme to be adopted. See Mr. Rennick's opinion that the western side of George-street is the proper route.)

Now Mr. Rennick, in clause 5 of his report, page 1, states:—

If cost did not govern, a line near to and west of George-street, bisecting the business portion of the city and curving round to Circular Quay, would, in my opinion, meet the requirements best; but the evidence points to such a line being enormously costly, and not likely to pay for many a year.

Again on page 3 of his report, Mr. Rennick states:—

On economic grounds, therefore, an eastern route must be selected, and that favoured by the Railway Department close to Elizabeth-street seems to meet the economic condition best.

Again on page 4 of his report, Mr. Rennick states:—

The western scheme, on account of the excessive cost of providing four or six lines with adequate station accommodation, and a terminal station at or near "The Rocks" is, it appears to me, out of the question, under present conditions of traffic.

So that it will be seen that Mr. Rennick favoured the eastern scheme.

At Question 1593, Mr. Selfe is asked:—

Would you have room at your terminus for all the carriages which would have to stand there in the middle of the day? Yes.

His terminus being at "The Rocks"; and at Question 1594, Mr. Selfe is asked:—

Would you have more room than there is at Hyde Park? Yes.

I wish to point out that Hyde Park was never intended to be a storage place. Six lines of rails are provided down from Redfern to Hyde Park for the purpose of the trains storing going to and from Redfern, at which the storage accommodation exists at the present time. Therefore, it would not compare with Hyde Park. At Question 1595, Mr. Selfe is asked:—

Would you have more room than there would be in the St. James' Road scheme? I measured the standing room provided in the King-street scheme at the back of the Art Gallery, and I found that it amounted to 7½ acres. I have 7¼ acres in the smaller scheme which only extends from Cumberland-street to Harrington-street.

That is referring to "The Rocks." Well, the accommodation provided in the Domain at the back of the Art Gallery was not intended to accommodate the whole of the carriages of the through trains and the suburban trains, but only a portion of the suburban trains. The through trains, and a portion of the suburban trains, would still run back from the King-street terminal station to Redfern, to store. The accommodation provided at the back of the Art Gallery was to enable, during the busy hours of the day, the trains to run straight away through the station, and unload quickly, get out of the way, and run to the back of the Domain to shunt and return—also, of course, when they had finished work in the evening, some of them to go and stand at the back of the Art Gallery. At Questions 1601, 1602, and 1603, Mr. Selfe is asked:

In your estimate of the suburban traffic, do you include the Penrith and North Shore line as far as the Hornsby Junction? Yes.

Do you include the Illawarra line as far as George's River? I have not gone into that question; but there is no reason why those trains should not come down.

Then it is only the great trunk line traffic that you deal with? Yes.

What I wish to point out is that in determining the question of through, or country and suburban trains, a definition should, in all cases, be sought for, because, if you take the through trains, pure and simple, they resolve themselves into very few; but if you take what we call the semi-suburban, although running long distances, they amount to a large number, and therefore affect the question very considerably. Mr. Selfe does not appear to have taken into consideration the actual trains he is providing for in his scheme.

At

* NOTE (on revision):—The price paid at Darling Harbour for excavation in open cutting can have no bearing whatever on a price to be paid for a tunnel under a street, where the traffic must not be interfered with.

At Question 1650, Mr. Selge is asked :

What led you to prefer a route more to the west—was it with a view of serving the greater number of people, or avoiding expensive resumption? No; it was simply to take the people where they wanted to be delivered. Nine men out of ten do not want to be delivered at the top of King-street; they want to be delivered somewhere near George-street. Nothing has better demonstrated what I have contended during ten years than the marvellous success which has attended the George-street tramway. That has put the seal on what I have been contending for all that time.

What I wish to point out is, that the passengers at the present time travelling from Redfern station by the George-street tram, do not indicate whether those passengers would travel to King-street or not. There is a very imperfect service now of the steam trams from the railway; in fact, during the greater portion of the day there is scarcely any such service, and in the morning the majority of people who take a steam tram, unless they wait, have to walk to George-street and get into the steam trams coming from the western suburbs. Therefore, rather than walk to George-street to get into the steam trams, many people simply get into the George-street trams at the platforms, and prefer walking at the other end. I know that to be the case to a very large extent. At Question 1662, Mr. Selge is asked :

Presuming it was thought desirable not to go to "The Rocks"—stopping, say, at the Markets for the present—would you be able to make such arrangements there as would successfully deal with the urban and suburban traffic, and enable the trains to get back? You would deal there with at least twelve trains an hour each way. I think you could deal with twenty.

Of course, twelve or even twenty trains in our busiest time would not meet the business; therefore, assuming the maximum at twenty trains, it would not deal with the business we have to do at Redfern, and get the empty trains and light engines and such-like through. At Question 1677, Mr. Selge is asked :

When Mr. Rennick came from Melbourne, do you know whether he had your scheme under consideration? He was under my charge for the first day. Mr. Reid sent for me, and as soon as Mr. Rennick came into town I was with him for the whole of the first day. For the rest of the week he was in charge of the Railway authorities; but he was so impressed with my scheme that you will see from his report that, in his opinion, it is absolutely the best scheme. He had no statistics as to cost, except what he could derive from the reports by the Royal Commission and the Public Works Committee. From these Mr. Rennick naturally deduced that my proposals were extremely costly. He therefore says, "If cost does not govern the question, the western scheme is the best, and it must come some day." He told me personally, "I think Sydney must have two schemes—one through the centre of the city, and one down the west, and I have recommended going down Hyde Park, because it appears that costs nothing for resumptions." He was led to understand that the Hyde Park scheme would not be debited with any public or quasi-public property. Therefore, as he simply made estimates on the data put before him, the Hyde Park scheme seemed much the cheaper, and he recommended it.

Now, I know for a fact that Mr. Rennick's instructions were—as given by the late Premier, Mr. Reid, in my presence—that he was to consider Hyde Park as covered with costly warehouses or mansions, and that it was impossible to obtain that site. Those were his instructions in going forward with his investigations. With those instructions he reported that, in consequence of the cost, he recommended the Hyde Park scheme—the eastern route. When his report was sent in the Premier wrote the following letter to him :—

Dear Mr. Rennick,

The Treasury, Sydney, N.S.W., 7 January, 1899.

I have just received your Report on the extension of the railway into the city, which I beg most heartily to thank you for, as a most valuable contribution on the vexed question.

The only point I wish to allude to is the fact that the scheme including the station in Hyde Park was, however admirable, not within the intentions of the present Premier, and that I wanted you to proceed on the basis of some other solution—even if not the best—of the question. On that point your Report—you will forgive me for saying so—is almost silent. For instance, take this part of a sentence: "As it is shown in evidence that the eastern line can be extended from St. James' Road to the Domain near Circular Quay for less than £100,000, this seems to be the right thing to do at once." In other words, you practically brush aside the actual position of affairs—that the Government will not deprive the people of the use of Hyde Park as a park, and as covered with a series of important city thoroughfares, and sacrifice the actual to that extent to the "ideal," with which, I can assure you, I am already most fully acquainted. The "railway ideal," when it comes into contact with a "health ideal," must, I think, take second place, if, at any rate, any other scheme is possible, and within reasonable bounds of expense.

"What shall the eastern line be?" Under that heading a few lines only as to the alternative scheme.

Now, having put the Government under many obligations by your kind visit, and the great trouble you have taken, would you object to give me a short addendum report, confined entirely to the "next alternative scheme," showing me your full opinion of it, on the basis that the Hyde Park official scheme is out of the question?

Yours, &c.,

G. H. REID.

In reply to that letter Mr. Rennick again endorsed the eastern route. He modified it so as to disturb less of the Hyde Park, and then takes his line down to Circular Quay and on to Government House grounds. What I wished to point out is that Mr. Rennick was fully seized with the desire of avoiding an eastern route if it were possible to obtain a western route, regardless, so far as he was concerned as an engineer, of the cost. At questions 1700 and 1701, Mr. Selge is asked :

Would the proposed station at Christ Church be merely a passing station? Yes; it would be practically a duplicate of the Burwood station.

Would that accommodate all the people who would require to get out between Eveleigh and Liverpool-street? Yes.

I desire to point out in connection with those two questions that for suburban passengers Redfern would be abandoned. It would become a through station for country trains only. Therefore the people in George-street West, Surry Hills, and Redfern—the district around that part—would be cut off from their vested rights which they have at the present time in Redfern station, and would have to go either to Eveleigh or to Christ Church. And there is no doubt that it would act prejudicially to the property-holders of George-street and George-street West, and also to the business establishments. Of course, if you retain Redfern, so that passengers can still get out or go through, then you do not disturb any vested rights. At question 1703, Mr. Selge is asked :

Do you think that if Mr. Rennick had come here quite disinterested, apart from any Government control, and if he had positive evidence as to the cost of your resumptions, he would have absolutely favoured your scheme? I could not say that he was not disinterested; but I would say that if he came here with a clean sheet, without the influence of the Blue Books, which he told me he had carefully read, and had to make an examination for himself, without any extraneous influence, he would have recommended this western line.

I should like to point out that Mr. Rennick, who is an engineer of great reputation, was brought here by the Premier of the Colony and told distinctly that the Premier desired the next best scheme, either by going on the western side of George-street or any other, but he required another scheme, to avoid going through the Park. Now, it is unfair to imply that Mr. Rennick was unduly influenced by Blue Books or by evidence put before him. He would analyse the whole most carefully; he would take the *pros* and the *cons* as to the value of the respective schemes, and his reputation would certainly cause us to believe that

J. Parry.
29 Mar., 1900.

that he would, after full investigation, recommend what he considered the best thing, and he recommended the eastern route. At questions 1713, 1714, 1715, 1716, and 1717, Mr. Selze is asked :

1713. Would your four lines be in the street, or would they occupy any portion of the Markets? Three lines would be under the roof of the building, and one line would be under George-street.

1714. Would you have ample room for shunting? There would be no shunting at all; that would be done either before we got to the Markets, in Goodlet and Smith's yard, or it would be done in the tunnels between York-street and the Markets.

1715. Would not that be likely to cause confusion? No; it could be arranged without any difficulty.

1716. How long would it take a train to come in and change the engine from Goodlet's yard to the Markets? It would take no longer than at Redfern at present. It is entirely a railway question, and cannot be affected by locality. Speaking as an outsider, I should say they could work twenty trains an hour in the Markets. I have put down twelve to be certain. Mr. Eddy said forty, both ways, with a hay line.

1717. Would there be sufficient room there to adopt the traverser platform system? There is sufficient room to work a platform by making a large vacant space under Market-street, but I should not advise that. The traverser platform was first proposed by me, in 1890, for the station on "The Rocks," but that is a dead end. It might be adopted at the Markets as long as they were a dead end, but it could be removed when the line was continued to Wynyard-square.

I wish to point out that Goodlet and Smith's yard is some little distance from the entrance to the Markets, and therefore engines and carriages proceeding from the Markets to Goodlet and Smith's yard would have to proceed back over the main lines, and therefore it is impracticable and would be valueless as a shunting-yard. With reference to the shunting arrangements in tunnel between York-street and the Markets, there is nothing to show you what they would be. That is all I desire to bring under your notice with reference to Mr. Selze's scheme.

FRIDAY, 30 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

John Parry, Out-door Traffic Superintendent of Southern Lines, Department of Railways, sworn, and further examined:—

J. Parry.
30 Mar., 1900.

3589. *Chairman.*] I understand that you wish to say something in regard to Mr. Greenwood's evidence? Yes. Taking Mr. Greenwood's evidence, I would first of all refer to the third paragraph under the heading "Description of route," in his scheme. Mr. Greenwood says:

In connection with this scheme, I propose to construct a loop-line from near Stanmore to a 70-acre shunting-ground near Shea's Creek, on which I propose to build self-acting gravitation sorting sidings, thereby virtually increasing the size (or working capacity) of Darling Harbour goods yard to three times its present capacity, and relieving the main line near Eveleigh of all goods traffic passing from South Coast district to South, West, or Northern lines.

Mr. Greenwood, I think, is under a misapprehension in regard to the traffic to be dealt with. In the first place, Shea's Creek would be an altogether unsuitable place at which to provide marshalling or gravitation sidings for Sydney. Then, with reference to joining at Stanmore, it is patent that you would have to construct a separate line from Stanmore, to get to the gravitation sidings at Shea's Creek. From a Departmental point of view it is difficult to see what advantages would be gained by going to Shea's Creek, even for the South Coast traffic. Mr. Greenwood says that the capacity of the Darling Harbour goods yard would be increased to three times its present capacity. Now, the whole of the Southern traffic and the Western traffic, and a part of the Northern traffic, are dealt with in marshalling sidings at Clyde and Strathfield. The trains are taken out from Darling Harbour in the rough—they are not marshalled at Darling Harbour, but are simply picked up in the rough as they are loaded, and run away to Clyde and Strathfield, where gravitation sidings are already provided. So you see that the South and the West are already provided for, and partly the North, at Clyde and Strathfield. To take the Southern, the Northern, and the Western traffic out to Shea's Creek, would be to take it out of its direct course; and seeing that the trains are nearly all marshalled now away from Darling Harbour, the increased capacity given to Darling Harbour by having marshalling sidings at Shea's Creek would not affect materially the present conditions of Darling Harbour.

3590. *Dr. Garran.*] But would it not be more convenient to do that business nearer to Sydney than as far off as Clyde? No. It is just as well dealt with at Clyde for the Southern and Western lines. You can bring goods trains into those sidings without interfering with the suburban line at any time; you are not restricted by suburban traffic in bringing goods trains into Clyde from the country, as would be the case if the sidings were at Shea's Creek. Mr. Greenwood says:—

And relieving the main line near Eveleigh of all goods traffic passing from South Coast district to South, West, or Northern lines.

Now, the traffic from the South Coast to the Northern, the Western, and the Southern lines is infinitesimal; therefore there would not be the least justification for spending such an enormous amount of money for gravitation sidings at Shea's Creek. I now go to question 1854:—

Apart from the question of expense, what objection have you to a site either at King-street, under the No. 10 scheme, or under the St. James' Road scheme? In the first case, you would simply repeat the trouble experienced at Redfern. You simply remove Redfern up to St. James' Road, and have a dead-end there.

I think that considerable pains have been gone to to explain to the Committee the improved design of the arrangements at St. James' Road, and it cannot in any way be said that it is removing Redfern station to St. James' Road, with its difficulties. St. James' Road is not intended to be a storage yard, nor for a large amount of shunting in marshalling trains to be going on. That would be done by running the trains back direct to Redfern, and there marshalling them.

3591. And then back again to take up their places to go out again? Yes; that is, after they had done their work in the morning, they would go to Redfern to stable, and would be brought out again at night, and, after finishing their work, would be stabled again. 3592.

3592. What would be the cost of running each train forwards and backwards twice, as compared with what you do now, doing it all in the present station-yard? The distance would be about a mile.

3593. Would 4s. a mile be a fair estimate? Oh, no. Working in with the suburban line, the cost would probably be 1s. 4d. or 1s. 6d. per train mile.

3594. This question has arisen in the course of this inquiry, and I should like to understand it thoroughly: the average cost per train mile has been for many years about 4s., now reduced to 3s. 10d. by economies;—how comes it that your average cost is 3s. 10d., and yet the cost of running over this particular bit of road is to be brought down to 1s. 10d.? Because 3s. 10d. is simply taking the whole of the working expenses of the Department, including administrative staff, dividing it by the number of train miles; but it will be readily seen that, to get at the actual cost of running an empty train back to Redfern from St. James' Road, it would not be at all right to take the average cost per train mile. In dealing with that matter you must deal with actual costs.

3595. But would you not charge it with anything for administration or for coal? For coal we would; but not for administration.

3596. At any rate 2s. a mile would be ample to cover the whole of the cost? Less than that—for empty running I am speaking of.

3597. Then, there and back would be less than 4s.? Yes.

3598. *Mr. Watson.*] The men who would have to work the running back of empty trains from St. James' Road to Redfern would otherwise be doing nothing practically for some little time? Well, Redfern would probably be the men's home—I mean that they would sign on and off at Redfern; practically, that is what would be done in many cases.

3599. *Mr. Dieh.*] Still that must increase the amount of time the men would be working on those trains, or shortening the effective time of their working? It would to a certain extent. I now come to question 1857:

Have you any other objection, apart from the duplication, of the difficulties at Redfern with regard to the proposed site for a station? It is useless for long distance and suburban passengers.

I must confess that I am unable to grasp the meaning of that answer. We contend that the suburban business admits at the present time of our doing the business satisfactorily at the new station, and as regards the through passengers, we contend that the great bulk of the through passengers would come to King-street. I now come to questions 1889 and 1890—dwelling upon the question of dealing with the business at Circular Quay, and assuming that the railway were carried down to Circular Quay, and that the eastern extension were not constructed:

Would you not want a little more than that to do the shunting? I do not think so, but we might. The remaining portion I have charged to the other line.

If we stopped there for the present, would you have to go under the Domain? No; I have 15 chains available.

That is in length. I have placed before you the number of trains to be dealt with; I have placed before you the actual number of trains which have come into Redfern on holidays, and which runs into as many as 629, I think. You know yourselves what the business is,—fast trains coming in between slow trains up to Redfern at the present time. Now all these would have to be dealt with at Circular Quay, with two lines of railway, and 15 chains long. I hardly need say more to convince you that the arrangements would be altogether inefficient. Besides, Mr. Greenwood himself is evidently in doubt. He does not seem to have studied the subject; because when he is asked whether he would require a little more land, he says, "I do not think so, but we might." It is too serious a thing to start on with conjecture such as that. We want certainty before dealing with a large question such as this.

3600. *Dr. Garran.*] Could Mr. Greenwood get over that difficulty by adopting Mr. Rennie's proposal to run up from Circular Quay, and go along by the side of the Domain fence, so as to shunt at Fort Macquarie, because he could easily turn round to do that, and Mr. Rennie treated Fort Macquarie as being an ample shunting place? I know the business lay of the place, and that the ground is very high and rugged. I do not say it could not be done—that is, the traffic which two lines would accommodate; but we must start with the fact that two lines will not accommodate the traffic, and it is utterly absurd to think that they would do so.

3601. I understand that during the busy part of the day the trains would follow one another at intervals of four minutes? But even then it could not be done. I propose to deal with that matter later on. Now I come to question 1930, referring to Redfern station:—

What I mean is this: If we are going to carry two lines of rails northward for your city extension, you might as well, while about it, carry your other platforms northward, in order to lengthen them—the long-distance ones? I do not think there is any need to take the long-distance ones northward for some years to come. If you can now accommodate both the long-distance and the suburban trains in the present station, and if you were to take 90 per cent. of that traffic through, you must have sufficient platforms left there for the long-distance trains.

Therefore, Mr. Greenwood's intention is clear—90 per cent. of the traffic is to come down, and 10 per cent. is to remain at Redfern. The number of trains—assuming that you bring the suburban trains down to Circular Quay—does not govern the question of the suitability of Redfern station. That can be determined only by actually laying down a plan which has not been done. I now come to questions 1933 and 1934:—

Then you would take the suburban on two sides, or on one side? I would take them on the east side of No. 3, and east from No. 3.

That is at Redfern station.

Towards the produce sheds? Yes; and I would keep Nos. 5 and 6, and west of them, for long-distance traffic—for the present, mind you.

Now, Mr. Greenwood tells you that in his scheme he would bring the suburban lines to the east of No. 3 platform, and that he would bring his country, or long-distance trains, in on the west. The effect of Mr. Greenwood's alteration, in carrying his suburban lines over to the east of Redfern station, and making his long-distance traffic go to the west of Redfern station, would be that you would have to cross the whole of the suburban lines with the through trains, with all their shunting, to get to your carriage marshalling sidings, all of which are on the eastern side of the main lines; besides which, it would, of course, necessitate the tearing up, practically, of the whole of the yard, because the main lines would have

J. Parry.
30 Mar., 1900.

J. Parry. have to be diverted on to the other side of Redfern station, and carried through as main lines, and you could not get through lines and platforms without considerable cost for alteration.
30 Mar., 1900. 3602. Would that difficulty be got over if Mr. Greenwood were to put the suburban on the western side? Then you would be on the side on which all the carriages were stored. You would have the same difficulty of having to cross the suburban line—that is, if you make that a storage place. In either way it is not satisfactory. I now come to Questions 1939 and 1940.

We have had it in evidence that proper platforms ought to be 600 feet long at the least;—do you agree with that? No, I do not.

Not for suburban traffic? Not for suburban traffic. Certainly not; and I doubt it very much for long-distance traffic. If you go to the station on Monday night you will find that they put two engines on the Northern train, and those two engines, and the cars as well, do not measure 500 feet; but, if I were building a new station in the Benevolent Asylum grounds, I would certainly make the platforms 600 feet long.

What we ask for is to be able to deal with the work at the present time. The Northern mail train, with two engines—when it is up to its maximum—would be about 560 feet long. With a long heavy train like that, you do not want to be in such a position as to be obliged to pull up within an inch or two of the buffer stops. If you run in right to the end of the platform, you cannot get the engine away unless you pull out again. You would require to put in a traverser, and that would be 60 feet, and you would have to stop clear of that. Therefore, 600 feet for those trains is not too long. There are, of course, trains shorter than that—some, perhaps, not more than 200 or 300 feet long; but what we have to provide in working the business is not merely for the short trains, but also for the long ones. At holiday times, for instance, what is the use of a 300-ft. platform? The difficulty is not in dealing with the day-by-day business, but in dealing with the holiday business, and when we have the trains up to their maximum length. I now come to Questions 1944 and 1945.

But your two suburban lines would spoil the crossing from east to west? Yes; but if you were approaching the station from George-street, you could get to No. 5 the same as you do now; but the moment you lengthen No. 6 across Devonshire-street, you cannot do it.

You could do it underneath Devonshire-street by means of steps? Yes; I think it will be possible, for a considerable time, to work your long-distance trains in your present station, without lengthening your platforms.

Of course that is merely an expression of opinion. When you have taken No. 3 and east of No. 3, that practically leaves Nos. 5, 6, and 8. The other platforms are altogether unsuitable for through business. It leaves three platforms, and the roads would have to be thoroughly reorganised; therefore, it practically means tearing up the whole of the yard. I should like it to be clearly understood by the Committee that, in dealing with long-distance trains, I gave the Committee figures of ordinary daily traffic. But it must be remembered that at holiday times nearly the whole of those trains are duplicated, and in some cases triplicated. Then, instead of the Southern mail running in one division, it will run in two divisions, the Western mail will frequently run in three portions, and the northern mail will run in two portions, and the Melbourne express will run in two portions. Therefore, when we speak of the normal daily traffic, it does not meet the case at all.

3603. When you split the traffic up like that, the trains are not quite so long—they are shorter than the excessively long trains? Yes, they are. You must have separate platforms to run your inward trains into, and sometimes the Western will come in in two or three divisions, and the Southern in two or three divisions, and the Northern also.

3604. Is there not generally an interval of, perhaps, twenty minutes between those trains in coming in? The Southern and the Western mails in the morning come in close upon one another. If one of those trains is running a little late, they may perhaps arrive at Granville Junction at the same time, and afterwards run block and block with each other.

3605. You would have that same trouble at King-street? No; I should have extra platforms there.

3606. Am I to understand that if you were to have a heavy holiday traffic—double trains coming in from the north, the south, and the west, and the usual suburban trains—you could deal with it all at King-street? Yes. I now come to question 1951:—

I have no right to say that it is a hardship that that train is not carried into the city of Sydney; but, apart from that, what reason is there for carrying long-distance trains into the city? I say nothing. Fully 90 per cent. of the public are better served at Redfern than they would be at King-street. People residing to the east of Victoria-street, Darlinghurst, and from there right down to Darling Point, Rose Bay, Randwick, Waverley, Woollahra, Paddington, Moore Park, Alexandria, Botany, The Glebe, Forest Lodge, and Pyrmont, are served better from Redfern than they would be from King-street. It is only one-tenth of those in town who would be better served from King-street than from Redfern.

We are not proposing to close up Redfern, therefore the whole of the through passengers for those places mentioned could alight at Redfern. No inconvenience would be occasioned to those people; they could either alight at Redfern, or go on to King-street, just as they chose. I now come to question 1955:

Simply an extra expense to the Railway Department? Yes.

We maintain that the running of through long-distance trains down to King-street would be a source of revenue to the Department.

3607. *Mr. Watson.*] You could not add anything to your long-distance passengers' fares for that little bit? Yes, we could put a long-distance rate on, according to the Railway Act.

3608. *Dr. Garran.*] But do you think that you could get half of the long-distance passengers who now stop at Redfern, to go on to King-street? I think we would get a large proportion of those who now stop at Redfern.

3609. Would it not depend a great deal on which suburb they resided in? Yes.

3610. If the cab-drive were shorter from Redfern to their house, I suppose that they would get out at Redfern? I now come to questions 1963 and 1964:

So, in your opinion, we can make a city extension with a very moderate additional expense to the present station-yard? Yes.

— There will have to be something done to adapt that to the change? Yes; I think that Mr. Deane, in one of the schemes, puts down £20,000 for alterations at Redfern.

But I, myself, know that that £20,000 was put down for an alteration very different from that which would be involved by leaving the long-distance trains at Redfern, and bringing the suburban trains through. That £20,000 was allowed for alterations at Redfern for simply running the present traffic through to St. James' Road. Therefore, that estimate of £20,000 is, altogether beside the mark, to alter the station as indicated by Mr. Greenwood; but, of course, it is impossible to say what his proposals are without a plan being furnished.

J. Parry.
30 Mar., 1900.

3611. If you separate the long-distance traffic from the suburban traffic, would that put you to the extra expense of keeping a large number of porters at Redfern? Yes. Now, in the morning, the suburban passengers require very little attention; but, when the through trains come in they require the maximum number of porters you can put on. Those men come on duty at half-past five in the morning, and practically they have done their work, so far as the through trains are concerned, by 7 o'clock—I mean as regards the mail trains from the country. They are then available to do the ordinary work of the station—attending to the ordinary suburban business, and such like;—but if we were to divide the traffic, and have part of it at Redfern and part of it at King-street, then we should require two distinct staffs—there would be practically almost a duplication of the staff. I do not say that there would be a duplication, but there would be a very largely-increased staff as compared with what it now takes to man the one station. I will give more particulars of that later on.

3612. *Chairman.*] This position might arise: if some of the long-distance passengers were to get out in large numbers at Redfern, that would cause great delay to those people who would want to go on into the city, and you would have to keep two large staffs; I suppose that the Department would encourage people to go right through;—you would rather that they came right through? You must not measure the business merely by the number of passengers, you have also to deal with mail bags and parcels, and there are van-loads of parcels.

3613. *Dr. Garran.*] They would all come on to Sydney? Yes. The luggage is not much when compared with parcels and mails.

3614. But the long-distance passengers would occupy your porters only in the morning and the evening? Yes.

3615. In the middle of the day they would not be wanted? Yes, they would. For instance, you have the Melbourne express coming in at 10.50, and the Northern mail at 11.40, and you have also your Newcastle trains coming in, which have to be attended to as through trains.

3616. *Chairman.*] You do not think there is any danger of Redfern and King-street becoming like two city termini? Not if we come down to King-street.

3617. *Dr. Garran.*] You do not get over the difficulty in any case if you stop at Redfern at all, because it is a certainty that some of your long-distance passengers will get out at Redfern? Yes. It will be similar to what we get at Strathfield. We stop at Strathfield and collect tickets there, and people who live on the suburban line between Strathfield and Sydney get out at Strathfield and change trains, and that keeps the train three or four minutes. I estimate that more people get out at Strathfield from some of the trains than would get out at Redfern, and I reckon that for through trains you would stop at Redfern perhaps two minutes, or three minutes at the outside.

3618. But if you stop at Redfern at all you must have a staff of porters there? Yes, like we have at Strathfield. We should have a staff of porters there, but nothing like the staff required to deal with through trains at terminal stations. I now come to questions 1982 and 1983:—

You are providing four lines of rails only for your city extension and for the line to North Shore, whereas Mr. Deane provides not less than six simply to go to a dead-end station at King-street? Granted.

If he wants six for that, can you make four do for what is a double railway? Yes. Mr. Deane's own opinion was that only two lines were necessary, and he designed his scheme for two lines, and everyone else who sent in a scheme designed only for two lines. The Commissioners have gone in for six lines now, but their scheme in 1894 was for only four lines. The 1896 scheme provides for six. These six lines consist of up and down fast, up and down slow, and two service lines. Those two service lines simply go into the Redfern yard, and no further.

Mr. Greenwood is under a misapprehension here. Those two service lines go to the Illawarra Junction. As a matter of fact we have six lines now straight away from the Illawarra Junction—that is the junction of the South Coast line—into Redfern. The six lines brought down to St. James' Road, therefore, would give us six lines from Illawarra Junction right to King-street, and we should have the great advantage of being able to throw the whole of the South Coast traffic (which at holiday times is very large), on to those two service lines, and utilise them not only for engines and carriages going backwards and forwards, but also for suburban traffic in addition. I now come to questions 1985 and 1986:

Having re-duplicated that line, they found that two lines would no longer carry the traffic? Two lines would carry double the present traffic on the lines if the whole of it were slow: but they want to run a fast train alongside a slow one, and they could not do that on two pairs of rails, and that is the reason why they have constructed four lines of rails. I propose to let the four lines remain there, and they will still run fast trains from Strathfield to Redfern, but at Redfern they must stop.

You cannot run fast trains through the city? No: you must run them slow.

I hardly think that Mr. Greenwood could have been speaking seriously when he informed the Committee that the whole of the present traffic could be brought down on two lines. Take our ordinary daily traffic: Between 8.30 and 9 o'clock we have the following arrivals at Redfern:—8.33 from Ashfield, 8.33 from Homebush, 8.36 from Hurstville, 8.37 from Parramatta, 8.40 from Hawkesbury River, 8.40 from Waterfall, 8.43 from Richmond, 8.44 from Ashfield, 8.46 from Campbelltown, 8.53 from Penrith, 8.55 from Homebush, 8.55 from Mount Victoria, 8.58 from Homebush. Those are trains which now arrive at Redfern, and would require to go on. If the first two trains were thrown out of their time, they would affect the whole of the business. Those are incoming passenger trains in the morning, to say nothing about engines, and nothing about empty coaches. Those trains are alternately fast trains, and slow trains going on different lines. If you were to bring your fast trains and your slow trains up to Redfern, and then make them stop at Redfern and take their ordinary course on a double line, is it reasonable to think that business could be properly conducted? If we could say to this person "You must come in at 7 o'clock," and to another "You must come in at 8 o'clock," and to another "You must come in at 9 o'clock," we could distribute our trains, one after the other, very nicely. But many passengers want to get in to their business at 8.30, and all want to come in together; or at 9 o'clock, and all want to come in together; and the workmen in the morning all want to come in together; and it is by the way in which we deal with the fast trains and the slow trains that we have popularised the suburban line, and caused people to look upon that line as being a model for any other place to copy. I do not believe that there is another place in the world—and I am speaking advisedly now—that has such an admirable service of suburban trains as we have, because we have located the trains in such a way as to suit the business people; for instance, we bring a train-load of passengers, express speed, without stopping at intermediate stations, through

J. Parry.
30 Mar., 1900.

through from Strathfield, another in through from Burwood, another in through from Ashfield, another in through from Summer Hill, another in through from Lewisham, another in through from Petersham. People have settled down to the habit of coming in by those through trains, and you practically fill the trains at those places, and then run them straight in. What would be said by the suburban passengers if anyone attempted to modify the suburban traffic, and reduce the fast traffic to a slow traffic? They would not tolerate it for a moment. I might here, perhaps, bring in a case quoted by Mr. Greenwood, to show that he could bring in all the existing traffic over two lines of rails. In replying to question 2167, Mr. Greenwood said:—

At St. Enoch's station, Glasgow, there are, every working day, nineteen trains arriving in a space of forty-three minutes. That is on one pair of rails.

This is what I have noted in regard to that statement: St. Enoch's station, which is a dead-end station, having two main lines and two branch lines, making four in all, running independently into the station, which has six platforms in two sets of three lines, and one set of two lines, the length of the platforms being, the longest, 957 feet, the shortest, 813 feet; the width of the broadest, 31 feet, and of the narrowest, 27 feet; the length of the roof is 525 feet. Area covered is about $6\frac{3}{4}$ acres. There are about 500 trains in and out during the day of twenty-four hours. The general manager, on being interviewed as to the work of the station, made the following statement:—

Notwithstanding its size, St. Enoch has been found quite inadequate for the large and increasing passenger traffic expected to be accommodated there, and we are at present busily engaged in enlarging and extending it. We are building a new bridge over the river Clyde, to carry four lines of rails, to replace the present one which carries two lines of rails, and the running lines from St. Enoch to Port Eglinton Junction are being quadrupled. When the enlarging and extending of St. Enoch station is finished, it will be practically double its present size, as we shall then have twelve platforms instead of six, and we hope, when the whole work is completed, to be able to deal satisfactorily with the increasing traffic for a number of years to come.

With reference to the work said to have been done at St. Enoch between the hours of 8:40 a.m., and 9:25 a.m., viz., fifty-four trains and engines, dealt with on two lines, it should be pointed out that the two lines only exist a very short distance, and outside of this the traffic is conducted on independent branch lines; also four lines of way on the part where the greater part of the traffic is concentrated for some distance before arriving at St. Enoch. Included in these fifty-four I find thirteen empty carriage trains, and thirteen light engines, which means that after arrival the empty trains are hauled out and taken away for storage or other purposes. In Redfern station, between the hours of 8 and 9 a.m., we deal with forty-five engines and trains, and if the empty trains are included, which have to be drawn from the platforms for storage purposes, the number is fifty-nine, and between 5 and 6 p.m. the number is sixty; and this does not include light engines to and from engine-sheds in Sydney yard. If we were to count the empty carriages, trains, and the light engines into our business at Redfern station, we should put before the Committee a statement very different from the one we furnished when we merely quoted the actual business done in passenger work. I produce a sketch showing that at St. Enoch's station there are two branch lines and two main lines, making four lines in all, running into that station. I now come to question 1987:—

I suppose that three-quarters of a mile is a fair distance for city stations to be apart from one another? Yes. You have four lines from Homebush to Strathfield; but, notwithstanding the fact that you have a double line joining at Strathfield, you do not put on an additional line to convey that traffic to Sydney; and although you have two lines from Illawarra joining near Eveleigh, you do not put on two more lines to carry that traffic.

You will see that Mr. Greenwood's reasoning here is not at all such as would prove that the whole of the traffic from the north, west, south, and South Coast could be carried over two lines of rails. At Strathfield, when the Northern line was constructed, it was first of all junctioned into a double line, but a double line would not carry the traffic. I am sure that many of you will remember that, before the suburban lines were quadrupled, a passenger never knew when he would get to Sydney, or get home again. It is eight or nine years since the quadruplication was done. Before that time, on holidays especially, the people would hang about the platforms for upwards of an hour waiting to get to Sydney. We could not go back to that condition of affairs after extending the railway into the city. If we were to do so, it would simply bring everybody connected with it into ridicule. I now come to question 2007:—

Will you explain to the Committee how these two lines are going one to cross or overlap the other? Simply by the fact that, starting from Bathurst-street, the one line rises and the other falls with a 1 in 60 grade, until such time as the difference of level between the two rails is 17 or 18 feet—sufficient to carry one line over the other.

If we were to bring the suburban trains down to Circular Quay, the introduction of a 1-in-60 grade on that extension would nullify, to a great extent, the large expenditure which the Railway Commissioners have incurred in quadruplicating the lines to make the maximum grade, or ruling grade as we call it, 1 in 100. I think it would be a great pity to introduce such a grade as 1 in 60 in the last mile of such an important suburban line.

3619. Are your suburban engines incapable of taking your average load up a grade of 1 in 60? Not incapable, but it occupies the section very much longer, and reduces the speed. We run nine cars on some trains—not on very many, it is true, but eight cars is a very common thing, and the speed on a grade of 1 in 60 would be very slow; in fact, I do not think the lighter class of suburban engine could haul the load.

3620. *Mr. Dick.*] How many cars do you send with the "M" class of engine along the Illawarra suburban line? Occasionally nine.

3621. And in two places on that line you have a grade of 1 in 60? We have one such grade, coming from Erskineville to join the main line.

3622. And the other going to Hurstville? I am not quite sure about the Hurstville grade.

3623. They are both 1 in 60, and with the "M" class of engine you can take nine carriages on that line? Yes, we do.

3624. *Mr. Watson.*] And the same number of carriages on the Western suburban line over a grade of 1 in 100, and with the same class of carriages and engines? Yes. But as regards coming from Erskineville to the Illawarra Junction, if you were associated with the working of the lines, you would very soon see the disadvantages of having such a severe grade. If the train happens to be brought to a standstill on that portion by signals, the struggling of the engine and the delay in starting again are most serious, and

and disorganising to the traffic in a busy time. We have had trains stuck up on the Erskville bank, and have had to send out engines to bring them in, and the delay, apart from the sticking up, is frequently very serious, and brings about disorganisation. My point is that, if we are spending a large sum of money to do a certain work, why should we introduce what are, manifestly, evils into the design. I now come to Question 2025:

J. Parry.
30 Mar., 1900.

What tunnels have we on our railways more than 30 chains in length? You have a tunnel at Lapstone which is 38 or 40 chains long. It has a curve at both ends. Half the tunnel at least is on curve, and it has a 1 in 33 grade. Since that tunnel has been built, I do not think that fewer passengers have gone over the mountains than used to go previously. It has not affected the passenger traffic in the slightest.

I think the best way to judge that statement would be to go through the tunnel itself. In the summer it is intolerable going through that tunnel. We have the same kind of thing on the South Coast line with our Offord tunnel. That has a 1 in 40 grade—not 1 in 33,—and in that tunnel we have had trains stuck up, and the passengers have been in the tunnel for twenty minutes with the engine struggling to get on, and the engine has at last had to back out down to Stanwell Park, and the driver has practically fallen off his engine stupefied. That has occurred not only once, but a number of times, and we have to reduce the load very considerably below the normal carrying capacity of the line in order to obviate that very serious difficulty.

3625. *Mr. Dick.*] What is the length of the longest tunnel between Sydney and Newcastle? I think it is about a mile.

3626. Can you tell us why we experience no inconvenience in going through that tunnel with the train windows open; whereas, in the Lapstone tunnel, with the windows closed, you feel a great deal of inconvenience? Because you have very little steam and smoke emptying themselves into that northern line tunnel. It is on an easy grade, and is constructed for a double line of rails, and you have a train through it only occasionally; but, with trains following each other at the rate, as estimated, of one every two minutes, it would be the greatest pity to construct a city railway in tunnel to be worked by steam. I have nothing to say about tunnels being worked by electricity. But if you bring in electricity, you have to consider the whole question of dealing with the suburban business by electricity, because the detaching of locomotives at Redfern, and the attaching of electrical motors, would simply be going back to the dark ages in dealing with such business.

3627. *Mr. Watson.*] You would have to work the suburban traffic right through with electricity? Yes. The only way that I could conceive of dealing with a city line only by electricity would be to make that line independent of the present line, and to construct a railway going by Redfern and let all the passengers change into it. I now come to Question 2036:

How long will people be, running at a city rate of speed between Bathurst-street and Wynyard-square? Something less than one minute.

I think that the distance from Bathurst-street to Wynyard-square is about 40 chains, or half a mile. Assuming that the train is going at full speed all that distance, then, at 30 miles an hour, which is a good speed for a suburban train, it would take just one minute in covering that distance, on a very easy grade—far below 1 in 100. Now, this portion of the line would be negotiated in a tunnel of 1 in 60. I do not know how long the tunnel would extend.

3628. Five hundred feet is 1 in 60, and the rest level? At any rate, you have a 1 in 60 grade in the tunnel, and it is clear that the trains would not be running at 30 miles an hour over that. Therefore, at the very least you can calculate two minutes for that journey, because, taking the average running on the suburban line—starting, getting up speed, reducing speed, and stopping at a station,—you would not go at a rate of much more than 20 miles an hour. The average speed to Homebush, including stoppages, is 7½ miles in thirty-three minutes, which is about 1½ miles an hour.

3629. Is that estimate for a train that goes through to Strathfield, or for one that stops at all stations? One that stops at all stations. The next Question is:

Not more than that? No; it cannot be. The difference in time between the trains leaving Burwood and the trains leaving Croydon is, according to the time-table, about two minutes.

Is that the same distance? No; that is about a mile, and that time includes stoppage at station. Therefore, the time occupied in travelling cannot possibly be a minute in this case.

Now, the time taken between Croydon and Burwood is three minutes. That is time-table time for all stopping trains. I now come to Question 2074:

But still, the Government have not said so to us; they have asked us to consider schemes for coming into the city;—therefore, we want to know whether you can make this service as a city scheme without an eastern suburbs extension, at present, at any rate? Yes; but to do that you must go back to the Government House grounds, or as far as the Government House stables, in an open cutting—construct, really, the eastern suburban railway as far as the Botanical Gardens fence.

I think I dealt with that question previously. It is clear that Mr. Greenwood intends, not only to put the whole of the passenger trains on to his double line, but he is going to work his empty trains and engines to and from Redfern and the Circular Quay on these two lines of rails.

3630. *Mr. Dick.*] It is only temporary; of course his scheme is really a circular scheme? Yes. But if we were beginning to run these trains from Redfern to-morrow, say, and as the passengers were kept standing there we explained to them—"We have only a double line to Circular Quay, but that is only temporary," they would want to know how long the temporary business was going to last. It would bring us all into most serious discredit.

3631. But I think that Mr. Greenwood made it clear, as far as his scheme is concerned, that he wants the whole thing done at once? I admit that; but I want to impress on the Committee the impossibility of dealing with it in the position of leaving it at Circular Quay.

3632. *Dr. Garvan.*] If it were to be made at once, there would be a number of trains coming in to Circular Quay for purely city purposes which would not want to go on the Eastern extension? Exactly.

3633. You would have to deal with those by sending them back? Yes.

3634. Could he deal with those—only a portion of the trade? Supposing that Mr. Greenwood's circular system were initiated,—the great bulk of the population of the Eastern suburbs is out in the direction of Waverley. These people would not go round *via* Eveleigh to get to Sydney; but would want to come in this direction. Therefore you would have the great bulk of your passengers coming in from the Eastern side

at

J. Parry.
30 Mar., 1900.

at the same time as you would have them coming in from the western side, because they would have to get to their offices at the same time, some between 7 and 7:30, others at half-past 8 or 9 o'clock; and with the bulk of the passengers requiring to land in Sydney at the same time, you would get a congestion of business at both ends; therefore you must provide a means of stabling your trains, not only from the eastern suburbs, but also from the western suburbs, and a circular railway would not meet the case at all.

3635. *Mr. Watson.*] Would you not have two lines of trains, one going each way, on your circular railway? But I should be running trains absolutely empty in one direction; it would be a great waste of mileage.

3636. *Dr. Garran.*] Mr. Greenwood proposed, in his complete scheme, to have a stabling arrangement on his eastern line as soon as he reached a suitable place? I did not know that. I deal only with his proposal as I see it in the evidence. What I want to impress upon the Committee is the fact that a circular train is all right for a certain proportion of trains—that is, to give the suburban people a chance of intercommunication; but that, for the purpose of bringing passengers into Sydney in the morning, and taking them out in the evening, a circular railway becomes a waste, inasmuch as you would incur a greater mileage to deal with the business. A circular railway is all right where you are right in the middle of a thick population, as in London, and where you can put on a five or ten minutes' hourly service; it is all right when you are in the midst of a big floating population all the time, and can run your trains round and round constantly. But we have not those conditions to deal with here. I now come to Questions 2076 and 2077:

That would involve some unproductive running? Yes.

Would that be less costly than taking all this ground out of that land? Far less.

You have first of all capital cost for taking out the ground, which ceases, and you simply pay 3 per cent. interest; but when you were running trains all day, as is proposed, it is evident that there would be a great waste in running these empty trains. The next Question is 2078:

There would not be very much traffic to Redfern in the early morning, or late in the evening, would there? I think there are eight trains now every day which come into Redfern, and run back straight to Homebush.

As a matter of fact, it would be difficult to say what the empty running would be under the conditions that would affect the new line, and, although the estimate is far below the mark, there would, I am satisfied, on the new line be upwards of twenty empty trains requiring to come down. Of course, they might be utilised for city passengers—I grant that—but they would not be required. Question 2081 is:

So all you want to do is to shunt your trains from one line to the other? Yes.

I have gone into that question in regard to St. Enoch's Station; and I think I have clearly shown the Committee that Mr. Greenwood's statement is rather an airy way of disposing of such a vast number of trains. It would require very much more consideration and arrangement than that. Question 2083 is:

We are told that if we were to widen the scheme before us so as to make it as wide as the original one was, they could do without this long route? No; they could do nothing of the kind. The additional standing-room on the St. James' Road plan is only two more platforms. The standing-room would hold only two more trains.

That is hardly intelligible to me.

3637. It means that if we were to widen No. 10 scheme so as to add two more platforms, as Mr. Deane explained to us yesterday, we could dispense with that circular line? Mr. Greenwood says: "They could do nothing of the kind." We say that we can do it satisfactorily—in fact, we should very much prefer it. It would suit the working very much better to get the additional space and go back to Redfern and avoid touching the Domain at all. I would point out why. You will notice that the station in No. 10 scheme is contracted in width, because we have four lines of rails running right through to a place beyond—that is, through to the Domain. That means that we can deal with more suburban trains in a given interval of time. A suburban train arrives at that platform, discharges its passengers in three-quarters of a minute, then runs away, and leaves the platform free for another train to follow; therefore, the object of the extension is not so much for the stabling of trains, but to enable us to deal with more trains at this station by getting rid of them more quickly. It is a distinct disadvantage to take them round there in tunnel to stable. We prefer going back; but it was absolutely necessary, in consequence of our being restricted to a certain width of space. Question 2087:—

So far as respects the cost of working, it does not matter whether we go into the city on the eastern or western side? The cost per mile ought to be the same.

In reply to that, I wish to state that the King-street and Domain scheme is about 2 miles long—about 1 mile 12 chains from Redfern to King-street terminal, and then about 1 mile from terminal to carriage and engine storing sidings in the Domain. This scheme provides that at the Domain shunting yard sidings only a portion of suburban trains would stable, through trains and some of the suburban trains being run back to Redfern, &c., to the present sidings to stable. This division of the business, by having to shunt trains at Domain, King-street, and Redfern, will necessitate a shunting staff at both Redfern and the Domain terminal, whereas the St. James' Road scheme provides for all trains being stabled at Redfern, &c., as at present, which only necessitates the staff at Redfern and St. James' Road, besides which the extension from King-street to the Domain requires three additional block signal boxes in addition to the terminal shunting yard staff. Again, the St. James' Road station is practically on street level, and provided with cab road to through platforms, thus enabling luggage to be easily dealt with; whereas King-street platforms being considerably below street level with upper and lower end platforms, and ramps from main assembly platform to train platforms and the cab road, it is evident more staff is necessary at King-street than at St. James' Road to deal with the business; the additional mile of permanent way of 4 miles in the King-street scheme, together with the carriage sheds and sidings in the Domain, would have to be maintained beyond that required in the St. James' Road scheme. In the King-street scheme, also, a number of trains would have to run on to the Domain shunting sidings owing to the through platforms, which, in St. James' Road scheme would not have to run forward to the Domain, but would return direct to the suburbs loaded with passengers. In criticising the estimates given by the Commissioners, Mr. Greenwood, in replying to Question 2088, is erroneous in his figures. He has multiplied the number of trains per working day by 365 days in the year, which is incorrect, as there are only 313 working days, and on Sundays the number of trains is only about 125, and less than that number in winter months. Therefore, you see that, at the very start, Mr. Greenwood, in furnishing the Committee with an estimate

of

of the cost of working, is seriously out, because of the number of days he has taken. In estimating the working expenses for the extension, Mr. Greenwood criticises the figures furnished; but I would point out that in estimating working expenses for the extension, the basis assumed by Mr. Greenwood, namely, multiplying the number of trains by the number of days and the mileage, is a wrong basis altogether. I have explained this matter previously. It would not cost us 3s. 10d. per train mile to run to and from King-street and Redfern. That is the general average cost for the year. In framing these estimates, the actual additional traffic staff required to man the stations, &c., the additional locomotive staff (other than engine men), the number of men required for permanent way maintenance, and the approximate cost of the running of trains, and the additional mileage were considered. You cannot bunch it with the average for the whole of the lines. You have to take the circumstances applying to the particular place, if the Committee is to be furnished with an estimate that can be relied upon.

J. Parry.
30 Mar., 1900.

3638. But you have put in no share for the general administrative services there? No; because you are taking what it is actually going to cost you, and that is what the Committee want to know—not what is the average cost of working throughout the lines, but what is the cost of working this particular section.

3639. *Mr. Dick.*] Would there be no addition, then, to the administrative staff for such a section? No; there would be no additional administrative staff. As a matter of fact, there would be a reduction in the administrative staff, for instead of the Railway Commissioners being down in these buildings, they would be at that station. The whole of the out-door traffic superintendence would be there, and there would be a general saving all round, apart from the additional cost of working the section.

3640. *Dr. Carran.*] You and your staff, and Mr. Richardson and his staff, would all be transferred to King-street? Yes. By having the staffs brought close together, we should be able to economise in very many ways. We should not want so many clerks for writing, and walking from one place to another, when the offices were close together.

3641. How do you communicate with the Railway Commissioners now—by telephone, or by writing? By telephone and by writing. But there is, of necessity, an enormous amount of travelling between the Redfern station and the Commissioners' office, and there would be an immense saving, difficult to put into figures, if the whole of the staffs were brought together.

3642. *Mr. McFurlane.*] Could not the Railway Commissioners have their offices at Redfern? Then the Chief Railway Commissioner would be right away from the Minister. Instead of wasting the officers' time, the Chief Commissioner's time would have to be wasted in going to and fro.

3643. Is there frequent communication between the Chief Railway Commissioner and the Minister? I should imagine so. Then, of course, Redfern is out of the way of the Commissioners.

3644. *Dr. Garrar.*] Which is the more important—that the Commissioners should be close to their customers, the general public, or close to their officials? To the general public, I should think. In his reply to Question 2088, and in criticising the estimate furnished, Mr. Greenwood put his own figures. He says:—

The Commissioners estimate the traffic at £32,000 per annum, which is really 10,240,000 passengers at $\frac{3}{4}$ d.

The Commissioners have said nothing about three-farthings. They have simply given a probable estimate of the receipts from the extension. They have clearly stated what the charges are which they propose. These are mentioned in the evidence, and, therefore, Mr. Greenwood should know of them; and it is misleading to bulk them into so many passengers at three-farthings. The basis on which the estimate is given is clearly set forth, and the figures have been again looked at by the Traffic Auditor, and the Railway Commissioners are satisfied that the estimate which has been furnished to the Committee by them will be realised.

3645. That estimate was made before the George-street tram had taken away a great deal of the Elizabeth-street traffic;—do you think that if you bring your railway into St. James' Road you will recover from the George-street tram all that you have lost to it? We should recover from the George-street tram very largely; but, in addition to that, we anticipate that owing to more people going out to reside in the western suburbs, the traffic will increase to a very large extent if the railway be extended to King-street. Large numbers of people now live at Bondi, Waverley, and Randwick, because they can get into a tram near to their business, and go home by it without changing; but if they could get into a train at King-street, I am sure that large numbers of people, who now live in the other suburbs, would go to reside in the western suburbs.

3646. Has the Department made any revised estimate in view of the changes brought about by the George-street tramline? No.

3647. You still go by the old estimate? Yes. I now come to question 2089:

But would not the traffic be much concentrated on this line—a great deal more going over it? If the Commissioners can work that line for 1s. 4d. per train mile, I want to take my expenses at the same rate.

I take it that Mr. Greenwood is giving you estimates formed by reasoning from analogy, and not from any information he has sought out for himself. The Commissioners have given an estimate for working the King-street scheme and the St. James' Road scheme. Mr. Greenwood says: "If the Commissioners can work that line for so-and-so, I can work mine for so-and-so." But it is of no use framing estimates in that way. In Mr. Greenwood's scheme, I think his total mileage is 1 mile 64 chains down to Circular Quay. But, in that scheme, as compared with the St. James' Road scheme, you would have to provide block signal-boxes at intervals on the extension, you would have to provide an additional staff to work Wynyard-square, and you would have to provide an additional staff for working Circular Quay; and it is the additional staff which is required to man the additional stations, and to do the shunting at the various places, which would increase the expenditure. I took the trouble to make a rough estimate of the traffic expenses alone of the three schemes. I am speaking now from a perfect knowledge of the business, having gone into it as closely as I could. In the St. James' Road scheme the traffic additional cost would be about £4,000 per annum, and in the King-street scheme it would be £9,400.

3648. *Mr. Watson.*] We were told that it was £8,000 per annum for St. James' Road? That is the whole thing. I am speaking now merely of the extra traffic employes. This is what I am perfectly sure about. As I have said, the figures are.—St. James' Road scheme, £4,000; King-street scheme, £9,400. As regards Mr. Greenwood's scheme, I am unable to give you an estimate for that, because I have not seen any plans which would give me details to work upon. For that reason I am unable to speak authoritatively,

J. Parry.
30 Mar., 1900. authoritatively; but making a rough estimate on my own basis, I calculate that the traffic working expenses would be about £10,000 at least. In dealing with estimates you ought to go into details and not take what are called average figures. I have explained to the Committee how the increase is accounted for. In the St. James' Road scheme you simply transfer nearly the whole of your staff from Redfern Station to King-street, leaving just sufficient at Redfern to deal with practically a suburban station such as Strathfield or Eveleigh. You bring the whole of the remainder of the staff to St. James' Road. In the King-street scheme we would, of course, transfer a large number of the staff from Redfern to King-street; but seeing that under the King-street scheme we would have to deal with a large number of trains for storage and marshalling purposes at Redfern, we must leave men there for that. Then we should have a shunting staff and a supervising staff at the Domain, and we should have to have block signal-boxes between King-street and the Domain, and in the Domain, in order to preserve the electrical block spaces between the trains; and when you come to additional block boxes and other things, you see the expense begins to swell greatly. I state this in order to show the Committee why it is necessary to go into the matter of estimates of railway working carefully in dealing with what actually has to be done or will have to be done. Question 2105:

Will you tell us what you think your traffic will be on your western line? I am going to use the Government figures for this. Mr. Kneeshaw stated that the number of passengers arriving at Redfern was as follows (I am speaking of one direction all the time):—he said the electric tram carried 13,000 daily. He further said that if there were no railway traffic at all—and he did not want it—his cars in George-street would still be filled. I contend that those 13,000 people will go down by the train on the western line, and I contend it for several reasons. In the first place there would be no changes, in the second place the trains would take 6 minutes to go to the Quay, whereas the time-table for the electric tram is 16 minutes.

Now in estimating the time for getting to the Quay on Mr. Greenwood's line, as compared with our present suburban working, it would take him at least 8 minutes, and not 6 as he states, to get to the Quay.

SATURDAY, 31 MARCH, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, J.L.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

John Parry, Out-door Traffic Superintendent of Southern Lines, Department of Railways, sworn, and further examined:—

J. Parry.
31 Mar., 1900. 3649. *Chairman.*] Will you now state further what you wish to put before the Committee? Commenting further upon the evidence of Mr. Greenwood, I would refer the Committee to a portion of the answer given by him to question 2131:

There would be a junction, which is, of course, a most convenient thing to do, at Liverpool-street, and the whole of the traffic that came into Redfern would have to be first carried to St. James' Road or the King-street station; then change carriages into another tram and run back to Liverpool-street and round to Wynyard-square.

Supposing we were to construct the railway to King-street at the present time regardless of the North Shore line, and supposing that in future years it should be considered necessary to connect the North Shore line with the main suburban line, I would point out that, supposing you had a North Shore line to Sydney, then, for all time, the great bulk of the passengers from North Shore would require only to come into Sydney; and it would be only what I may call the visiting passengers who would require to go between North Shore and the suburban line stations. Therefore the great bulk of the North Shore traffic that you would have to provide for would be to and from Sydney only, and it is contended that a station on the western side of George-street would be the most convenient for that traffic. I would point out that it might not be necessary to connect the main suburban lines with a North Shore line for a great many years to come; but, if it should be, then a plan I have here shows how it could be done.

3650. *Dr. Garran.*] Your explanation is intended to show that the proposed curve in the Hyde Park scheme, *via* Liverpool-street, will not be wanted at all? Yes.

3651. If you connect at all, you would go straight on? Yes. The only possible thing that you require for North Shore and the main suburban line is, to make a connection for visiting passengers between the various suburbs.

3652. Then your view is the same as Mr. Deane's—that you should separate the North Shore line absolutely from the project we are now considering? Yes; and the contention is that there will be no difficulty in dealing with the question eventually, when it arises. Question 2132:

It has been suggested, in reply to a question, that by taking 50 feet from Hyde Park, on the east, we might dispense with a long tunnel under the Domain, and with large stabling yards at Sir John Young's Crescent, thus making the station practically a dead-end one—what objections can be urged against such a scheme? The first is one that has not been mentioned so far, namely, the blocking up of the streets.

I merely quote that question in order to lead up to 2133:

We are now on the question of working the station? Assuming that from Liverpool-street to Park-street the line will be in cut and cover, practically the whole of the shunting will be done in tunnel.

What I wish the Committee clearly to understand, which I have endeavoured to point out previously is, that the large amount of shunting that is done now at Redfern will not be done at Hyde Park or King-street.

3653. *Mr. Watson.*] Looking at the King-street station as a complete one, practically on similar lines to the St. James' Road station, then I understand you to say that, without the proposed extension into the Domain, there would be no shunting done at that station—it would be done out at Redfern? There would be a certain amount of shunting done there, but the great bulk of the shunting would be done at Redfern. Now the marshalling sidings at Redfern are in the station yard, and therefore the whole of the shunting in connection with the marshalling has to be done in that yard. But shunting equal to that now at Redfern would not be done in tunnel.

3654.

3654. *Dr. Garran.*] The other day Mr. Deane marked the St. James' Road scheme with a cross on the south-western portion of Hyde Park, as showing the place where the shunting would begin? Yes. J. Parry.

3655. Under those circumstances, do you consider it would be best to have the whole of the line from that point to Park-street in open cutting, so as to be in daylight? It would be far preferable. 31 Mar., 1900.

3656. Because if it were not all in open cutting, there would be some portions in semi-darkness? Yes; it would be far preferable. Of course, there would be no objection to a passing bridge. My view is that we should keep it open. At any rate I should prefer to see it divided up—not to have such a long continuous stretch of covered portion. I am speaking from a railway point of view, and I say that it would be very desirable to have it open.

3657. As a practical man, you would rather work the trains in the daylight than in the dark? Yes.

3658. The cross-over roads begin at the point where Mr. Deane put the cross? Yes, for through running.

3659. Without that cross-over you could not make any train go into any particular platform? No, that is so.

3660. Do you want the two cross-overs—one from one side to the other side, and one the reverse way? Yes. I think that that cross is approximately near the right place, but I should put it nearer to Park-street—the end of the second tunnel.

3661. How many feet have you from the northern end of the tunnel before you begin your cross-over for shunting? I think that in the St. James' Road scheme the shunting would commence 20 feet south of the Park-street crossing. In replying to question 2160, Mr. Greenwood says:—

That makes a total of 40,000, which, multiplied by 2, multiplied by 365 days, gives a gross yearly total of 29,200,000 passengers, at $\frac{1}{2}$ d. per journey.

What I wish to point out is that Mr. Greenwood has taken 365 days, which, of course, includes Sundays. Now, we have only 313 full working days, the Sunday traffic not being half of what the traffic is on the ordinary days. So his calculations are, at the outset, on a wrong basis.

3662. But, in any case, the Commissioners do not propose to put $1\frac{1}{2}$ d. a day on to the fares of their season-ticket holders? The basis on which their estimate is framed is clearly stated in their estimate, namely, by charging on an ordinary ticket $1\frac{1}{2}$ d. extra each way; the first-class season ticket, 1s. 6d. per month extra; the second-class season ticket, 1s. per month extra; and workmen's weekly tickets, 3d. per week extra.

3663. That would not come out at anything like as much as $\frac{1}{2}$ d. per journey per passenger? I have not run it out, but the basis is clearly given there, and it can be clearly ascertained what it will amount to.

3664. *Mr. McFarlane.*] How much per passenger per journey do you think it would be in addition—would $\frac{1}{2}$ d. be an excessive estimate, taking all the different classes of passengers together? Taking the ordinary ticket holders, the season-ticket holders, and the holders of workmen's tickets, the total number of journeys per annum would run, approximately, into 27,500,000. The Commissioners' estimate was £38,000.

3665. *Mr. Watson.*] Can you say, roughly, whether the bulk of the passengers in the aggregate number of journeys would be season-ticket holders of one form or another? Yes; the great bulk of the passengers would be season and workmen's ticket holders. In replying to Question 2164, Mr. Greenwood said:

On two lines of rails, I can work all the traffic that will come into Redfern during the next twenty-five years.

I think it hardly necessary for me to go into that question in detail further, because I went into it fully yesterday; but on the face of it, I can hardly think that that statement was meant to be taken seriously. However, following on to the latter end of the same answer, I notice that Mr. Greenwood says:

At the present time, they number 329. Practically, the number of trains arriving at Redfern is stationary; there has been no increase in the last three years.

There has been an increase during the last three years. But what I particularly wish to point out, as I did yesterday, is that 329 trains do not cover the business to be done. Questions 2166 and 2167:

But the increase in the passenger traffic would not be spread equally over the whole of the day, would it? No.

And, therefore, could not be applied equally to every train? But I am taking the busiest time of the day—from 8 o'clock until 9 o'clock. The Government figures show that there are 5,565 passengers carried between 8 and 9 o'clock in the morning. That is in twenty-two trains, which gives an average of 253 passengers per train. I say that a train of eight cars will seat 480 or 500 passengers; therefore, if you were to have double the number of passengers, you would not need to increase the number of trains, because the trains are only half full, according to the Government's own figures. It is shown that in the busiest part of the day there are only twenty-two trains arriving at Redfern. If you deduct four of those as being long-distance and semi long-distance trains, that will leave only eighteen trains per hour to be taken along the Western line.

What I want to point out is that Mr. Greenwood estimates that he would carry 480 to 500 passengers by each train. Now, as the Committee well know, a large number of trains—for instance, from Penrith, Campbelltown, the Hawkesbury River, or from Waterfall—do not carry 480 or 500 passengers each trip, and if we were to say, "We will not run a train unless it has 480 or 500 passengers on board," we would shut out the long-distance people. Mr. Greenwood's reasoning is not sound at all. You have to give facilities for people to come to Sydney and to go out of Sydney at the proper time.

3666. Your argument is that the working of the trains will not stand being averaged? Yes; the working of the trains will not stand being averaged. Supposing we were to say, "We will not run a Penrith or a Campbelltown train unless we have 400 passengers." The public would not tolerate such an absurdity. One train may not have 100 passengers, but it is a profitable train nevertheless. With regard to the evidence as to conducting a two-minutes service, I should like to say that if the city railway were independent of our present system, and you were simply running round a short line with a big population, and you had your stations close together, and also your block-boxes close together, and had light trains so that you could start them quickly and stop them quickly, it might be possible under such conditions to run your trains at a two-minutes' interval, because you would reduce them to a sort of tram service; but you cannot run fast trains and heavy trains and maintain a two-minutes' interval.

3667. *Mr. Watson.*] Especially with converging lines from different points? Yes. Take the Illawarra Junction. With all the trains mixing there, the matter would be perfectly impracticable. Question 2314:

And as to all these Government schemes, I may take it that your answer is the same answer? There is not one I would put my name to, saying that I, as an engineer, designed that scheme as a scheme for a city railway for a city like Sydney. I would be ashamed to put my name to it as a means of producing revenue on the capital you would have to expend. I say it cannot possibly produce such revenue.

The

J. Parry.
31 Mar., 1900.

The only reply that I think that calls for is—and I speak advisedly—that the scheme has undoubtedly received the greatest consideration, chiefly in regard to its convenience to the public, but at the same time the economic side of the question also being taken into consideration. As to the engineers who have designed it, I think we can place every confidence in the gentlemen who have undertaken it. Mr. Rennick, the Engineer-in-Chief for Victoria, has endorsed the scheme, and I think it is reasonable to accept that gentleman as an authority, and you are aware, I believe, of the enormous amount of consideration that has been given to the scheme. Question 2315:

Have you anything to add? In reference to the question generally of building a terminal station, either at King-street or at St. James' Road, I would point out that if you build a station at either of those two places, it will necessitate two terminal staffs, for this reason—you may take a horse to the water, but you cannot make it drink; and you may build a station at King-street or St. James' Road, but the public will not go there. The greatest portion of the public will leave the train at Redfern, and consequently you will have to keep two terminal staffs—one at Redfern and one at King-street, if you have a station there.

I explained to the Committee yesterday that if the terminal station were at King-street you would still require a good staff at Redfern to deal with the ordinary business, but that the chief portion of the terminal staff would be brought down to the new terminal station. I furnished the Committee with an estimate showing the traffic expenses for each scheme which I had worked out most carefully and in detail. It gave, I think, an additional expenditure of £1,000 for the Hyde Park scheme—that is for traffic expenses only—and £9,400 for the King-street scheme, and, as far as I could calculate it roughly, £10,000 for Mr. Greenwood's scheme. Those estimates were not made haphazard, but took into account everything that would require to be attended to, and the business that would have to be done.

3668. If the King-street proposal were altered by taking a further portion of Hyde Park, and not carrying out with the proposed Domain extension, would the traffic expenses then be smaller in proportion to those of the St. James' Road proposal? They would be increased a little, for this reason: The Hyde Park station, as I understand it, would be practically on a level with the street; but at King-street, the main assembly platform would be 13 feet above the train platforms. Therefore you would have ramps going to the general platforms and buildings underneath the assembly platform at the end, and the means of transporting the luggage between the train platforms and the assembly platform would necessitate some additional expense, but not a very large one.

3669. *Dr. Garran.*] Would you have to wheel the trucks up the ramps? No. The luggage arrangements would be perfect, because you would put the luggage down by electric lift to the lower platform, and then convey it to any platform as desired, either by Aspinall's overhead carriers, or by truck—probably by Aspinall's carriers, which are found to work so well at some of the English stations. I am not sure that I explained to the Committee that I have had taken the time of transfer between the trains at Redfern station and the electric trams in the morning. I had a special officer watching. Two trains arrive in the morning at 8:40—one from the main suburban line and one from the Illawarra line. After the arrival of the first train, the time was taken. Of course some of the passengers got away on the tram within a minute after the arrival of the train; but from the time when the first tram left with the first lot of passengers until the last tram left with passengers from those trains, the interval was 5 minutes, so it may be taken as correct that, during the very busy hours of the morning, the time occupied by passengers in changing from train to tram may vary from 1 minute to 5 minutes.

3670. *Chairman.*] And, no matter how many trams you put on, that cannot very well be avoided? They were going away practically as fast as they could.

3671. *Dr. Garran.*] Is that any quicker than the steam tram used to be when that came into the station? The steam tram used to be worse, if anything.

3672. It took longer than 5 minutes? Yes; in the case of some trains, because you had them bunched.

3673. Then, on the whole, the electric tram gets people away more evenly than the old system did? I think so. If it would not be thought presumptuous on my part, I would most respectfully say that, as the superintendent charged with the responsibility of working Redfern station, I would most earnestly urge that some decision be come to with regard to this question of railway extension. Of course, it is immaterial to me, personally, what may be done—as to whether we go to Devonshire-street, on the Benevolent Asylum site; whether we go to the western side of George-street; or whether we go to Hyde Park; but I do hope that something will be settled which will enable us to get out of the present Redfern station. At holiday times there is a great strain on the staff, and also on myself personally, because, although I may not have to do the actual detail working of running the trains in and out of the yard, still the arrangements are mine, and the strain at holiday times is very great indeed in working the Redfern station, and I do hope that something will be done to give us relief.

3674. *Mr. Shepherd.*] The great object is to relieve Redfern station? That is my object.

3675. *Dr. Garran.*] You explained to us fully before, that your greatest trouble is owing to the shortness of your platforms, and the impossibility of lengthening them between the tunnel and Devonshire-street;—could you get over that difficulty, to some extent, by adopting Mr. Selfe's suggestion, and beginning your cross-over roads at Eveleigh? I am sure it would not be satisfactory. Suppose, for a moment, that we were to attempt that, we should have to take up the whole of the Redfern yard as it now stands. The existing platforms, apart from their being short, are inconveniently arranged. For instance, one portion of the main station buildings is between No. 3 and No. 5 platforms, and the other portion is between No. 6 and No. 8 platforms. Consequently, to get at those station buildings, all the passengers have to go on the main platforms, and you cannot control the business. You would have to tear up the whole of the yard; therefore, practically you would have to construct the whole of the Redfern station anew, and, in my opinion, you would be spending an enormous sum of money to do that, and what would be the result in the end? You would simply have taken up the little room existing, and would leave no room for future developments in the Redfern yard.

3676. *Chairman.*] Would it be very risky to do that and carry on the traffic at the same time? It would be most inconvenient for the public and the safe working of the traffic during the carrying out of the alterations would be seriously jeopardised. In saying this, I should like to state that I am speaking with authority. I have been charged with the supervision of the carrying out of several alterations in that yard, and the anxiety in dealing with the traffic during the time those small alterations—small as compared with what these would be—were going on was very great indeed. I will not say that it would be impracticable, because there is nothing impracticable, but I do say that it would be most undesirable and risky.

J. Parry.
31 Mar., 1900.

3677. *Dr. Garran.*] Then I take it you do not think it really practicable to lengthen any of the platforms in a southerly direction? I do not think it reasonable.

3678. If they are to be lengthened at all, they must be lengthened to the north? Yes.

3679. Even if we carry out the Hyde Park scheme, it may be necessary hereafter to lengthen some of the platforms at Redfern? No.

3680. You think it will not be necessary? No; Redfern would then become a very easy station to work, so far as the passenger business is concerned. Speaking about the alterations to Redfern station, I may instance the number of times that the Spencer-street station, Melbourne, has been pulled to pieces, altered, and reorganised, and afterwards organised again. If they had set down a complete plan at the beginning, as they have done now, I think that hundreds of thousands of pounds would have been saved.

3681. But there they have an entirely different arrangement—all their platforms are on one side? Yes. The design of that station is not analogous to the design of Redfern station. If there is anything that wastes money, it is patching a place like the Redfern yard.

3682. *Mr. Shepherd.*] What would require to be done at Redfern station in the event of the Benevolent Asylum scheme being carried out? You would have to take up the whole of the platforms to remodel the whole of the connections between the main lines, and partly remodel the sidings.

3683. Could the whole of the goods traffic be done at the present Redfern station in the event of the Benevolent Asylum scheme being adopted? Yes; that which is done there at the present time.

3684. That would be a thorough relief of the Redfern station? Yes; so far as working is concerned, that of course would relieve the Redfern station, and remove all danger.

3685. *Chairman.*] I understand you have some figures of the traffic? Yes. The estimated revenue, as given by the Commissioners, for the King-street-Domain scheme, was £38,000, worked out by the Traffic Auditor at the rates set forth in the estimate furnished by them on 20th December, 1899. The estimated number of passenger journeys by ordinary daily tickets and season tickets between Redfern and King-street, based on the existing traffic to and from Redfern, is 24,562,957; the estimated number of passenger journeys by workmen's tickets, 2,923,824. Total journeys per annum, 27,486,781. This assumes that each season and weekly ticket holder would travel once each way daily, Sundays excepted. No allowance was made in the estimate for passengers who may alight at Redfern, as it was considered the increased traffic which would be obtained by the extension to King-street, together with the saving of rents which would accrue by bringing the whole of the staff into the terminal buildings, would more than compensate for the loss of passengers who may get out at Redfern. The Railway Commissioners in that estimate did not specify that there would be a saving of £1,710 in rent—for instance, £1,200 paid for offices in this building, Electrical Engineers' office, £330; and Tramway Manager's office, £180. Since that time two other houses have had to be taken for offices at a rental, I think, of £365. So that the amount saved from rent through the staff being removed from the various houses and this building into the central terminal station buildings would be about £2,075.

3686. *Mr. Shepherd.*] Would a similar saving be effected if the Benevolent Asylum scheme were adopted;—would that site do to build all the offices upon? I think so; but I am not quite sure. In that matter there comes in a question of policy as to whether the Railway Commissioners should be up at Redfern, away from the Minister and the centre of commercial business, or not.

3687. *Mr. Watson.*] In the projected station at Devonshire-street, have they provided offices for the Commissioners? Yes, I believe they have; but I am not in a position to make a statement on the matter.

3688. *Mr. Dick.*] Where did you get the 27,000,000 journeys from? The Traffic Auditor—from actual work done.

3689. Do you know what your total number of journeys last year was? Those are last year's figures.

3690. Last year's figures, plus the increase which you hope to get, are they not? Oh, no. I want to make that clear. That is work actually done. No allowance is made for passengers who would get out at Redfern, because it is considered that the increased traffic which would be developed by an extension of the railway, together with the rents to be saved by transferring the offices to the central building, would more than compensate for that which might be lost at Redfern.

3691. *Dr. Garran.*] The first estimate of all, for the first Royal Commission, was made in 1890? Yes.

3692. The traffic has increased since then? Yes.

3693. You have had the Illawarra railway come in? Yes.

3694. And some additional traffic from the Great Northern line? Yes.

3695. Do you remember the old estimate? I think it was £32,000.

3696. It has now gone up to £38,000? Yes.

3697. *Mr. Shepherd.*] That is a plan of the Devonshire-street proposal; every convenience required for the whole of the staff is provided for there, is it not? I think it is; but I had nothing to do personally with the arrangement of the rooms in that building. I can speak of the King-street building, but I cannot speak of that one.

3698. *Dr. Garran.*] Were you consulted as to the rooms in the King-street building? Yes.

3699. You would have all the accommodation you want there? Yes.

3700. And in the St. James' Road building? I have not looked at the arrangement of offices at St. James' Road, therefore I cannot speak authoritatively as to that.

3701. *Chairman.*] If the proposed station were built at Devonshire-street, together with all those offices, that scheme would be unproductive in the way of revenue from the railway, would it not, because the railway would stop there? Yes.

3702. There would be no extra revenue to the Department for all that expenditure? Not one shilling.

3703. *Mr. Dick.*] You see the plan of the station at the Benevolent Asylum grounds, and you note that the whole of the station area is roofed over;—do you think that is necessary? I do not know that it is an absolute necessity to have a roof over the whole of the station; but you would require a roof over all the platforms; and when you consider the appearance of the place, I think it is far better to roof the whole of the station. Besides, the great convenience of having a large roof like that is that you have a comprehensive view of the whole of the station under it.

3704. Would not that keep the whole of the smoke and other products from the engines within the enclosed area, and would there not be a tendency to corrode the iron girders, and so on? I think that would be infinitesimal. I saw a statement on that matter in one of the American papers not long ago, and I suppose that is where the idea has originated of the unsuitability of large roofs; but if the station

J. Païry.
31 Mar., 1900.

roof were looked after, and given a coat of paint every four or five years, there should be no trouble as regards corrosion. People might just as well begin to argue that iron bridges are unsafe because the girders are subject to the steam of the trains going underneath. I suppose that this roof will be from 60 to 80 feet high. We have a hard and fast regulation that drivers are not to emit smoke while they are inside a station building. There is no necessity for them to do so, and it is carelessness for them to do it, and, therefore, it is a question of discipline to prevent smoke from being emitted in a main station building. They can prevent the smoke from being emitted in the station.

3705. With respect to the steam trams, were they taken off before it was found that the people very largely patronised the George-street trams, or for some time after the opening of the electric tramway did the two systems go on together? The steam trams were not taken off exactly, but people were discouraged from using them from the first morning the electric trams began to run, because of the great inconvenience of bringing the railway trams, which all had to stand in Devonshire-street, to the station.

3706. *Mr. Watson.*] I understand that the steam trams ceased running into the Railway station-yard as soon as the electrical trams began to run? Yes, the same morning.

3707. *Mr. Dick.*] Have you made any calculation as to the increased cost—or the waste, as it may be termed—involving in sending trains back from King-street to Redfern to be stabled, and then back again to the station, presuming that that long tail were cut off the scheme now before us? The cost would be less going back to Redfern than it would be continuing on to the Domain.

3708. In what way? Because a number of the trains under No. 10 scheme would have to go to the shunting-ground in the Domain for the purpose of reversing. The four lines, or fast and slow trains, are on through platforms. Therefore, the trains would require to go, whether they were returning immediately or not, otherwise you would get no advantage by having the through lines. From a working point of view, it would be better to go back to Redfern than to go to the Domain, if we had the increased width.

3709. *Mr. Watson.*] During the busy times the suburban trains would not be shunted anywhere? That is so.

3710. *Mr. Dick.*] But taking, for instance, the morning—you do not send out nearly so many trains as come in, do you? No.

3711. Then what proportion would be able to go into the station and stop there in the morning and then go out again as passenger trains? I do not think there would be many in the morning; they would be chiefly in the evening. You commence your evening business at half-past 4, and your trains begin to go from Redfern loaded to the suburbs, and they come back empty as fast as you can get them back. That would be the time when you would have a rush of traffic in the evening, and the trains arriving at through platforms would have to go on to the shunting ground to be marshalled in order to go back again and take a second or a third load, as the case might be, to the suburbs. But if all these platforms were terminal platforms, and you had sufficient platforms to accommodate the trains, then the trains would not require to go to the Domain. Another engine would come on to the other end of the train and the trains could go out every two or three minutes. Besides you would save the time that would otherwise be occupied in going from King-street to the Domain. In other words, you could bring in a train say from Homebush to the dead-end, and the moment it arrived it would discharge its passengers, and in two or three minutes you could have another engine ready on the other end of the train and load up your passengers, and it could go out towards Redfern on its second journey.

3712. With respect to the point about the trains coming in to Sydney not fully loaded; admitting all that you have said is true, does it not follow that a train, say, from Waterfall, which now has only 200 passengers aboard, though it has seating capacity for 400, would, if that district which it drains became more populous, be able to take twice the number of people in that district and that there need not necessarily be an increase in the number of trains? Provided that you make it a stopping train at all stations.

3713. I thought you said that a train might come right straight into Sydney from Waterfall—not stopping at all the stations—and that it might have only 200 passengers aboard;—well, Waterfall might become more populous, and might supply 400 instead of 200 passengers for that train; in that case, you would be able to get twice the amount of traffic from Waterfall with the same amount of trainage accommodation as you have now? No; because if I put on an engine suitable for running from Waterfall with speed, and if I wanted to give the people of Sutherland and Hurstville a quick service,—and that is the only thing that will develop the districts—I should not, as a railway manager, think of insisting upon that train having 400 passengers. It may transpire that it will be so, but I do not think that it will be found that all your trains will be fully loaded up to 480 or 500 passengers.

3714. How many carriages do you generally run on the Belmore line? Sometimes five, and sometimes eight.

3715. What is the ruling grade there? It is 1 in 100.

3716. How many on the Milson's Point line? I am speaking of the more powerful class of engines. We have different classes of suburban engines—we have the "M" class and the "CC" class. They are the most powerful suburban engines that we have. We have also a very large number of "F" and "E" classes, but those engines are not so powerful. We have 17 "F" class engines. Those are not so powerful as the "M" class engines, but you cannot throw those engines away, and you cannot ensure having an "M" class engine. If you are going to work your locomotives to advantage, you have to work your engines first train in and first train out, as far as you can, and a train may come in worked by an "M" class engine, and may go out worked by an "F" class engine. Take the North Shore line: The load laid down, in the past, was seven cars for an "M" class engine out of Milson's Point station, but that has been reduced by the locomotive officers to six cars, because of the unsatisfactory working involved, owing to the grades.

3717. You stated, in explanation of Mr. Deane's plan concerning an extension to North Shore, that you thought the people of North Shore would require to be brought only to a station on the western side of George-street? No, I said to Sydney—that they would require only to come to Sydney.

3718. But you indicated that Wynyard-square would probably be as far as they would care to be brought? I simply said that they would require only to come in to Sydney, and they would come in on the western side—it might be to Wynyard-square or further along, but I have not gone into the question as to where they would come to.

3719. I thought that Dr. Garran asked you where you would put them down, and that you said about Wynyard-square; if that were the case, I intended to ask you whether it would not suit the people of the western suburbs as well as the people of North Shore to come to Wynyard-square? There is not sufficient room to deal with the business there.

3720. Can you give us any idea from memory of the cost per mile of working the suburban line at present? No, I cannot; in fact, it is almost an impossible calculation. It might be done roughly, but I would not give a snap of my finger for it, because you would have to go into what should be debited to country business in connection with the suburban line, and what should be debited to the suburban line proper; the difficulty is in separating the two.

J. Parry.
31 Mar., 1900.

3721. Has any attempt ever been made to artificially ventilate either the Lapstone tunnel or the Waterfall tunnel? Waterfall tunnel—yes. One shaft was put down, but, though it was put down, our difficulty still remains; in fact, it is since the shaft was put down that we have had the trouble I spoke of—of trains sticking up in the tunnel, and having to back out.

George McRae, Principal Assistant Architect, Government Architect's Branch, Department of Public Works, sworn, and examined:—

3722. *Chairman.*] How long have you been in your present position? Two and a-half years.

3723. Prior to that you were the City Architect for the Sydney Corporation? Yes.

3724. For how many years? Twelve.

G. McRae.
31 Mar., 1900.

3725. Have you studied the plans for an extension of the railway into the city, as suggested by Mr. Selze and Mr. Greenwood? I have seen the basement plan here, showing Mr. Selze's scheme.

3726. Mr. Greenwood proposes to go under part of the foundations at the north-east corner, of the Town Hall? I have not any knowledge of how far the foundations of the Town Hall extend beyond the plinth, but I should say not more than 1 foot or 18 inches generally. Mr. Greenwood's plan shows that the tunnel wall clears the plinth corner, but cuts into the area wall, and that area is used for supplying light and ventilation to the basement rooms, and there is a window right opposite to where the proposed wall would cut into the area, and that wall would affect the light in that room.

3727. But he is below the level of that window? If so he would not affect the light in that room.

3728. It is proposed by Mr. Greenwood, and he says his plan shows it, that the railway should go within a foot of the Town Hall foundations at the north-eastern corner of the Town Hall; do you think it would be desirable to have the railway traffic of the whole of the suburbs of Sydney brought by trains so close to that building? I do not think it would be desirable to have the tunnel so near to that building. The footings are sure to project, as I said, 1 foot or 18 inches, and that being a building of great importance, and a public building, I think that the running of the railway so close might ultimately have a tendency to, in a measure, cause cracks or settlements in that building.

3729. And possibly vibration? Yes; I think there would be a certain amount of vibration communicated to the building, because the tunnel wall, being so near the foundations—almost touching them—is bound to communicate a certain amount of vibration to the superstructure.

3730. The railway rails would, I understand, be about 20 feet below the street surface at that corner, and the top of the tunnel would be about 3 feet under the street surface;—do you think that 20 feet would be lower than the Town Hall foundations? I have no knowledge of the actual depth, but I should imagine that it would be. I do not think it is at all probable that the foundations go to that depth.

3731. If this railway tunnel, close to the Town Hall, were to be 20 feet below the road surface, and if the foundations of the Town Hall did not go down as much as 20 feet, would that necessitate underpinning the foundations of the Town Hall? Certainly.

3732. Would that be an easy job? It would be a very difficult job. It could be done, but it would be a difficult undertaking.

3733. *Mr. Dick.*] Are not the foundations of the Town Hall on solid rock? I should imagine they are on solid rock.

3734. Then, would there be any necessity for underpinning? Yes; they must be underpinned. So near the surface the rock would not be sufficiently strong to support the wall above if a side of the rock were cut away. It would be absolutely necessary to underpin the wall if the tunnel went lower than the foundations, going so close to the corner of the building.

3735. *Chairman.*] If you were City Architect at the present time, and you were asked to give your consent to a railway skimming that north-eastern corner of the Town Hall, as proposed, what would you say? I should advise the Council not to sanction it.

3736. *Mr. Shepherd.*] It would be attended with danger to the building? Yes; in my opinion it would.

3737. *Mr. Lericq.*] I suppose that underpinning is always undesirable? It always tends to weaken.

3738. *Chairman.*] And, independent of that, there is the undesirability of having trains running so close to the building, very likely causing vibration and possibly injury to the building? Yes.

3739. *Mr. Dick.*] This tunnel, if it were constructed, would have to be ventilated, and the ventilation shafts would be for the purpose of letting out a large quantity of smoke that would accumulate in the tunnel;—if any of those ventilation shafts came near to the Town Hall entrance or windows, would that be desirable in a building like the Town Hall? I do not think it would be at all desirable to have the ventilating shafts near to the Town Hall, unless they were carried up beyond the building, and even then they would be very unsightly.

3740. There is a large amount of steel and zinc work in the Town Hall? Yes, in the Centennial Hall—the large hall—the ceiling there is constructed of zinc.

3741. If smoke from the trains were to get into that building, would that be desirable; would it not seriously affect the decorations of the ceiling? It would be very undesirable to allow smoky fumes to get into the Town Hall at all.

3742. The windows of the Centennial Hall are mostly open? They are nearly always open during a performance—the clere-story windows.

3743. It is also proposed, under Mr. Greenwood's scheme, to cut over from the north-east corner of the Town Hall to the south-west corner of the George-street Markets, with the lower railway tunnel, but not going within 2 or 3 feet of the basement of the George-street Markets;—what do you say to that? I do not think that that would be so objectionable as touching, because this pier at the south-west corner of the Markets is a very large pier, and there would be 3 feet of solid rock between that and the tunnel, and therefore I do not think that the building would be affected.

3744. The construction of that basement is quite different from the construction of the Town Hall basement? Yes; and I do not suppose that the tunnel would go lower than the basement; besides, the pier

G. McRae.
31 Mar., 1900.

pier is a very large one, and the angle of the building above is some distance from the corner, and there is a retaining-wall with a space of about 3 inches, and it would be very difficult to communicate any vibration to the pier directly. I do not think there is so much objection to the tunnel at that part as at the corner of the Town Hall, where it touches the building.

3745. Mr. Selfe, in his scheme, proposes to utilise the basement of the Victoria Markets for a central railway station, having a separate line of rails on the eastern side of the Markets, and under the footpath and part of George-street? On looking at the plan of the suggested utilisation of the Victoria Markets, as proposed by Mr. Selfe, I understand that the central portion shown in dark red indicates the brickwork which he intends to leave, and that the portion tinted pink, or a lighter colour, shows the portion that he proposes to take away. I should like to point out that there are four central piers, and that these piers are carried up to the underside of the main girders supporting the dome, and any interference with those piers would be a most dangerous, difficult, and almost impossible operation—an operation that I could not possibly recommend, and would not care to carry out.

3746. *Mr. Watson.*] You speak as the architect of the building? Yes.

3747. It was your design, and you carried it out? Yes. Referring to another plan exhibited, you will see a section of the dome resting on the piers previously mentioned. Mr. Selfe does not indicate in any way how he proposes to buttress or support these large piers. If half of each pier is taken away, as shown by this plan, he ought to put an equivalent buttress or amount of brickwork in to support the weight. I think it would be a very difficult and dangerous undertaking to move that portion of the pier.

3748. Are we to assume that it would be possible to buttress the piers up at a higher level than the existing brickwork, and over any railway platform that might be made there? Under the level of the ground floor it would be possible.

3749. Would that be an expensive operation? Most expensive, and most difficult and dangerous. Those four piers are carried up to the underside of the main girders supporting the dome. Then from these girders springs the dome wall itself. Any slight settlement caused by cutting these piers away would probably increase with the height, and damage or cause a settlement or crack in the dome, and would ultimately show itself outside the dome.

3750. *Chairman.*] At any rate it would be a very risky thing to interfere at all with the main central piers? Yes.

3751. That station will be a wayside station—it will be entered at the southern end by trains coming into Sydney, and the trains will run out at the northern end, and it will involve a considerable interference with the Victoria Markets foundations at either end of the building:—what do you say to that? The same remark would apply as I have already made. It is an extremely difficult operation. I refer to the southern end and the northern end where it is proposed to cut through piers. Those piers are carried up the whole height of the building.

3752. *Mr. Watson.*] Do those portions coloured deep red at the southern end and the northern end of the building represent piers as they now exist, or as they would be under Mr. Selfe's proposal? Those piers, as shown on plan, are shown as they would be if Mr. Selfe's scheme were carried out.

3753. The portions coloured pink are what Mr. Selfe proposes to take away in order to make room for his entrance and exit? Yes.

3754. And you say that the taking away of those portions at the two ends of the building would tend to destroy the stability of the building? Yes.

3755. And be a risky and expensive operation? Yes; risky, expensive, and difficult.

3756. From that answer I assume that you could not recommend that the scheme be carried out in the shape it is there proposed? I would be very strongly against any such scheme being carried out.

3757. Without destroying, in some way, the value of the general building, would it be possible to make that basement of any value for a railway station? I do not think that is at all possible. If the basement of the Market be taken for a railway station, I think that it will have a tendency to reduce the rental value of the premises above.

3758. There would be various things contributing to that, for instance, the presence of steam and other fumes? Yes; that would be most objectionable. If a railway station were made in the basement, it should be absolutely sealed off from the superstructure. No smoke or other fumes should be allowed to enter the upper floors, and I do not see how it is possible to prevent smoke or other fumes ascending, and at the same time to let the people go down into the station unless you make side entrances and entirely disconnect them from the interior of the building. But I notice that Mr. Selfe proposes to use the staircases. It is not possible to prevent the fumes from going into the building unless you seal the floor of the building above the station and carry the ventilators right up to the roof, and I think that that would be most impracticable.

3759. *Chairman.*] You will notice that it is proposed to run certain lines (coloured blue) under the Victoria Markets, and also to run a line, likewise coloured blue, under George-street; Mr. Selfe in order to connect his line under George-street with the lines under the Markets, proposes to honeycomb the basement, as shown by those red dots, by making cutaways right through, and, instead of the foundation which you thought it necessary to carry right down, he proposes to have a series of piers to supply the whole of the George-street frontage? Well, seeing that these piers at present carry the weight, and that the outside wall is merely a retaining wall, I do not see much difficulty in doing that. That could be done, because the piers already support the entire weight of the building, and those outside lines merely indicate the retaining wall and area.

3760. What was the object in having those piers instead of having a continuous wall? Cheapness for one thing, and also to get more room in the basement.

3761. The piers would be sufficient? Yes.

3762. There would be no objection then on that score? No.

3763. If the staircase going down to the railway were shut off as you suggest, would not the ventilation in the basement for the purposes of a railway be very defective and bad? Ventilation of some sort would have to be provided.

3764. Taking the whole of the proposal, do you think it is desirable? I do not. I think it is very undesirable to take the railway into the Victoria Markets. The basement was never designed for such a purpose, and I think it would deteriorate the building rapidly, and reduce the value of the superstructure, and I do not think that sufficient station accommodation would be provided.

TUESDAY,

TUESDAY, 3 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVLES, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

John Kneeshaw, Traffic Superintendent, Tramway Department, sworn, and further examined:—

3765. *Chairman.*] Have you any statistics for the information of the Committee? Yes. The Committee J. Kneeshaw. asked me to supply certain returns, one in regard to the passengers travelling on the western system of tramways for January, 1900, as compared with January, 1899, and another dealing with the railway and George-street traffic. Over the Botany, Balmain, Glebe Point, Marrickville, and Leichhardt lines we carried, in January, 1900, 2,236,320 passengers. In January, 1899, we carried 2,069,920 passengers, an increase of 166,400 passengers in January of 1900, as compared with January of 1899. With regard to the railway and George-street traffic, in January, 1900, we carried 1,608,989 passengers. In January, 1899, we carried 248,580 passengers. I was also asked for a return of the passengers travelling on the railway tram lines for the year ending 30th November, 1899, as compared with the year ending 30th November, 1898. For the year ending 1899 we carried 2,838,780 passengers, and for the year ending November, 1898, we carried 2,833,740 passengers. There is only a difference of 5,040 passengers increase. I put in the returns as follows:—

PASSENGERS travelling by Railway trams, year ending 30th November, 1899, compared with year ending 30th November, 1898.

Period.	Passengers.	Period.	Passengers.	Period.	Passengers.	Period.	Passengers.
1898.		1899.		1897.		1898.	
December	259,020	June	231,120	December	258,300	June	223,330
		July	236,880			July	224,640
		August	233,640			August	220,140
1899.		September	227,160	1898.		September	221,220
January	248,380	October	223,920	January	258,660	October	239,940
February	230,940	November	224,640	February	220,500	November	236,340
March	252,540			March	246,600		
April	236,700			April	255,600		
May	233,640	Total	2,838,780	May	228,420	Total	2,833,740

PASSENGERS travelling by Western System of Tramways, January, 1900, compared with January, 1899.

Line.	January, 1900.	January, 1899.
	Passengers.	Passengers.
Botany	362,400	312,640
Forest Lodge and Balmain	362,560	301,280
Glebe Point	199,040	183,520
Marrickville	824,480	819,040
Leichhardt	487,840	453,440
Total	2,236,320	2,069,920
Railway	38,340	248,580
George-street	1,570,649
Total	1,608,989	248,580
Grand Total	3,845,309	2,318,500

3766. *Dr. Garran.*] Does the increase in the steam tram traffic arise from a general increase in the number of passengers carried by railway, or from a larger number of passengers taking to the steam trams? I think it is due to an increase in the number of passengers travelling by railway.

3767. *Chairman.*] Are there any points in the evidence upon which you desire to comment? I notice that a statement was made the other day to the effect that the tramway traffic is not growing. Mr. Greenwood stated in his evidence:

The tramway traffic is not growing; it is stationary, and has been for some years. You can see that from the Commissioners' returns.

I should like to say that there appears to have been some misunderstanding. There is a large increase in the revenue of the city and suburban lines. Take, for instance, the twelve months ending June, 1899, as compared with the corresponding period ending June, 1898, and there is an increase of £22,187 in the revenue of the city and suburban tram lines. Taking the previous twelve months ending June, 1898, there was an increase of £1,725 as compared with the same period ending June, 1897. I would point out that towards the latter end of 1897 the tramway fares were greatly reduced—in some cases by 33 per cent. Therefore, if the Tramway Department earned a little more, it stands to reason that there was a much larger volume of traffic carried.

3768. *Mr. Watson.*] That remark will apply also to the later reductions to which effect has just been given? Yes; but we shall not be able to gauge those reductions for the next fortnight, perhaps not for a month, seeing that Easter comes at a period different from that at which it came last year.

3769.

J. Knecshaw. 3769. Evidently the answer of Mr. Greenwood was intended to apply more particularly to the western suburban tramways. If you examine his general answer, you will find that he was speaking of a railway line to reach the western suburbs by the city and suburban route. He states:

The western suburbs do not grow at all; the railway traffic from those suburbs is not growing.
The tramway traffic is not growing.

I take it that he was referring to the tramway traffic from those particular suburbs? In that case I will refer to the return which I put in little time ago, in which I showed that in one month there was an increase of 166,000 passengers on the western suburban lines alone.

3770. *Mr. Levien.*] When are the Commissioners' returns published? Every year.

3771. Mr. Greenwood was referring to the last return? That was published somewhere about last August.

3772. And I believe all the increases to which you have referred have taken place since then? Not the increase of £22,000 to which I have referred. That is mentioned in the last report of the Railway Commissioners.

3773. Then it is evident that Mr. Greenwood could not have considered that report? No. I desire also to draw attention to Mr. Greenwood's answer to Question 2118, wherein it is stated that if a person can ride 1½ miles on the tramway for one penny, you cannot charge mileage rates on the railway, if it is to compete with the tramway. That reasoning is not sound. A tramway is benefited by the pick-up traffic which a railway cannot possibly obtain. Therefore there is no reason why a mileage rate should not be charged on a railway. If the western suburbs railway scheme were adopted, it is hardly possible that the passengers would be conveyed right to Circular Quay for one penny, as was originally proposed in connection with the King-street scheme.

3774. *Dr. Garran.*] If you run passengers on the George-street tram for one penny, will the passengers on the extended railway line pay more? A large number of them would be season ticket-holders and holders of workmen's tickets. They would come forward. I am sure that the greater percentage of the ordinary passengers, travelling on ordinary tickets, would come forward, rather than undergo the inconvenience of changing at Redfern Station, and getting into a tram where they would probably have to stand. A large percentage of them have to stand now, and more would have to stand as the volume of traffic increased. In his answer to Question 2109, Mr. Greenwood estimates that under his scheme he could get 3,000 passengers per day from Circular Quay, and 2,000 local pick-up passengers by the western railway scheme. I am satisfied that he would not get one-tenth of that number. The Circular Quay traffic is well catered for by the present electric trams. They pass closer to the ferries than any railway scheme could do.

3775. *Mr. Watson.*] I understood Mr. Greenwood, in that connection, to mean that from Circular Quay he would be able to get 3,000 passengers whose objective was some distant portion of the western suburbs, and not merely people who wished to go up George-street? He is too sanguine even then.

3776. *Dr. Garran.*] Have any of your officers tabulated the number of people arriving at Circular Quay, per day, by the electric tram? No. Of course, the traffic is different now from what it was a week back. The proper time to take the traffic would be in the course of a week or two, when the ferry boats go to their proper wharfs again. The traffic just now is inflated. I desire to draw attention to Question 2100, which is as follows:—

They say that people would not get out to make a change, but would rather go straight on to their destination, and, therefore, that there would be more passengers by railway to Hyde Park? I say not one more.

I think that Mr. Greenwood, if he were asked that question again, would admit that his answer is not sound, because we have to bear in mind the large number of signed petitions for a city railway. The people who have signed petitions would be sure to travel by it. There must be thousands who would travel by it. I would also refer to Questions 1951 and 1952, in which it is stated that 90 per cent. of the public are better served at Redfern than they would be at King-street. The witness went on to refer to those residents east of Victoria-street, Darlinghurst, and from there to Darling Point, Rose Bay, Randwick, Waverley, Woollahra, and Paddington, whom, he stated, would not be benefited by the extension of the railway to King-street. There, again, there is a distinct mistake. If those passengers were brought on to a central station at King-street, where they could join a tram travelling eastwards, or travelling to Woollahra, by William-street, they would be distinctly benefited. I should be inclined to say that the witness intended to state that 90 per cent. would be benefited by a city railway, rather than that they would not be benefited.

3777. He was referring to the long-distance travellers when he mentioned the 90 per cent.? Even they, if they were going to Randwick, Paddington, Waverley, and Woollahra, would be benefited by coming in to the city.

3778. I suppose it all depends on where their residences are situated? Yes; but there are no means of direct communication from the present railway station with those localities.

3779. The trams do not radiate from the present station? No.

3780. *Mr. Dick.*] Judging from what Mr. Greenwood said conversationally, he was referring mainly to people who come to the railway station, and go from there to their homes by cab, taking their luggage with them? There are a number who do that, but there are great numbers who take their luggage by tram. That is noticeable in the morning when the mail trains arrive. Numbers come into the city with a fairly large-sized portmanteau, tin box, or other baggage, which they convey by tram.

3781. *Chairman.*] With regard to Question 2123, Mr. Greenwood contends that the city railway would only give you an additional traffic of suburban people, amounting to £2,623 8s. 9d.? I have read that. I think Mr. Greenwood will require to reconsider that matter, because it is impossible that there would only be 1,150 people travelling by a railway to the city. Mr. Greenwood has taken the figures I supplied in regard to the passengers who travel by the steam trams at the present day, and who prefer to travel by them to the railway station to taking the electric tram.

3782. *Mr. Dick.*] Did you take the railway steam trams away before you started the electric trams down George-street? No. We started the electric trams to Redfern Station on a Monday. Up to the Saturday night we had run into the railway station as formerly. On the Sunday we shunted the whole of our steam trams in Devonshire-street, and on the Monday morning we ran eight or ten steam trams—between 8 and 10 o'clock—into the city, and we continue that now. Those are the only steam trams we run from the railway station. Practically, we discontinued the steam trams when we opened the electric trams.

3783. Where do you start those trams from? From the subway entrance in Devonshire-street.
3784. How many people travelled on the steam trams during the first week that both classes of trams ran into the railway station? They were not running in together. We changed on the Sunday night. On the Monday morning we started with the electric trams, and we had a few steam trams running from Devonshire-street as well, and those steam trams we have continued ever since.
3785. They do not come into the railway station at the same time? No.
3786. Presuming there would be no great difficulty in doing that, do you think you would get a large revenue from the steam trams if they ran into the railway station, as they did formerly? There is no doubt that a very much larger number of persons would patronise the steam trams than at present.
3787. Can you give any idea as to the proportion of the total traffic which is now taken by the electric trams, and which would patronise the steam trams? No. Again, referring to Question 2123, I notice Mr. Greenwood refers to 10,240,000 passengers at $\frac{1}{2}$ d. It is difficult to follow his reasoning, because he has divided money by a certain rate fixed by himself, and has brought it out into a number of passengers. His reasoning is unsound, because the numbers mentioned by him would not be anything like the numbers which would appear. You could never get a fair estimate of revenue on such a basis.
3788. *Mr. Watson.*] Have you examined Mr. Greenwood's scheme as far as it would affect a possible tramway extension towards Circular Quay? If the railway station were constructed between the Custom House and the front of the Quay, it would seriously affect the means of bringing the eastern suburban trams to Circular Quay. The eastern suburban passengers would expect the same facilities to reach their destination as would the western suburban passengers. It is contemplated to bring the eastern suburban trams to the Quay. A railway station between the boats and the tramway starting-point would be a great source of inconvenience.
3789. It has been suggested by various people that Macquarie Point, if enlarged by reclamation, or even without it, might be made available for railway purposes in the shape of shunting yards;—do you think that possible, or that the land there would be needed for tramway purposes later on? So far as I am aware, the Minister has already approved of the tramway being extended to Fort Macquarie, and there will be storage room there for tramway cars, which is urgently needed. Our shunting arrangements at Circular Quay are, at present, too limited.
3790. If your present arrangements are inadequate for the traffic now going to Circular Quay, would they not be much more inadequate if you brought the eastern suburban traffic that way, unless you got an extension to Macquarie Point? Yes.
3791. Would it be easy to get a crossing over the railway station at Circular Quay, such as is shown on Mr. Greenwood's plan? It would block the tram lines generally. It would be a great inconvenience, and the 'buses would continue to ply, and in that case the congestion at Circular Quay would be enormous.
3792. One object of extending the tramway system there would be to relieve the congestion of Circular Quay? Yes. I understand that the Minister has agreed to the eastern trams coming down there, and there will be a loop, such as is shown on the plan.
3793. Another suggestion has been made to take a railway line round by Circular Quay on a viaduct;—I presume that that would not materially interfere with the tramway extension? As long as the viaduct were kept sufficiently high to clear the overhead wires, and did not interfere with the trolley poles. That means it would have to be pretty high.
3794. What is the height of the headway? I think it is 18 feet.

John Horbury Hunt, Architect, sworn, and examined:—

3795. *Chairman.*] You will remember that you were examined before a Royal Commission in 1897 on J. H. Hunt, what was then known as the St. James' Road scheme? Yes.
3796. The matter which has been referred to us by Parliament is a somewhat modified St. James' Road scheme, coming a little more to the east, and not taking so much of the Park? I understand that. I will read what I have to say, and then I shall be pleased to answer any questions which may be put to me: "If the Government vote me the money required I will make at Redfern, in conjunction with the asylum site, one of the finest stations in the world." These are not my own words, but those of the late Mr. Eddy, as spoken to me. Repeating them with emphasis may be pardoned in justification of their solid truth and great national importance. With all the able advocacy that I have had the privilege of listening to on behalf of the many Government and private schemes, I still hold firm to my original proposal as here set out on this Government map of the city. The outline of the scheme is so clearly delineated and free from alternative proposals that I think it will enable you at a glance to grasp my intentions. I have looked over my previous evidence, and would respectfully ask you to consider it as evidence in this inquiry. I have no desire to withdraw or alter any of that evidence. I propose now, as originally, to extend the present railway station grounds right over the whole area of the asylum and cemetery sites, and their adjoining properties, up to and into Belmore Gardens, as here shown by the area filled in with black. On that area I would build only so much of a terminal station to meet the requirements of the city for a few years—say twenty-five—with full provision for extending from time to time to the full area here assigned for that purpose. To help you compare this terminal station area with the Hyde Park area I have tinted that portion of the Park green. I think I am right in stating that all railway authorities aim at having three sides of any important terminal station free and open for public use. You will please note how I have observed that highly important requirement. On the west side of the site there will be a street 100 feet wide, while on the opposite side there is a very wide space at the narrowest part over 100 feet wide. Then at the city end there will be a square measuring 700 feet by 350 feet, thus providing plenty of elbow room at this important spot. All this spaciousness Mr. Eddy had in his eye when he expressed himself as above. From this terminal station I propose to continue two lines around the city, with provision to extend to the North Shore, as set out in this map by thick black lines. The rails will be carried by viaduct construction from the terminal station to George-street at Goulburn-street; then by tunnel to York-street, behind the Markets, making use of the basement of the Markets as the first city station, the Kent and Sussex streets traffic to be taken to this station at platform level from a point in Kent-street, as here shown; the rails to be continued

J. Kneeshaw.
3 April, 1900.

3 April, 1900.

J. H. Hunt. continued to Wynyard-square in tunnel. Here we will have the chief city and suburban station, to be approached from George-street footpath at rail-level somewhere midway between Wynyard and Margaret streets, and in a like manner from Kent-street at rail-level. Thus, by these two points of direct communication between Kent-street and the railway, the whole of the western business section of the city will be well provided for. While approaching Wynyard-square station from George and Kent streets, it will have other approaches from York and Margaret streets, the whole area of this station to be open to the sky. From Wynyard-square we proceed to the site of the Education Department; there construct a third city station, continuing on by tunnel to Phillip Park, coming out of the Domain grounds in cutting, with a station in Phillip Park on the surface of the Park ground. From this station, we pass on under William-street, entering a tunnel at Stanley-street, coming out on a viaduct at about the junction of Goulburn and Wexford streets; thence to the terminal station. Much has been said by many of us in the past against tunnels. Depend on it, the time is not far distant when our overcrowded cities will have streets and sub-streets—call them tunnels, if you like—working in conjunction with city traffic. The largest length of tunnel in my scheme is that passing through the Domain, about equal in distance from Park to Bridge streets—or, in other words, about 50 chains. The inward and outward trains passing through this length of tunnel will be practically empty at all times of the day. The next longest tunnel will be about 30 chains, or a distance from Park to Moore streets. By this circular service two lines of rails will be able to do more work than four under the Hyde Park scheme—the trains can be run to follow each other with an intervening space of time equal to that of putting down and taking up passengers. While I am no advocate for a tunnel across the harbour, I have, however, shown on this map how such service may be made to fit in with my City Railway scheme. You will notice that I have indicated on the plan a branch line to be taken to Woolloomooloo Bay; this I propose for use in goods traffic from, say, midnight to early morning. To connect the central and terminal station with Randwick and the far eastern suburbs, a line is proposed to be taken thereto as set out in this map. I may be allowed to refer to a project unfortunately not submitted to you; it is however so closely allied to the present inquiry as to be worthy of some notice being taken of it. I mean the consideration in the matter of resuming the whole of that portion of the city known as Flagstaff Hill, commencing with the boundary lines of the harbour right back to St. Phillip's Church, as indicated on this map by the area tinted red. I think the elder members of this Committee will remember my bringing this proposed city improvement before the public from time to time for fully thirty years. In any other city but Sydney it would ere this have been an accomplished work. At present this section of the city is of the lowest commercial value, while if levelled down to, say, 5 feet to 10 feet above high-water, and with a railway station in the centre of that area, then the value of that section of the city would be of the highest commercial value. It would be a work of, say, fifteen years, and if skilfully handled the Treasurer could pocket a million of sovereigns out of the transaction. If it is determined to connect the North Shore direct with the City Railway, in accordance with my scheme of rebuilding the Flagstaff Hill section of the city, then bridge the harbour as here shown to carry the continued rails from Wynyard-square. Had I, however, the determination of this question, I would bridge the harbour as indicated on this map,—starting from the main land of Balmain on to Goat Island, then to Ball's Head. The whole of the short distance traffic of the Northern line should be brought to the terminal station by this branch line. There should be a station at Pymont, as here shown, with tram communication to the city. Permit me to say, and I do it with every respect to you, gentlemen, who are evidently conducting this inquiry with much care, that these isolated proposed city improvements are at best but a one-horse endeavour to making Sydney the finest commercial city in Australia.

3796. Will you amplify your explanation of the route you propose to take;—which part of the Devonshire-street station would you construct first? I should start by obtaining the whole of the area of the Asylum site, the cemetery, and all those adjoining properties about half-way through the Belmore grounds—all this area I propose to take for the purposes of a terminal station for the present and the future. From that point I start by viaduct construction, until I strike George-street at a level to be determined, and proceed under George-street to Goulburn-street. I pass under George-street, and outside the foundations of the Town Hall.

3797. At the back of the Town Hall? No; clear of the George-street frontage, this not interfering with the foundations. Then I get into York-street, and through George-street, behind the Markets. I then make communications from the platforms of the railway with the basement of the Markets, without touching their foundations. That would be the first getting-out place for the suburban traffic coming in.

3798. *Mr. Watson.*] Is that an open station? I make use of the basement of the Markets.

3799. *Dr. Garran.*] The rails would be under York-street? Yes. I go through York-street, behind the Markets. Before leaving the Markets, and in order to give business people of the western portion of the city a chance of getting to that station without climbing up the steep grades of the streets, I strike in at Kent-street, at street level, and have a subway into the Market floor level. Then I continue along York-street until I come to Wynyard-square. I look upon Wynyard-square as the chief business station. The Markets station might be the chief station for people coming to Town Hall meetings, and so forth; but the Wynyard-square station would be the principal station for business men. We have a large area in Wynyard-square available for a city station. I then can go, at kerb-stone level, from George-street, right to the rails at Wynyard-square, without difficulty.

3800. *Chairman.*] By a series of openings, I suppose? No. There is no difficulty whatever from an engineering point of view in carrying out what I propose. We should bring the rails to Wynyard-square, and make use of the whole of its area for the chief city station. If you cast your eye through Cole's book arcade, and imagine a space twice that width taken right through to Wynyard-square, then you will quickly see my intention and its practicability. We could then build above it for any purpose we chose to bring in a good revenue. Thus there would be no waste by cutting through and destroying a slice of George-street property. The same remark applies to the western side. Another piece of property could be cut through there, and the basement used for traffic, and the upper portion as a warehouse. We then proceed by an easy curve to Bridge-street. The railway engineers may pick me up in regard to Bridge-street. That will be the tightest piece of engineering of the lot.

3801. *Mr. Watson.*] You would go under the lowest part of Bridge-street? Yes.

3802. *Dr. Garran.*] If you go straight on you will come to the surface by the time you get to Pitt-street? We will avoid that. As I have stated we go on under Bridge-street, then at the Education Department.

J. H. Hunt,
3 April, 1900.

I would make another station. That would be the last city station. Then we go on through the Domain, and that is where there would be the longest tunnel, until we come out by an open cutting on the eastern side of the Art Gallery. Then, at the point where the Blind Asylum is situated, at Woolloomooloo, I propose to construct another station—an open station. Then I should pass under William-street, until I got behind the Museum and the National school, to somewhere about Stanley-street. I should then go by tunnel to the terminal station. By this means we should have, practically, a circular railway.

3803. At the hollow of Bridge-street you will have to cross the Tank Stream? I do not care a rap for any difficulties in the way—we only require skill and money to overcome them.

3804. Do you propose to be in tunnel all the way from Wynyard-square to the Education Offices? I start in tunnel from Goulburn-street to the Town Hall. I go in tunnel from the Markets to Wynyard-square.

3804½. *Mr. Watson.*] I see you have a branch line towards Woolloomooloo Bay? Yes; to help the Woolloomooloo commercial traffic. I think it would be an advantage—I do not however advocate it—to have a station there, connected with this line; we could use that line for a night service in freeing Woolloomooloo from goods traffic. We all know that we should not mix up the passenger and the goods traffic. I think here is a chance for the line being made use of at night in getting goods away from Woolloomooloo.

3805. *Chairman.*] Your proposal is for a city line to serve the suburban people only? Yes.

3806. The long-distance traffic is to remain at Redfern? Yes. It is known to you, gentlemen, that a very great friendship existed between Mr. Eddy and myself. We have spent hours talking these matters over. He told me more than once—and you have it on record—that he had no ambition whatever to go to Hyde Park; that it was a matter of money; and that if he had not the money to operate at Redfern he must go to Hyde Park. The centre of Sydney, eventually, will be Redfern. We are limited in our area of building operations for the city proper, hence the city traffic is, and will be limited, and we must provide for outer extension.

3807. Is it of any use asking you questions as to details? No; unless paid to work them out.

3808. *Mr. Watson.*] Or as to cost? Yes. I wish to repeat the evidence I have given relative to the proposed extension from St. James' Road, which is as follows:—

My desire to appear before you again arises out of the singular statement made to me at a previous inquiry, recorded as follows:—"The Committee would be quite unable to recommend your scheme without an estimate of cost. Any recommendation they may make to Parliament must be accompanied by a recommendation of cost." Therefore, to save my scheme from being pigeon-holed, I have resolved to waive my strong objection to giving approximate estimates, especially for nil. I have, however, safeguarded myself, and tried to protect you, by writing down a very liberal figure in the sum of £725,000 for my scheme, carrying with it the following items:—

Purchase all the properties on the Asylum site, also the small parcel of privately-owned land connected therewith, and all other city properties required to be purchased, or the owners thereof compensated.

Remove the human remains from the old graveyard to Rookwood.

Build a portion of a grand central station on the Asylum site, with platform area, &c., equal in all respects to what is now proposed for St. James' Road station.

Convert one-half of the basement-storey of the new Markets into a station.

Build under a portion of Wynyard-square and so much of the side streets as may be required to make this the chief city station for suburban traffic. No structure will be built above surface of Park. In no way will the property in the square be injured. There will be neither smoke, steam, nor noise connected with this scheme.

Resume 50 feet frontage to George-street, so as to make a passenger entrance from the level of the footpath right through to the platform-level of station in the square.

Build on this site offices for Commissioners of Railways, with other offices to let; out of this rent pay to the Corporation rent for one-half of basement of Markets.

Build under the square in Macquarie-place, and continue under Bridge-street into a portion of the vacant land at offices of the Education Department. This will be the Circular Quay traffic station.

Build a small underground station at the cricket-ground site, facing Art Gallery, for the use of suburban visitors to the Botanic Gardens and Art Gallery.

Build above ground a small station at Phillip Park.

From the point A, at the intersection of Goulburn and George streets, right around to the point B, at the intersection of Goulburn and Wexford streets, shown on plan, the road to be in tunnel, with two sets of rails, with signals and lighting plant complete; motive power, electricity.

While my proposal is a tunnel scheme, the longest length is but the distance from Goulburn-street to Park-street; in fact, you will see, on examining the plan, that it is a less distance than the length of the semi-tunnel for the St. James' Road scheme.

By the time the inward train reaches Macquarie-place (which will be by these short-distance tunnels) they will be empty of passengers, while the outward-bound traffic will commence at the Macquarie-place station, and in travelling to the great central station will pass along these short tunnels.

The real tunnel length of the line exists only through the Domain portion of the route, where the trams will be all but empty of inward and outward bound passengers.

You will please observe and take into consideration, when you are making your recommendation, that I have shown on the plan my line extended on to the site of the proposed future city platform (No. viii on plan), while still preserving the circular line. This proposed future city station, placed as here shown on the new and future area of the city, is to be for passengers and small goods, yet in two distinct stations and sets of rails, the goods to be taken by tunnel on to Darling Harbour station.

To compare the two schemes with fairness, then, you must add to the St. James' Road scheme the value of the Park lands and Asylum lands taken for the use of that scheme. £300,000 is the least value of those lands, and must be added to the £650,000 = £950,000. To this a further sum must be added for the widening of King-street and making a new street as an outlet for the traffic—there is a dead certainty of every penny of half a million being fooled away in trying to make this St. James' Road site fit for its work. £500,000 added to £950,000 equals (say) one million and a half as against three-quarters of a million for a complete scheme as proposed by me.

3809. *Chairman.*] You seem to be a strong advocate for the use of tunnels in the future? No, not a strong advocate.

3810. But you seem to think that they must come? Many things will be forced upon us which we do not like at the present day, and our present mode of life will be very much changed in regard to them. Personally, I prefer an open road to a tunnel; but if you cannot get an open road, what are you to do?

3811. Have you thought out the difficulty of ventilation in a tunnel? There will be no difficulty. I have private letters from friends at Home who say that it is a pity that some of those who object to tunnel traffic were not there to see how nice and clean and well ventilated everything is.

3812. As you are aware, our suburban traffic, so called, involves a good deal of long-distance traffic? I know that; but get a man like Mr. Eddy to control it, and he will make it work. I may mention that in

J. H. Hunt. order to carry the traffic out to the eastern suburbs, I propose to branch off from the Redfern station and go out to Randwick, as shown on my plan. If it is determined to connect North Shore with a tunnel, that tunnel will work with my scheme as shown on the plan. I propose to resume the whole of that portion of the city tinted red on the plan, as already, in detail, stated.

3 April, 1900.

3813. *Mr. McFarlane.*] What is the length of your proposed circular line? About 3 miles.

3814. How much tunnelling have you in that distance? About 50 chains will be the longest length out of 155 chains, or under 2 miles, divided into five sections. Of course intercepted by the stations.

3815. What length would the stations take up? The length of the Markets and the length of Wynyard-square, and station in Bridge-street, as shown in map.

3816. There would not be much of a blank between one tunnel and the other? The longest tunnel would be through the Domain, where the trains would be almost empty.

3817. Speaking generally, there would be a lot of tunnelling? No. In my opinion it is the shortest route which can possibly be devised for a line round Sydney.

3818. *Mr. Levien.*] Would it not save a lot of resumption? Yes; there would practically be little or no resumption, excepting in regard to property which it would be a blessing to resume—in Wexford-street. The line would chiefly go along the streets. A little piece would have to be resumed near Bridge-street.

Frederick Cavill, sworn, and examined:—

F. Cavill. 3819. *Chairman.*] How long have you been a resident of Sydney? Twenty years.

3 April, 1900.

3820. Have you taken an interest in the proposed railway extension? Yes; a very great interest.

3821. I believe that on the 26th March you sent the Committee a letter indicating a scheme for railway extension? Yes; I will read it:

Gentlemen,

Lancaster Villas, Ocean-street, Edgecliffe, 26 March, 1900.

I have the honor to lay before you for your favourable consideration a scheme whereby the construction of a city railway will be facilitated, and not only will the initial cost be a great deal less than of those schemes which have already been submitted you, but, by the collection of certain rents hereinafter referred to, the undertaking to a certain extent can be made to practically reimburse in part the initial cost of construction after a comparatively short period.

I propose taking as a beginning of the route the extension from Redfern to Darling Harbour, or, as a matter of fact, any other desirable route which would lead from Redfern station to the bottom of Liverpool-street in Sussex-street. That part of the city railway route is not an essential to my scheme, as it is evident that the obstacles to be surmounted are comparatively trifling to those which would attend the construction of the railway from the last-named point to the city proper, and with which my scheme deals particularly.

The railway would continue and utilise the western side of Sussex-street, and would be built upon arches, as shown in the accompanying sketch marked "A," these arches being made into stores facing Sussex-street, and the various streets would be crossed by viaducts. By a gradual ascent Erskine-street could be reached so as the altitude would approximate that of Wynyard-square. The railway proceeding in a northerly direction would cross Erskine-street and enter the central station to be built on an area resumed between the following boundaries, namely, on the north Margaret-street, on the south Erskine-street, on the west Sussex-street, and on the east York-street, the various intervening streets, Kent and Clarence, being connected by subways beneath the station.

The accompanying map and sketch will give an idea of the before-mentioned route and construction. I do not give the actual figures of construction and cost, as I am unable to procure them, but would most respectfully suggest that if the scheme herein set out should be deemed by you to be feasible, that it be submitted to your experts for computation as to its actual cost, &c.

By this city railway route, I would point out that if any further extension—say, to Circular Quay, and particularly to North Shore—were desired, it would by this route be greatly facilitated.

Contention might be raised as to the cost of a scheme such as I have set out; but I would point out that by the letting of the stores and shops which would be built beneath the arches aforesaid, the rents would eventually repay a considerable portion of the initial outlay.

In addition it would be greatly beneficial in rebuilding that part of the city which is at present greatly infected by the plague.

The front of the central station could be made an hotel like those in London, and made to face York-street, whilst Wynyard-square could be cleared for vehicular and other traffic, and which would be absolutely necessary for the promotion and conduct of good order before a station such as I have described.

In submitting this, my scheme for a city railway, I may state that further than any benefit which may accrue from the placing of my suggestion before you, I am totally disinterested.

I may state that if this scheme is carried out, the shops and stores underneath the viaduct would produce a rental of not less than £100,000 per annum. That would be tantamount to about 10 per cent. on an outlay of £1,000,000. I have made a slight alteration in my scheme since I sent in my letter. I said in my letter that I was uncertain which way to go after leaving the bottom of Liverpool-street, but on the plan I start from the Redfern station. From there I cross over Devonshire-street, take a good circle round the park, come in on the northern side of Campbell-street, and build arches there. There is a row of Chinamen's dens there which could be pulled down and built into arches, which would realise an enormous amount of money as stores. I would then take a viaduct across George-street, in a slanting position, so as to make a gradual sweep to the foot of Sussex and Goulburn streets. Then from Goulburn-street I would start my line proper. I would pull down the whole of Sussex-street, on the western side, down to the water's edge, destroying all the plague-stricken spots, and building up this line of railway, which would be 10 feet further back than the present frontage of Sussex-street. That would make Sussex-street 10 feet wider than it is at present:

3822. *Mr. Watson.*] West of Sussex-street you would resume? Yes; I would resume the west, and make the frontage of the railway 10 feet further back than the present line of shops.

3823. *Dr. Garran.*] You do not propose any parallel street close to the wharfs? It would be for the Government to do what they chose. They could make a very decent place of it. The whole of the line would be, comparatively, on a level. I would build the arches 20 feet high. I would make a gradual circle from Margaret-street, cut through "The Rocks," and come out at Circular Quay, on the western side of George-street, where you could build a station of any size you like. There is another line which I proposed, namely, to go to Erskine-street. That line would have to be made a little higher. I would then make Wynyard-square into a station. I believe, however, that a station at Circular Quay would be the best. In the event of the station being carried out, I would make an intermediate station somewhere between Druiit and Market streets. That would be halfway between Circular Quay and Redfern station. The stores to which I have referred would be 100 feet by 20 feet, and I think they would fairly fetch £5 a week rent.

3824. *Mr. Watson.*] I know of a place in Sussex-street, with five floors, which is only bringing in £4 a week? But my scheme would materially improve the street; it would be one of the principal streets of

of

of the city. If the scheme were carried out, the owners of property on the eastern side of Sussex-street would rebuild. I do not think the scheme would cost as much as the St. James' Road scheme, because the resumptions along Sussex-street would not amount to much. I would make the route I propose a traffic route. I would connect the line which is in existence from Darling Harbour with the bottom of Liverpool-street. We could then take all our stores and wool to Circular Quay, and the traffic around Belmore Park would be confined entirely to passengers. The whole of the city traffic, instead of being carried through the principal streets, as it is now, would be taken by rail. There could be a goods depôt at Circular Quay, and if it were not considered desirable to continue the line around the Quay, there would be little trouble in carting the produce from the goods station at the side of George-street to any part of the shipping around there.

3825. *Chairman.*] Have you estimated what the probable cost of resumption would be? No.

3826. *Mr. Watson.*] I suppose that what you claim as points for favourable consideration are cheap resumption along the western side of Sussex-street, and the possibility of getting revenue from the arches? Yes.

3827. You consider that the cost of resuming any other part of the city would be much greater than the cost of resuming Sussex-street? Much greater.

3828. You do not attempt to provide for the people on the eastern side of the city? That could be easily done by continuing the line of arches along Circular Quay, and tunnelling under the parks to Woolloomooloo.

3829. Your present scheme does not provide for the eastern side? My scheme could join any scheme on the eastern side.

3830. Supposing we only had enough money to build a line on either the eastern or the western side— which would be the most convenient? A line on the western side. Of course, if you built to Circular Quay, you could go anywhere you liked from it.

WEDNESDAY, 4 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Charles Fry, clerk, Registrar-General's Office, sworn, and examined:—

3831. *Chairman.*] Have you any evidence to submit? I desire to make the following statement:—

THE distinctive and, I think, original feature of the suggestion herein offered is the resumption for city railway purposes of a strip of Hyde Park, 60 feet (or upwards) in width, parallel to and adjoining College-street, for the full length of the Park. The proposal is outlined at length in the *Daily Telegraph* of 9th and 19th July, 1897.

The suggestion is for a loop-line (four or six lines of rails) for passenger traffic only. Being a loop-line the necessity for acquiring any considerable area for shunting purposes is avoided, all stations being way stations (as at Eveleigh). In order to minimise alteration of existing arrangements as to necessary uniformity of position of first and second class carriages, it is suggested that first-class carriages should always form the centre of train, second-class carriages being at both ends. *Vide* 8.18 a.m. train from Hurstville. The route (shown by red on sketch) would be from Redfern Station, *via* Devonshire-street Cemetery and Wexford-street, to a station (No. 1) at the intersection of Oxford-street with College-street; thence in deep cutting by a resumed strip of Hyde Park, adjoining College-street, to a station (No. 2) at District Court Buildings (Chancery-square) at top of King-street; thence by the most practicable route in open cutting through the Outer Domain to Lower Macquarie-street, a station (No. 3) to be placed in Inner Domain near Water Police Court.

If the eastern portion only of the scheme were to be carried out the line would run from station No. 3 to Fort Macquarie, which (when enlarged by spoils from cuttings) would serve as a shunting and terminal yard. A passenger platform might be required at Fort Macquarie.

Fort Macquarie is a possible point of departure for tunnel connection with North Sydney. From the station No. 3 (near Water Police Court) the line would be carried by viaduct across Circular Quay to the high rocky land (Harrington-street) opposite the Metropolitan Fire Station in Lower George street. Here a station (No. 4) would probably be required. From station No. 4 the line proceeds, partly by cutting, partly by short tunnel, to Wynyard-square. From Harrington-street the elevation would be sufficient to reach Observatory Park if bridge connection with North Sydney should be at any future time desired.

A station (No. 5) at Wynyard-square, excavated 10 or 15 feet below Carrington-street level, would be the chief station for western side of city. Connection by subways to the level of Kent-street or Sussex-street, would convenience Erskine-street and King-street ferry passengers. From the Wynyard-square station a tunnel 20 or 25 chains in length would connect with a station (No. 6) at Sussex-street, under the Sydney end of the new Pyrmont Bridge. Thence the route would be by Darling Harbour frontages, or other most practicable course to Redfern yard, having one other station (No. 7) intermediate between Pyrmont Bridge and Redfern (about the western end of Engine-street or Hay-street). The route, as outlined above, would be practically a daylight one. Only two short tunnels would be required, *i.e.*, those immediately north and south of Wynyard-square. The other tunnels would be road crossings only. They would be—1. Under Lyons-terrace and Liverpool-street; 2. Under Park-street; 3. Under King-street. Possibly also under or over Lower Macquarie street. No streets of any traffic importance would be blocked or crossed on the level.

The circuit of the city would be effected without entailing costly resumptions of privately-owned land.

The only resumptions of any magnitude would be—(1) At Wexford-street; (2) at Harrington-street; (3) at Darling Harbour frontages above the Pyrmont Bridge. At all these places the land is amongst the lowest-priced areas in the city, and the buildings are of a most inferior character.

The stations would be seven in number—No. 1 at intersection of College and Oxford streets; No. 2, at Chancery-square, top of King-street; No. 3 at Lower Macquarie street; No. 4 at Harrington-street; No. 5 at Wynyard-square; No. 6 at Sussex-street, at Market-street end of Pyrmont Bridge; No. 7 at western end of Eugene or Hay street, or Ultimo-road.

The feature of the proposal to which the attention of the Committee is most particularly invited is that it would inflict upon Hyde Park the minimum amount of curtailment and disfigurement compatible with utilising the Park in any degree for railway purposes. The railway in deep cutting with dwarf screen walls would be invisible from the city side of Hyde Park. The taking of only so small a portion would probably avoid the danger of arousing that sentimental opposition which defeated the St. James' Road scheme in 1897.

As previously stated, it would provide practicable points of departure for railways extension to—(1) Eastern suburbs *via* Cook Park and Woolloomooloo Bay; (2) North Shore, by tunnel, from Fort Macquarie; (3) North Shore, by bridge, from Observatory Park.

F. Cavill.
3 April, 1900.

C. Fry.
4 April, 1900.

C. Fry. I desire to add the concluding paragraph of the letter I wrote in 1897:—

4 April, 1900.

It is with a very conscious sense of my own incompetence to offer anything but the most general ideas on so important a question that I have ventured, at the risk of incurring some doubtless well-deserved ridicule from professional critics, to ask attention to the project as it has for some time past presented itself to my mind. So far as I have understood the various suggested schemes, the cost of land resumption, rather than that of actual construction, has been the rock on which many otherwise suitable proposals have been wrecked, and it has been the aim of these two letters to suggest a possible route on which the amount of land to be taken from private owners would be inconsiderable, both in value and in area. Not having any technical or professional knowledge, I cannot venture to offer any opinion as whether or not the cost of construction or the engineering difficulties are such as to place my proposals beyond the region of practicability. My only desire is that the scheme as outlined may attract the interest and attention necessary to ensure its examination at the hands of gentlemen qualified to express an authoritative opinion upon those points.

3832. *Mr. Watson.*] You have not attempted to go into any estimate of cost? No; I am utterly incompetent to frame any estimate of that kind.

3833. Have you made any investigation to see how far your levels would run? No; beyond walking over the ground, and roughly estimating that the scheme is practicable, possibly at the expense of deep cuttings. I believe the scheme to be practicable; but I ask for an opinion to be obtained on that point from someone competent to decide.

3834. Assuming that it were not advisable to construct more than the eastern half at the present time do you think your scheme as far the Water Police station would fairly meet the necessities of the travelling public? I think it contrasts very favourably with any of the other schemes I have seen. I have measured the distance from the District Court station to Warby's corner, Pitt and King streets, and find that the distance from the latter place to the probable entrance to the railway station would be 100 to 150 yards further than from the proposed station at St. James' Road to Warby's corner.

3835. Your proposed station at the District Court would be distant only 150 yards more from Warby's corner than a station at the corner of St. James' Road and Elizabeth-street would be? Yes.

3835½. The corner of College and Oxford streets is more convenient for a station than any of the other sites suggested in that locality? It is more convenient for the Surry Hills passengers.

3836. You suggest that if the eastern half only is constructed, Macquarie Point might be utilised for shunting? Yes.

3837. We were informed yesterday that the tramway service would probably require Macquarie Point for shunting purposes;—that would necessitate the finding of another place for shunting under your scheme? I think any scheme would be incomplete which did not serve the western side of the city. I have been a daily railway passenger for sixteen years, and my observation leads me to think that two passengers go to the west of George-street to one who goes to the east of George-street.

3838. You think it would be inadvisable to construct the eastern extension without continuing it westerly by way of Darling Harbour? Yes.

3839. Would the property which would require to be resumed be of great value? Apparently not. The houses are of an inferior character. Wexford-street, as you know, is one of the slums of the city, and the line would go more directly through Wexford-street than it would in connection with Mr. Rennick's or the St. James' Road scheme.

3840. Is your idea to join on to the existing Darling Harbour line? Yes. The idea all through has been to avoid resumptions, and that would be best served by getting into the Government yard at Darling Harbour as directly as possible.

3841. The present line to Darling Harbour has a steep gradient, in comparison with other portions near the city; consequently, a train travelling over your proposed line would be governed by the gradient at the Darling Harbour end? I think it would be possible to make the connecting line independent of the goods line gradients.

3842. That is, by carrying it on viaducts from Pymont Bridge? Yes. That is an engineering question. Of course, if land is available at little cost, engineering talent will overcome the difficulties of grades. It might mean extra cuttings, or the possible raising of the bridge at George-street. I believe the steepest part of that gradient is from Cleveland-street Bridge to George-street.

3843. Supposing the Hyde Park scheme were carried out, do you think it would conveniently serve the people? I think it would be very nearly useless to the people who arrive by steamer at the various Sussex-street wharfs.

3844. Have you any means of judging whether it is likely that, with a railway station at Hyde Park, the people on the western side of the city would use that railway station or continue to go to Redfern by the existing trams? I think they would travel by trams.

3845. *Mr. Dick.*] You propose to bring passengers down the eastern side of the city, and to send the trains back along the western side? I think they might be arranged to run alternately.

3846. You have stated that you think that for every two persons who go west of George-street one goes east? I think so.

3847. Would not that suggest that it would be better to bring people down the western side first, and along the eastern side afterwards? Yes. I think they might be made to run alternately.

3848. *Dr. Garran.*] You do not propose your scheme as a mere circular railway? No. I suggest that the trains coming from Hurstville should come in on the eastern or western side, and return direct to Hurstville. The train which came in from Hurstville would return to it.

3849. You do not propose to run through the Redfern line for your western station, but only for your eastern scheme? Yes. It would be necessary to have a passenger platform near the Mortuary, and there should be no shunting.

3850. But the train that came back into the yard would have to go to the suburbs again;—it would have to shunt back to the platform? No. Coming into the Redfern yard it would not stop at the same platform as it would on its return. On its return it would call at a platform somewhere near the Mortuary.

3851. Do you know the grades of your proposed line? No.

3852. Do you know what depth you would be in at the corner of Oxford and College streets? Twenty-five or 30 feet. The depth would be guided by Park-street. It would have to be sufficiently deep there to go under Park-street.

3853. You would have a station in a rather deep cutting at that place? A little deeper than what Eveleigh now is.

3854. When you are on what you call the water frontage blocks at the head of Darling Harbour you will be under high level? No. At the Wynyard-square station you would be below the street-level. At the Pymont Bridge end you would be under the level of Market-street and slightly above high water-level.

3855. And you have to climb the height from the water level to the Redfern station yard in that short distance? I should like to point out that, in the Darling Harbour yard, the rails are on the water level, and they have to do the climbing. From there, of course, it is steep from there to the Redfern yard. You could ease the grade considerably by starting as far back as Pymont bridge. C. Fry.
4 April, 1900.
3856. You would have a considerable descent from Wynyard-square to get under Pymont bridge? The depth of the station at Wynyard-square could be regulated so as to bring it out under the bridge.
3857. Would you go under Sussex-street? Yes; also under York-street, Clarence-street, and Kent-street.
3858. *Mr. MacFarlane.*] How would you convey passengers to the west of George-street? If it were desirable to come down the western side of the city first, the line would come down the present goods route to the Darling Harbour yard.
3859. You would have the train running both ways? Alternately east and west.
3860. It would be necessary, then, for the western passengers to get out at Redfern, and wait for a train to the eastern part of the city? If the trains ran alternately they need not do that.
3861. *Mr. Shepherd.*] Do you propose a double line? I think four lines each way would be necessary for the traffic.
3862. You are aware that the principal object in the construction of a city railway is the saving of time? Yes.
3863. Do you think the carrying out of your scheme would result in a saving of time to the passengers as against their travelling by the tramway? I think that a person in the centre of the city, having a knowledge of the time-tables, would know whether to walk to the eastern or western station.
3864. Your first station on the eastern side is at the corner of College and Oxford streets;—what portion of the city do you suppose that would serve? Oxford-street is, next to George-street, the chief artery of the city, and it would serve the Oxford-street and Surry Hills passengers.
3865. Then you do not calculate upon its serving the centre of the city? I think its chief value would be for the passengers coming down Oxford-street and from Surry Hills.
3866. You do not suppose any one would get out there and walk across the Park to Elizabeth-street? I think it is possible that those who wished to reach that part of George-street would; but my chief idea was that it would convenience Surry Hills and Oxford-street.
3867. Your next station is at the top of King-street, and then you go round by Phillip-street and come to Darling Harbour? You do not go near Phillip-street. You keep well to the east of the Parliamentary buildings and the Sydney Hospital, in order to avoid any possible complaint as to its proximity to the hospital.
3868. Do you suppose any of your proposed stations would serve the business people of George-street, as opposed to the George-street trams? Yes. Under my scheme you would save the change at Redfern.
3869. But you only have a station at Market-street and Wynyard-square? And the District Court, which would be of great convenience to the eastern side of the city.
3870. Do you know the distance from the station there to the Market-street or Wynyard-square stations? It is not much over half a mile.
3871. So that anyone wishing to reach a central position between those two points would have to walk a quarter of a mile? A quarter or a third of a mile.
3872. Which trams do you use now from the railway station? The steam trams.
3873. Do you find much delay caused in coming in by those trams? At present a considerable delay.
3874. In the event of an electric tram being run down Elizabeth-street, would you take it in preference to going to King-street by a railway? It would be more expensive, and there would be the break of journey.
3875. Have you heard many complaints about the delays of passengers coming into Sydney who have to change into the trams? Latterly, since the railway steam tram has been abolished, there have been a good many complaints.
3876. Do you think the steam trams serve the people better than do the electric trams? No, excepting in regard to those people who have to get out in the streets through which the trams run.
3877. Do you not think that the city could be well served by a good system of electric trams in the different streets? No. On the Illawarra line the regular railway passenger traffic does not commence until you get to Arncliffe. Up to that point the population which travels into Sydney does not, as a rule, travel by railway, but by other means of conveyance. The railway loses a large amount of revenue from places like St. Peter's, Erskineville, and Macdonaldtown. I think that if there was a good system of city railways those stations would be the largest revenue-producing stations which the Department possesses. At present they are much behind such places as Rockdale and Petersham.
3878. Under your scheme, you propose to reach Miller's Point, Dawes' Point, or Fort Macquarie? At Harrington-street you would have a sufficient elevation to make your own election as to which way you would cross the harbour.
3879. *Chairman.*] I understand that you have submitted your scheme as one to be inquired into by the authorities, to ascertain if it is practicable? Yes.

John Moore Smail, Engineer-in-Chief, Metropolitan Board of Water Supply and Sewerage, sworn, and examined:—

3880. *Chairman.*] Have you examined the different schemes before the Committee? I have examined Mr. Solfe's, Mr. Greenwood's, and Mr. Deane's schemes. With regard to Mr. Deane's scheme the only sewer with which it is likely to come into contact is one crossing Devonshire-street. If the line is on a viaduct, of course, it will not interfere with it; but if it takes the form of a dip or tunnel it must necessarily interfere with it, and will require some deviation. J. M. Smail.
4 April, 1900.
3881. What depth is your sewer below the present Devonshire-street level? Not more than 8 feet.
3882. Is that one of your main sewers? It is a branch sewer of brick.
3883. The objection in regard to Devonshire-street would, of course, apply to all schemes of railway crossing Devonshire-street on viaducts opposite the present railway station? Yes.
3884. It is apparent that Devonshire-street would have to be lowered 9 feet in order to get under the railway viaduct? If that is the case, the crown of the sewer could be protected in a way which would be sufficient to carry the traffic. In other words, it would not cause the deviation of the railway line. Structural alterations could be made sufficient to carry the ordinary traffic. 3885.

- J. M. Smail. 3885. Then you do not see any grave objection from that point of view? No. The next sewer it crosses is the main Bondi sewer. That is deep enough to escape the line. It passes underneath Carter's Barracks and the Benevolent Asylum. The King-street and Mr. Greenwood's schemes intersects this line of sewers; but they will be above it. The King-street scheme also crosses a small branch sewer in Elizabeth-street; but that can be dealt with.
- 4 April, 1900. 3886. Supposing you wanted to go underneath King-street, so as to get the necessary grade to Circular Quay or Fort Macquarie, how far under King-street could you go without interfering with your sewer? It branches off at the corner of King and Elizabeth streets. It then makes a detour near Governor Bourke's statue. The sewers intersected there would be the Castlereagh-street and Macquarie-street sewers, which are quite deep enough to allow of a railway tunnel being made over them. They are from 20 to 30 feet deep.
3887. Supposing the railway tunnel were 20 feet underneath the street, what then? Then, at the point at which it crosses Macquarie-street, there need be no interference with the sewer.
3888. Do your sewers vary in depth according to their position in the city? Yes. Under the old system the Macquarie, Castlereagh, Phillip, and Elizabeth street sewers were put down deep, so as to accommodate deep cellars. The only objectionable feature I see in Mr. Greenwood's scheme is where the line crosses some storm-water sewers at Sydney Cove—that is, on Circular Quay—which would necessitate some structural alterations. I have gone into the matter with him, and he is quite clear as far as our sewers are concerned.
3889. *Dr. Garran.*] He crosses the Tank Stream? Yes.
3890. Can he do that? No. We shall have to alter the Tank Stream, or he will have to alter his railway.
3891. Is he satisfied that he can do it? Yes; there is nothing unsurmountable in it.
3892. *Chairman.*] Would it involve great expense? I think the whole lot could be done for £2,000.
3893. *Dr. Garran.*] Would Mr. Horbury Hunt's scheme intersect the sewer at Bridge-street? Yes. The sewer there is not more than 8 or 9 feet below the surface. The Bridge-street sewer hugs one side of the street, and he could keep clear on the other side.
3894. But he crosses it at right-angles? I understood he tunnelled right up Bridge-street.
3895. *Chairman.*] Where does your main tunnel which goes out to Bondi begin? At the corner of Liverpool and Oxford streets, where it is 110 feet deep.
3896. What is your minimum fall towards your main sewer? It varies according to the quantity of sewerage we have to take. The outfall sewer only has a fall of 3 feet in a mile; the others vary.
3897. Can you say, with regard to any proposal for a railway which does not interfere with the main sewer, that the ordinary reticulation sewers could be diverted, even if a line crossed their route? I take it that the people who have laid out the three lines I am speaking of have tried to interfere with sewers as little as possible. I could not speak generally on a matter like this.
3898. *Dr. Garran.*] If there were a tunnel under George-street from Bathurst-street, would it interfere with anything? No.
3899. Would it interfere with anything from the Town Hall, along York-street, to Wynyard-square? No. Mr. Green has a detailed way of getting over the difficulty near York-street Markets. He makes an upper and a lower level, which will avoid our sewers altogether.
3900. Does your sewer run along George-street? Yes; 24 feet deep. It was put down to drain the new Markets.
3901. If the Hyde Park scheme were adopted, could an extension of that line be made down Phillip-street without interfering with the sewers? I think so.
3902. And down Elizabeth-street? It does not touch the sewer in Elizabeth-street. It intersects Phillip-street and Macquarie-street.
3903. Does it go down Castlereagh-street? No.
3904. Is there any sewer in Castlereagh-street? Yes; there are sewers there. There is the Bondi branch, which varies from 20 to 30 feet deep. The old sewer there will be 20 feet deep.
3905. Then a 20-foot sewer would interfere with the railway line on the top of it? Yes; but the line could hug one side of it. There is room for that.
3906. Could you put a line on each side of it? Yes.
3907. And make two separate tunnels? Yes.
3908. Your sewerage would throw no obstruction in the way of extending a railway from Hyde Park to Circular Quay? No material obstruction. There are no engineering difficulties in the way.
3909. If we crossed Devonshire-street, and have to lower it 9 feet, would it be cheaper to make a new sewer or patch up the old one? You could patch up the old sewer so as to carry the passenger traffic.
3910. Is it a house sewer or a surface-water sewer? A house sewer. If at any future time lines were carried across, and we found the sewer was seriously interfered with, we could arrange to have a smaller pipe, which would take the sewerage from the houses into the Bondi sewer. That could be laid at a depth below the tunnel, or any depth below the subway, and the storm-water could be dealt with by the shallower one.
3911. Is a level of 10 feet below Devonshire-street sufficient to enable you to divert that sewer into the Bondi sewer? Yes.
3912. At present all that goes out to Darling Harbour? Yes.
3913. Would that be altered when the Shoan system comes into operation? Yes.
3914. Do you not allow anything to go into the lower levels which can be sent to Bondi? No.
3915. Some day you will have to divert the Devonshire-street sewer to Bondi? It should be done now. We were afraid to divert it into the Bondi sewer whilst they were making gas at the railway station. That has been done away with now, and the probability is that the Board will do the work soon, irrespective of the railway.
3916. When that is done Devonshire-street will not interfere with the storm-water sewerage at all? Excepting the storm-water which comes from Strawberry Hills.
3917. You could not divert the stormwater round by Belmore-road? No. I may say that, as far as the water-mains are concerned, the railway does not matter to us.
3918. *Chairman.*] From an engineering point of view, you do not see any engineering difficulties in the way? No; excepting in regard to Mr. Greenwood's scheme at Circular Quay.
3919. *Dr. Garran.*] I believe that under Mr. Selge's scheme the line goes close to the rear of your present offices;

offices; will it injure the foundation? Mr. Selfe explained to me that he laid out the line before the land was built upon; but it is not a detriment to us.

3920. Will you not require to build to the rear? We can always build over a railway tunnel. Even if the buildings were constructed first they could be tunnelled underneath.

3921. Are you going to make any deep cellars there? No.

J. M. Smail.
April, 1900.

Joshua Percy Josephson, A.M.I.C.E., sworn, and examined:—

3922. *Mr. McFarlane.*] I understand that you have some proposal to submit to the Committee? It has always been my idea that the centre of the city is the present Redfern station. The city is so situated that it cannot extend any further north, south, or east, and it must extend to the west. Different engineers, in speaking of this matter, have always come to the conclusion that as Redfern station will be the centre of the city for many years the railway should not be extended. I have been a constant traveller from Petersham for many years, and I have never found it inconvenient to transfer from the train to the tram. The electric trams are a great improvement on the old system. Who are the people who are clamouring for an extension of a railway? They are the western suburban passengers for a distance of 3½ miles. Beyond that distance we hear of no cry for extension. I refer, of course, to the extension of the railway for passengers only—not for cargo. No doubt the Redfern station has become cramped for room during the last few years. There are buildings and workshops there which never should have been there. It would, of course, be very expensive now to move the machinery sheds elsewhere. The carriage-sheds, the repairing-sheds, the storage department, and all the buildings west of the main line between Eveleigh and Macdonaldtown should be removed to a new site. All the hay and produce sheds near the institute should be removed to Wilson-street between Eveleigh and Macdonaldtown.

3923. Is there sufficient room for them? There would be, if the shops were removed.

J. P. Josephson,
A.M.I.C.E.
April, 1900.

3924. Where would you remove the shops to? To near Vickers' factory, St. Peters. There are 80 acres of good land there, which could be resumed for about £100 an acre. I think this is the only country in the world where the Government run both the trams and the trains, and a certain section of the people want for the sake of their own convenience, one Department to fight against the other. I would suggest that we should resume the land from the railway station to Belmore Park, containing the Asylum, the Inspector-General's Office, the burying-ground, and part of the barracks. I would close Devonshire-street, come down to the residence of the Inspector-General, and make a new railway station there. I would extend the platforms back to the present railway terminus, and make a 3-chain road in front of the station. The old police station site could be resumed, and the trams could come down in front of the station. Then you could divert a road on the eastern side of the platform into the present railway yard, near the Railway Institute, where all the produce comes down at the present time. Every tram could then be brought past the station. I would not extend the railway further than I have mentioned. I think we have sufficient room for a central railway station for many years to come. If it is absolutely necessary that the railway should be extended, there are only, to my mind, two schemes which can possibly be adopted. The first is the Hyde Park scheme, and the other is the St. James' Road scheme. Some few years ago I was opposed to the utilisation of Hyde Park, but of late I have given up my opposition to it.

3925. I think that the objection has been to the resumption of a large area of the Park? I understand that the Railway Commissioners said that they would give the old burying-ground in exchange for a portion of the Park. Most people travelling by tram get out at King-street, and, as a rule, they do not go beyond George-street to their businesses. You must not lose sight of the fact that in a few years hence, we should have nothing but storage places all the way up Kent-street to Bridge-street. That means that passengers will still go further west. Under what is known as No. 10 scheme, property is resumed which will make it very expensive to carry out. It seems to me that that scheme is suggested in order to save the Park.

3926. Have you looked at Mr. Greenwood's and Mr. Selfe's schemes? Yes. I object to Mr. Selfe's scheme because his object is to connect with North Shore, and I do not think it is worth doing. I saw the excavations for the Central Markets, and I do not think they would stand any railway there. They are only 22 feet deep. I object to tunnels. Engineers have told me that the people of England do not like the tunnels which have been made there.

3927. *Mr. Levien.*] What is done with the smoke in the London tunnel? It is consumed. It seems to me that the desire of the Government is that that the trains should fight against the trams, and I do not see why that should be done.

3928. *Mr. McFarlane.*] Do you think George-street will be sufficient to carry the trams with the extended traffic which we expect in years to come? No; but I think the trams along George-street and Elizabeth-street will be sufficient.

3929. Do you think the travelling public would be sufficiently served by an extension of the railway station such as you suggest, and by the adoption of the system of electric trams which it is proposed to carry out? Yes.

3930. It has been stated that the majority of the railway passengers coming to Redfern would travel to a central station at King-street rather than change at Redfern and take the trams? It depends on where they are going. I do not think they would.

3931. If passengers wished to alight between Market-street and Liverpool-street, would they come to the King-street central station, or take a tram? They would take a tram.

3932. Which class of passengers coming to the city would take advantage of the train? First-class. I believe passengers would rather get out at Redfern station, and take a tram to Liverpool-street, than they would go by train to King-street, and come back again.

3933. Supposing people wanted to get out at Bathurst-street? I think 25 per cent. of them would take the tram from the Redfern station.

3934. Supposing people wished to go to George, Pitt, Clarence, or York streets? In my opinion they would take the tram.

3935. What about the Circular Quay passengers? They would take the trams. If I were going to the Quay, I would get out at Redfern and take a tram.

3936. What part of the city do you come to now? I get out at King-street. My office is in Stephen-court.

3937.

J. P. Josephson,
A.M.I.C.E.
4 April, 1900.

3937. What is your experience in regard to the delay which is alleged to take place in changing at Redfern from the trains to the trams? The delay takes place at the congested point opposite the Asylum, where all the trams have to cross each other.
3938. Do you use the electric tram? Yes, in the afternoon.
3939. Since the electric tram has been established, has there been much delay to passengers getting out at Redfern? I think not.
3940. Do you consider that the tram accommodation is sufficient to carry away the passengers as fast as they arrive? Yes. I have watched the trams. One will go away full, another partly full, and another with very few in it.
3941. What about the trams to the railway station in the evening? They are full. I have allowed half-a-dozen trams to pass me in order to get room in one.
3942. Does not that show that there are certain hours of the day when there are not sufficient trams? Yes; but many of the passengers are not railway passengers; they get out at Park-street and Market-street.
3943. Would it convenience the ordinary traffic if trams ran down some of the other streets? Not at all.
3944. Would it be necessary for people going to streets west of George-street and Sussex-street to have trams to those streets? I think not.
3945. Assuming that George-street cannot carry the traffic, what then? Of course, most of the George-street people will take the electric trams in preference to the steam trams. They will come from Castlereagh-street and Elizabeth-street to it. The steam tram to the railway does not run regularly now.
3946. You have suggested the removal of the produce sheds at Redfern;—would you move them in view of carrying out alterations at the existing station? I think it will not be long before we shall have to resume a little portion of Prince Alfred Park for the produce sheds.
3947. Would it not be difficult to get a more central position? They might be removed a little to the east of the Railway Institute. They might, however, remain where they are at present for some years.
3948. *Mr. Watson.*] You have stated that you think the tramway system might be extended sufficiently to serve, with a railway station which took in a portion of the Benevolent Asylum ground, all requirements? Yes.
3949. Do you think it would be inconvenient to vehicular traffic to have a tramway the whole length of Pitt-street? Yes.
3950. If that is so, would it not be advisable, with your station as suggested, to run a tram line for railway traffic down Pitt-street, only reserving the George-street tram for the western suburbs traffic, and thus obviating the crossing which at present takes place? Yes; that could be done.
3951. Do you think that with that alteration the tramway service generally would be reasonably sufficient for the traffic from the railway? Yes.
3952. Could you offer an opinion as to whether people west of George-street wishing to go to the railway would be likely to use the George-street line, or whether they would walk another block and take a tram along Pitt-street to the railway? My opinion is that they would take the Pitt-street tram, because they would then be able to get right into the railway station.
3953. With an alteration of that kind you think the terminus at or near Devonshire-street would be quite sufficient for railway travelling for some time to come? Yes, for some years.
3954. *Dr. Garran.*] You are the only suburban passenger who has come before us who has given evidence that there is no need for an extension;—have you found amongst the suburban passengers any who agree with you? Yes; I told several that I was coming before you, and they said, "We do not want an extension into the city."
3955. Some have said that the extension is wanted because of loss of time in changing, and others because of the inconvenience of changing, which do you think is the most likely? People object to changing their seat; it is a trouble to get out. I have travelled for fifteen years and I have never found it inconvenient.
3956. If the people who want the luxury like to pay for it, it should not be a reason against making the extension? No.
3957. The original estimate of Mr. Eddy was that he could do the whole work for £550,000, and that an additional charge of 1d. would be made on the first-class fares, and a proportional additional charge on the second-class fares, and so on;—Now we are told that the line will cost £50,000 more, because the price of material has risen; Mr. Eddy was induced to offer £100,000 for the value of the Park land, but it appears from the valuers that the land is worth at least £200,000;—do you think that if we took the land we ought to pay full value or one-half? I would point out that if the railway is carried to Hyde Park the property facing Elizabeth-street will deteriorate to third class property.
3958. *Mr. Watson.*] The railway might give it extra value for business purposes? It might. Of course if it deteriorated, Hyde Park would deteriorate, but nevertheless the full price should be paid for the Park, by reason of the depreciation, through the agency of the Railway.
3959. *Mr. Levien.*] Is there any particular advantage in being alongside a railway station? Yes, for a large hotel.
3960. *Dr. Garran.*] Supposing the full price were paid, and the cost of the line was £800,000, or 50 per cent. more than the original estimate, do you think the passengers would pay 50 per cent. more on their fares, when they can come down for 1d. by the tram? No. I know of many passengers who walk rather than pay the penny.
3961. Some of the witnesses say they would be willing to pay the extra fare? I do not think you will find half of them will do it.
3962. Do you mix a great deal with the passengers? Yes. Some of them have said, "We do not want to pay any more fare. We pay quite enough now."
3963. Is not there an agitation for a decrease of fares? Yes. Only yesterday there was a deputation to the Commissioners in regard to the Illawarra line.
3964. If the cost should be £800,000, you do not think there will be a revenue to pay a fair interest upon it? No.
3965. Still less would there be a revenue to pay interest on No. 10 scheme, which is to cost £1,500,000? That is so.
- 3966-7. The tramway in Elizabeth-street suits you where it is; but do you think it suits half the people who want to come into the city? I believe that if the tramway in Elizabeth-street were an electric tram it would be as well taken advantage of as the George-street tram.

3968. That implies that it would put people down where they want to go? Yes. The steam trams from the railway station do not run regularly.
3969. The Elizabeth-street trams suit many professional people who have their offices in East Sydney? Yes.
3970. Does it not suit the business people so much? No, they go more to George-street. Many people having business in the neighbourhood of Elizabeth-street prefer the George-street tram on account of its cleanliness and quickness.
3971. Supposing your office were in Clarence or Sussex streets, would you walk across the George-street tram to King-street to take the train so as not to be disturbed when you arrived at Redfern, or would you pick up the George-street tram? I would take the communication to Redfern direct.
3972. Do you think most men of business would do that? Yes.
3973. Many people say they would cross George-street and go to King-street for the sake of not being disturbed? I do not think they would.
3974. Do you think Hyde Park is equally as central position? At present it is a central part of the city.
3975. Would not a railway station at King-street accommodate a great many people? Of course it would. There is no doubt that if it were carried out it would be used as much as possible.
3976. Would a tram from the station to through West Sydney accommodate more people than one taken through East Sydney to Hyde Park? I think the one tram would be used as much as the other.
3977. Then, on the whole, we had better make the cheaper one? I think so.
3978. The great objection to the western one has been that it will cost too much money? Just so.
3979. The question has been asked whether, if we paid the full value of the land we took from Hyde Park and spent the money in making reserves elsewhere, it would not be a fair exchange? I think it would. All our lungs are in one spot,—Hyde Park being the lung of the city.
3980. I judge from your evidence that if a suitable station were built on the Benevolent Asylum site, and two or three electric trams were run into Sydney, the traffic would be practically coped with? I think it would for many years.
3981. That is not the evidence of most of the people who live between Sydney and Burwood? I have taken a radius of 34 miles.
3982. Do you think the long-distance passengers want to come nearer the city than Redfern? I think not.
3983. What about the passengers from Penrith and Campbelltown? They would use the extension at times, but they are not calling out for it.
3984. The cry comes from the suburban passengers? Yes.
3985. And mainly from those on the western line? Yes.
3986. We have evidence that there are 45,000 people who come and go from the western suburbs every day;—do you not think that most of them come on to Sydney? A great many of them do, especially on Wednesdays, when there are cheap fares from beyond Richmond and Penrith.
3987. You think that those people would sooner get out at Redfern, and be conveyed into Sydney by tram than go on to Sydney by rail? Not if the railway is made; but they are not agitating for it.
3988. Would it not be a great convenience to them? It would be a convenience if they wanted to go to the Court-house, but it would not be convenient if they wanted to go to Hordern's.
3989. *Mr. Shepherd.*] You think there is no need for the extension of a railway into the city, and that the trams are capable of coping with the whole of the traffic? Yes.
3990. By enlarging the station, greater facilities will be afforded to the trams carrying the passenger traffic? Certainly.
3991. About what area do you calculate a railway line to King-street would serve? I think that people who wanted to go to Bathurst-street would go by tram; they would not go to King-street by rail and then walk back.
3992. What streets north, south, and west would bound the portion which would be conveniently served by the King-street train? I do not think they would go further back than Bathurst-street.
3993. Do you think they would go that far? It is questionable whether they would.
3994. On the west how far do you think people would go? They might go to Pitt-street, but not further. If I wanted to go to Bridge-street, I would not take the Bridge-street train, I would take the tram. If the railway is carried to King-street, it certainly must not stop there. I do not think two-thirds of the people would ride to King-street.
3995. What proportion of the day traffic do you think the King-street station would serve? Not more than one-half.
3996. Do you think it would serve one-fourth? It is hard to say.

THURSDAY, 5 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDSAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Frederic Harrison Quaife, M.D., sworn, and examined:—

3997. *Chairman.*] I understand that you have taken a great interest in the city railway extension for many years? Yes. I attended the first meeting which was ever held, presided over by the late Thomas Walker, at the Exchange.
3998. Are you acquainted with what is known as the St. James' Road scheme, recommended to Parliament by a former Public Works Committee, and also by a Royal Commission in 1897? Yes.

F. H. Quaife,
M.D.
5 April, 1900.

- F. H. Quaife, 8999. Are you acquainted with what is now called the modified Hyde Park scheme, bringing the railway more to the west? Yes.
- M. D.
5 April, 1900. 4000. In April, 1897, you were examined at length before a Royal Commission on the subject of the extension of the city railway;—you then submitted a scheme which you had thought out, and I believe you now come before the Committee to give your present views? Yes. I had drawn out a plan similar to that contained in the printed report of the Royal Commission in 1897, considerably before that time. I went before the Royal Commission which sat at the Town Hall, and presented almost the same plan. My idea was, there being a difficulty about taking the whole width of the park between Elizabeth-street and the central avenue, to see whether or not a modification might be made which would save as much of the park as possible, and yet give equal convenience to that required by the Commissioners in their report on what was known as the Park-street plan—that is to say, taking the south-western portion of the park instead of the south-eastern portion. When it was objected that it would be inconvenient to stop at Park-street the Commission took the view that the St. James' Road scheme would be the best. I came to the conclusion that by taking in Elizabeth-street, and seeing that the Government had already got a large piece of ground between Elizabeth and Castlereagh streets, namely, the High School property and the property extending to Market-street, and by shunting the whole business across to the frontage of Castlereagh-street, and taking in the dilapidated and obsolete Court-house buildings, there would be an equal area of land obtained without very much resumption of property. Resumption there would have to be, and the resumption would embrace between Market-street and the Synagogue and the square block at King-street, north of the High School. Before I drew out the scheme, I went, by leave, to the Railway Engineer, Mr. Deane, and he kindly supplied me with the levels of the different points about that neighbourhood, and also gave me a practicable curve. I think the curve he gave me was one of 10 or 12 chains radius, but my plan was drawn on a 12 chains radius. I notice, however, that Mr. Deane now allows in that plan a curve of 10 chains, and that would make it easier to carry out. It would enable you, for instance, to shunt over the railway towards Castlereagh-street with a shorter distance between the Synagogue and King-street. If you went back to King-street, as I think you ought to do, you would save approaching the Synagogue so nearly as you would under some of the other plans, and it would be a great advantage to the building and its occupants.
4001. Do you understand No. 10 scheme? Yes.
4002. You might explain the difference between your scheme and No. 10 scheme? The distance between King-street and Park-street is 1,440 feet. The distance from King-street to the Synagogue is 1,150 or 1,200 feet. My scheme begins at the east side of Castlereagh-street; 30 feet of the ground east of it is added to the street to make it 92 feet wide. The station, as in No. 10 scheme, crosses Elizabeth-street and closes it, and goes into the park a little further—in fact, takes 190 feet of the Elizabeth-street frontage. It goes into the western porch of St. James' Church, and runs by a line practically parallel with Elizabeth-street to Park-street. A little more land is taken near Park-street for the purpose of carriage-docks, horse-docks, and so on. That is put in, because I find it in the plan of the Commissioners in connection with the Park-street scheme. The station would be practically level with Castlereagh-street, and therefore would be considerably below the level at the eastern boundary. There would be a wall there, and it would cut the park off from it. The western curve near Park-street would be practicable. The old Court-house would have to be taken down. I propose to widen King-street opposite the station about 10 feet, and then inside there would be width of 30 feet or thereabouts for carriage entrance to the front of the station. Most of the main traffic away from the station would run along Castlereagh-street. The platforms, as in the Commissioners' schemes are 700 feet long. My proposed approach through Hyde Park would be more easterly than the No. 10 scheme; it would come half way to Lovers' Walk. The south-west part of the Park contains certain avenues, and the trees there are very fine. It has always been a question with me whether we could get through the Park at the proper level and save them. On each side of the avenues there are open spaces which are not planted, and I found on getting the levels that you could get under the trees very fairly almost without damaging one of them. The trees would grow over the tunnel. As to the rest of the Park, I take the view that, if we have two or three open spaces in the Park with a railway running through, there can be no objection whatever. The city of Edinburgh has a railway which runs through Prince's Gardens, between the Castle and Prince's-street. My reason for going east is because the land rises from Elizabeth-street to the central avenue of the Park more than it does in the northern section, and the more east you go the more head you get over the tunnel. The land taken up lengthwise is not so long in the St. James' Road plan as in my plan. I go to King-street and the other plan does not. That being so it would be necessary to have the whole of this length with the lines jammed up against the Synagogue. In my plan I escape the Synagogue. If the line should go to King-street, it follows that it will be set back near King-street, and you will be able to get a much wider road near the Synagogue.
4003. You only take about 5 acres of the Park? About 5½ acres, but I take down St. James' Church, and I add the land where the church stood, and the eastern half of St. James' Road to the Park. If I take away three-quarters of an acre in one block I give it back in another place.
4004. Do you intend to preserve Elizabeth-street? No, I shut it up. I may mention that the trams would come along Elizabeth-street, turn off at Park-street, and go over the trains, coming out at a spot where the church now is, go along Phillip-street, and thus avoid the curve at Hunter and Elizabeth-streets. There would be a bridge at Park-street, and there the tram would become an elevated tramway.
4005. *Mr. Watson.*] It has been suggested by the Railway Commissioners that they will bring the eastern trams through Park-street, and on to Castlereagh-street, and thence to the Quay, instead of through the Park, and along Elizabeth-street. Of course, that will be another way out of the difficulty, and it would be very suitable as regards bringing people from the Quay direct to the railway. I was not aware until lately that it was possible to take the tram-lines along Castlereagh-street. I thought there were difficulties in the way in the shape of crooked streets, such as O'Connell-street and Bligh-street. That, however, is a very small matter. One advantage of my plan is that, instead of the railway traffic having to cross the tram-line, the tram-line would be out of the way. The main traffic coming from the east would have to cross it.
4006. *Chairman.*] Apparently your proposed line is similar in construction to that of the Department;—I suppose you estimate the cost of constructing your line at about the same—£550,000? Yes.
4007. I see in a former statement you put down the probable land resumption at £362,000, so that the total cost of your scheme would be about £912,000, irrespective of any value for the 5½ acres taken from Hyde Park? Exactly.
- 4008.

4008. You do not put anything down for that? No, except that I provide that if any portion of Hyde Park is taken, an equivalent will be given somewhere else. F. H. Quaife,
M.D.

4009. *Dr. Garran.*] Where is the money for the equivalent to come from? We have the equivalent in the shape of the cemetery. There might be some expense caused in dealing with the owners of graves, but that would be a small matter. 5 April, 1900.

4010. *Chairman.*] Do you still adhere to the scheme contained in the evidence given by you before the Royal Commission in April, 1897? Yes.

4011. Do you wish it to be embodied in your present evidence? Yes, as follows:—

A MODIFICATION of the 1890 Hyde Park scheme proposed by the Commissioners, saving a considerable area of the Park, and giving an area for the terminus equal to that stated to be required.

Levels of the important points are official, kindly supplied by Mr. Deane, who also supplied a practical curve (railway).

My remarks refer to the area for the station and yard at Park-street, and some important ones to the levels and conditions of the southern quarter of the Park.

Plan is drawn on a copy of the large city official map—sections 33 and 34—on a scale of 40 feet to the inch.

Boundaries of the land.

Castlereagh-street, north-west corner, to a point 60 feet along King-street East, beyond the Supreme Court about 400 feet; from that point to Park-street, parallel or nearly so with Castlereagh-street, about 1,440 feet; from Park-street point 145 feet to within 15 feet of south-east post of entrance to Park; thence curved line of 12-chain radius to a point about 30 feet from corner north-east of Synagogue; thence a line proceeding to that corner and along the northern boundary of the building to Castlereagh-street; thence back to starting point at King-street, about 1,205 feet, along east alignment of Castlereagh-street.

It might be necessary to take about 45 feet more at Park-street east of above, and thence to join the second line through the Park to a point about 580 feet from Park-street; and, also, a strip along Park-street east of that, sufficient for a roadway. The area of this land is nearly 13 acres, and includes all that is wanted for the station buildings, platforms, lines, and approaches.

To this should be added the rest of the site of St. James' Church, and that part of St. James' Road east of the line from King-street to Park-street, on the eastern boundary of the station ground. Of the above addition there are almost two-thirds of an acre, and it is meant to be added to the Park in lieu of some taken away. It is bounded east by a curved line from the church to the entrance of the avenue. It is shown by red and black lines in the plan.

Contents of principal area.

1. Tower and about one-fourth of the church.
2. Supreme Court and Land Titles Office.
3. Western half of St. James' Road.
4. Part of the Park—190 feet wide in the margin, and lessening at each end.
5. Elizabeth-street from King-street to the Synagogue.
6. Market-street, east of Castlereagh-street.
7. All the property from the Synagogue north boundary to King-street.

Appurtenances.

Area taken from Park is 5 acres, and $7\frac{1}{2}$ acres to avenue are left, including two-thirds of an acre more, added as described above.

Of this area the State already owns a large portion, viz.:—1. The Supreme Court and Registrar-General's Office.
2. The land on which the High School stands and on to Market-street.

The square block at King-street, between Elizabeth and Castlereagh streets, and also all south of Market-street to Synagogue would have to be resumed. This should be now much lower in value than formerly. There is not much good property on it. The old Court-house would have to be replaced probably where the Mint is, and that could be moved out to spare ground in the Barrack area. Such an institution should not occupy so magnificent a site as it does. A good part of the ground in Castlereagh-street has only rookeries and hoardings on it. Of course the church would have to be paid for, and it is unfortunate that a fine new building should have been erected for an additional Court-house close to it; but that is, after all, a small matter if the great public convenience of a railway terminus is considered.

Four hundred feet are taken because I understand that Mr. Eddy considers it necessary, or less of the Park might be interfered with.

The expensive and fine Synagogue is to be carefully preserved, and this limits our facilities of approach, as we must enter the ground from the south to the eastward of the central line of the station. The gentle curve necessary on the western side conveniently causes the widening of Castlereagh-street by about 30 feet, making it about 92 feet wide, which would give fine room for the great vehicular traffic which would be concentrated there. We still then get about 370 feet of width for the station.

I have followed as closely as possible the published plan for the Park-street station, and have provided room for similar platforms and lines; also an interior cab-road to go in at Castlereagh-street and rise over two of the westernmost lines to a road out at the Synagogue, on a grade of about 1 in 13 for 170 feet, then a level or slight rise over the bridge. Beside the Synagogue, a road nearly 30 feet leads out to Castlereagh-street, and has a gateway to Elizabeth-street; also a 5-foot footpath along the Synagogue wall. There, also, on the Castlereagh-street front, is provided a large luggage office, 100 x 85 feet, with a second front to a road-space opposite the Synagogue, but separated by a wall from the roadway mentioned above. Such an office is provided in the Park-street plan, and is to be on the surface of the ground, and have a lift from the long western platform to its floor. This may be done here, but I would have underneath this building a basement which might be used for electric power plant for the lighting of the station, and also for part of the power necessary for working the tramways proposed to be converted from steam ones into electric ones. It would be found probably more economical to run the current from this central point that from the Rushcutter's Bay station as proposed, and, if necessary, the room could be extended nearly up to the Synagogue, giving a very large space indeed.

Room in the yard is provided for seven distinct platforms from 20 to 27 feet wide, with the necessary room for the lines between, as proposed by the Commissioners' plan. The bridge at Park-street is also made wide enough for all the lines required, with two supporting piers, each 3 feet 9 inches thick, with room for three lines between the piers and abutments and four lines between the piers.

The levels shown are official, and give plenty of headway by raising Park-street from 1 to 2 feet over the bridge, and an easy grade on each side to Elizabeth-street and towards College-street. I think a fall of about 1 foot in the 580 from the ends of the platforms will require a 2-foot rise at Park-street; more fall would of course require less. According to Mr. Deane, a rise of 2 feet 6 inches to 3 feet at Park-street would take them out level.

The level for the rails at the platforms is 64 feet, being 3 feet as required below the level of Castlereagh-street at Market-street, or 67 feet. The other levels at various points are shown on the map. The land rises on each side in Castlereagh-street. At King-street it is 74 feet, at Elizabeth-street 85, and near Phillip-street 95. At Park-street, near eastern boundary of the station land, the level is 82 feet; and hence there would have to be a deep cutting with retaining-wall from Park-street to King-street. Hence there would be required the excavation of the whole land from Castlereagh-street to the eastern wall, and this would be advantageous, as tunnels to the Quay and the eastern suburbs could run out from the last pairs of rails under Phillip-street and so on into Macquarie-street with plenty of head over them—20 feet being required for a double tunnel, but 15 feet or upwards for a bridge (10 or 11 feet over the tunnel). A tunnel can run along Macquarie-street to the Quay without any compensation payment by keeping it on the eastern side of the street. The level of the station would provide for all sanitary arrangements. The platforms are all of the same length as in the proposed plan, and the carriage road is 30 feet wide.

At King-street there is a widening of 10 feet for the extra traffic, and a roadway for cabs to the front of the station at the least part 35 feet wide, and as these cabs would be all taking people to the trains they would merely set down and drive

F. H. Quaife,
M.D.
5 April, 1900.

drive away. The cab-stand would be in Castlereagh-street. I do not presume to go into station arrangements, except in so far as to indicate what seems practicable. The general level is so near that of the land at Castlereagh-street side that there would be everywhere very small descents to the platforms by either steps or inclined planes.

The traffic across the Park at Market-street would be provided for by either an over-head bridge or sub-way, from which, if necessary, communication with the platforms can be made, and ticket offices provided for requirements.

The trams along Elizabeth-street would be diverted across the Park-street bridge, and would curve round to the east side of the railway ground, and be carried on an elevated railway to King-street, where, by a reverse, they would pass across the cable tram, as at present, and pass into Phillip-street, joining the present lines at the north side of Hunter-street, and the awkward and very expensive curve from that street to Elizabeth-street would be abolished. The viaduct would be as light as possible, and its eastern edge would rest on the railway boundary wall, the other on the ground and eastern platform on iron posts; it would have to be about 22 feet or 24 feet wide. The curve at Park-street could be made much easier than the present one at Hunter-street, and there would be a gentle rise from Park-street to King-street. Here note that as the trams are probably to be converted into electric, the works would be much lighter than necessary to carry the present steam trams.

As the great mass of traffic would pass to an iron west of the station, it would be a great advantage to remove the trams as proposed, as the traffic would no longer have to pass over the tram lines, and the entire tram traffic would be virtually only the length of the Supreme Court further away. I consider this point of special value.

In advocating this plan it is well to point out that there has been a great increase in important offices and buildings within an easy radius of the site. Castlereagh-street, Elizabeth-street beyond King-street, and Phillip-street are becoming more used, and as the area required becomes greater, Woolloomooloo, near the water, will be taken up more and more; also the eastern part of the city, Darlinghurst, &c., should be considered.

If the station is west of George-street, the eastern part of the city and the eastern suburbs will be left out in the cold, as the people will have to cross the main business parts of the city to get to it, while a railway to the east will be rendered almost impossible by the tremendous cost of ground and destruction of important buildings.

The main features of advantage in this plan are:—

1. Its central position for a station, taking generally the city and suburbs, and the easy distance from it to the most important centres.
2. The ease with which lines can be taken to the east and the Quay, when required.
3. The comparatively small amount of valuable property to be resumed.
4. Half of the property required is already in the hands of the State.
5. About 7 acres of the Park are saved, and possibly more may be on revision by the experts.
6. The removal of the old Court-house and St. James' Church will be no loss, but rather a boon, to the architecture of the city.
7. The station is close to the general traffic, especially since the cable tram has been introduced.
8. The cost of construction of the proposed electric tram in Park-street would be saved—some £12,000 or £15,000. I should think this may be put against the removal of the new Court premises built next the church.
9. The proximity of the station to the great hotels and boarding-houses, clubs, public offices, the Library, Domain, Botanic Gardens, Hospital, &c.
10. The widening of Castlereagh-street would be a great advantage, and would probably quite make up for the closing of Elizabeth-street at the part required.
11. The great advantage of ending at King-street, so much nearer the centres than Park-street.
12. The southern part of the Park, where the new station is proposed, is much the better planted and grown than the northern part. Along the middle of it is a high ridge, from Bathurst-street to the avenue, and on this are the finest trees; and there is such a height here that by curving the line east from the Unitarian Church a good head could be got over the line, and tunnelling might get under these very fine trees without injuring their roots. North and south of them the ground might be opened, cut down, and, as much as possible, re-covered in. Near Park-street there is no valuable timber, as an inspection will show. The trees in the northern section are mostly old. Numbers have lately been lopped to make them grow better. If the lake in the southern part is injured, a new one might be constructed somewhere else in the Park to make up for it. The drainage will probably rather improve matters than otherwise in such a shaley soil. How little the presence of a high cutting injures trees may be seen near the Cleveland-street bridge, where there are some very fine and old trees in the grounds of St. Paul's Church, Redfern, which abut upon the railway yards.

The objections no doubt are:—

1. Mechanical. This the railway engineer alone can settle; but I have, so far as I know, avoided any.
2. The closure of streets. The gift of a fine railway terminus will quite make up for this.
3. The compensation. On any other route, the Park excepted, this will be simply enormous. It should be taken on the land-tax returns sent in by the proprietors, and with the usual additions for compulsory resumption and for buildings.

The block next King-street is no doubt the most valuable. The High School might be removed to the vacant semi-circle at the Colonial Architect's office—a much more suitable and quieter place; and, as I said before, the Law Courts to the present site of the Mint.

It would be fully worth the money to bring the station to King-street, and the additional distance would be only so much nearer the Quay for any extension.

I do not see why so much provision for horses and carriages should be made as proposed; there are about 540 feet of line frontage in the Park-street plan. All the racing stables, I think, are out Randwick and Waterloo way, and room for horse-box trains could be most conveniently got at Redfern or on the Benevolent Asylum site; but a little room for casual purposes may be easily supplied, and in my plan would require a little extension of the width of the Park-street end of the enclosure. This is shown on the plan.

Values.

Taking Mr. S. Perdriau's values, as published, the area of the land from the Synagogue to Market-street is about £260,000; the King-street block, £102,000; making £362,000. I would remove the Mint to Green's Road at the Barracks; remodel the whole site on which it stands, adding the space out to Albert-street from the Domain to Macquarie-street. On this are there should be room for fine Law Courts of all kinds, a new High School in a much quieter and equally convenient position, and a new St. James' Church, equally convenient with the present. The whole might be named Victoria Crescent, to commemorate the glorious reign soon to be celebrated.

4012. Have you studied the question as to whether the proposed line is too much up hill to the east? If we put the railway west of George-street we shall treat the eastern part of the city and the eastern suburbs very unfairly, because the cost of connecting with the railway under those circumstances will be so immense that we shall practically defeat the scheme until the present generation is dead and gone. I desire to read a statement I have prepared on the general question, as follows:—

CITY RAILWAY.—Points to be emphasised.

1. Incidence of traffic inward and outward between Market and Hunter streets—Main by King-street.—Business centre lies near here (geographical centre at Park and Elizabeth streets), especially since the North Shore suburbs have developed so much. The shipping interests also tend to keep business at this end of city. Woolloomooloo wharfage improvements accentuate this, and will bring more people to this neighbourhood. Easy extensions to North Shore and eastern suburbs are provided for in the plan. Tunnelling now much less difficult and much more used, *vide* the Thames, Mersey, &c., electric traction in tunnels does away with nearly all the objections to railway tunnels. Central station at King-street much fairer to eastern half of city and eastern suburbs, as otherwise it is quite out of any advantage from the extension.

Eveleigh.—A large population round the station, to whom it is of little use, except towards the suburbs, as it is only a short distance from Redfern, and then a change into the tram or other vehicle must be made. Any extension as far as King-street, or further, at once makes Eveleigh a very useful and paying station. It would probably be used ten or twentyfold over what it is now.

The

The above is from my own observations during many years ; but it is backed up by expert evidence, notably that of F. H. Quaife, the late Mr. Eddy (Royal Commission, 1897).

2. The main extent of the passenger station required for the suburban traffic, not the long distance. The present time-table shows 273 suburban trains against 46 country inward and outward on an ordinary day. On Saturdays and holidays, proportions still more telling. Hence the large stations should be built near the travelling centres. All authorities agreed that it is bad policy to separate them. It is also cheaper to work a combined station than two separate ones. The long-distance trains could still set down at Redfern for the southern end of the city.

3. King-street within easy distance of all lines of communication throughout city. The traffic is getting beyond all the powers of the trams to deal with it. Changing cars is a loss of time, and a nuisance. Imagine the eastern people obliged to change at Darlinghurst to get into city trams, what indignation there would be, and yet the railway travellers have stood this ever since the line was first opened.

Saving of time would be from eight to ten minutes on every journey (say, to or from the Post Office). Trams running every minute cannot travel very fast. Through trams cannot be run. Hence the complaints already made about the slowness of the electric line in George-street.

4. Axiom of all railway experts. Terminal traffic of passengers must be kept entirely separate from that of goods.

5. Equal or greater area to be given at south end of city for a park if any of Hyde Park is taken. Serving 31,000 people instead of 16,000. Either lump sum of £160,000, or £1,000 a year from railway funds. Old cemeteries to be so dedicated. Been done elsewhere.

No more of Hyde Park would be needed in the future, as conditions would be altered.

The people who are so anxious to preserve Hyde Park are quite willing to give up Wynyard-square (one of the few small western reserves).

It has been stated that if the Railway Commissioners took a portion of Hyde Park it would not be long before they took the whole of it. That is nonsense. Mr. Eddy himself stated that no more of Hyde Park would be needed in future, as the conditions would be entirely changed. People seem to be perfectly willing to give up poor little Wynyard-square, but they will not give up a foot of Hyde Park. I may mention that, in connection with the Town Hall commission, Mr. Foxley, the then railway engineer, gave important evidence on the question of the difficulty of getting under the western streets without heavy damage being done to buildings, and heavy compensation being paid. I hope that you will endeavour to obtain some practical central scheme, and not build a big station at Devonshire-street.

4013. By that do you mean that an enlargement of the premises at Redfern and the stopping of the trains there will not suit present requirements? I think it will be a great blunder. To say that Devonshire-street should be our city terminus is absolute folly.

4014. Under your scheme 5 acres of the Park will be taken independent of the running line at the southern end ;—as a medical man, do you think it will be a serious thing to deprive the city of that lung? I do not think it is worth talking about. If you adopt my scheme you will take away the only dwellings of any consequence near the railway by destroying the frontage of Elizabeth-street, and the buildings on the other side are only shops. Therefore, I do not think you would do as much harm to the city as you would by putting the railway station at Wynyard-square. Excepting for the smoke, I do not see that a railway station is an injury to a city. I do not think the matter is worth talking about, seeing that within a stone's-throw you have the Domain and the Gardens, as well as 38 acres of Hyde Park, which will be untouched. The portion proposed to be taken is exposed to a western sun. There are a few good trees there, but the majority of the Moreton Bay fig trees there have to be lopped in order to keep them alive. Some day we shall have a change in traction, and all the city trains will be drawn by electricity. It seems to me to be proved by expert evidence that if we go west we shall have to spend a large amount in compensation. Why not spend that money on the eastern scheme. After the Illawarra railway was opened the Ministry of Sir Henry Parkes presented a Bill to Parliament for £600,000 compensation which had never been thought of, and the Government had to pay it. I hope that no such mistake will be made this time. It is necessary that we should carry the traffic of the great metropolis, and what does it matter whether we spend a few hundred thousand pounds or not? It will give us the most magnificent improvement, next to sanitary improvements, that I can think of, and one for which there has been a general request for over thirty years.

4015. *Dr. Garran.* You take as much private land between Elizabeth and Castlereagh streets as do the Commissioners? Yes.

4016. And you even go to a little more expense by partly dealing with the church? Yes.

4017. The total cost, according to your estimate, is a little over £900,000? You might say £1,000,000, as I did not estimate in regard to St. James' Church.

4018. But substantially the same work, estimated by the Government, is to cost £1,500,000 ;—how can you carry it out so much cheaper than the Government? I am not aware that is the case. Those were not the estimates put forward by the Government when I made my plan.

4019. They are the estimates put before us for No. 10 scheme, which is almost identical with yours? Before I could answer the question I should like to know where the incidence fall.

4020. You have not dealt with the Commissioners' more recent estimates? No.

4021. Either your scheme or No. 10 scheme will cost more than the original St. James' Road scheme, which the Commissioners put forward? Certainly; because of the resumption on the Castlereagh and Elizabeth streets properties.

4022. They originally estimated the cost of the work and land under that scheme at £550,000? £550,000 for the works, and £100,000 for the land.

4023. Then they estimated that 1d. extra on the fares would pay a fair interest on that expenditure ;—do you think that the first-class season ticket-holders would agree to pay the extra penny fare? I think they would be only too glad to do so.

4024. Do you think the second-class passengers would agree to pay an increased proportion? I think so.

4025. Do you think the holders of workmen's tickets would pay extra? My belief is that before long you will find the Commissioners reducing the fares, because there would be so much traffic.

4026. Is not there a disposition on the part of the suburban passengers to ask for a reduction of fares? No doubt we all like to travel cheaply, and I think the traffic would so increase that the Commissioners would be able to grant a reduction.

4027. Is there not a feeling on the part of suburban passengers that the railway authorities are making a large profit out of that part of the line which they utilise, in order to pay which goes to pay the loss on country lines? That used to be an established fact. I remember well when it was said that the line from Redfern to Homebush really paid the interest on country lines.

4028. Does that feeling exist still? I do not know. I do not see that it matters. It is all one concern.

4029. It matters in this way: If the Government borrow £700,000 or £800,000 to make the line, and immediately

F. H. Quaife, M.D.
5 April, 1900. immediately it is opened there is a clamour for reduction of fares, what becomes of the profits? They would not get a reduction immediately; they would have to wait. They might clamour, but it would not be fair to grant a reduction at once.

4030. If it is granted prior to the line paying the interest on the debt, the country will lose money by the extension? The people will have to pay the extra fare now, either by tramway or 'bus.

4031. The tramway is paying its way—the question for us to consider is whether the railway will also pay its way? If people pay the extra fare on the extended railway they will not have to pay it on the tramway.

4032. Would they desert the railway? Why should they do so? Why should they get out of a comfortable carriage into an uncomfortable one, and lose seven or nine minutes on the journey? It is not likely that the people will get out at Redfern and go in an electric tram which stops at every corner.

4033. You consider that the people will not ask for such a reduction of fares as will make the proposed extension an unprofitable one? I do not think so.

4034. There are people who think otherwise? Well, if I were a Railway Commissioner, and they asked for it, they would not get it.

4035. Do you think, looking at the great difference in cost for the St. James' Road scheme and the present scheme, it is worth while, for the sake of saving a mere slice of the Park, to go to such an enormous extra expense? I consider that the 5 acres will be well used, and that what is preserved will be well preserved.

Myles McRae, provision merchant, sworn, and examined:—

M. McRae. 4036. *Chairman.*] I believe you are an old resident of Sydney, and a former Member of the Legislature?
A il, 1900. Yes.

4537. You were examined before the Royal Commission which sat in 1897 on the question of railway extension, and you then made a statement;—do you wish to emphasise that statement? Yes, and I wish to add one or two other features to it. I consider it an honor to advocate the late Mr. Eddy's scheme. It has been approved of by the ablest engineers in Australia,—the greatest of experts on railway transit and administration, Public Works Committees, and Royal Commissions, and finally by the Legislature itself. The last-named body indirectly approved of Mr. Eddy's scheme, because they referred the extension of the railway into the city to the Public Works Committee, who were sitting as a Royal Commission, and that Royal Commission recommended the late Mr. Eddy's scheme. The Public Works Act provided that the recommendation would have to come from the Public Works Committee sitting as a Committee, and the majority of the Members of the Legislative Assembly knowing the decision of the Royal Commission, remitted the question to the Public Works Committee, sitting as a Public Works Committee. I would like the Committee to consider thoroughly Mr. Eddy's scheme, and to realise the congestion that exists in the city at the present time, without going into the future consequent upon our narrow streets and the abrupt termination of those streets. Thoroughly realising the congestion that already exists in the city, let any disinterested citizen stand on the platform at Redfern and take a bird's-eye view of Mr. Eddy's scheme,—its directness into the city, passing through Devonshire-street Cemetery, Belmore Park by viaduct, and an open cutting through Hyde Park, terminating at St. James' Road, and making provision for a grand modern railway station on that elevated portion of the Park which will certainly add to the improvement and appearance of the city. It is a piece of good fortune that the coast is clear, there being no buildings in the way. Mr. Eddy's scheme relieves the congestion which exists in the city at the present day, and it does not close a single street. I want the Committee to realise this fact in connection with all other schemes. Mr. Eddy, in his great anxiety to preserve the lives of the travelling public who patronise the railways, knowing that a number of persons would object to touching Hyde Park, provides for the dedication of the Devonshire-street Cemetery (consisting of double the area of that portion of Hyde Park which is required in the public interest), which he proposed to convert into recreation grounds by expending £100,000, and making provision for £1,000 or £2,000 a year to beautify it. He went into figures, and he discovered that there were no less than 32,000 souls living within a radius of half a mile of the Devonshire-street Cemetery, as against 14,000 living within a radius of half a mile of Hyde Park. There is no doubt that the Devonshire-street Cemetery is a menace to public health. Had Mr. Eddy propounded a route which would have pulled down half the city, regardless of expenditure, no Government would have been able to withstand the pressure which interested persons would have brought to bear upon it. If Sydney were laid out similar to Melbourne there might be more to be said in favour of other schemes. People have been allowed to subdivide blocks of land in all sorts of shapes, and we are suffering from congested traffic as the result. I do not see that any other scheme can be placed on the same footing as that of the late Mr. Eddy. That scheme provides, when the traffic becomes congested at St. James' Road, for a circular railway touching Circular Quay, going round between George-street and Darling Harbour, and thence to Redfern by viaduct. He also provides for an extension to North Shore by bridge or tunnel, and an extension to the eastern suburbs. There is no doubt that the eastern suburbs cannot get a starting point until the railway is brought into the city. There is a good deal to be said in reference to Mr. Norman Selfe's scheme, but that portion of the travelling public who are on either side of George-street are already accommodated by a light railway in the shape of the electric tram, and to have a heavier railway alongside would be ridiculous.

4038. *Mr. Watson.*] Would not that apply to the eastern side in the same manner? Mr. Norman Selfe proposes to have a station in the Queen Victoria Markets

4039. Would not your objection as to its being ridiculous to have a heavy railway alongside a light one apply equally to the eastern and the western side? There is this difference. At present the traffic at the Queen Victoria Markets is congested, and with a railway station there we should have no ingress or egress. Not so with Mr. Eddy's scheme. The coast is clear under his scheme. Mr. Norman Selfe proposes to resume the Wynyard-square Park which is fulfilling its purposes from a recreation point of view, and which is surrounded by a dense population, whereas the portion of Hyde Park which Mr. Eddy proposed to utilise is commanded by day-sleepers and night-prowlers in search of prey. No respectable person is ever seen on that portion of the Park. It has failed to fulfil the purposes for which it was intended; in fact, it is dangerous for any person to go through there after sunset.

4040. *Mr. Shepherd.*] You say that the George-street traffic is already congested, and that it would be absurd to run a railway parallel with the electric trams? I think so. M. McRae.
4041. Do you not think that that is the very argument why a railway should be placed there—to relieve the congested state of the street? But it would increase it. There is no space there. Where could the passengers get in and out. Even now you are in danger of being run over there by vehicles or tram cars. 6 April, 1900.
4042. If you object to two lines running parallel, would not your objection hold just as strongly to the King-street route as to the other? No; because there is ample room going to King-street. There would be space for platforms, and also space for carriage drives. The public would not lose that portion of the Park from a "lung" point of view. In the open cuttings we could have flower-pots, and so on. It is not proposed to build shops and houses there, as it is on the opposite side.
4043. Do you not think that the great object of an extension to the city is to go to a point which will serve the largest number of the day populations? I made a computation some years ago. I took the eastern suburbs into consideration, and the conclusion I came to was that seven-tenths of the passengers who patronised the tramways got in and out at the corner of King and Elizabeth streets.
4044. That was before the George-street tram was established? Yes.
4045. Of course people would come from George-street and even west of George-street at that time to that point, whereas now they travel by the George-street tram? They are amply provided for, and do not want a second railway.
4046. But you calculate that because seven-tenths of the passengers got out at the corner of King and Elizabeth streets, they would do so, if the railway were extended to King-street? Personally, I always got out there, but now I get out at the Queen Victoria Markets, because it is more convenient.
4047. What area do you suppose the King-street scheme would conveniently accommodate? It would accommodate the eastern suburbs far better than Norman Selfe's scheme, and it would accommodate those who constitute the greatest portion of the traffic of our railway system. It is ridiculous to land them outside the city. In Melbourne, 100,000 people daily travel by train on account of the railway stations being in the heart of the city. Here not more than 40,000 travel by train, and the population of Sydney exceeds the population of Melbourne. I am satisfied that 10,000 people go home to lunch every day in Melbourne. They have only to cross the street to get into the Flinders-street or Princes' Bridge station. In West Melbourne there is the Spencer-street station; on the eastern side there is the Richmond station, about the same distance as Redfern is from where we are now. Then on the northern side there is the North Melbourne station. All these stations are as near to Melbourne proper as Redfern is to Sydney, and yet Melbourne has three stations in the city in addition. That is the reason why 100,000 people travel by train per day in Melbourne, whereas only 40,000 people travel by train per day here. It is only a favoured few who can live in the suburbs in Sydney. A working man cannot do it. With regard to workmen's tickets; until recently workmen were fined to the extent of 900 per cent. by the steam tramways. You go to Auburn or Oatley, 9 or 10 miles out of the city, for 2s. 10d. per week, and until we got the electric tram here it cost 1s. 6d. a week extra by the tram. Now it costs 1s. per week from Redfern into the city, an extra charge of 40 per cent., taking mileage into consideration. People lose a lot of time getting out of the train into the train. Many workmen have to be at their warehouses at 5 and 6 o'clock in the morning, and if they could travel right into the city by train, they and their families could live in the suburbs instead of in the slums, lanes, and alleys of the city.
4048. Do you not think that Redfern station is nearer to the centre of Sydney than is the Melbourne station to the centre of Melbourne? Certainly not. There are three stations in the heart of the city of Melbourne, independent of the Richmond and North Melbourne railway stations, either of the latter stations is as near Melbourne proper as Redfern is to Sydney proper.
4049. Is not Spencer-street station on the outer outside of Melbourne? No; it abuts on Bourke and Collins Streets, the two principal streets in Melbourne on the west. The Princes' Bridge and Flinders-street stations front Flinders-street, another important street on the south, and all the other principal streets of Melbourne running at right angles terminate at Flinders-street, and almost opposite the two central stations referred to. The very fact that 10,000 people go home to lunch every day in Melbourne, whilst nobody goes home here, is a proof that they are head and shoulders above us in railway transit. I was over there some time ago, and being interested in the extension of the railway into the city, I took notes, and I saw at once why our people do not live in the suburbs.
4050. Do you say that the working people do not live in the suburbs of Sydney? Very few in the railway suburbs on account of the loss of time in waiting for trams and buses in the city, and transhipment at Redfern. The charges of the Railway Commissioners in Melbourne for season tickets being about 23 per cent. less than the charges here—now about 20 per cent., since the recent reductions. The increased volume of traffic there enabling them to make the reduction. Only the other day our Commissioners were 100 per cent. out of their calculations as to the returns from the electric trams. A reduction of fares increases the volume of traffic. That has been the experience of Melbourne. The suburban passengers, who contribute largely to the revenue of the railway system of the colony, have a long standing grievance in not being carried right into the city, as the congestion at Redfern is dangerous to life and limb.
4051. Do you think if the station were enlarged, it would prevent the existing danger? No; even if the tunnel at Redfern were widened at a cost almost equal to an extension into the city, it would only be a temporary expedient; the railway would have to be extended afterwards.
4052. Do you think that an extension of the electric tram system would cope with the passenger traffic in Sydney? The electric tram system will have more than enough to cope with in conveying the suburban passengers on account of our narrow streets, without meddling with the railway traffic, and it is antediluvian to ask them to leave comfortable carriages at Redfern, waste time there, and afterwards rush into a tram. Thousands now have to stand on the footboards, crushed beyond endurance.
4053. It is proposed to have no intermediate station between Redfern and King-street;—do you think that is a wise thing? It would be better to have one at Liverpool-street, but the electric tram would accommodate intermediate short-distance passengers in the vicinity of Liverpool-street. There is no scheme that can be compared with Mr. Eddy's scheme, because it exempts resurrections, relieves the congestion of traffic in our narrow streets, and, contrary to other schemes, it does not close a single street.

FRIDAY, 6 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Charles Nicholson Jewel Oliver, Chief Commissioner for Railways, sworn, and examined:—

C. N. J.
Oliver.
6 April, 1900.

4054. *Chairman.*] Do you wish to make a statement before being questioned? Yes.

THE most exhaustive evidence having been taken by the Committee on the city railway question, I deem it advisable to briefly place before you the Commissioners' views on the subject.

It has been previously pointed out that this question has been prominently before the public at various times since about 1856, between which time and 1890 a number of plans were formulated. In 1890 the whole question was referred to a Royal Commission, when no less than thirty-five different schemes were placed before the Commission for consideration. The inquiry commenced on 2nd April, 1890; a thorough examination was made into the whole of the proposals, and finally, in March, 1891, the scheme put forward by the Railway Commissioners to extend the railway into the city with a grand central station at the top of King-street, and on portion of the north-west corner of Hyde Park, was adopted and recommended, but from various reasons did not receive the sanction of Parliament.

The subject was revived by the Railway Commissioners in April, 1896, by a letter to the Premier and Minister for Railways, as one calling for immediate settlement in the interests of safety, &c., and suggesting an alternative to the King-street site that the city terminal should be erected in the south-west division of Hyde Park, bounded by Park, Elizabeth, and Liverpool streets, and thereby reduce the interference with Hyde Park. As a result of this representation, another Royal Commission was appointed by the Government on 22nd December, 1896, to make investigation as to the expediency and best methods of extending the railway system of the Colony into the city, or through the city and to the waters of Port Jackson, &c.

About twelve schemes were submitted and inquired into, and the subject dealt with most thoroughly in all its aspects by the Commission, who reported, on 1st June, 1897, in favour of the extension of the railway into the city, and that the best method of doing so was by the route and according to the plan described as the St. James' Road scheme.

This recommendation was then referred to the Public Works Committee to consider and report upon "the expediency of extending the railway system of the Colony from the present terminus at Redfern into the city, including the erection of a large central station in the north-western division of the Park, fronting St. James' Road."

The Committee made a further full and complete investigation, and on 1st June, 1897, reported in favour of the scheme recommended by the Royal Commission, and stated that the other schemes compared with it were "inadequate, inconvenient, unduly expensive, and, in some instances, of such a character that they could not be seriously entertained."

Owing to strong objections to the appropriation of Hyde Park, the question was then referred by the Premier, the Right Honourable G. H. Reid, to Mr. Rennick, Engineer-in-Chief for Victorian Railways, for the purpose of advising and reporting on the various schemes submitted, and he, after careful inquiry and inspection of the routes and sites proposed, pronounced the St. James' Road scheme, which had been adopted and recommended by the Public Works Committee as the best, but suggested an alternative scheme with a view to overcome the objection to appropriating Hyde Park.

The subject has now been referred by Parliament to your Committee for further consideration and report, and here I would invite your most serious consideration of the matter as one calling for urgent settlement, as the difficulties of working Redfern station are increasing to such an extent that a considerable improvement in the terminal arrangements is, in the interests of safety as well as to provide for the comfort of the travelling public, absolutely necessary, and should not be delayed.

The schemes investigated by the various Commissions since 1890, together with those which have been placed before your Committee, number upwards of fifty, so that it might fairly be said the subject has been exhaustively dealt with, and the Commissioners hope that the fruits of the Committee's labour will contribute to a speedy and final settlement of the question.

The Commissioners have considered the evidence given before your Committee on the various proposals, and it seems to them that, apart from the plans submitted by Mr. Deane, there are only two schemes which it is necessary to refer to, namely, those submitted by Mr. Norman Selfe and Mr. Greenwood, both of which have been most fully and carefully considered by Mr. Deane, the Engineer-in-Chief, and Mr. Parry, Out-door Superintendent, and their evidence is now before you. We concur in the conclusions arrived at as to the unsuitability of both the schemes to meet the requirements of a city railway and terminal.

With regard to the schemes prepared by Mr. Deane, and which are numbered 1 to 10, we do not regard with favour any of those numbered 1 to 8. No. 9 provides for an extension from Redfern to the Benevolent Asylum site, and the erection of a large terminal station thereon. This proposal would meet all requirements for dealing with the traffic so far as a terminal station is concerned; but it would not produce any additional revenue, nor—a matter of far greater importance—would the public convenience be served, inasmuch as it does not provide for a railway into the heart of the city.

No. 10 scheme, although not an ideal one, would meet the requirements of a city extension with a terminal station for long-distance and suburban trains at King-street, but if adopted we should prefer the suggested modification of the scheme, which has been made, of taking about 80 to 100 feet more of the Park, so as to provide additional platforms at King-street, and thereby avoid the necessity of the extension from King-street to the back of the Art Gallery in the Domain. In our opinion this scheme is the next best to the Hyde Park scheme adjacent to St. James' Road.

We desire, however, that it should be clearly understood that we consider Hyde Park is the ideal scheme, which stands out pre-eminently superior to any other that has been put forward, and we respectfully, but earnestly, commend it for adoption.

I have observed that it has been suggested that, in view of the plague, it would be a desirable thing to resume the wharfs round Darling Harbour and construct a city railway from Redfern, round the wharfs, to Circular Quay, both for passenger and goods traffic. This, however, would be most unsatisfactory for dealing with passenger business, and contrary to all modern practice, which is to keep the passenger and goods business entirely separate, as far as possible, in large cities. A line round Darling Harbour would be an enormously costly undertaking, and, so far as passenger business is concerned, would be most unsuitable, both as regards steep gradients and convenience to the travelling public, so that the suggestion is, in the opinion of the Commissioners, out of the question as regards passenger business.

Referring to the tramway question as affecting the railway traffic, it is the opinion of the Commissioners that the requirements of this traffic cannot be satisfactorily met by street trams, abundant evidence of which has been placed before you. What is required is a terminal railway station situated in a position reasonably adjacent to the business centres of the city. In this connection it cannot be substantially asserted that the Hyde Park or King-street schemes are inconveniently situated; indeed, it is respectfully urged that the evidence points to a contrary conclusion, and, in our opinion, no practicable scheme has been submitted which would be preferable to either.

4055. Do I understand that your statement is presented as the unanimous opinion of the Railway Commissioners? That is the unanimous view of the Railway Commissioners as a body.

4056. Since the adoption by the Royal Commission and the Public Works Committee of the St. James' Road scheme, the electric tramways, as you indicate, have been running from Redfern into Sydney;—I should like to know whether you think that a system of electric tramways to connect Redfern with the city, not necessarily along George-street alone, but possibly by more extended routes, is likely to satisfy the

C. N. J.
Oliver.
6 April, 1900.

the demands of the travelling public? I think no tramway system can possibly accommodate the railway travellers. It is only necessary for anyone to take up a position at the Redfern platform during the busy parts of the day to see how inadequate the otherwise efficient service of to-day is. You cannot take people who arrive in hundreds by trains, away in trams which will only hold thirty or forty passengers. The result is that during the busy part of the day it takes quite five minutes to get away from the station, and then it is frequently what may be termed crush loading. If that is what happens to-day, the position will only be intensified as our suburban traffic increases. It is not a question of the number of streets through which the trams are permitted to travel. Of course, George-street is the street through which the electric tram travels now, and it carries the principal portion of the railway traffic, and, by-and-by, when we convert the western suburban tram-lines into electric lines, those trams will come down George-street, which will become very congested. That is only one phase of the question. Even supposing we had an outlet for the traffic from the railway station down Pitt and Castlereagh streets, it would not get over the initial and the real difficulty of lifting the people immediately after they leave the trains. The railway traffic of Sydney is an in-traffic in the morning and an out-traffic in the afternoon. I do not mean to say there is no traffic during the day; but the principal traffic is in the morning and out in the afternoon. In the afternoon it is difficult to lift the traffic. The worry and anxiety of people in the city as to whether they will miss or catch their trains by the George-street trams must be very great. The George-street trams—it does not matter how frequent they are—fill up. People may be waiting at the corner of King-street or Market-street, and tram after tram will come up full. This must be a tremendous strain on the people, and must cause them to lose a considerable amount of time. Therefore, it would be far better, even if the station were not, perhaps, situated in a perfectly central position, that they should be able to spend the time they now waste in waiting for a tram in walking to the station, where there would be a certainty of getting a comfortable seat, and they could go straight home. The difficulty is not only in the morning, but also in connection with the return traffic in the evening. The pick-up traffic of the city, and the traffic from the suburbs, which do not and cannot enjoy railway communication, must largely increase. It is only a matter of a few years, and the streets will be thoroughly congested. It is in the public interest that the railway traffic should be removed from the streets of the city—that is to say, that people should be put down in a central position, from which, by means of their own locomotion, they can be got to their places of business.

4057. Since the electric tramways have been started they have, I believe, been very largely patronised by people coming in the direction of George-street;—if the railway benefited by bringing those people into town the tramway would lose? That follows as a natural consequence. They cannot both have the traffic, but we really do not want that traffic on the tramways. We want, if possible, to compel the people, so to speak, to travel by the railway, so as to avoid putting any traffic on the streets which can possibly be kept from them. With regard to the George-street tram, I should like to point out that railway passengers have very little option as to the tram by which they shall travel, because we have practically withdrawn all the railway trams from Elizabeth-street. Even if the people are desirous of travelling by the old route they cannot do it. I have no doubt that that in itself has largely increased the traffic by the George-street trams.

4058. One great reason for the Commissioners and others advocating the Hyde Park scheme is that it will be a fairly remunerative one, as compared with the other schemes;—where is the increased revenue to come from? From the additional fares to be charged. We pointed out in our report that a certain revenue would be obtained by charging 1d. extra per passenger. I have, also, no doubt that the traffic would increase owing to the facilities which would be given to people to live in the western suburbs. It is astonishing what a loss of time there is in getting from Redfern to the city, or from the city to Redfern. It has often been estimated that it means to the business man a loss of about half an hour a day. It is largely a matter of opinion, but it has been thought out very thoroughly, and taking into consideration the possible acceleration of the train service, a business man could almost be lodged at the corner of King-street as soon as he can to-day be put down at Redfern.

4059. I suppose that if the residents of suburbs like Newtown and Macdonaldtown could get into a railway train, and be brought to King-street, they would not travel by bus? I must, of course, draw attention to the recent reduction in the tram fares, which possibly offer considerable inducement to those residents to travel by tram. I am of opinion, however, that the Newtown and Macdonaldtown people, who have been in the habit of travelling by train, would prefer to continue to travel by train if they were brought further into the city.

4060. Many people contend that the large traffic brought along George-street by the electric trams, is an indication that that is the centre of the city, and that Elizabeth-street is out of the way? I do not think that anyone would venture to dispute the fact that George-street is more in the centre of the city than is Elizabeth-street. I should not like it to be inferred that I am of opinion that it is absolutely necessary to have a railway in the centre of the city.

4061. It would be impracticable to have one along George-street? It would. Of course it is impossible to bring a railway to every man's door. As long as we can put it in a reasonable position, so that the people can, with a reasonable amount of exertion, get to it, it is all that the public can expect. We must also consider the changes which a city undergoes in the course of years. It is quite possible that the city will undergo a considerable change, and extend in the direction of Woolloomooloo and places in that locality. That would quite alter the centre of the city. Of course the business centre of the city at the present time must be admitted to be George-street.

4062. Do you consider that it is desirable that the suburban and long-distance traffic should be brought to the same terminal point? Undoubtedly. I would point out that many of our long-distance trains, which come from Moss Vale, Mount Victoria, and other places, do a large amount of suburban work, and if we were compelled to provide a special station for dealing with them it would be inconvenient to the public, and expensive to the country.

4063. Are you of opinion that it is desirable to keep the goods traffic separated from the passenger traffic? Certainly.

4064. Are you of opinion that it is a great advantage, in a large station such as is required for a terminus, for a level site to be secured, and one not approached by steps? If possible, it should be approached on the level.

4065. The schemes propounded by Mr. Selfe and Mr. Greenwood seem to have the disadvantage, in one

C. N. J.
Oliver.
6 April, 1900.

or two instances, of having the station approached by steps;—do you consider that objectionable? It is a great disadvantage. I may mention that we have had to rearrange some of our suburban stations, and do away with level crossings, and introduce subways or overhead bridges. People object strongly to going down or up steps. Nothing is more objectionable to approach a station otherwise than on the level.

4066. Having studied this question for many years, are you of opinion that the St. James' Road scheme is the best, and that next to that, No. 10 scheme is the best? Not only am I personally of that opinion, but my colleagues are strongly of the same opinion.

4067. And you would advocate that in preference to a large central station at Redfern? Certainly. It would be an act of folly to attempt to create a station on the site of the present station, and even on the Devonshire-street site. I do not say you could not make a good station on the Devonshire-street site; but it would not be in the centre of the city, and it would not give that convenience which the public have been looking forward to for so many years. It would not obviate the difficulty with regard to the tram traffic—it would rather intensify it—and it would not return 1d. additional revenue.

4068. *Mr. Dick.*] You have made some statement as to the annual cost of the extension being met by increased fares; we have before us practically two schemes for improving Redfern Station, and its surroundings—one known as the No. 10 scheme, which includes an extension, and the other for the building of a large station on the Benevolent Asylum site; it is urged against the latter that as no increased charges can be levied to make up the annual cost of the work, a certain amount of capital will be expended and will remain unprofitable; with respect to the No. 10 scheme, the greatly increased cost over the St. James' road scheme will lead to the same result—that is, if the income is only £38,000, as set forth in your report;—have you considered that view of the question? In one instance you will convenience the public, and in the other you will give no convenience at all, besides laying the foundation of a difficulty which will ultimately prove insurmountable—I refer to the removal of the people by tram from the Devonshire-street site.

4069. It has been stated that if a railway station were built on the Benevolent Asylum site, and a new system of trams were inaugurated—one down Pitt-street, to deal solely with the railway traffic, and one down George-street, to deal with the western suburban traffic, and one along Castlereagh-street, to deal with the remaining part of the traffic—the convenience of the public would be fully met? I have heard the same views expressed myself; but they will not bear looking into. The traffic is going to increase. As I have already said, if anyone will stand at the Redfern Station for a few minutes during the busy part of the day, he will see how impossible it is for any tram system to adequately provide for the railway traffic. I do not care, even if the trams followed each other as fast as they could, the difficulty which occurs to-day at Redfern would occur just the same if we had a station on the Benevolent Asylum site. We should still compel the overtaxed streets of the city to bear a burden which they should not be called upon to bear, but of which they should be relieved at the earliest possible moment.

4070. You do not think that the present construction of the station at Redfern puts difficulties in the way of dealing with the travelling public by tram, which would not be present if we had a modern station on the Benevolent Asylum site? I do not see that the difficulty would be removed. No doubt you would have an enlarged exit from the station, but it would not reduce the number of people who went through it.

4071. Would it not enable you to handle the traffic more rapidly? It is possible that there would be a little improvement in that direction. I cannot see, however, why the public should be inconvenienced. Why should they be taken out of a train and put into a tram. Would it not be far better to allow them to go on to their destination by train.

4072. Of course, you proceed on the view that the Government scheme would do all you expect of it, namely, place the majority of the people near their places of business? I think it would.

4073. The business area of Sydney is, roughly speaking, of the shape of an oblong, at the south-eastern corner of which it is proposed to put a station;—would not a station more in the centre, and more north of our great business area, result in greater convenience to the people? There is only one way of answering a question put in that way; but I do not think that is the real point. We will assume for a moment that George-street is the centre of the city. I do not think, myself, that it matters much to the people wanting to go to George-street, or to Pitt-street, whether they are put down on the east or west side of George-street. That being so I cannot admit that a person who is asked to walk a short distance down hill or up hill, as the case may be, suffers any inconvenience. Therefore, the question to my mind resolves itself into this: in which position could the most convenient arrangement be made for the public at the least expense. I think that the answer to that is not difficult to find.

4074. Supposing you had your old system of steam tramways down Elizabeth-street, in conjunction with the present electric lines down George-street, would you like to hazard any guess as to the comparative numbers those trams would take of your railway passengers? No. There is no doubt that a large proportion would go by way of George-street, because George-street is nearer, we will say, to Pitt-street. At the same time, although it happens to be a few hundred feet or yards nearer to one point, it cannot be said that if the people have to walk that distance we inconvenience them at all. Many of the people who come to the different suburban stations have to walk all that distance every day, and even twice a day, to join their trains.

4075. Do you think the effective result of an extension to Hyde Park would be a saving of time, as against travelling by the electric tram, to the people, say, of Sussex-street? I do not think the Sussex-street people require to be considered in the matter. If you put the people who want to come to George-street, Pitt-street, and York-street, against those who want to come to Sussex-street, you will find that the latter are a very small quantity. Sussex-street is on the extreme west of the city. I am satisfied that the people who want to go there are out of all proportion to those who want to go to other parts nearer the east. The Sussex-street business, again, is confined to a certain class of business. It is a narrow street, and is always congested. One is impressed with the idea that there are hundreds of people in it; but if we put the same number of people into Pitt-street or George-street they would be practically lost.

4076. Is it not a fact that the majority of people do their shopping to the south of Park-street? I admit that a number of them do so. Of course the people of Brickfield Hill must live.

4077. *Mr. Shepherd.*] I suppose that the chief object to be gained by any extension would be the relief of the present traffic? The principal object in getting away from Redfern is to provide the Railways

Commissioners

C. N. J.
Oliver.
6 April, 1900.

Commissioners with reasonably safe facilities for conducting the traffic. Year after year we have represented that we are called upon to work the traffic under conditions which ought not to be allowed to exist. We say that if a removal is to take place—and it really must take place in the interests of all concerned—it should be to a position where the station will give reasonable facilities to the public.

4078. But still it would be a great advantage to relieve the present station of its present congested condition? Of course, the relief which is required at Redfern is the relief in connection with the traffic at Redfern.

4079. Is the station at present in an unsatisfactory condition, and dangerous? I would not like to say broadly that it is dangerous, but the working there is surrounded with an amount of danger and risk which should not be allowed to exist. It is not so much the relief of Redfern that is required as the affording of facilities for better carrying the traffic. The congestion at Redfern is largely owing to the arrangements of the yard and the way the place is laid out.

4080. In any extension which might be carried out, the convenience of the public would be the principal thing to consider? Certainly.

4081. And as an investment, I suppose, it should hardly be put in opposition to the convenience of the majority of the public;—in other words, the construction of a comparatively cheap line, although not so convenient as one upon which a few extra thousand pounds might be spent, would not be desirable? I think the convenience of the people should be studied with a due regard to economy.

4082. Ought not that to be a paramount object to be gained? I think the two should go together.

4083. You might manage to get a far cheaper line by going a mile away from your proposed site, but that would not be desirable, because it would not convenience the people? It goes without saying that you must study the convenience of the people, but that expression is a very comprehensive one. It depends on what may be meant by the convenience of the people—whether it is that some line should be decided upon which should practically go round the city in such a way that it would almost be a house to house service, or whether you should obtain a fairly central position, where you could not only land the people in a convenient place as regards the particular point which they want to reach, but upon which you could obtain facilities for working the traffic.

4084. I suppose that country travellers are well served at Redfern;—if they have luggage, they will have to take a cab at King-street, in the same way as they do now at Redfern? I cannot agree that the country people are sufficiently well served. They are equally entitled to go into the city as are those who enjoy the comfort of living adjacent to it. With regard to "cabbing" it, I have not the slightest doubt that if the station were more in the centre of the city the facilities for dealing with luggage would be of a more modern character. The facilities for handling luggage would be so much improved that people would not be troubled about it at all. They would leave it at the station and would find it at their homes when they got there.

4085. Is it not the experience of the Department that travellers like to take their luggage with them? Yes; because we have not yet been able to introduce other systems. We have, however, recently instituted another system in connection with the Melbourne express. An authorized man joins the express at Strathfield. If you want to get rid of your luggage he takes your address, and you find it there on your arrival. That is a great convenience to a long-distance traveller.

4086. Another argument in favour of the extension is the saving of time to travellers;—is that a reason why the proposed Liverpool-street station has been struck out of the scheme? No; it is not considered necessary to provide a station at Liverpool-street, but it would not be an expensive thing to place a station there in the future.

4087. We have had ten plans explained to us, and in seven of them a Liverpool-street station is provided. In the last two plans it is omitted;—can you state the reason of that? The Commissioners do not think a Liverpool-street station is necessary at present.

4088. Then the saving of time is not the chief object of constructing the extension? The saving of time is a very considerable object.

4089. Do you not think that a tram service could be instituted to meet the convenience of the public, equally as well as the extension of the railway into King-street? I do not. In view of the peculiar shape of the city, and the enormous tram traffic which will have to be carried as a pick-up traffic, and from suburbs which cannot be served by the railways, I consider that the greatest effort should be made to keep the railway travellers out of the tram-cars.

4090. Would it not be a great advantage to have a large station on the Devonshire-street site, which could amply deal with all kinds of traffic? That would depend on where your terminus was. If you took the line beyond such a station, the construction of that station would simply be a waste of money.

4091. Would not a large station at that point facilitate the running of additional trams, say along Pitt-street, Castlereagh-street, and Elizabeth-street? It would have nothing to do with it. As a matter of fact, the Commissioners have already recommended that tramways should be constructed down Pitt-street and Castlereagh-street. That is considered to be necessary for the ordinary suburban tram traffic, which must always be carried by trams, and the increasing pick-up traffic which will follow on the introduction of the system of penny sections.

4092. Even though the city extension were carried out? Yes.

4093. Is it intended, if the extension is carried out, to devote the Redfern station chiefly to goods traffic? No; it is not proposed to extend the goods traffic at Redfern. As a matter of fact, the Commissioners have just decided to enlarge the accommodation at Darling Harbour, in order that part of our goods traffic, which is now dealt with at Redfern, may be transferred to Darling Harbour.

4094. The point to which it is proposed to extend the railway—King-street—has a large vacant patch of land on the west, namely, Hyde Park and the Domain;—do you not think that a more central position would convenience a large number of the day population of Sydney? Of course, if you could get a station somewhere in George-street, I should say yes; but I think that of all the sites which are obtainable for the purposes of a city terminus, the Hyde Park site is certainly the best.

4095. I suppose the matter of expense enters largely into that idea? Assuming, as I have heard it put, that Hyde Park was covered with expensive buildings, and would cost as much money as the resumption of the centre of George-street would, probably we would say go to the centre of George-street if an equally convenient station could be placed there. We do not for a moment advocate that no consideration should be given for the park land which is taken. The late Chief Commissioner put that matter very forcibly

C. N. J.
Oliver.
6 April, 1900.

forcibly before the Committee, and the views of the Commissioners on that point have not altered. We are perfectly prepared to pay—we do not say it is necessary to pay—but if the authorities say it has to be paid for, by all means let a reasonable charge be made, so that the city may have parks provided where a very large number of people think they are more required than at this particular spot.

4096. Do you think the St. James' Road scheme would be a paying one in the event of electric trams being run down Pitt-street, Castlereagh-street, and Elizabeth-street? Yes. I do not think the electric trams will interfere with the ultimate paying of the railways at all. The trams are controlled by the Commissioners, and they are not likely to be run in opposition to the railway. Although the railway may take traffic which to-day goes by the trams, one of the principal objects of the proposed extension is to remove that traffic from streets along which it ought never to be carried.

4097. *Mr. Watson.*] Have you considered the possibility of applying electricity to the suburban traffic in connection with the railways? Yes.

4098. Do you think that it is within the limits of practicability? It is within the limit of practicability so far as the traffic is concerned, but it would prove a very expensive luxury.

4099. In what way? Electricity can only be profitably worked with a large volume of continuous traffic, which we do not possess on our suburban lines. Apart from that the superseding of an efficient service, such as we have to-day, and the throwing away of hundreds of thousands of pounds worth of rolling-stock, is hardly to be contemplated.

4100. I should imagine that it is merely a matter of waiting your opportunity as your rolling-stock wears out? The opportunity of doing it would not occur for very many years.

4101. But I understand the Commissioners are doing something in that direction with respect to the tramways at the present time:—they are exhausting the rolling-stock in use before introducing the electric cars;—I understand that you do not intend to throw aside altogether your steam rolling-stock? No; it is being worn out.

4102. If you thought it wise to agree upon an electric system for the suburban and city traffic, you would adopt a somewhat similar course? Naturally; but there is a vast difference between a railway and a tramway service. The service we have to-day is a thoroughly efficient one for the purpose, and I am not aware that there is any real necessity for considering the introduction of electricity. Of course, if we had only to deal with a short suburban service it would be all very well; but even if we had electricity we should always have the steam motive power as well, running into the same station. At the best you would have to have a mixed service.

4103. Assuming that we could manage with an extended Redfern station in the direction of Devonshire-street, and with the tram system which the Commissioners have recommended for some few years to come and by that time electrical development has sufficiently progressed to admit of its consideration for suburban or other traffic, could you not then approach the city railway project with a much greater probability of giving the maximum of convenience at a minimum cost? It is quite possible to look forward to anything, but I do not think that there is any necessity to approach the subject in that way. It is quite true that if we are to have tunnels it would be better to have electricity. But it is better not to have tunnels.

4104. Is it not found that tunnels, with electric traction, are practically convenient? It has been found that tunnels are more endurable with electric traction than with ordinary steam traction; but I do not know that any one would construct a line in a tunnel if they could possibly get one on the surface.

4105. The only reason for going through a tunnel in the city would be to avoid the expense of resumptions? I think, in this country particularly, tunnels would be very objectionable if they could be avoided. There are certain inconveniences attached to the system you suggest. There would have to be a change of engines somewhere, or a change of passengers.

4106. I was applying my remarks only to suburban traffic, in which case it would come right through with one motor? A difficulty would crop up with our trains. For instance, take the train on the Hornsby line, which runs into Sydney. How would you conduct that traffic? Would you call that suburban traffic, and run an electric line right out to Hornsby. There is not the slightest doubt that you could carry out such a scheme, but, in my humble opinion, it is one which is not necessary.

4107. There are two objections to the Hyde Park scheme, the first being that it is an unwise thing, wherever it can be avoided, to take any portion of a public park; and, secondly, it seems to me that it would only give convenience to such a small portion of the city day population, that it would not justify the expense? In reply to that I should have to know how the word "convenience" is defined. I contend that Hyde Park is a convenient position for the very large majority of the people who would travel by train. I do not consider Hyde Park is inconveniently situated as regards York-street, and that is more than half the way, I presume, to Sussex-street, which has already been mentioned, and it certainly embraces three-fourths of the people who travel by rail.

4108. We have been told by some people, whose business is on the western side of George-street, that they, sooner than pass George-street, and walk to Hyde Park, would take the electric train in George-street and go to Redfern? I have no doubt that there are people who would say that, but the majority of people would not. It depends very often on the time at which a person wants to catch a train. It may be that he travels by a train which is not a crowded one—that is, when it is not a busy part of the day. He would then walk to George-street, and get a tram; but I undertake to say that the majority of people who go to George-street to-day between 5 and 6 o'clock would be willing to walk up King-street if there was a station there.

4109. Another phase of the question in regard to electric traction is this: You might be able, without great expense, to get nearer the centre of the business part of the city underground? That is quite possible; but I am quite satisfied no one thoroughly conversant with railway traffic would advocate that you should have an underground entrance into the city, if it could possibly be avoided.

4110. You admit yourself that if it were simply a question in each case of resuming the land with buildings, you would prefer George-street to Hyde Park? I did not say I should prefer it. We were talking then about the position—not about the site for a station. I expressed no opinion as to George-street as a site for a station.

4111. I was referring to the possibility of taking passengers underground along George-street;—it seemed to me that, with electric traction, you could, without resumption, take people closer to the present centre of trade? Certainly. I hope you consider the question of the accommodation which would have to

C. N. J.
Oliver.

6 April, 1900.

to be provided underground, and the suitability of it to deal with the traffic which is dealt with at Redfern to-day.

4112. But, assuming the central station was at Devonshire-street, and that we could for a few years get through with the tram lines referred to by yourself a few moments ago, could we then have a probability, within a reasonable time, of electric traction being introduced? Your contention is that the people want to go to George-street. If they do they will not get out at Devonshire-street, no matter what accommodation we have there. They will have to be brought to George-street, and we shall have to provide facilities for receiving them, and for getting the trains away just as we do now. We should also want a parcels office and everything else underground for the convenience of passengers.

4113. That is only if we had a terminal station there? If we have a terminal station we must have it where the traffic is.

4114. I take it that the suburban passengers would not require luggage? The people travelling on the suburban lines have their parcels, &c., and must have accommodation.

4115. I do not wish to imply that there should be a terminal station at George-street, but that we should use electric traction to take the people underground near George-street? Wherever you make your stop, it is the travelling public who will decide what the accommodation is to be.

4116. Do you know whether the underground railway in London has very large stations underground? Personally, I do not. I do not understand that there is any comparison between the underground railways in the old country and our suburban railways. I understand that the underground railways are largely circular railways; they do not carry traffic such as we carry; it is an entirely different class of traffic.

4117. You have stated that you think that within a reasonable time there will be an immense increase in the tram traffic in the city, and in the ordinary suburban tram traffic;—and in order to cope with it you have recommended certain extensions of the service? Mr. Shepherd asked me a question as to what would be the effect on the railway traffic if we had lines down Pitt and Castlereagh streets. I stated that the Commissioners, irrespective of the railway traffic of the future, had already recommended those lines. The reason we have recommended those lines is this: we find there is no prospect now of being able to carry the whole of the western suburban traffic in George-street; in fact, we will not be able to accommodate the Leichhardt traffic unless we get some relief for George-street. The Commissioners had it under consideration this morning to wire Elizabeth-street, so that we could bring, as a temporary expedient, part of the electric trams down Elizabeth-street instead of George-street.

4118. Have you formed any estimate of what the probable percentage of tram traffic would be within the next few years? No.

4119. There has been a large increase lately in connection with the George-street tram? Yes; a larger increase than was estimated. When that estimate was made the fare was fixed at 2d., and it was afterwards reduced to 1d. It has been stated that the traffic was under-estimated; but the circumstances are different to-day from what were anticipated. Originally we estimated that we should run about forty cars in George-street, and we are now running about eighty.

4120. You have stated that you will, in the future, have three or four streets along which to run tramway traffic; you will have George-street, Pitt-street, and Castlereagh-street;—will you still retain Elizabeth-street? Yes; the conditions of the traffic are very different now from what they were when we only ran the tramways along Elizabeth-street. We never had the George-street traffic at all. All our trams were running down Elizabeth-street, which was absolutely a clear street. We did not pick 500 people up in what you might call pick-up traffic in a week. The pick-up traffic was infinitesimal. In George-street we have run into the heart of the city, where some hundreds of 'buses were plying. They carried much traffic from the suburbs which we are now carrying. The traffic which has been developed in George-street, excluding the railway traffic, is, to us, absolutely a new traffic. It must be remembered that the electrical system is going to develop the traffic. With the introduction of the penny sections it will develop a traffic which we have never had before. We contend that in order to provide for the growth of the traffic in the streets of the city, it would be a very good thing to take the railway traffic out of those streets altogether. We should thus convenience the railway travellers, and relieve the streets of the city of a traffic which they should not be called upon to carry.

4121. Assuming that you require George-street, and even Pitt-street, for your western suburban tramway traffic, would it not then still be possible to use Castlereagh-street for railway purposes, assuming that you had a station at Devonshire-street? It would be possible, but the railway traffic could not be satisfactorily dealt with.

4122. I mean apart from losing time, which is admitted? It would be quite possible without this consideration and at the present time to conduct the traffic, but it is not to-day that we have to look to. This is a question of determining the matter practically for all time. The city is not going to stand still. We must look ahead. The city is most peculiarly shaped, and every arrangement that is made should be with the object of keeping the traffic off the streets, if possible.

4123. I presume the Railway Commissioners were consulted in respect of No. 10 scheme, which has been put before us as an alternative? Yes.

4124. Do you not consider that that would afford greater facilities, as far as platform space and accommodation for trams is concerned, than the St. James' Road scheme; in the St. James' Road scheme you have provision for eleven platforms, two of them being rather short, and two docks, with a road between them; in the King-street, or No. 10, scheme there are only nine platforms, but in addition to the two with traversers and refuge roads between them, there are two straight-through platforms into the Domain? Yes; but one is a dead-end station, and the other is not.

4125. Would not greater facilities be afforded by the No. 10 scheme than by the Hyde Park scheme, because of it not being a dead-end station? A dead-end station is always the most difficult to work, and in a dead-end station you must have more accommodation.

4126. I want to know whether No. 10 scheme does not afford more accommodation than the old Hyde Park scheme? I do not know that it affords more accommodation. It is the accommodation which is differently arranged.

4127. As a matter of quick working, would not four through-platforms be better than six dead-end platforms? Six dead-end platforms would be utterly useless to work our traffic.

4128. There are four of the nine platforms in the No. 10 scheme which are through-platforms; they compensate

C. N. J.
Oliver.
6 April, 1900.

compensate for six dead-end platforms out of eleven at St. James' Road; I want your opinion as to whether the four through-platforms do not really more than compensate for the six dead-end platforms in the St. James' Road scheme? In actual working you can do many things with a through-station which you cannot do with a dead-end station; but I am not prepared to say you would get the same facilities. After all, you must have your platforms. I cannot say that four platforms would be as good as six. It would all depend on actual working. You may have a work to do for which you require all your six platforms at once. For instance, you may want trains to stand for some time in order to receive their loading. No through platform would compensate for a deficiency of platform in that respect.

4129. But with a through platform you can get a train through for suburban traffic in a couple of minutes? But you might not want to do that. Our stations are not only for suburban, but for country traffic as well. Sometimes the Melbourne express and other trains stand at the station for half an hour. You cannot conduct that traffic on the run-through principle.

4130. I understood that the arrangement of the station was such that, of the nine platforms, five would be available for the long-distance trains which stand at the platforms, and that the other four would be available for the suburban traffic;—if that is so, it seems to me that at those nine platforms you can deal with more traffic than at the eleven platforms at St. James' Road? I doubt it; but I prefer not to express an opinion on a point like that, because it all depends on circumstances.

4131. It was stated during the last inquiry into the Hyde Park scheme that the accommodation then asked for would be sufficient for twenty or thirty years, and that, therefore, there would be no necessity to so extend the scheme as to take in any more of the Park;—it seems to me that, on the present occasion, there is an admission that the estimates then were not as liberal as circumstances have since proved necessary, and that an increase has now been asked for? Without looking carefully into the matter I could not reply to that remark, but I am satisfied that nothing in the shape of trying to get a little more of Hyde Park is intended. If there is any difference in the size of the station—I am not prepared to admit that there is—it has simply arisen from not strictly adhering to the arrangements of the building as set forth in the original scheme.

4132. *Dr. Garran.*] Have you given consideration to the schemes of Mr. Seife and Mr. Greenwood? Yes.

4133. From what you know of the business of Sydney, would not the sites they suggest be very central and convenient? They would be central, but highly inconvenient to the people who travel.

4134. Are not the Town Hall and Wynyard-square centres for a good deal of business? I do not think that Wynyard-square could be said to be a central site, although it is in a fairly central position.

4135. Is it not a fact that the neighbourhood of Hyde Park is well suited for professional men, who come into Sydney? It certainly is in the vicinity of the Supreme Court.

4136. Is it as central for the business people in George-street, and the west of George-street? Its position is not as central.

4137. Do you think it is central enough, considering the difficulty of getting good sites elsewhere? Yes.

4138. It is the difficulty of getting a good site elsewhere more than the absolute centrality of Hyde Park, which makes you favour it? That is so.

4139. Do you remember the original construction of the tram-line down Elizabeth-street? Yes.

4140. That was constructed, not to bring people into Sydney from the Redfern railway station, but to connect the passenger traffic with the exhibition? I believe so.

4141. But for that the Commissioners of the day would never have thought of choosing Elizabeth-street as the best route for a tramway into the city? No; but it might have been a question whether Elizabeth-street did not afford the best facilities at the time. Of course, I should not think of saying it was in a central position.

4142. The line having been made down Elizabeth-street, all the others converged from it? Yes.

4143. The consequence is, that the entire suburban traffic of Sydney has been carried into Elizabeth-street? Yes.

4144. Now that you have made a line down George-street, it appears from the evidence of your officers that it has captured thirteen-fourteenths of your railway business? It is true; but you must remember that they have not got the tram service in Elizabeth-street now.

4145. But allowing for that, is not the fact that the George-street tram has captured most of your railway traffic a proof that that tram puts people down nearer their business places than they were when carried by the Elizabeth-street line? I could not say that. I can only say that the majority of people go down George-street by the electric tram.

4146. As a matter of fact, they prefer the George-street tram? They travel that way certainly.

4147. If it has been proved that a tram-line down Elizabeth-street is not so suitable for your suburban customers as a tram-line down George-street, is a railway line into Hyde Park—which is practically alongside the Elizabeth-street tram—likely to be central for their purposes? I can assure you that they will be perfectly content with it, and they will not get out at the railway to join the electric tram.

4148. It comes to this, that though it may not be the best position it is good enough, and will capture the traffic? I think it is the best site which can be obtained, taking all the surroundings.

4149. The best site to be obtained means the cheapest to get at, and the cheapest to get possession of? I do not say that.

4150. But that is involved in it, is it not? That is not my reply.

4151. You say the Commissioners quite recognise that they ought to pay for the land they take from Hyde Park? We ought to pay something reasonable for it.

4152. Is a reasonable price for a piece of land its value or half its value? I think a reasonable price would be a reasonable value.

4153. Mr. Sievers and Mr. Perdriau have estimated that the land to be taken by the Commissioners under the old scheme would be worth £200,000, which is twice what Mr. Eddy proposed to give;—would you object now to saddling the cost of your scheme with £200,000? I do not think that is a question I should be asked, nor do I think it is one which needs consideration in the way it is put. After all, this is a public question. It is a question of the State railways affording the best facilities for the travelling public, and I do not think when it comes to a question of value of what is really State property that the utmost farthing should be extracted from the State for what is practically in this particular connection a transfer from one purpose to, I should say, a better purpose.

4154. £200,000 worth of land, which is now open space for the enjoyment of the people is to be taken away;—do you not think that it would be a fair exchange to give £200,000 in money
tc.

to find open-air spaces in other parts? If it is said that £200,000 is a reasonable sum to ask I express no opinion about it. I say again, however, that the utmost farthing of value, in a case like this, should not be extracted. I think the offer made by the late Mr. Eddy is a good one, and that it is worthy of consideration, in view of all the circumstances surrounding it.

C. N. J.
Oliver.
6 April, 1900.

4155. The original estimate for the St. James' Road scheme was £650,000; if we add £200,000 to that to pay for the land, it will make it £850,000; Mr. Deane has told us that some additional cost must now be incurred, because the price of material has risen, and there will be additional alterations at Redfern; the total cost will, therefore, be about £900,000;—the profit which the Commissioners estimated would be made by charging additional fares would not apply if the larger sum were expended? It might not, but the traffic is an increasing quantity. If I had to express an opinion as to the Hyde Park scheme, compared with all the other schemes, I would say, "Pay twice the money for Hyde Park."

4156. You think, then, that if the St. James' Road scheme is not remunerative at the start, the increase in traffic will, in the course of time, bring it to a remunerative standpoint? I think that is a fair view to take of the matter.

4157. Since the first estimate of £650,000 was made the cost has mounted up—that is, if we have to pay for the land at Hyde Park;—I want your definite opinion as to whether the Commissioners still think that they can put the scheme before Parliament as a remunerative as well as a convenient scheme? The alteration of the estimate will not affect the traffic. Whatever our estimate of traffic was, it remains, subject, of course, to the increases which we know are occurring every day. No doubt the increased estimate would mean a certain loss, at the start, in connection with the transaction; but, under the circumstances, I think we are perfectly justified in advising the Government to adopt the scheme.

4158. Then, to some extent you would overlook the financial aspect of the question in consideration of the general aspect? Yes.

4159. In the plan put before us for a station at Devonshire-street, there is a pile of offices to accommodate the Commissioners and their staff; the same thing occurs in connection with the Hyde Park terminus;—is it more convenient for the Commissioners to be in the city near their customers than to be at the station near to their working staff? It is very important for the Commissioners to have their officers around them. At the present the loss of time, and inconvenience we suffer, when we want the attendance of a particular officer is very considerable. Wherever the central position is, there we certainly ought to be located, and there we ought to have our staff.

4160. If the Government agreed that the station should remain at Devonshire-street, would you rather have your offices there than have them in Sydney near your customers? We would not rather have them there, but we think wherever the terminus is our offices ought to be.

4161. Would you not find it difficult to face the expenditure of £1,500,000 on No. 10 scheme? That is what has to be paid to preserve Hyde Park as much as possible.

4162. Is not that an immense price to pay? I should think so. That scheme, I understand, is put forward—not by the Commissioners—but for the purpose of saving Hyde Park as much as possible.

4163. Would it not be a more serious thing for you to have to saddle your capital account with £1,500,000 for the sake of saving a strip of Hyde Park, than it would be to have to face an expenditure of £900,000 under the original scheme? We should prefer the original scheme under any circumstances.

4164. You think that the sinking of the difference of £600,000 of dead money would be a serious thing? I do not think there is any justification for spending it. I think the other, which is the cheaper and the better scheme, should be adopted.

4165. Is there not, at times, a pressure on the Commissioners from suburban passengers for a reduction of fares? I cannot say that it is a pressure. A very large deputation from the Illawarra suburbs waited upon us a few days ago, but they were not granted what they asked for. I think I sent them away fairly convinced that they were cheaply carried. I showed them that our fares were less than the fares in England, where, of course, the volume of traffic is much greater than it is here. Certain allusions were made to the Victorian fares being cheaper than ours. I was able to point out that the circumstances were special, and that the private tramways came into competition. I was also able to satisfy them, as men who had some regard for the public interest, that it would be improper to adopt fares which would have the effect of transferring the railways from a sound commercial concern to one which would be a burden on the State. I pointed out that a reduction in suburban fares for distances over one mile to the extent of 1d. for every single journey, 1½d. for every return journey, and 1½d. per day on each season ticket would cause us a loss of £40,000 a year, and such a reduction would not be appreciated. I believe the deputation went away quite believing that the fares they were charged were reasonable. I am perfectly satisfied that the public, if they get this extension into the city, will be prepared to pay the additional fare without murmur.

4166. You do not imagine that after the expenditure has been incurred, you will meet with strong pressure to reduce the fares? I do not think so. It would be unreasonable, and there would be no result from the pressure. We should be under an obligation to make the extension pay, and you might rely upon it that we could not accomplish that by reducing the fares.

4167. Some people are under the impression that by reducing the fares you increase the traffic? You do to a certain extent; but in this instance you would have to overtake the reduction, and we have not the necessary population to create increased traffic. The natural growth of the population will not do it. People from the Illawarra district very often say, "The train fares are driving the residents from our district." I reply, "It is difficult for me to combat a statement of that kind, but let me put this case to you: You have described your district as an attractive one; but look at the North Shore district, which came into existence after yours was established. The same fares exist at North Shore, and how is it that the people do not go on the Illawarra line as they do on the North Shore line?" They could not answer the question. New lines here and there do not increase the population, nor would reduction of fares, and that is the reason you so often find the Railway Commissioners deprecating either, more particularly as regards tramways. People say reductions will increase the traffic, but we say they will not. They may transfer the people from Burwood to North Shore, but the population is the same. Therefore we should not be likely to respond to requests to reduce the fares if we got the railway extended—at any rate, not until it was placed on a paying basis.

4168. The remunerativeness of your proposal depends entirely on the willingness of your customers to pay the extra fare you propose;—if there is a risk of their kicking at that extra fare, your calculations break down? If we do not get the money, they must break down, but the reduction of fares rests with the Railway Commissioners.

4169.

C. N. J.
Oliver.
6 April, 1900.

4169. You are not apprehensive on that point? Not at all.

4170. Your scheme makes no connection with Circular Quay, other than that which would be caused by an extension of the Elizabeth-street line to it;—do you think it of any importance to connect the ferry traffic with your central line? I do not think it is of pressing importance. I do not know that there is such a business connection between the suburbs and the Quay as to render it necessary. Besides, it would be a very short distance to walk, and I really think that the people would not object to that short separation. The traffic would not be a regular one; it would be principally a holiday traffic, and it is very difficult to gauge the value of it.

4171. Do you think the people who arrive in the ferry steam-boats at Circular Quay are fairly accommodated now? I think so. You could not very well bring the train right to the Quay.

4172. If you take the Elizabeth-street tram to Circular Quay by way of Castlereagh-street or otherwise, you will then make a connection between Circular Quay and the station? Yes.

4173. You have not that at present? No.

4174. But you will make it? Yes.

4175. And do you think that will answer all purposes? Yes.

4176. *Chairman.*] Dr. Garran mentioned £200,000 as the market value of one-fourth of Hyde Park; but seeing that there are thousands of acres adjoining the comparatively small portion taken, and considering that a large portion of the travelling public will be inconvenienced, and that large quantities of land in other centres may be obtained for much less money than what is to be paid for the Hyde Park land,—do I understand you to say that those are matters which should be considered in determining the question of the value of the particular land to be taken? It seems to me that a fancy value has been placed on Hyde Park. You can obtain land for recreation purposes in localities where parks are more required for much less money. Therefore, the transaction should be looked at in the light of the fact that it is surrounded by special circumstances. If the money paid is sufficient to provide reasonable recreation grounds in other places, I think the circumstances of the case would be met. I do not wish to say anything against Hyde Park; but personally I cannot see the great value which is placed upon it. I can see many advantages in Hyde Park, or some portion of it, being devoted to purposes other than those to which it is applied at the present time. At the same time I can quite understand the sentimental cry which is raised in connection with this matter. As regards the value, I would ask the Committee to consider the matter as I have put it—that it is not the absolute value of Hyde Park as a beauty spot which has to be considered, but of Hyde Park required for a public purpose for which it almost looks as if Providence had preserved it, and the providing of spaces in other localities more in need of those spaces than the Hyde Park district.

SATURDAY, 7 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEU, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Charles Cowdery, Civil Engineer, sworn, and examined:—

C.
Cowdery.
7 April, 1900.

4177. *Mr. Shepherd.*] Have you had experience in railway construction? Yes.

4178. Have you had an opportunity of making yourself acquainted with the proposed schemes for railway extension into the city? I have watched them very closely ever since I came to the Colony.

4179. What is your opinion of No. 10 scheme, and the St. James' Road scheme? In a matter of this kind the first thing to look to is a railway which will be of the greatest use to the greatest number of people. We have had two splendid object lessons. The first is the steam trams from the station along Elizabeth-street. Of the business people, and of the people who come into the city shopping, not one in 100 went east of that line. The next object lesson is the George-street electric tram. We find it can hardly take the traffic away, thus showing that the bulk of the traffic is there or thereabouts. I contend that if a railway is taken to Hyde Park it will be on one side of this traffic, and not where it is required. The terminus should be somewhere in the neighbourhood of George-street or York-street. I am not prepared to say the exact route it should take, but it should have a future extension to the North Shore in view. That is a new suburb; but it has grown faster than any suburb around Sydney. Within a few years it will be larger than even the western suburban district, which the railway accommodates at present. I had reason to count the houses from one point to another on the North Shore two years ago, and twelve months afterwards I found that they had increased 33 per cent. When the North Shore railway was made six or seven years ago the authorities had no idea that the suburb was going to grow so fast, because they thought a single line would last for ever. In five or six years they have found out their mistake. In putting the railway where I suggest you will carry out three things. First of all you will have a city railway proper. You will have a link in the trunk-line of the country, and also a link for an outer circle railway, *via* Milson's Point, Hornsby Junction, Strathfield, and so on. At present there are twenty trains a day each way on the Milson's Point line. Those trains could then run round and round, and no shunting would be required.

4180. You are of opinion that any extension to the city should have in view the ultimate connection with North Shore? Undoubtedly.

4181. And that the extension should be constructed in such a position as to conveniently connect with North Shore? That is so.

4182. You do not think that either of the schemes referred to are calculated to afford that facility? I cannot see how they could possibly connect with North Shore unless by tunnel, which would be out of the question entirely in a climate like this.

4183. It has been pointed out that by going back to somewhere near Liverpool-street, and by making a curve, we could connect in that way? You could do that certainly, but the people would not put up with the back shunting very long.

4184.

4184. You think a plan of that kind would be objectionable? I think it is the worst plan which could be conceived. C. Cowdery.
4185. There is another proposal in connection with the extension from King-street, and that is to go to Fort Macquarie, and tunnel under the harbour to North Shore;—do you think that is practicable? I think not. On the North Shore the gradients are bad enough now, and that would make them worse. You would be at least 100 feet under the harbour from the present level, and that would have to be got over. 7 April, 1900.
4186. Another objection you had to either of these schemes is that they do not meet the convenience of the bulk of the business people? They certainly do not. The business people coming in from the western suburbs would, no doubt, come to the St. James' Road station, but the people from George-street and Darling Harbour way, going home at night, would not walk to the top of King-street, but would jump into the George-street tram and join the train at Redfern.
4187. You are aware that there is no provision for an intermediate station between Redfern and King-street? That there should be in any case, otherwise people wishing to get in and out of the train between Redfern and the terminus would derive no benefit.
4188. Have you mastered the details of Mr. Selge's scheme? As far as his scheme applies to the city, I think it is all right.
4189. He proposes to leave the line at Eveleigh? There I think he is wrong. I think it would be better to continue from the present terminus, across Devonshire-street through the Benevolent Asylum, across Garden-road, Belmore Park, over Hay-street, and what is at present known as Paddy's Market—the old portion of the building—and then across Campbell-street and Goulburn-street. Goulburn-street I would cross somewhere between Castlereagh-street and Pitt-street, and then follow Mr. Selge's line. I believe that would do away with the objectionable grade of 1 in 75, to which I believe the Engineer-in-Chief has such an objection.
4190. Do you think it would be practicable to form a station at the Victoria Markets? I think that is the only use to which the basement can be put.
4191. It has been pointed out that there would be a danger to the foundations if that idea were carried out? I do not think there is anything in that. I have the plans of a station in London which has been built underneath a church.
4192. With regard to what is called the Asylum site—would not any extension of the tram service from a station on that site be facilitated? Of course. I think the wisest thing to do is to construct a station on that site. It is as near the centre of population as possible.
4193. Do you think the tram system, if extended to further other streets, would be able to cope with all the passenger traffic? There is no doubt it would; but you must not lose sight of the fact that we must some day have a connection through to North Shore.
4194. At present the whole of the tramway traffic from the railway station is crowded into one street, but if an extension along Pitt-street, Castlereagh-street, Elizabeth-street, and some other street west were effected, do you think the trams would be able to cope with that traffic? Undoubtedly. I have always contended that any railway would not accommodate the people so well as the future trams will do.
4195. You think it is quite practicable to form a station at the base of the Markets? I should form the platforms on the base, and keep the railways outside.
4196. Do you think the Asylum scheme would be a desirable one? I think it would meet all requirements until such time as the increase of population demanded an extension to the North Shore.
4197. Mr. Greenwood proposes to cross Devonshire-street, Belmore Gardens, and Paddy's Market on a viaduct, striking into Pitt-street; he would then tunnel from the Water and Sewerage Board's buildings to the corner of Bathurst-street, form a station there, and go down George-street, and between the Town Hall and the Markets into York-street;—what do you think of that scheme? I think that is very nearly the right route.
4198. Objection has been taken to the curve from George-street into York-street;—it is thought it would endanger the Town Hall? I do not think there is any danger of that. It strikes me that there would be a sharp curve there, and perhaps it would be better to go by way of George-street instead of York-street.
4199. You think either of these schemes would be preferable to the Hyde Park scheme? I do, because Hyde Park is on one side of the traffic.
4200. *Mr. McFarlane.*] I understand that you do not consider Hyde Park central enough for a railway station? That is so.
4201. Your idea is that we should have a city railway extension so constructed as to join the North Shore railway? Undoubtedly.
4202. Could not that be done from Hyde Park? The Hyde Park scheme does not lend itself favourably to connection with the North Shore.
4203. What is the nature of the difficulty? The whole of the trains would have to be shunted. Again, if you go on from Hyde Park, you will run across the best and most valuable part of the city.
4204. Have you considered the cost of land resumption in bringing a railway along George-street from Redfern? I have no doubt it would cost more than the Hyde Park scheme.
4205. How would you bring the railway from Redfern, say, through George-street to Dawes Point? Almost as Mr. Greenwood proposes.
4206. Would not that involve tunnel? Only a short one.
4207. And you object to running trains through tunnels? Yes, for any long distance; but I venture to say there would not be a tunnel longer anywhere than a quarter of a mile.
4208. Have you a fair knowledge of the passenger traffic from the western suburbs? Yes; I lived in the western suburbs some seven or eight years.
4209. Do you think the existing tramway arrangements sufficient to convey the whole of the passengers arriving by train at the proposed station on the Benevolent Asylum site? No. I should like to see an electric line down Pitt-street, and, perhaps, Clarence-street.
4210. Your idea is that, with an increased tram service, railway extension into the city is not necessary? Not as far as the traffic at present is concerned.
4211. Do you consider that increased tram accommodation would meet the increase in the traffic of the future? I have no doubt it would.
4212. If the proposed extension is carried out to Hyde Park, and the electric and other trams are run, which

- C. Cowdery. which would the passengers from the western suburbs be likely to use? I think it is likely that in coming to business they could continue in the train to the terminus, but in going home at night they would not take the train at the terminus. A man who is tired after his work, prefers to jump in the tram which is passing, perhaps his place of business, to walking to the top of King-street. It would be less fatiguing to do so.
- 7 April, 1900. 4213. Do you think the people who go to business west of George-street would come by train to the top of King-street, and walk down rather than travel by tram? I do not think I should do so myself.
4214. Do you think there is much inconvenience caused by waiting for trams at Redfern? I have seen nothing of that kind since the electric tram has been in operation—certainly not so much as there used to be.
4215. *Dr. Garran.*] Do you suggest a route coming through the station yard to West Sydney very much on the lines of Mr. Greenwood's scheme? Yes.
4216. The objection raised to that is that to get down so quickly you must have gradients of 1 in 60. The railway authorities object to anything worse than 1 in 100. They have reduced the whole of their grades as far as Parramatta to 1 in 100, and they have adapted the engine-power to the loads of carriages. They say that if you spoil the grade for the last 1½ miles of the line you spoil it for the whole of the line? I fail to see why it is necessary to have a 1 in 60 grade.
4217. The railway authorities say that to get under Goulburn-street you would require a 1 in 60 grade? I think there must be some error there.
4218. You admit it would be an objection to have a grade of 1 in 60? Rather than have that I would close Goulburn-street.
4219. You admit the force of the official objection? Certainly if the grade is 1 in 60. At the same time, they are calling for designs for a bridge on a grade of 1 in 35.
4220. That is on the North Shore line? Yes; but that will probably be part of the city railway some day.
4221. Mr. Greenwood's three stations would put people down near the Town Hall, Wynyard-square, and Circular Quay;—do you consider those three good passenger centres? Wynyard-square certainly is.
4222. Is not the Town Hall? Yes; but I hardly think one is required at Circular Quay.
4223. Do you think it is of any importance to connect the railway extension to Circular Quay? Not for passenger traffic.
4224. Do you think the present electric tram along George-street will sufficiently meet the requirements of the people coming from North Shore? Yes. Of course, if there was another tram-line up Pitt-street it would be better.
- 4225-6. It is proposed before long to alter the Elizabeth-street line by taking it to Castlereagh-street and to connect it with Circular Quay; when that is done the ferry passengers will have two routes into the city;—would that amply meet their requirements? Yes, for the present, at any rate.
4227. You do not look upon it as urgent that the railway should connect with the Quay? I do not think it is necessary.
4228. Some of the witnesses have stated that no plan would be complete and satisfactory which did not make such a connection? I do not think it is required.
4229. Nearly all the people who land from the ferry boats come to town to get to their business—not to go to the railway station? Certainly.
4230. Do you know where the steam tram shunting yard is? Yes.
4231. At the further end of the yard you are on a level with Macquarie-street? Yes.
4232. Would it be a good arrangement to have a tram-line from there to Fort Macquarie, joining the other line which comes to the Quay? I have not studied that.
4233. If we bring upon the electric tram-line at Circular Quay the whole of the present tram traffic, should we not cause a congestion of cars there? There would be more cars certainly; but it is a wide space.
4234. You have expressed an opinion in favour of making the Benevolent Asylum site a permanent central station, and then dealing with the traffic by multiplying electric lines through the different streets of the city? Yes, for the present, not losing sight of a future city railway.
4235. If we have four streets with trams converging on Circular Quay, we shall have a much greater congestion of cars there than we have now? But they would not be congested there more than they would be in any of the streets, because they would continue going round. They would not require to be shunted.
4236. But the carriages even now in George-street follow one another so rapidly that they make it quite as congested as is desirable;—if you quadruple that traffic you will have so many more cars on the Quay at the same time? Undoubtedly; but you do not notice much congestion on the Quay now.
4237. But if we take the whole of the tram traffic there, will it not become congested? Of course, it will be worse.
4238. There is a great deal of heavy traffic there? Yes; but a great deal of it is 'bus traffic, which will be cut out.
4239. And the drays going to the steamers? Certainly. At present the 'buses are often a great nuisance.
4240. Do you think that if we went to Hyde Park under any of the plans put before us we should out-grow the station there in the course of time? I do not think so. The moment you connected with North Shore that station would be a white elephant.
4241. Which would be a convenient place to bring the North Shore people into Sydney? Leaving the present line somewhere about Bay-road and getting across the harbour to Dawes Point.
4242. Would you make the terminus in Sydney? You would have a circular railway, and one would not be required.
4243. All the West Sydney routes which have been put before us, excepting that of Mr. Deane, have a certain length—39 chains—of tunnel;—do you think a tunnel of that length would be objectionable? I should prefer it to be as open as possible.
4244. Do you think a tunnel as objectionable as the Lapstone tunnel would be a good thing for suburban passengers? I should not think it necessary to have a tunnel of such a length. I should think there would be a number of gaps.

C. Cowdery.
7 April, 1900.

4245. It has been pointed out to us that electric power is so rapidly developing that in a few years' time we may be able to manage the whole of our city traffic by electric-power;—there would not be the same objection to tunnels then? Certainly not.

4246. Is not that rather an argument in favour of postponing the construction of the West Sydney line until we can bring electric-power to bear upon it? It is an argument in favour of postponing the construction of both.

4247. But something must be done at once; the alternative seems to lie between making the Benevolent Asylum station at once, or some extension into the city at once;—what I want to point out is that we are not quite ripe for electricity and tunnels on the western side; therefore, if we are to have an extension into the city, it must be on the eastern side? I do not think you need construct any tunnels sufficiently long to cause them to be objectionable, even if we used steam power.

4248. Would not 39 chains of tunnel be too long? Yes; but I do not think it is necessary to put in 39 chains of tunnel. You might get two or three openings in that length—sufficient to clear the tunnel from foul air.

4249. One scheme brings the line under George-street in front of the Town Hall, and comes to the basement of the Markets, and thence to Wynyard-square, in tunnel? Of course you can ventilate into the street.

4250. Would a scheme which goes so far west of George-street as to carry the line to Kent-street, be of much use to people coming out of the Town Hall at night? I think that is too far to the west.

4251. Whereas Mr. Greenwood's scheme under the Markets would be convenient? It would, no doubt, be a convenient position for passengers.

4252. Then, in making a passenger line for West Sydney, it is not desirable to go too far to the west? No; the line of traffic is somewhere about George-street or York-street.

4253. Supposing we had a central station at the Benevolent Asylum—the existing tram lines down George-street and Elizabeth-street, another down Pitt-street, and another down Kent-street;—do you think those four lines should practically deal with the passenger traffic? They would.

4254. Then to the cost of the Devonshire-street extension you have to add the cost of two new tram lines which, we are told, would amount to £80,000 or £100,000 each? Yes; but at the same time you would get a return from them.

4255. Which would be the better—the expenditure of £200,000 to go to Hyde Park, or the expenditure of £700,000 on the Benevolent Asylum scheme, with two extra tram-lines? I should say the expenditure of £700,000 on the Benevolent Asylum scheme, with two extra tram-lines. The tram-lines would bring in money, whereas the other extension would, in a few years' time, be worthless.

4256. Do you not think that you are going too far in saying that the Hyde Park scheme would become useless? I cannot see what else it would become.

4257. A very large number of people who have offices in that direction could always use the line? I do not think many would.

4258. We are told that people would prefer to pay an extra fare to be taken on to the city without being disturbed? Therefore, I say that we should put the station in a position where it will give facilities to the greatest number of people.

4259. The Hyde Park extension would suit all the law people, the Parliamentary people, the great clubs, and some of the largest hotels, besides many business people who have offices in Castlereagh-street, Phillip-street, and Elizabeth-street? There would be a much greater traffic near George-street.

4260. Would there not be enough traffic to make the Hyde Park extension remunerative? I do not think so.

4261. Every scheme but Mr. Deane's tries to make a West Sydney line fit in with an extension to North Shore; Mr. Deane is of opinion that that is a mistake, and that if we make a West Sydney line for passenger traffic, we should not confound it with a line to North Shore? I do not agree with him.

4262. Do you think the two could be dovetailed together without sacrificing either? Yes.

4263. To dovetail the two means an awkward arrangement of one line climbing over the other, in tunnel? That is bad.

4264. You would not say that it is a desirable arrangement? I should not do it if I could avoid it, although it is done in other places.

4265. If you do not go into tunnel until you get to Wynyard-square, you would require a stiff gradient to get on the top of a bridge 160 feet high? That is so. Still it is the highest land we have. There are already grades of 1 in 50 on the North Shore line.

4266. But to go from Wynyard-square to the bridge we should require a grade of 1 in 40;—if we make a grade of 1 in 60 we shall have to come back as far as Bathurst-street? I am not prepared to say anything about that, because I have not the levels before me.

4267. Are you in favour of a circular line, turning round and coming back to Redfern; several of the witnesses say that that is the best—not that we should have a terminal station in Sydney, but a line along East Sydney, coming back along West Sydney? I do not think East Sydney requires a railway. I do not think it will be accommodated by a railway so well as it will be accommodated by future trams.

4268. Mr. Dick.] In your opinion we do not require a large terminal station in the city, whichever way the railway is extended? That is so.

4269. If it is necessary to build a large station on the Benevolent Asylum site, and, later on, it is found necessary to extend the railway into the city, shall we not, practically, be compelled to have a double staff—one at the terminal station, and the other at the Benevolent Asylum site station? No; the station in the city would really be a roadside station. There would be nothing to do beyond getting the passengers in and out, especially with a circular railway.

4270. But what if we have a terminus in the city? We should then require a little larger staff than the one we have at ordinary times.

4271. But we should have to shunt the trains? That is a matter of keeping an extra locomotive there.

4272. Would not 200 or 300 trains coming in and out per day require a large staff to manage them? I see no reason why they should. When a train comes in it can be got back again in about a minute and a half. When a train pulled up at the terminal station, there would be a spare engine on a siding or road in the centre. The moment the train stopped it would hook on to it, and the train would be ready to go back before the people got out of it.

- C. Cowdery. 4273. Do you anticipate any larger extension of the business area of the city in the direction of Woolloomooloo? Since I have known that district I have not seen much change for the better in it. New wharfs have recently been built in that neighbourhood, but the traffic is not very extensive.
- 7 April, 1900. 4274. Do you think the utilisation of Woolloomooloo Bay is likely to bring about any extensive change in the character of the houses and other buildings in that neighbourhood? It has never struck me that it would.
4275. You lay some stress on the rapid growth of the North Shore suburbs, and you have stated that people from there must be brought into Sydney;—have you considered which of the two methods is better for bringing them in—by bridge or tunnel? By bridge, undoubtedly.
4276. You think it is quite possible to dovetail the connection between North Shore and the southern shore, with an extension of the railway into the city? Quite so.
4277. At the point where the two extensions meet, you would have this state of things: from Strathfield or Parramatta to the point of meeting you have a grade of 1 in 100, with carriage loads and engine power arranged for such a grade. From the point of connection towards the North Shore, you have a much steeper grade—1 in 35, as far as the bridge is concerned, and 1 in 50 on the other side of the bridge? I know they have called for designs for a 1 in 35 grade.
4278. If that is the case, how are you going to dovetail your traffic arrangements? In the busy part of the day it is only a matter of putting on a pilot engine to take the trains up the grade.
4279. Would not that involve a good deal of delay? Of course the fact of putting the bridge there relieves the greater portion of the grades on the North Shore end.
4280. There is a grade of 1 in 50 between Pymble and Gordon, and there are also three pieces of heavy grade between St. Leonards and Milson's Point? A bridge would avoid a good deal of that. Between St. Leonards and Milson's Point the whole of it could be cut out.
4281. Between Pymble and Wahroonga the grades are 1 in 60, 1 in 75, and 1 in 81? Of course I am not prepared to say that those grades can be altered; but we know the Commissioners have altered a number of other grades with a little expense.
4282. Do you think it a difficult matter, from an engineering point of view, to go close to the Town Hall corner on the one side, and the new Market on the other, with a subterranean railway? The curves, I am afraid, would be rather sharp, but there could be no danger to the building.
4283. You can get two 10-chain curves there, but there is no transition between them? It is rather sharp.
4284. Have you had any experience in matters of this kind in other parts of the world? I have always followed railway matters through the means of the scientific papers, and I was born and bred on railway works. In England and in this country I have been largely employed in railway construction.
4285. Is it the practice in England to bring the suburban passengers to the heart, or the edge of the city, and then let them go to their places of business by means of trams or underground railways? In London the terminal stations are not nearer than is Redfern to the centre of business.
4286. Could we say this of London: that city people coming in from the suburbs have to change from one kind of carriage or railway into another? They have in most cases.
4287. Do you think the delay involved in changing from the train at Redfern to the tram is a matter to be so seriously considered as to involve the expenditure of something like £1,500,000 under one scheme and £800,000 under another? I do not.
4288. *Chairman.*] At which of the stations in London do the passengers coming from the suburbs get out of their trains into underground trains in order to go to their places of business? The station I used most was the Paddington station. To get into the metropolis you have to cross Parade-street, and get into the Paddington-street station. Of course, I am speaking of ten or twelve years ago. You have also to do it at King's Cross.
4289. Do people getting out of the train at Charing Cross go into other means of conveyance in order to reach their business? Yes, or walk.
4290. Do most of the passengers who leave Charing Cross station get into a tram or other vehicle to proceed to their business? The majority of the business people coming to Charing Cross have to go as far to their business as we have from Redfern.
4291. You have stated that you are strongly of opinion that it would be better to leave the main station at Devonshire-street, and have four lines of tram into the city, and that that would suit all purposes;—have you any details upon which you base your opinion? No; it is only my opinion.
4292. Can you tell us, in order to back up your opinion, what is the number of passengers at present travelling on the George-street tram per day? I cannot say. The tram is always very crowded.
4293. Are you sufficiently acquainted with the construction of the Town Hall buildings as to say whether the foundations would be affected under Mr. Greenwood's scheme of carrying a line below the foundations of the north-eastern corner? It may be necessary to under-pin them; but it is possible to do that without any danger to the building.
4294. Even if the line goes close to the buildings? Even if it goes under it.
4295. You would hazard that opinion even if the architect said it would not be advisable to do it? You can go under any building without interfering with the foundations, provided that due care and precautions are taken.
4296. Do you think there would be any vibration? I do not think there would be any vibration which would hurt the building.
4297. When you stated that a railway to the neighbourhood of Hyde Park would, in a few years, be useless, had you considered the possibility of an extension of trade and population in the direction of Woolloomooloo and the Woolloomooloo Bay wharfs? I have known the places for some years, and I see little difference in it now to what it was twelve or fourteen years ago.
4298. With largely increased shipping facilities, is it not likely that there will be an extension of trade there? There may be to a certain extent; but Woolloomooloo Bay is only a limited area compared with what we have on the other side.
4299. I suppose that district is not one where people live from choice? There is a large population of the working class there.
4300. Would it suit them better to have a railway at Hyde Park than at Wynyard-square? I think the trams would suit them better than a railway, because they do not live in the suburbs.

4301. But they may want to travel to the western suburbs? Some might occasionally, but a very small proportion. C. Cowdery.
7 April, 1900.
4302. If there is to be a future business development of the city, must it not necessarily go in the direction of Woolloomooloo? Either in that direction or to the south. I think it is more likely to go south than east.
4303. *Mr. Watson.*] You have stated that you think a central station at Devonshire-street, with a tram line down Pitt-street, would serve the people fairly well for some years to come? It would serve them better than they are served at present.
4304. Would it be sufficient for some years to come? Yes, until we are in a position to connect right through to North Shore.
4305. A rough estimate for the construction of a tram line down Pitt-street is £100,000; if we constructed that tram line we should, practically, obtain as much revenue from it as we would from the Hyde Park scheme? Quite as much, or more.
4306. Estimating the Devonshire-street extension at £530,000, and the Pitt-street tram line at £100,000—in all £630,000—the cost would not be more than the Hyde Park scheme? No.
4307. And we should have a larger area at Devonshire-street for shunting-yards and so on? Quite so.
4308. *Chairman.*] You admit that with the best of tram services to take passengers from a train, loaded with 300 or 400 people, there must be delay for some of them? A slight delay, of course.
4309. If a train comes in with 400 passengers, how long would it take to get them away by electric cars, seeing that we only run two cars together? But the cars would run in different directions—George-street and Pitt-street, for instance. In that case two lots of cars could be loaded at once.
4310. Do you suggest a number of platforms for tram cars at the railway stations? Of course they would have to be there, but we have no platforms for the tram cars at present.
4311. *Mr. Shepherd.*] There would be ample room for a station like the one proposed? Room could be provided.
4312. You are of opinion that the travelling public would prefer to get out at Redfern and come in by train to being brought comparatively into the heart of the city by train direct? Certainly; in preference to going to King-street.

TUESDAY, 10 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK JENDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIER, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Edward Johnstone Sievers, Government Land Valuer, Department of Public Works, sworn, and further examined:—

4313. *Dr. Garran.*] When you were here on a former occasion, you stated that you had obtained a statement of the probable cost of land resumptions in connection with Mr. Selge's and Mr. Greenwood's schemes? Yes; I should like to increase Mr. Greenwood's figures a little. Mr. Selge's figures may be considered as outside the mark. Some years ago Mr. Selge consulted me when property was worth more than it is to-day, and he has based his figures upon the value of property at that time. With regard to "The Rocks" end, the estimate was based on a 4 per cent. capitalisation, which is too much for that class of property in that neighbourhood. I think it might be taken that Mr. Selge's valuation is quite outside the mark, with the exception of the basement of the Markets, and the damage to the properties between Market and King streets. E. J. Sievers.
10 April, 1900.
4314. The basement of the Markets is capitalised at £2,000 a year? Yes.
4315. Have you any of the sections between Eveleigh and the tunnel? I agree with Mr. Selge's figures up to that point—Druitt-street. I scarcely think we would obtain permission of the Town Hall authorities to use their Markets for all time for £50,000. No basis exists to go upon in respect of that matter. It is a question of interfering with the building, and a good many points would arise, and I am afraid that £50,000 would be looked upon as a low sum. Mr. Selge has estimated that he can tunnel below the buildings between Market-street and Wynyard-square, and take what land is required for £200,000.
4316. That would be more compensation than purchase? Yes; but unless a bill was specially prepared to deal with it under the Public Works Act, such an arrangement could scarcely be made. In order to run tunnels we should take the surface, because we take what are known as cellars, and they are not sufficiently low to be called tunnels. Therefore, the properties along the route would have to be resumed in many cases where they could not be dealt with privately. I think you might say that they would all require to be resumed. In that case the damage to business would be enormous.
4317. You think, then, that he has under-estimated that section until he gets to York-street? Yes; I think £200,000 is much too low. I am backed up in my opinion by the Principal Assistant Architect in the Government Architect's Office, who thinks, with me, that there would be a difficulty in tunnelling along York-street without interfering with the properties on either side. As regards Mr. Selge's new George-street proposal, I scarcely think there would be a market for 3,000 feet at £150 a foot at the present time. On the other hand, I do not think his 30 acres would cost £812,000.
4318. You think he has over-estimated the resumption of "The Rocks" property, and has over-estimated what he will get back from the new George-street frontage? Yes.
4319. We should like to know the exact difference between your estimate and his; his extension to Circular Quay is independent, to some extent, of his main line to Sydney, which terminates at "The Rocks";—he could make a purely West Sydney line without branching off from Wynyard-square at all? In that case I should say that what he calls his red scheme may be accepted as approximately correct, with the exception, of course, of the £200,000 between York-street and Market-street.

4320.

- E. J. Sievers. 4320. What we may call his purely West Sydney passenger line may be taken as a fair estimate? Yes; it errs on the safe side.
- 10 April, 1900. 4321. Your principal difference with him is as to what he would get in return for the sale of his new George-street frontages? Yes; and also the cost of the bit between the Markets and where he tunnels under York-street. I am inclined to think that the whole of the properties would have to be purchased, and the results of the re-sale would not be equivalent to the damage caused by loss of business.
4322. I understand that Lassetter's have premises on the other side of York-street, and a tunnel to them from their George-street premises? Yes; but they have the tunnel only on sufferance. Of course, if that tunnel were required, it might be regarded as a loss which the firm would not otherwise have sustained, and I am afraid that they might be able to get in a claim. With regard to Mr. Greenwood's scheme, I think the property could be obtained up to the Town Hall for about £250,000. I consider that the land would cost £410,000 altogether—that is, right through to Circular Quay. That is also inclusive of a fair value for a portion which he takes of the park at Wynyard-square.
4323. *Dr. Garran.*] What is your estimate of the portion of Wynyard-square he takes? I consider that he ought to be charged with £60,000 for the portion taken, and that is included in the £410,000.
4324. *Mr. Watson.*] Your only difference with him amounts to about £75,000? It is not very serious. I may mention that Mr. Greenwood's scheme was estimated for at the time of the land boom of 1888. Since then several buildings have gone up, and the lower end of Pitt-street has been improved.
4325. Then Mr. Greenwood's estimate is not an extravagant one? No.
4326. That is, on the assumption all through that he will not need to interfere with buildings or cellars? Yes; but I am of opinion that he will have to interfere with them. I should like the Committee to understand that resumption cannot be made of cellars and other places on the assumption that you will not affect the surface. The law as to driving a tunnel through a hill will not apply in regard to city property.
4327. What is your valuation of Wynyard-square as a whole? £120,000.
4328. *Mr. Levien.*] From where did you obtain your experience in valuing land? I have done nothing but value for the last ten years. Before that I dealt largely in city properties. I have a record of every sale during the last twenty years in Sydney. I was valuer for the Savings Bank between 1892 and 1896. Since then I have been doing Government work.
4329. Did the people who were taxed under the Land Tax Act agree with your valuations? They did, ultimately.
4330. Have you had any conference with anyone with reference to the valuation of the land to which you have been referring? No.
4331. Do the Crown Law officers always call you in connection with their cases? Yes.
4332. In all disputes, have they used your valuations as authoritative? Absolutely.

Mark John Hammond, J.P., sworn, and examined:—

- M. J. Hammond, J.P.
10 April, 1900.
4333. *Mr. Levien.*] I believe you were a member of the Legislative Assembly for many years? Yes.
4334. How many years have you resided at Ashfield? Twenty-four.
4335. Have you constantly used the suburban railway line? Yes.
4336. Have you any statement to make? Yes, I will read it.

The question of the extension of the railway into the city has been before the public for upwards of twenty years, during which time a number of schemes have been submitted, none of which, to my mind, should be adopted in their entirety. The proposed extension from Redfern to St. James' Road comes nearer the plan I would suggest than any other, and, therefore, so far as entering the city by that route I agree, but I widely differ from the scheme in other respects. For instance, I would not build a terminal station at St. James' Road. I am certain the quantity of land required for a large station, with sufficient shunting room, is not available there, unless by destroying the Park. And this is clearly shown in the evidence given before the Parliamentary Standing Committee on Public Works in 1897, in which mention was made of relieving Hyde Park by carrying on some of the shunting of trains in a portion of the Government House grounds. See in that report questions 150 to 155. As to how long the size of the proposed site at Hyde Park would answer, the reply was clearly evasive, mentioning "that this station would be good enough for twenty years." I glean from the evidence given on that occasion that the size of the land taken for station purposes from the Park would be about 1,150 feet in length by about 400 feet in width, or about 13 acres in all. While this seems a large piece of land I may mention that, for a central terminus for the whole of the traffic of this colony, that, in my opinion, it would from the first day prove far too small. I am supported in this opinion by having visited many of the large stations in Europe. Frankfort-on-Main, I found to measure, covering the width of rails and platforms under cover alone, 800 feet x 630 feet; the station, offices, and buildings are outside of that. Birmingham, across the rails and platforms, measures about 300 feet by about 700 feet in length, exclusive of buildings. I disagree with the Hyde Park scheme, because it associates the country traffic with the suburban in the same station. I think they should be entirely separate. The suburban traffic does not require a large station in itself; it is the country traffic that mainly demands station accommodation; that combined with the shunting room at Hyde Park is the great obstacle in the way, and is the cause of so much serious objection to the extension of the line to St. James' Road. I will now roughly sketch out a plan that will admit of the line passing through Hyde Park to St. James' Road, and will remove all or nearly all the objections to that route. To commence with, I would resume the Devonshire-street cemetery, the grounds of the Benevolent Asylum, the Inspector-General of Police's grounds, and the Convent of the Good Shepherd. Pitt-street, from Belmore Park to Devonshire-street, should be widened to 100 feet; Devonshire-street up to Castlereagh-street might be closed, thus connecting the newly-resumed areas with the present Redfern site, making in all an area of between 30 and 40 acres. With Belmore Park on the north-east, and Prince Alfred Park on the south-east, a large central railway station should be built on that site suitable in size for the next fifty years, designed with a view to further extension when required. For the plan which I am about to propose, this great railway station would not be required for suburban traffic, and, therefore, the cost of it should not be made a charge against the extension of the line into the city. A large central station, as a terminus for four systems of country railways, is required, and cannot be done without. There are not less than thirteen terminal stations around London, and with the exception of two or three, none of them come near its centre; they are, nevertheless, very large stations, and they are required for country traffic. The suburban passenger traffic is conducted to the heart of London by a separate system known as the Metropolitan Circular System. I produce a rough sketch to give the Committee an idea of these separate systems, from which it may be seen that while the suburban traffic by the circular system requires practically no stations, every country terminus consists of a large station. Well, I would adopt a modification of the metropolitan system, as carried out in London, that would save the necessity of resuming much of Hyde Park. Besides the line through the Park, by adopting the circular system, would not require to be one-half the width of the line as at present proposed, thus saving land and expense, and removing the objections at present raised against that route. In order to explain the scheme that I favour, I will ask you to follow the route recommended by the late Mr. Eddy, from Redfern, through Hyde Park, on to the Circular Quay, somewhere about the Water Police Court. I would then, by turning to the left, pass round Circular Quay overhead, thence by tunnel through Flagstaff Hill, thence overhead round Darling Harbour, passing over all the streets leading to Darling Harbour without in any way interfering with the wharfs or the traffic leading to them continuing that course through the present Redfern site. I would not make that the limit of the Circular System; it should

should be extended on the western line, out as far as, say, Homebush; thus a train passing round the route I have just described would, on its return, pass through the new central station at Devonshire-street, and continue on to St. James' Road. There should be two sets of rails, so that trains would be constantly running both ways without danger of collision.

In any proposition for the extension of a railway into a city, I do not think it advisable to undertake the destruction of street frontages, the impression I have gained in the many cities of the world that I have travelled through, is that the object has been to avoid that as much as possible by either going underground or overhead, the latter I favour most, and, I think, is best. By adopting the Circular System of extending the railway into the city, sheltered platforms would be all that would be required for passenger traffic, and hence but little land would be required for that purpose. I feel thoroughly convinced that the Circular System, as sketched out, will be found, if faithfully gone into, to cost less to construct, and after it is constructed cost less to manage and maintain, than any system which involves the building of a large station and shunting of trains upon valuable city land. As an alternative scheme I would advise the Committee to take into consideration the possibility of improving and extending the electric tramway system. I am aware that the already improved system of conveyance has largely reduced the pressure for railway extension into the city, and it must not be overlooked that, no matter how perfect the system of railway extension into the city may be, much of the traffic will still go, by the trams especially, if the Circular System is adopted so that passengers may go, say, by George-street, and return by Castlereagh or Pitt-street, and *vice versa*. In my opinion, the double line should be continued from Circular Quay by way of one of these streets back to the station, and thence to and from the suburbs, the trams thus continually travelling both ways without shunting, and without danger of collision. Suburban passengers, however, object to changing out of the trains at the central station into the trams. To obviate this, I think, if the Circular System of electric trams were made to extend by way of illustration to Homebush, on the present railway lines in lieu of the suburban trains coming into the city, possibly that plan would make perfect the scheme of conveying the suburban passengers to the heart of the city without a break, and this could, I believe, be done at a comparatively small cost. If this could be done, and I see no reason why it could not, it would cause an immense saving, not only in the original cost, but in the working expenses thereafter. There would not be required one fourth the expenditure at the various suburban stations. Tickets could be issued to the passengers on the way from the suburban stations just as they are now supplied on the trams already running.

I may mention that in making this proposal to extend the tramway system that I still hold that it would be the right thing to resume the lands that I have previously mentioned for the purpose of erecting a large central station as suggested, as this station would be the terminus for all trains beyond the Metropolitan area, and would be in a situation that must yet become the very heart of the city.

4337. You understand the proposal to erect a central station at Devonshire-street? Yes.

4338. And if that were constructed you would favour the running of tramways all round the city? Certainly. The suburban passengers, however, object to transferring themselves from the trains to the trams. If we were going to adopt the tramway system I would favour an extension of the electric tramways to the distant suburbs.

4339. If the central railway station were on the Asylum site, you would favour tramways to the city and suburbs? If you left us in that position we should always be advocates for an extension of the city railway.

4340. Then you want the railway to come right down to the city? I want it carried through on the Circular System—two lines, one going from Redfern or Devonshire-street to St. James' Road, round by Circular Quay to the west side of the city, back to Redfern and out to the suburbs, and then back again; the other going by Darling Harbour, then to Circular Quay, back on the east side of the city, that is, by St. James' Road to the suburbs, and back to the city.

4341. You would not favour stopping at the Asylum site, and running the tramways from there? It is a magnificent makeshift system, but it would not be perfect. I favour a mode of coming into the city, either by railway or tramway, which will obviate breaking the journey. I know that the system of railway extension which I am now suggesting will not compare with the costliness of pulling down street frontages, and resuming valuable land. Under my proposal little land will require to be resumed.

4342. What is your opinion of the St. James' Road scheme? I favour the St. James' route from Redfern to the Circular Quay, but I am unfavourable to a resumption of a large portion of the Park for a country railway station, requiring immense shunting room, and a great width of rails, in order to accommodate the whole of the traffic of the Colony. We are trying to do too much in one station. In London there are thirteen stations, and although we are not a London yet, we ought to adopt our plans to meet an increase in population.

4343. Where would you propose the country station should be? I am satisfied that if you have a station at Hyde Park it will not be sufficiently large for all time. More of the Park land will ultimately be required to meet the demands of an increasing population, whereas at Devonshire-street you have from 30 to 40 acres of land which will give ample room for all time to come. At Hyde Park the station will be too cramped. The whole of the schemes which have been suggested during the last twenty years concentrate too much on too small an area.

4344. Where would you propose that the main trunk lines of the Colony should come to? To Devonshire-street.

4345. And the suburban line should come right into the city itself? Yes. Seventeen or eighteen years ago I proposed a scheme which would communicate through the city to the North Shore. I did that with the view of trying to prevent the construction of a line from Hornsby to Strathfield, and also to prevent the expenditure of money on the Milson's Point line. I thought it would be a saving if a direct line from the north could be brought into Sydney, and I advocated it eighteen years ago. Those lines, however, have now been constructed, and they alter the view I hold of the situation. I think now it would be an extravagance to mix up the extension of the railway from the western suburbs into the city with a connection with North Shore. If ever a line comes through, we shall require a great northern station of its own somewhere about Flagstaff Hill. If we try to connect a western line through Sydney with a northern line we shall knock our heads against a stumbling block which will prevent any extension of a railway into the city at all. The two things cannot be done at reasonable cost, and give an equivalent in the shape of convenience. Unless we are careful as to how we construct this line we shall not have half the people travelling by it; they will still come in by means of electric tram and other means of conveyance. Charing Cross, the most central station in London, communicates with a very large population at Clapham and other places. As a suburban station line, one would have supposed that if it could it would have commanded the whole of the traffic in that direction, but that is not so, as many passengers are yet carried by omnibus to and from Clapham. Again, within the last eight or nine years, an underground electric tramway has been constructed from London to Clapham to intercept and cut away traffic from the railway. Although there is a station in the heart of London it does not command the whole of the traffic, and so it would be in Sydney. We must not anticipate, even if we spend a large amount of money that we shall get the whole of the suburban traffic on the railway. One half of it will never go by it, no matter where we construct it.

4346. *Chairman.*] You are a strong advocate of separating the suburban from the country traffic? Yes.

4347.

M. J.
Hammond.
J.P.
10 April, 1900.

M. J.
Hammond,
J.P.
10 April, 1900.

4347. The late Mr. Eddy and the present Commissioners are very strongly of opinion that the suburban and up-country traffic should be brought to one centre;—would you place your opinion against their experience? It would be presumption for any man to do that, but we have had great generals who have made great mistakes on big battle fields, and common soldiers have seen it. I am positive of this, that none of the Commissioners can show any example in Europe to support them in their view.

4348. *Dr. Garran.*] But is it not difficult to find a similar city to Sydney elsewhere? Yes.

4349. *Chairman.*] It is proposed, not only to erect a large railway station for the convenience of the traffic, but to have the administrative offices therein;—do you not think it would be an advantage to have all the officials centred at the main place of operation? Certainly, and the scheme I propose will admit of that. I think the whole of the official business should be carried on in a central station building at Devonshire-street instead of at Hyde Park.

4350. Have you made any estimate of the cost of your circular railway? No.

4351. Supposing your scheme were found impracticable from an engineering and financial point of view, would you, as a traveller and a resident of the western suburbs, sooner be brought into the locality of King-street direct, by train, or would you get out at Devonshire-street, take a tram, and finish your journey into Sydney? If the scheme of which I speak could not be carried out, I would leave it to the electric trams to accomplish the rest.

4352. *Dr. Garran.*] Supposing the railways were private property and you were the managing director, would you build a big station at Devonshire-street and bring the people in by trams, or would you bring them in by rail to Hyde Park and let them find their own way to where they wanted to go? If I were the largest shareholder in a railway company I would advocate what I am advocating now—a circular system of railways; and in the event of that not being practicable, on account of cost or other objection, I would resort to the extension of the electric tramway. I would extend it to the suburbs and make it a circular, or a loop line, system. The heavy trains, excepting long-distance trains, would cease at Homebush, and the trams would take their place. The people could then get into a tram-car at George-street and go right out to Ashfield, or other places, and *vice versa*. I would recommend Castlereagh-street, if practicable, as the street by which the trams should return to and from the station or suburbs.

4353. You think that the electric system is possible of great development? I think so.

4354. Is it possible, if we construct a line to Hyde Park, that such line may be superseded by a larger use of the electric system? If the railway were extended on the plan I have submitted it would never give you an opportunity of extending the circular system of tramways within the metropolitan area. That would shut out the possibility of extending the electric tram to Homebush.

4355. Do you think there is any risk of an extension to Hyde Park becoming useless on account of the increase in the number of electric trams down the different streets? I have only made a suggestion about the electric trams. I am open to be convinced that it is an impracticable suggestion. I would never undertake the construction of a railway into the city until I was satisfied that the extension of the electric trams to the suburbs was not practicable.

4356. I suppose that if it can be done it will be done? There is no doubt that it will be done. Someone has stated that a large station at Hyde Park would be an ornament to the city; but we have too many ornaments without utility. I do not think a large station is an ornament to a city. No one thinks Charing Cross is an ornament to the Strand.

4357. *Mr. Shepherd.*] You object to the extension of the railway to Hyde Park as a site for a terminal station? I do not object to the extension of the line to Hyde Park—I approve of it on the route laid down by the Commissioners.

4358. But you object to a terminal station at Hyde Park? I do.

4359. In the event of the Asylum site being converted into a large station from which the tramways could be diverted to various streets, do you think those tramways would be capable of coping with the suburban traffic coming into Sydney every day? The tramway system is capable of meeting any demand. Before we had any tramway system the omnibuses met all demands, in, of course, a very awkward way, but the people put up with them for twenty-five years. In 1879 the steam motors commenced to run, and a larger number of people travelled by them than by the omnibuses, because of the improved means of communication. Now we find that still more are travelling by the electric tramway, because the communication is so much better. The improved systems of conveyance are meeting all demands. I can see nothing to prevent the electric tramway meeting all demands. At present it is only half a completed scheme. We run down George-street, and waste time shunting at Circular Quay, whereas we ought to run down George-street and return by way of Castlereagh-street or Pitt-street, to the railway station.

4360. Do you think the inconvenience of the suburban people could be better served by an extension of the tramway system than by an extension of the railway line to King-street? You are putting the case of a circular tramway *versus* a circular railway. If it were possible to run a metropolitan circular railway, and it was also possible to run a metropolitan circular tramway, in my opinion the tramway would carry far more passengers to the city than would the railway. If it were possible to have a circular system of railway to Homebush, and also a circular system of tramway to Homebush, and we had the option of coming in by rail or tram, I, for one, should come in by the tram, because it would drop me in George-street or Pitt-street, whereas the railway would drop me at St. James' Road, far away from the place where I usually get out.

4361. *Chairman.*] Regardless of whether it occupied you an hour or twenty minutes to come in? That would be an impossibility. I have already made provision against that. I have stated that we must inquire whether the electric tram system is possible. If it cannot bring in the passengers in the same time as the railway, it is shut out altogether.

4362. *Mr. Shepherd.*] The principal reason for the agitation for an extension of the railway into the city is on account of the saving of time;—would not the electric trams from Homebush occupy a longer time in coming in than would the railway? I do not see any reason why the tramways cannot come in per mile as fast as the train. There is no evidence to show that the trams cannot run a mile or 5 miles as quickly as can the trains. In my opinion, they can and will prove a quicker means of communication than the trains.

4363. As a rule, the tramway has so many places at which to stop? The tramway traffic would have to be arranged so that each tram-car would run through to certain stopping places similar to the through-train system now in vogue; the number of cars, of course, would be numerous and their services divided,

so as to provide a speedy transit to and from the city with the greatest possible convenience to passengers. Besides, passengers would save by being enabled to alight nearer to their places of business than would be possible by any plan of city railway extension. Anyone who will reflect for a moment will see that.

4364. *Mr. Watson.*] Such conveyances, then, would be looked upon as electric trains whilst they are on the existing railway, and as electric trams whilst they are in the streets? Exactly.

4365. *Mr. Shepherd.*] There is a vast difference between travelling in a train and in a tram;—the trams traverse streets where there is a continuous crossing of vehicles, and it would be impossible for them to obtain the speed which is obtained on a railway; therefore, the trams could not compete, as far as speed is concerned, with the trains? A train leaving Strathfield or Burwood, and coming direct to Sydney, brings in a number of passengers in quick time. The same thing could be applied to the electric train system. It could pass every station with its load and come right in at the same speed, and, if it were required, at a greater speed than the trams.

4366. Would you utilise the railway lines for the tram after going a certain distance? Yes; from Redfern to the suburbs.*

M. J.
Hammond,
J.P.
10 April, 1900.

John Horbury Hunt, architect, sworn, and further examined:—

4367. *Chairman.*] I understand you have some further statement to make? I desire to state that it is impossible to erect a station on Hyde Park under what is known as the St. James' Road scheme. I desire that there should be appended to my evidence the statement I made before the Royal Commission in April, 1897, as follows:—

J. H. Hunt.
10 April, 1900.

As an old colonist—but more especially as an architect following my profession in this city these thirty-five years—and, further, having for the past twenty years devoted much thought to the subject before you, while during the same time advocating through the public Press the practicality and possibility of making Sydney a beautiful commercial city, prompts me, gentlemen, to come before you to-day for the purpose of entering my strongest protest against any attempt to insert the thin end of the wedge of destruction to Hyde Park, which is certain to be its ultimate fate, by placing on any portion of that site a railway station—I care not how magnificent the conception of that building may be.

All of us must admit that there will be a great national and civic advantage to a young and fast-growing city like this by having its metropolitan railway station well placed.

Yet a chief city station with all its advantages is not the only, neither is it a paramount, feature in either our civic or national requirements.

Let it be remembered, however, that the metropolis of any nation is in a way national property.

In all earnestness, I ask, shall one of the main features of a naturally beautiful city as Sydney undoubtedly is, I repeat, shall that feature be now taken from us; yea, lost to posterity for ever. Gentlemen, I submit that this is no trilling question—one not to be brushed to one side simply to satisfy the requirements of a few rabid advocates of this Hyde Park station. I make no hesitation in saying that nine-tenths of these advocates have never carefully considered this important question, while very few have any fitness or disposition of thought for matters of this kind, simply their own selfish wants ruling their determination; and to fully satisfy these wants these men would have no compunction whatever in placing this big station building in the midst of the Botanic Gardens.

With every respect to our brother civil engineers, and especially our deservedly respected Railway Commissioners, I must say that these big railway structures are at best but ugly-looking fabrics, the larger in bulk the more intense in their inherent utilitarian ugliness.

On these grounds alone, a chief railway station should not be thrust into juxtaposition with our city architecture of the type that should adorn the frontages to Hyde Park. Big warehouses and a railway station are fitter companions.

All this will by some be termed sentiment—in fact, several who have already given evidence before you and to a previous Commission have spoken jeeringly of sentiment. Those gentlemen are, I fear, just a bit ignorant of the fact that this particular trait of character was notably very prominent in our ancient city builders, and cannot well be set to one side by our modern city builders.

Every true advocate for making Sydney a beautiful commercial city will require, and they will stoutly contend for, the absolute preservation of the whole existing area of Hyde Park.

The advocates of the Hyde Park scheme can depend on it that any attempt to obtrude on the Park any railway station or open cutting will be resisted in a surprisingly effectual manner. There are hundreds and hundreds of citizens who, in other ways than coming here to protest, will make their power felt. Why, it is a fact that such a proposal of vandalism would not have forty-eight hours' life in Victoria.

The streets bounding the Park will provide our coming architects with most valuable frontages for important future buildings in addition to several now surrounding the park.

The present or some closely-following Government will do well for the nation by making these sites secure for the purpose here advocated.

The necessity for preserving this our most important city square as such (and not to be turned into a railway yard) will, I am confident, when once brought straight home to your intelligence, be accepted in the manner and for the purpose which I now desire to set out.

If I were an autocrat as well as an architect, I would at once assign to our future Public Library the whole of the sites of the present Law Courts, St. James' Church, and the Registrar-General's Offices. Then, for our future Courts of Justice (to embrace all the Courts, except the Criminal), also the Attorney-General and Registrar-General's Departments, I would give thereto the sites of the District Court, Equity Court, and the Mint.

No better position can be named for those important offices. The architecture of such a group could then to exceptional advantage be seen and enjoyed from the Domain on the one side and from the Park on the other.

We have on the next and adjoining site the Cathedral of St. Mary's, which, when completed, will be one other grand feature in the Park view.

Next comes the Museum, which, when finished, will be a very imposing building.

Following on comes our Sydney Grammar School. The site adjoining this should be taken for the Technical Museum. Then at the corner of Liverpool and College streets I would place the Girls' Public High School (removed from its present position opposite the Registrar-General's Offices), thus completing the north and east side of our city square, while on the east side preserving that beautiful outlook over Cook Park. (Sentiment again.)

On the south side, at the corner of Oxford and Liverpool streets, I would place the future new Anglican Cathedral, this site to be in exchange for St. James' Church properly, together with the old parsonage property site. Let it be remembered that the present St. Andrew's is but a parish church. Permit me parenthetically to say that when the Church of Rome has completed its fine structure, then the Church of England will be aroused to a spirit of emulation; then this will be unquestionably the site for its cathedral.

On the west and fourth side we have the Synagogue, also the Oddfellows' Hall. This hall some of these days, no doubt, will be made more imposing architecturally, the remaining sites to be taken for various large public buildings, for instance, a grand opera house, while another will go for a grand theatre. Sites on this side of the Park are eminently suitable for the last-named buildings, as they would have the protection of streets on all sides. Others of these sites, with those on the south side, to be in time taken for various important buildings here might properly be found homes for all our learned and scientific bodies.

Hyde Park thus surrounded on its four sides with buildings of the public character here set forth, and of good architecture, then this Park would be a spot in our city which even the ultra-utilitarian man would be justly proud of—

yes,

* NOTE (on revision):—The plan, which at the request of the Chairman I forwarded to the Committee, shows roughly the route in connection with my proposal.

J. H. Hunt. yes, as proud as all of us are of the harbour—while few cities could compete with us in two such fine civic features. Will it not, therefore, be a great national mistake—yea, a big blunder—to intrude into this city square such a building as proposed, with its surroundings. Do what you will with a railway station, it will be foreign to the architectural capabilities of this part of our city. On the other hand, to do anything that will prevent the future conception of what I have so imperfectly set before you, will be a positive disgrace to our intelligence, and a disregard to our trustship for our successors, who may, to our shame, ask where exists the proof of the need for destroying this city square.

10 April, 1900.

REDFERN v. HYDE PARK.

On this plan of the city I have ventured to plot down my views of the extension of the railway into the city, with extended wharf accommodation, new sites for warehouses, together with some street improvements, all of which I respectfully submit should be taken up as one study, because they are each important features, and, from a commercial point of view, in any comprehensive plan of railway or other city improvement, they should not, in the interests of the whole city, be considered one aside from the other.

It is contended—and rightly so—that a railway terminus should be near the centre of the city, but what centre—that of 1897 or that of 1997?

In 1863 I was engaged in building a block of buildings near the Exchange, the site for those buildings having been fixed upon, because at that time (thirty-four years ago) that locality was considered to be about the centre of the city, while the old post office (standing on the present site) was spoken of as "up the town." Therefore, those of us who have had many years' practical experience of the growth of this city can best bear testimony to the fact that year by year the active commercial centre of the city is tending Redfernwards, where it will no doubt permanently fetch up ere fifty years have rolled by. On the other hand, it must be remembered that our toilers for daily bread are not now all engaged in Pitt, George, and York streets, as of yore. Do we not see springing up in every direction about Redfern places of business where thousands of employeess will be speedily required: quick and easy access to the central station just as much if not more so than those of us in the north-west part of the city, where we are limited in city area, while to the south-east there is no such limit.

It will be admitted on all sides that a metropolitan station wisely placed requires plenty of space all about it, within and without its own boundary lines. This, I think, is well provided for by my scheme, which, in a great measure, is that of one of those set forth by the Railway Commissioners. The area embraced in my plan being about 35 acres taken within the station fences, while on the outside of those lines there will be a road 100 feet wide; also a large square at each of the three angles where the roads meet, the larger of these having an area of about 5 acres. By this plan the city would have for the present and far into the future ample provision for its railway requirements. In these proposed station grounds there will be about three and a half times the area of the proposed Hyde Park scheme.

To seriously compare the many and important advantages of the Asylum site, together with its ample future requirements and great capabilities as against the few and less important capabilities and restricted future requirements that this Hyde Park scheme possesses, might well be termed playing with such comparisons. Now, as against the Asylum site, there cannot be advanced and successfully supported any railway engineering or civil engineering difficulty, or any architectural or civic objections thereto, for it has not any. Whereas, with Hyde Park site, neither railway engineering combined with civil engineering skill can make it a site for a station such as this city will be demanding ere long.

The Chief Commissioner says, in answer to 464 (previous enquiry), "How long do you think the station (Hyde Park) you have proposed ought to last?"—"I should think it ought to last twenty-five years; but, as I have already said, I would rather suggest, if any further accommodation were required, that the scheme to the west of the city should be considered." On page 22 the Chief Commissioner further says, "It is absolutely necessary that the station should be on the street level. . . . It would be most unwise to adopt any underground station or anything of the kind to deal with the main traffic of Sydney." Here we have the most reliable evidence from the highest authority amongst us showing that Hyde Park is not a perfect spot for the terminus, because it will be good for only twenty-five years; while the fatal objection to it is that it is an underground station. Mark the Commissioner's words—"It would be most unwise to adopt any underground station or anything of the kind." Mr. Eddy informed the Commission that the Lancashire and Yorkshire Company had recently spent £975,000 to bring their station to street level by only a few feet.

It will be found that after the novelty of the new station has passed away which generally awaits upon new things, then the business public who are to be brought into the city from beyond Redfern, and shot out at Hyde Park, 25 feet below the street level, there left to climb up innumerable steps, and wend their way to the vicinity of Wynyard-square—mark you, the buses, trams, and cabs are supposed to be dispensed with by the adoption of this Hyde Park site—then on the homeward trip to have to climb up the King-street Hill, and of a hot summer afternoon to sit in a carriage sunk down into an excavation 25 feet deep; imagine all this, and the wail to follow, and the indignation that will be expressed for having adopted this what will be called "Dutch oven" terminus, or, on the other hand, "All-to-one-side-of-the-city terminus;" while the eastern residents will be severe in their censure for the unpardonable damage done to the Park grounds.

FLAGSTAFF HILL.

For fully twenty years past I have advocated, through the public press, a scheme for resuming the whole of the Flagstaff Hill and its surroundings to the extent shown on this plan by the neutral tint, and levelling the whole of that area down to the present level of the Circular Quay. This importantly-situated section of our city as now existing is, from a commercial point of view, all but useless to us. On this newly-formed area of the city could then be placed with great present and future advantage a truly city station at street level—in the position, for instance, shown on the plan by a red tint—with one or two underground stopping places *en route* to Redfern.

TRAMS.

I am of opinion that our Railway Commissioners are capable of serving in a most efficient manner the wants of the city people as well as the near-at-hand suburban residents, by trams traversing the city streets north and south, east and west; picking up and putting down the travelling public almost at their will, to an extent that never could be attained by a railway service for such short distances. On this plan I have indicated some extension of our tram service.

FLAGSTAFF HILL FOR WHARF AND WAREHOUSE ACCOMMODATION.

Those who are alive to the future commercial importance of this city will commend Mr. Reid for his forethought in commissioning you to take into consideration the desirableness of resuming the whole of the wharf frontages of Darling Harbour, and reconstructing that line of wharfage and improved warehouse facilities. No doubt all this will appear to some men a stupendous order; however, it is not a work to be done in five or twenty-five years. In conjunction with the Premier's project, I submit my scheme as set out on this plan for resuming the whole of the Flagstaff Hill locality, and level it down, as before stated. We could then have one line of wharf frontage from Circular Quay to the head of Darling Harbour, with an immense area for modern warehouses, thus making this important section of the city our chief seat of commercial activity.

As your Commission does not include the street question, it would be out of order in making any reference to what I have shown on this plan. It is, however, a question that cannot well stand out of the two subjects before you.

I also desire that the evidence I gave before the Public Works Committee in August of the same year should be further appended to my present evidence:—

The planning of the proposed station is, in my opinion, an unskillful piece of work, unworthy of a great terminal station for a great city such as Sydney will become. There is much in the architectural treatment of the exterior that is very pleasing.

It is a bit strange how the spirit of economy balances itself in the matter of trying to save money in an endeavour to secure park lands, and then spending money without stint in these station buildings. Pray what is the tower for?

The general planning is as bad as bad planning could be put to paper. May it never get beyond the paper stage of its existence. It is evident that the planning is the work of one brain, while the architectural treatment of the exterior is the work of one other (may I say) higher brain intellect. Spaciousness is absent in the planning, whereas it should be a prominent and ruling feature of the whole scheme, while egress and ingress should be of such ample character as to prevent the remotest feeling of want of freedom of action under the most trying circumstances, even to the demands of a double Eight-hour Day. It is, however, evident that the plan before us will not provide for the pressure of half an Eight-hour Day demonstration.

What

What is to be expected from this want of provision for ingress and egress, coupled with want of spaciousness? J. H. Hunt.
Why, curses upon curses, attended by confusion in all its glory.

I have no fear of competent contradiction of this very severe statement. I should feel myself untrue to my profession and wanting in my duty as citizen should I hold my peace with such a faulty work as is this now before us. 10 April, 1900.

I will deal with a few details. We have here marked on the plan entrance hall, and figured 54 feet x 36 feet. Now, the term entrance hall belongs more properly to domestic architecture, while the above-named dimensions are such as to be found in any fair-sized private house. Many private residences that I have built have entrance halls of larger size than this so-called entrance hall to the proposed great terminal station of the New South Wales railways—a fabric to cost over £200,000.

While its chief entrance is planned at 54 feet x 36 feet, it is made of much less practical working value by having but one opening thereto of the great span of 20 feet for the means of ingress and egress. Make no mistake about it, gentlemen, the whole of the inward and outward foot traffic to this station will have to squeeze through this 20-foot hole. And then when the crush of outward traffic has cleared the outer 20-foot hole it is even then not clear of the walls of the station, but is met by a screen-wall of the covered way, along which you have to travel more than 100 feet to the right or the left before you are clear of the station, and this among vehicular traffic in a confined space. To criticise such bad planning is enough to make a fellow use the strongest unparliamentary language.

I repeat that the whole of the traffic will have to pass through this 20-foot hole, except, of course, those who go by cab or carriage to the Elizabeth-street side of the station. There are, I must in fairness admit, two other small side entrances far away from this main one, but they are about the comparative size of a back entrance to a yard of a small villa.

Next defect, and a cardinal one, is that the station is placed in a cramped corner. There is not, and cannot be made, a proper street outlet for the going and coming traffic, not even for the present-day service, to say nothing of that of the morrow. The Elizabeth-street side of the station is of no practical use to the general public, except those going to the station by cab or carriage. Here again, in this very simple matter of providing for a cab approach, the want of knowledge in the art of good planning is evident. Why, the cab approach to the old station is far and away before this proposed new one. Coming around to the main front, we find fully one-half of its length jammed into an embankment, and retaining-walls 20 feet high or deep. This is the very worst feature about the whole scheme, and is inevitable to the site. Here, again, there is no proper or sufficient get-away for traffic to and from this the main entrance; and further, let it be clearly put before the public, the undisputed fact that there is but this one side entrance to this station, namely, Elizabeth-street. The Park side is all buried against Park ground at a depth of from 20 to 25 feet above platform levels; therefore no public entrance can be had on this side—another inevitable bad feature of this site.

To grade the surface of St. James' Road from the Queen's Statue to the level of the main entrance (a fall of about 19 feet) cannot be properly and efficiently done, even by removing the Registrar-General's offices; in any case this block of public buildings must come down, or there will be no approach whatever to the station. Here is another obstinate feature of this jammed-up site.

Stronger evidence is before us of how cramped this site is—notwithstanding it carries a high-sounding title of roominess, namely, "Twelve acres of Hyde Park"; nevertheless it is not the site for a big terminal station, because you have not the required distance from St. James' Road to Park-street to get under that street without raising up some 9 feet, which will not be permitted, depend on that. The Sydney Corporation have from time to time been cutting away at this particular part of Park-street so as to ease its grade as much as possible. To lift that street up above its original level will not be tolerated, for this is one of the main approaches to the city from the eastern side. It is just a bit too much liberty for the Railway Construction Branch to take with this principal street.

To get under Park-street at its present level, then, the station will have to be what is termed an underground station, which we all know has been condemned by the late Chief Commissioner, and to support his condemnation he told us that the Lancashire and Yorkshire Company spent close to £1,000,000 to bring their station to street-level by only a few feet. This Park scheme has these two difficulties confronting its promoters, namely Park-street levels, and the below-street level for the platforms of the station.

Here is one other objectionable feature, and one which will seriously affect the pedestrian traffic from the eastern suburbs, *via* Boomerang-street across the Park to Market-street—a traffic not to be thoughtlessly ignored by the Department; a traffic increasing year by year, which is now to be cut off by the station buildings, and shot along an overhead bridge 400 feet long, and of the capacious width of 15 feet. Double this width and you will be near the proper dimension. Are we not to utter a grumbling word as to the smoke we are to be enveloped in while crossing this overhead bridge with dozens of engines passing and repassing under our feet—for there will be no turning to the right or to the left to avoid such a nuisance. Ladies and gentlemen coming to business, wearing bright, clean, linen, will not be very presentable after walking 400 feet through smoke and moist steam. The unthinking public are having, permit me to say, dust cast into their eyes by the advocates of this scheme, while they are being misled by the arguments advanced by the Department; and not until the scheme is completed will they be able to see that they have been misled, and a big mistake made in a big national work.

One other prominent feature of defective planning is to be found in the main colonnade to the St. James' Road end of station, which is shown by figures to be 15 feet wide. Twice that width would not be too large for so important a feature. Better wipe the colonnade clean out of the plan unless it be of a proper width, and thereby save its cost. Step by step we find evidence that there is no real conception of the requirements of a big terminal station.

The evidence that has been given by the Department in the matter of protecting the rails in the deep cutting through the other section of the Park is as amusing as it is impracticable. They speak of them as "openings." This is a deceiving word. The rails passing along this deep cutting must be well and securely protected, or we will have to record year by year many serious accidents and loss of life. An accident in a deep cutting is more serious than in the open. To erect great high walls, as has been proposed, will never be tolerated, because it will give this part of the Park the appearance of gaol grounds. All this is on a par with the many other bad features of the scheme.

Mr. President, I have no hesitation in making these very unfavourable and strongly-expressed statements. They are, I think, fully warranted by the great public importance attached to the scheme.

I have no quarrel, and never have had any, with any of the departments. I am acting in this matter in the frankest and freest manner with all good-will towards those whom I am compelled to differ.

I have had a long term of practice in the profession of architecture; therefore, the knowledge thereby gained as to the fitness of these things enables me to judge correctly of what is here before us.

The evidence given by the late respected Chief Commissioner would lead one to believe that he considered Hyde Park an exceptionally fine site. I happen to know different to this.

Mr. Eddy, being a neighbour, I had the advantage of many talks on this subject while on our way home or coming into town of a morning. More than once he has told me he had no desire to go to Hyde Park, except on the score of saving money. During one of these conversations, about the later part of his first term, he said, "If the Government vote me the money required, I will make at Redfern, in conjunction with the Asylum site, one of the finest stations in the world."

It is proposed to place in the Park a terminal railway station jammed up on one side by a bank with a retaining wall of 22 feet, which can never be of use for railway purposes. We then have to negotiate the levels and the grades of what is now called Queen's Square. It is impossible to grade that street and bring it into other streets, and give a proper outlet or inlet for passengers in that cramped up corner. If we carry out this scheme thousands of pounds will be squandered in making it right again. Look at the North Shore line. That work is now being pulled to pieces, all through want of forethought. If the station is built on the site proposed the whole of the Park will certainly have to go, and even then it will be a bungle. The site is as unsuitable as it can be, while the No. 10 scheme is just as bad. With regard to the Devonshire-street scheme, I look upon it as one of the most unskillfully prepared designs for a station which could well be made, and that on a grand site. I hope the Committee will pause before recommending No. 10 scheme, or the St. James' Road scheme. We must preserve Hyde Park for the erection of public buildings all round it, to be, in fact, a city square.

WEDNESDAY,

WEDNESDAY, 11 APRIL, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.JOHN CHRISTIAN WATSON, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Edward Johnstone Sievers, Government Land Valuer, Department of Public Works, sworn, and further examined:—

E. J. Sievers. 4368. *Dr. Garran.*] Yesterday you promised us some additional or more precise estimates with regard to
11 April, 1900. Mr. Norman Selfe's scheme and No. 10 scheme? Yes. In regard to No. 10 scheme, I desire to amend the figures I originally gave. I put in the following statement:—

CITY RAILWAY.—No. 10 Scheme.

Government property, including a strip 80 feet in depth of Hyde Park, from Liverpool-street to St. James' Road, also Supreme Court, Registrar General's Office, Carter's Barracks, and High School, say	£300,000
Private lands, business interruptions, &c.	540,000
Total	£840,000

As amended—

Inclusive of the whole of the private land required for No. 10 scheme, but excluding the tail fronting Sir John Young's Crescent, Doinain, but taking a depth of 140 feet of Hyde Park, between Park-street and St. James' Road

£860,000

Or a difference of

£20,000

The reason I have increased the estimate is because I find more of the Park is taken than I originally thought.

4369. Have you separately valued the strip in the south-west portion of the Park? Yes, that is included in the £840,000. I put it down at about £110,000.

4370. What about the strip of the Park which, under the St. James' Road scheme, would be taken between Park and Elizabeth-street? That is about 760 feet, and it will be worth £35,000.

4371. *Mr. Watson.*] In No. 10 scheme, do you include the strip along the western edge of the Park between Park-street and Elizabeth-street? Yes.

4372. *Dr. Garran.*] What will be the value of the station yard between Park-street and St. James' Road? About £130,000.

4373. You estimated it at about £200,000 some years ago? Yes; but in the light of recent sales in the locality I have amended that calculation.

4374. If the St. James' Road scheme is carried out, the portions of the Park to be taken will be worth about £165,000? Yes.

4375. I asked you yesterday if you could give me a rough estimate in regard to Mr. Deane's West Sydney line. I find that a large portion of that line will be on elevated piers;—will they interfere with the value of the property beneath? I understand that we shall not interfere with the buildings.

4376. You might go over a man's cottage without hurting it? Yes; but if he wished to build, say, ten more storeys upon it we should not be able to go over it for nothing.

4377. Then, at present, it is impossible to value the cost of that line? Yes; from the data I have.

4378. When that line gets into Market-street it goes into tunnel? I think you could assume that it would be more expensive than Mr. Norman Selfe's scheme up to that point, assuming that the land has to be taken. It must be remembered, however, that the land is capable of resale, so that one would be safe in assuming that it would cost about the same as Mr. Selfe's line up to the Town Hall.

4379. Would Mr. Deane's estimate be as high as Mr. Greenwood's? I do not think it would be less than Mr. Greenwood's, and it probably would not exceed Mr. Selfe's, whilst it might be a good deal less.

4380. In the revised estimate you have made in regard to the Park land, you have taken into consideration the fall in the value of land? Yes. I have revised Mr. Norman Selfe's scheme, and I put in the following statement in regard to it.

CITY RAILWAY—NORMAN SELFE'S SCHEME.

REVIEWING the estimates on page 74, the gross cost of the route from Redfern Station to Wynyard-square, estimated at £500,000, may be assumed to be fairly reasonable, provided Mr. Selfe's contention, that he can tunnel and underpin the properties between Market-street and the Square is borne out	£500,000
7½ acres of "The Rocks," bounded by Essex, Cumberland, Harrington, and Argyle Streets, estimated by Mr. Selfe at £220,000, I think could be secured, including 10 per cent. forced sale, for	165,000
Approach from Wynyard-square.....	114,000
Excavation	66,000
Total	£845,000

Regarding the proposal to resume 30 acres of "The Rocks" with a view to levelling the land, creating a large terminal station, and extending George-street 100 feet in width, I find that an error has crept in as to the number of feet frontage which might be realised upon. Instead of 3,000 feet, Mr. Selfe's figures should be taken as to read 2,000 feet. (The plans have been amended so many times that this is understandable).

In my opinion the resumption of the 30 acres estimated by Mr. Selfe, to cost £812,500, would be obtained for, say, £750,000.

As to the resale, I do not think that the diversion of business interests from George-street North, as now existent, would immediately follow the new street. I am, therefore, of opinion that instead of £150 per foot, £70 per foot would be a closer estimate.

Therefore

Therefore, revising Mr. Selve's figures, I think a nearer approximate would be :—			E. J. Sievers.
Value of 30 acres	£750,000		11 April, 1900.
Mr. Fowler's estimate of excavation	120,000	£870,000	
Deduct—			
For resale of land	£140,000		
Value of route for North Shore extension	75,000	£215,000	
		£655,000	
Actual cost of 20 acres to be utilised		110,000	
It will be noted, too, that Mr. Selve utilises approximately five-sixths of Wynyard-square, the value of which to-day may be set down at			
I understand, too, that there is a proposal before the Committee delineated on plan No. 26 to construct a central station and a terminus for the North Shore line, in the future, at Wynyard-square having, approximately, an equal area to that obtainable at Hyde Park. For this the additional cost would be			
inclusive of forced sale and business interruption. 520,000			
The cost of securing the land at Eveleigh for the improvement of the station approach may be set down at			
96,000			
<i>Summary.</i>			
Red scheme	£845,000		
Additional cost of Blue scheme	430,000		
Making total cost of Blue scheme	£1,275,000		
Wynyard-square to be added	110,000		

I may mention that I asked Mr. Selve if he had not made a mistake in having 3,000 feet frontage, whilst I had only 2,000 feet frontage. He admitted that he had. That took off £150,000 at once.

4381. Do you think a line through West Sydney will cost more for land resumption than one through East Sydney? Yes; if you terminate at "The Rocks."

4382. There is a desire on the part of some people to press the point that as the population lies to the west, the railway should go to the west. I want to ascertain whether the extra cost of the land would be in proportion to the extra volume of population on that side? I do not see any way of devising a cheaper scheme than under the figures I have given.

4383. You know the land in West Sydney? Yes.

4384. Do you think any improved route could be laid out? I do not think so.

4385. *Mr. McFarlane.*] How do you arrive at an estimate of the value of the additional 60 feet in Hyde Park? I have assumed that it will be of less value than land with a frontage. Anyone dealing with 140 feet would make arrangements for a frontage. I thought that, in taking it out of a public park, it should not be assumed to have no street frontage; otherwise it would be worth less money. I think we ought to assume that it would be dealt with as anyone else would deal with it.

4386. You have assumed that it should have a frontage? Yes.

William Sandford, Lithgow, sworn, and examined :—

4387. *Vice-Chairman.*] You are the proprietor of ironworks at Lithgow? Yes.

4388. Have you given attention to the question of extending the railway into the city? Yes; as a traveller of many years standing. I have had an annual season ticket over all the railways in New South Wales for many years. For eight or nine years I have travelled over the mountains to Lithgow on an average forty times a year. I travel occasionally to Queensland and Victoria. When a traveller arrives by an early morning train, between 5:30 a.m. and 6:30 a.m., he has, as a rule, to get into a cab, and drive to an hotel, and it is very inconvenient. During the last fifteen years I have been four times to Europe. I have travelled through America, and on three occasions from Naples to London. Arriving in Paris I have experienced the greatest inconvenience in having to drive from one station to another. When you get to Dover the inconvenience is repeated. All these things have occupied my mind, and have brought home to me the inconvenience which passengers experience on their arrival at Redfern Station. I have come to the conclusion that the best site for a railway station in Sydney is King-street. The neighbourhood of King-street is the home of the business life of the city. I will give an illustration of the inconvenience of the present system. Crowds of men desiring to travel to Melbourne, or to other distant places, rush upon the station platform at the last moment. If they could have got into the trains at King-street, they would have saved a considerable amount of time. Under Federation, everyone's income is likely to be doubled. That being so they will have plenty of money with which to travel, say, to the mountains; and we must look ahead to the increased traffic. I have discussed this question with 90 per cent. of the passengers who travel up and down, and they are in favour of having the railway station at, or as near to, King-street as possible. Again, we want the extension, not in tunnels, but in open daylight. There are occasions when we are detained in the Eveleigh tunnel, and it is very unpleasant. In the old country the railway people endeavour to avoid tunnels. The extension should come as near to King-street as possible, and we should do away with the existing nuisance at Hyde Park. I consider that it is a great nuisance that one portion of the Park, at any rate, should be occupied by those by whom it is occupied at present. They could easily move into the Domain, and we could utilise that part of Hyde Park for a terminal station. There is plenty of room for such a station at King-street. We require eight lines of rails, and plenty of space between the platforms. I would cover in with glass nearly the whole of the space between Elizabeth-street and St. Mary's Cathedral. What could not be used for a railway station at once, could be used for the trams, and a space could be utilised for long-distance travellers who have to wait for their trains. The more comfort and better accommodation we give the people the better the traffic we shall get. I have had a great deal of business with the railways. If I want to get to the Comptroller of Stores at Eveleigh it occupies me fifteen minutes. If I want to see the Superintendent of Tramways at Randwick it occupies me half-an-hour. If I want to go to the goods sheds it also occupies a long time. It also takes me half-an-hour to get to the Chief Mechanical Engineer. If we had one large station in the city the whole of the Departments could be housed in it, and the result would be a great convenience to business people. From the King-street station we should have electric trams along Macquarie and other streets to Circular Quay.

W. Sandford.
11 April, 1900.

- W. Sandford. 4389. You seem to regard the extension into the city mainly from the view of long-distance travellers? No. I was staying during one winter at Strathfield, and I know the inconvenience caused to people coming from the suburbs. Business people have to calculate minutes. I consider that the people should be brought from the suburbs to the business life of the city.
4390. The suburban traffic will, of course, form the bulk of the traffic which will go over the proposed extension, and which will help to pay? There is also a large through traffic from the west, north, and south. To make the traffic pay you require a number of trains, and no interchanging.
4391. It is a part of our duty to consider the financial aspect of the proposal, and we have evidence which seems to suggest that if a station were erected at Hyde Park or King-street, we would not get the bulk of the suburban traffic into the city, but that it would go by the electric trams down George-street; No. 10 scheme will practically cost £1,500,000; a matter for consideration is whether, under that scheme, we should obtain the whole of the suburban traffic;—have you considered the question of the eastern as against the western extension into the city? I have. People want to come into business, to the theatres, to Parliament House, to the lawyers, and to the doctors, and could they have anything better than King-street as a railway terminus, with tramways extending from it. If I were a resident at Strathfield I should certainly prefer the King-street site.
4392. Supposing it were possible to have a station somewhere near the new Markets, do you think it would convenience a larger number of people than one situated at Hyde Park? No.
4393. Do you know that out of every thirteen persons now alighting at Redfern, per day, twelve go by way of George-street, as against one by way of Elizabeth-street? There is no argument in that, because the steam tram along Elizabeth-street does not travel so quickly nor so frequently as the electric tram. The bulk of the passengers by the electric tram to the railway station, get in at the Post Office, and that neighbourhood. If they could go direct from the suburbs to King-street they would do so. If they could do that not one-fourth would travel by the electric tram, as they do now.
4394. You consider that there is little doubt that the main suburban traffic would, if the line were made to King-street, come to King-street? I do.
4395. I also gather that you consider that the King-street extension would suit the long-distance travellers because of its proximity to the large hotels? Yes, and to places of business. I may mention that, on Mondays, a train arrives from the west at a little after 4 o'clock, and at that hour every minute is valuable to business people. I consider that King-street will always be the centre for people wishing to come to the hotels, and to the greater proportion of the places of business.
4396. A large number of travellers who come from a long distance to Sydney do not wish to go to any of those places, but to their homes;—do you think King-street or Hyde Park would be as central for that class of passengers as would Redfern? At present a great number get out at Strathfield and Ashfield. If, however, you had a station at Redfern, anyone living, say, at Paddington, could take a cab home. Nevertheless, King-street would be the terminus for the great number who travel on the Western, Southern, and Northern lines.
4397. Your idea, then, is to utilise the whole of the northern part of Hyde Park? I believe it would pay to do so. Let the Commissioners pay so much for it, and convert it into a sort of Crystal Palace. Personally, if I had anything to do with the railways, I would try to buy the whole of the Park, and make it a suitable place for visitors, especially in the winter.
4398. *Mr. Shepherd.*] Is it not a fact that persons coming from the country usually have portmanteaux, or something of that kind, with them? Yes.
4399. And at whatever point they get out they, as a rule, take a cab? That is the question. I do not do so myself. I use the tram to the "Métropole."
4400. It would not make much difference whether they took a cab at Redfern or King-street? You will find that, if the extension is carried out, a large hotel will be erected pretty near the railway station. You would find the hotel porters ready to meet you at the terminus, and you would not require a cab.
4401. *Dr. Garran.*] Do you not sometimes find hotel porters and their vans at the station now? Sometimes; but the system is not satisfactory. You would have to take a cab from Redfern to the "Australia Hotel."
4402. Can you not take the tram? There is the getting in and out of the tram.
4403. But that would not be likely to kill a man? I look at the matter at the point of view of saving time.
4404. Is it a greater exertion to get out of a train into a tram than to get out of a train into a cab? You would have to get out of the tram at the other end, and passengers, as a rule, have little things with them, which they have to carry.
4405. But you would have to get out of a cab at the other end as well? Yes; but the matter of saving time is of great importance.
4406. *Mr. Shepherd.*] Do not some of the hotel people have their porters at the railway station now? The "Métropole" people do, and they charge pretty stiffly for their services.
4407. We have had evidence to the effect that the Redfern station would convenience fully 80 per cent. of the country travellers visiting Sydney;—do you think that statement is correct? I do not.
4408. An extension to King-street would convenience those wishing to go an easy distance from that spot, but it would not convenience a very large proportion of the passengers to the city of Sydney? I think it would. I do not see how the Redfern station can possibly convenience 80 per cent. of the country travellers. If that were so, the passengers with whom I have conversed would have expressed themselves to that effect.
4409. The great object of the railway authorities in extending the line to Sydney is to suit the suburban rather than the country traffic; if that is so, would it not be best to select some spot as a terminus which is nearest the largest number of business people? Yes; and I think King-street is the spot, and that it will suit the largest number of business people.
4410. If your place of business were in George-street, do you think you would be likely to come to King-street by train, in preference to coming along George-street by tram? If my place of business were in the Equitable buildings, I should come to King-street.
4411. In connection with the proposed extension, there is no intermediate station between Redfern and King-street? Personally, I should like to see one at Liverpool-street.
4412. On the eastern side of the city there is nothing, until you get to Woolloomooloo, to be served by the

the King-street scheme; under those circumstances, do you consider that King-street is the most central spot which can be reached? Yes; the trams even now go from King-street to Woolloomooloo, Darlinghurst, and beyond.

W. Sandford.
11 April, 1900.

4413. One of the schemes before us is what is known as the Asylum site scheme for a terminal station;—do you not think that the convenience of the passengers from the suburbs would be served by having a large station there, and an extended system of electric trams running down the various streets? No. The home of our lawyers, doctors, stock exchange and business people generally, will always be about and beyond King-street. Our Houses of Parliament will also be beyond King-street. There will be no commercial life around the Asylum. The Chamber of Commerce and the Chamber of Manufactures will not be there, and the business life of the city will not be there; it will always be between King-street and Circular Quay.

4414. Do you not know that the great mass of business people in Sydney are between Pitt-street and Sussex-street; directly you come east you get into Castlereagh-street, where there is not a great deal of business carried on;—does not that fact indicate that between Pitt-street and Sussex-street lies the chief portion of the city to be served by any system of railway extension? No. The electric trams, of course, work at present in connection with the railway, and the bulk of the passengers who travel to the railway board the trams about the Post Office.

4415. We have evidence to show that the majority board the trams between Market-street and the Post Office? I consider that, in addition to the suburban, the mountain traffic and other long-distance traffic should be considered. That traffic is an increasing one.

4416. The bulk of the evidence we have is to the effect that the country travellers would not be so inconvenienced by an extension of the line as would the suburban travellers? I can only speak of an experience of thirteen years' travelling, and I say that 90 per cent. of those with whom I have travelled are in favour of the King-street extension.

4417. I admit that the King-street extension would be convenient to people whose business is within the bounds of Market-street, Pitt-street, and Hunter-street; but nine out of ten people would take the tram in preference to coming to King-street by the railway? I beg to differ with you on that point. If you were a traveller from the Mountains you would arrive at a different conclusion. The hotel life of the city will always be in the neighbourhood of the "Métropole," the "Australia," and the Post Office. Most of the sharebrokers and other people are also in that neighbourhood.

4418. Do you not think that the Redfern station is as central as is the Spencer-street station, Melbourne? No; there you are within a minute's walk of a very large hotel—the "Federal."

4419. Spencer-street station is on the outside of the city, and so is the Adelaide station? I think it is acknowledged that it is a mistake that it is so. You may depend upon it that there will be a great traffic in the future, and that Sydney will become a second London.

4420. Of course, we cannot compare Sydney with London in regard to railway accommodation? If the London people could go back to the time when they made their first station they would not stop at Paddington, but would come into the heart of the city. The result is that they have spent millions of money in connecting their various stations by means of the underground railway. It is acknowledged by railway managers that we should go as near to the business life of the cities as possible.

4421. Are you acquainted with Mr. Norman Selfe's scheme? I have read of it, but it seems to me that New South Wales cannot afford at present to pay the enormous amount for resumption which we shall have to pay, especially if we can get a railway at a cheaper rate.

4422. Is it not considered that the cost of Mr. Selfe's scheme is in excess of the cost of the Hyde Park scheme? It is, so far as resumption of land is concerned.

4423. I think you will admit that the Market is a more central position for the business population of Sydney than the top of King-street? There is no room for a station there. It would do very well for a branch, or a suburban line station, but it would not do for a terminus.

4424. Then you are of opinion that Hyde Park is the best point to which to extend the railway? Yes. You will get a return for your money almost immediately from the adoption of that scheme, and you will not have to pay a large amount for the resumption of land. The finances of New South Wales do not, at present, justify a great outlay of money, and we should obtain a piece of land for which we should not have to pay an excessive amount.

4425. Do you not think that any system of extending the railway into Sydney ought to be considered in connection with the ultimate extension from North Shore? We have the electric trams to the Quay already, and we should convey our passengers over by steamer. If necessary, I would have steamers large enough to take the trams upon them, so that passengers need not change their seats. I may mention that the bulk of the passengers coming from the North Shore line do not go from Redfern by train. They simply come to the city. If they require to travel north, they can join the northern trains by means of the communication at present in existence.

4426. We have a plan before us by which North Shore can be reached from Hyde Park; in order to do that it will be necessary to go back beyond Elizabeth-street, and, by a circular route, reach Dawes Battery; do you think that would be desirable? No. I do not think the traffic would justify it for many years. You could accommodate the traffic in another way. We should treat North Shore in the same way as we treat Darlinghurst and Darling Point. North Shore is not a terminus for traffic—it is simply a suburb. If there were a bridge over the Harbour we could carry our electric trams over it, as is done in Brisbane. Personally, however, I contend that we should not have a bridge across the Harbour. The largest ships afloat should always be able to come up the Harbour.

4427. *Dr. Garran.*] You know that the Hyde Park scheme deals with a very limited area of land? I suppose the Commissioners did not wish to frighten the people by stating their intention of taking any more of Hyde Park at first.

4428. The site you decried—the Benevolent Asylum—gives us 22 acres of land, upon which we could make a station equal to all requirements? I do not see what is to hinder us from taking more of the Park.

4429. The advantages you mention in regard to King-street exist so far as the professional, Parliamentary, and club people, and a large number of those who have their places in Elizabeth-street and Castlereagh-street are concerned, but the people west of George-street say that a line in that direction would suit them better than a line to Hyde Park? Yes; but what about the other people.

4430. To accommodate all, we should require two extensions? We should accommodate the largest number.

W. Sandford. 4431. Is not the largest number to the west; it is stated that the George-street electric tram has captured twelve-thirtieths of the railway passengers to Sydney:—do you think that if we extended the railway line to Hyde Park, it would recapture them? Certainly. Of course I assume that we shall have electric trams through every principal street.

11 April, 1900.

4432. That raises the question whether we could not have electric trams from the extended station at Devonshire-street? I think the Committee ought to consider the large number of business people who travel from the Mountains and other places. The business people are the life-blood of any country.

4433. The basis upon which the profitableness of the extension exists rests on the original assumption that a railway to Hyde Park will continue to keep the whole of the passenger traffic which formerly got out of the trams at Park-street and Market-street; since the George-street tram-line has been opened, we find that the people do not now come along Elizabeth-street; I should therefore like to know whether the calculation that we should receive the additional penny from the whole of the suburban passengers is a good one? Yes; because those who were not carried to King-street would be carried from Redfern by the electric tram.

4434. But at present we get the additional penny fare without any additional outlay; in order to get the additional penny from the business people about King-street, we have to spend nearly £900,000? As a business speculation, I should certainly come down to King-street.

4435. The profitableness of the extension depends upon our keeping the people in the carriages until they get to Hyde Park? If I were the managing director of a railway company, and had this scheme before me, I should tap King-street for the traffic, notwithstanding the existence of the electric trams.

4436. *Mr. Watson.* With regard to the undesirability of tunnels, I should like to know what was the principal undesirable quality you noticed in the tunnels of the metropolitan railway, London? The stifling feeling arising from the smoke and fumes.

4437. I take it that the greater part of the objection to a tunnel is in regard to the smoke and fumes which an engine gives off? Yes; of course it is not noticed to such an extent when the trains are travelling fast.

4438. Do you think that the same objection to tunnels would exist if we had electric instead of steam traction? No; not with proper ventilation.

4439. From what is going on in America, it would appear that electrical traction is being applied not only to trams on the surface of the street, but also to concentrated suburban traffic? Yes. They have electric motors in America; but so far they have not been a success. Otherwise, I would have suggested that all suburban traffic in and out of Redfern should be conveyed by electric motors.

4440. Would you care to offer an opinion as to whether electrical traction for that class of traffic is within reasonable distance of being adopted? I would not like to say until the experiments which are now being conducted with regard to electric motors have been carried a little further.

4441. It has been suggested that if it were found advisable to adopt electric traction for the suburban area of our railways, it would put a new complexion altogether upon the city extension, as it would permit of tunnels being used without much objection, and would thus avoid the necessity for land resumption;—would that view of the matter in any way alter your opinion as to the desirability of going to Hyde Park? No; because I would have the electric traction through the streets above ground. The overhead railway in New York is a great convenience. All the railway managers in London avoid tunnels for the suburban traffic as far as possible. Tunnels, where electric traction is used, are less objectionable than where steam engines are used.

4442. Anyhow, it would put a new face on the possibility of dealing with suburban traffic if electric traction were found practicable? I admit that.

4443. The great majority of the country travellers who come to the city—leaving out the semi-country travellers who visit the Mountains at the end of every week—generally have to go to an hotel, or to the residences of their friends in the suburbs;—would it make much difference to them whether they came to Belmore Park, or to King-street? I think so, because the bulk of them would go to hotels. Take the people who are coming to the Show. The bulk of them will go to the various hotels, most of which are situated between King-street and Circular Quay.

4444. Can you say that most of them are situated between Circular Quay and King-street, when there are only the "Australia," the "Oxford," the "Métropole," and the "Empire"? And a large number of others.

4445. If a man wanted to go to "Petty's Hotel" he would require to take a cab from a station at King-street? Yes.

4446. The same remark applies to the "Royal Hotel" and the Grand Central Coffee Palace? Yes; but in that case he would only pay 1s. instead of 2s. as at present.

4447. Take, again, the case of a man who got out at King-street with a bag, and wanted to get to the "Métropole";—I suppose he would sooner take a cab than walk? Yes; but the question of the saving of time again comes in.

4448. What time do you calculate a man could save, as between the Benevolent Asylum scheme and the King-street extension, if he wished to get to the "Métropole"? Eight to ten minutes.

4449. Of course, you are aware that a man has not now to wait so long at the railway station for an electric tram as he had to do when the steam trams were in existence? I am aware of that. That, of course, applies to suburban people who are coming in and out every day, but it would not apply to men who have luggage. It would take them a certain length of time to collect it. Again, the trams along George-street do not go near the "Métropole" or the "Australia" hotels.

4450. You do not regard Hyde Park as of moment to those who use it at present during the day? They could go a little further away—to the Domain. At present they are a nuisance. I consider that if we bring the station to Hyde Park, people in future years will say that it was the wisest thing to do, because of the facility it would afford for further extension of the station.

THURSDAY, 12 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LYNDESAY CRAWFORD SHEPHERD.
 THE HON. ANDREW GARRAN, LL.D.
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Norman Selfe, M.I.C.E., sworn, and further examined:—

4451. *Chairman.*] I understand you have a written statement, which you would like to read, in reply to the comments of the Government officials on your scheme? Yes, as follows:—

N. Selfe,
 M.I.C.E.

REPLY TO MR. DEANE'S CRITICISM OF THE CITY RAILWAY SCHEME PROPOSED BY NORMAN SELFE, MEMBER INST. C.E. 12 April, 1900.

MR. DEANE'S remarks on this scheme are set out in his evidence on pages 163 to 165 of the Proceedings of the Committee, and are summarised in a paper which has been handed to me by the Secretary (Mr. Lyne). I find they may be considered as forty-five separate objections, and I presume they include all that can be urged against my scheme.

It should make me extremely proud to find that this scheme (promulgated by me, at my own sole cost, and through long years of careful attention to the requirements of my fellow citizens), now stands on a more solid foundation than ever, inasmuch as Mr. Deane, assisted by Mr. Parry, has not been able, after exhaustive criticism, to urge one valid or substantial objection to it. Nothing is now said by him, as was done in 1891, as to the conveniences which it will afford to the public; but at the same time no attempt is made to deny the fact that this Western Scheme looks further ahead, and, in view of extensions which must come in the immediate future, will ultimately be far cheaper than any of the official proposals. While forty-five minor objections are certainly brought forward, many of these objections are based on an entire misconception of what the details would be like when working plans are got out; others rely on a too hurried interpretation of the outline plans already prepared; while many altogether beg the questions they are supposed to settle. Taken altogether, they seem to me like objecting to live in a princely mansion because you dislike the colour of the front railings.

I now proceed to deal with Mr. Deane's criticism of my proposals for City Railway. His criticisms commence with section (2).

Objection (1).

Says—"This would necessitate the reconstruction of the Wells-street bridge and the Eveleigh platforms in part." "The bridge would have to be raised about 6 feet." These statements include the first of a long series of exaggerations.

Reference to the drawing shows that the points are placed 250 feet from the north side of the Wells-street bridge. With a rise of 1 in 70, it is certain that the ascent would be about $3\frac{1}{2}$ feet in that length, and not 6 feet, as stated.

Mr. Deane does not explain that only a very small part of one of the platforms would have to be altered, and that at one end only, in order to allow the Darling Harbour branch to come in. Neither does he say that when the scheme is worked out even that may easily be got over. He often makes such a remark, however, when difficulties on his own plans are pointed out. As the question of grades crops up in several of the objections, I propose, instead of replying piecemeal, to deal with them more fully when dealing with No. 10 Objection. I will only say here that before making the plans I had it from the best authority that 1 in 60 was common on the railways near Sydney, and I know that the Government is inviting tenders for a railway bridge to North Sydney, the permissible grades on which are 1 in 36.

Such being the case, why, I ask, should I make a difficulty about grades of 1 in 70? So far as my scheme is concerned, it is simply a question of a little more expense in some cases, and no extra expense at all in the city itself, to get as easy as 1 in 100. It is actually 1 in 90, and not 1 in 100, running into Redfern now, and when that is improved, then 1 in 100 may possibly be made the railway grade for the city extension over the whole western route.

Objection (2).

"Cleveland-street bridge would have to be constructed at a higher level." As it is part of the whole scheme although a non-essential as far as route is concerned, to remove the present obstructive tunnel, and give the Commissioners the greater room which Mr. Eddy and Mr. Parry have so clearly shown to be necessary, it is of very little moment that the new bridge would be made a few inches or feet higher than the present one. When the sketch plans are supplemented by working drawings, then will be the time (and it will be worth the while to do so) to consider whether the streets in this locality cannot be carried under the railway lines, as Mr. Deane proposes to do with Devonshire-street.

The objection, as it stands, is simply a statement; it cannot be treated as an objection at all, because the cost is allowed for in the estimates.

Objection (3).

"The altered grades run into the terminus and would extend a considerable distance towards the station platforms, and would necessitate the reconstruction and the regrading of the whole of the goods and passenger sidings in Redfern station yard." Now, the proposed new grade terminates half-way between the rear end of the present station and the tunnel, say 600 feet from the tunnel and 1,000 feet from the front end of the present platforms; it is therefore an unwarrantable exaggeration to say the whole of the goods and passenger sidings would have to be regraded and reconstructed on that account, because it is clearly evident that the greater part of the yard is on the unaltered level.

The evidence of Mr. Parry shows—Question 265, 15/7/97—"That, in the interests of good management, it is necessary to remodel the roads in that yard, and that a great surplus of points and crossings would have to be taken out with improvements carried out." He also makes it clear—Questions 290 to 322, 234, 24/2/97—that things are very bad now under the antiquated condition of things which exists at Redfern. When a proper approach is provided the Existing Lines Branch and the Interlocking Engineer will have an opportunity to make a model station yard at Redfern, although the principal part of the interlocking will not be affected by the new grades proposed, for a special reason.

Objection (4).

This statement is as follows:—"The Chippendale school site and a portion of the Wesleyan Church would have to be resumed." I cannot answer this, unless I know what the extra ground is wanted for; but I cordially support the suggestion (if suggestion it is), that while the improvement of Redfern is taken in hand, it might be a good thing to spend another £20,000 and have the church. The school is provided for in the estimates. The plans clearly show that the church addition is not an essential at present in order to get a proper turn-off to the city lines.

"Considerable alterations would have to be made at Eveleigh to make connections between the running-sheds and the new set of lines to the Darling Harbour branch. In fact, it is doubtful if the latter could be connected at all, or any of them satisfactory." Now, Mr. Deane must admit that the main lines run through Eveleigh, and have connections with the running-sheds. He can see by plan 6, that the city lines can get in to the running-sheds, and he must admit that he is able to plan any number of cross-over roads between the Darling Harbour lines and the city ones because they run parallel to one another. What then is the meaning of the paragraph as it stands? When Mr. Parry was asked (questions 358, 359, and 360, 25/2/97), as to the present connection of the Darling Harbour lines being satisfactory, with the projected improvements for a terminus, he gave three evasive answers, for the reason that he had already shown that the connection ought to be further back. It was largely on account of the very clear evidence which Mr. Parry and Mr. Eddy gave as to the present difficulties that I make proposals for removing them.

N. Selfe,
M.I.C.E.

12 April, 1900.

Objection (5).

"The line to Mortuary station would be on a different level, and for the transference of engines and carriages it would be necessary to run back to Eveleigh." Both statements for once are quite true, and both are in exact accordance with the Commissioners' expressed desires. Evidence already given shows that they object to trains like those from Darling Harbour and the Mortuary station meandering all over the Redfern yard in front of ordinary passenger trains. (See evidence page 21, 366).

Under the proposed Hyde Park scheme it is intended to run return empty trains right back again to Redfern yard; but with a main signal-box at Wells-street, where every train would be put upon its own road, all such meandering of the trains over the place, as led to the great accident in the year 1891, will be done away with.

It must be admitted here, however, that the Mortuary building is the one redeeming feature of the Redfern terminus. It is an exquisite little piece of architecture worthy of a better position, and it should be removed if possible. The alternative plan No. 19 (which Mr. Deane does not appear to have seen) shows how the whole re-modelling of the new terminus and the city branches can be much simplified and cheapened if the Mortuary station is removed from its present position.

Objection (6).

"Connections between the city lines and Redfern yard can only be made by going back to Eveleigh."

This is again quite correct, and if it was on an official proposal, instead of on an unofficial one, it would be pointed out as the great merit of the scheme, because it gets over the present troubles, and the risk of accidents due to crossing at the immediate rear of the terminal platforms. When such objections are made to features specially introduced in order to obviate the difficulties in the present working so forcibly pointed out by Messrs. Eddy and Parry, it shows one of two things—either the different branches of the Railway Department hold different opinions on the matter, or else it is an evidence that any proposal from outside must be condemned, and at any price.

If the Railway Commissioners prefer to retain the present system, as it exists at Granville and is now being perpetuated at Strathfield, of crossing main lines on the level, then it is obvious that it can still be retained on my scheme. If the city lines, "fast and slow," are arranged so as to get on to the main fast and slow on the level, then the causes of nearly all the objections so far dealt with would disappear, and the cost of my scheme would be much reduced. Such level crossings, however, would not be allowed by the Board of Trade in London, and I did not see why Sydney should not profit by English experience, hence I proposed the better arrangement shown by the plans.

Objection (7).

"Signalling and interlocking arrangements would have to be altered, and the Darling Harbour connection with Redfern yard would have to go back to Eveleigh." The first part of this has been answered in the reply to Objection (3), and the latter part in answer to Objection (6). After the very clear statements of Mr. Parry in reply to Question 318, 24/2/97, and elsewhere, as to the restriction caused by the connection of the Darling Harbour lines, and also his statements in Questions 2428 and 2429, 12/8/97, that it was a feasible proposal of mine to take the Darling Harbour branch to the south of the tunnel, and that it would facilitate the working of the traffic; and also his remarks in 265, 15/7/97, about removing points and crossings—it is most unkind to keep on objecting to a proposal for giving the traffic management the very accommodation they have shown to be imperative. They say, "The present Darling Harbour points are too close," and when I propose to give them a little more room than they say "they are too far away."

Objection (8).

The next paragraph I cannot understand. As printed on the paper handed to me it reads—"It is evident that provision must be made for storing suburban trains either south of Eveleigh or somewhere on the new set of lines, so that the space at Redfern could not be utilised." This passage is probably a misprint; it conveys no meaning to me, and I cannot fathom the intention. I will simply point out to the Committee that a very brief inspection of the plan will show that as return empty trains come up from the city lines they can, if required, get on to the Redfern main lines at Eveleigh, and go into sidings at Redfern or Eveleigh. All the principal roads would be controlled from a main signal-box at Wells-street, therefore any accident which involved the personal equation, such as that already referred to, would be impossible. If the Hyde Park trains have to run all the way back to the tunnel points to get to the Redfern sidings, it is a very small matter for trains on the Western branch to get to them also, and they do it without running through the terminus, like the Hyde Park trains.

Re Goodlet & Smith's yard, I admit my words, in giving evidence, are not as clear as they might be, though no railway man ought to misunderstand them for a moment. I had no particular intention of shunting trains in this yard, but intended it as an engine yard for coal and water. The traffic officers will easily see that with the Markets as a terminus for some trains (either permanently or until the extension is made to Wynyard-square), an engine could follow an "up" train into the Market station from this yard, and be coupled up ready to take it out again before the train had discharged its load. The in-coming engine could either follow the train out on the same line and shunt into the yard, or shunt first north of Market-street, and then go back to the yard on the other line. (See Plan 20.)

Objection (9).

"The estimate of cost seems to be inadequate." "The plans are not sufficiently definite in detail." About cost, I shall show in another place that when compared with Mr. Deane's estimates I have been much more liberal than he has been, and it will be better to deal with the estimates together. The remark about the insufficient plans is a most unkind rub, seeing the very great expense I have been put to, and how my plans make plain to the most unprofessional eye how great will be the gain to the city, as compared with the desecration contemplated under other schemes. I cannot conceive what Mr. Deane would like me to do, and I submit to the Committee: Could I be expected to provide a more elaborate section than No. 5, which is here complained of?

I have put down for my cut-and-cover tunnel under George-street, £150 per yard. Now, on looking over Mr. Deane's evidence I have found that for his much more difficult tunnel under buildings, from King-street to the Domain, he only allows £137 per yard. (See Questions 56 and 65 of the present inquiry.) It is the same thing, I believe, all the way through, that my prices are higher than Mr. Deane's.

Objection (10).

This is a long and far-fetched complaint about the grade of 1 in 73 for connecting the city lines. It contains several statements which are not justified by facts, and when looked into will be seen to beg the whole question. Mr. Deane says: "It is clear that as money has been spent to provide grades of 1 in 100 on the suburban lines, to work the city lines with a gradient of 1 in 73, either the train loads must be reduced, or a completely different set of powerful engines must be purchased for the purpose of taking the same length of train." I am sure Mr. Deane has been dreadfully worried over this city railway inquiry, and I do not want to worry him more; but he must pardon me for pointing out that what I have quoted above is all rubbish, because there is another alternative which he forgot to mention—he should have added, "or the trains will have to go a little slower over the steeper grade."

Now, no one really believes it is intended that heavy long distance trains with the most powerful engines are to go careering over the city lines at express speed. It is not the case in other countries, at any rate, and is not wanted here.

Subsequent evidence has been given by Mr. Deane as to grades of 1 in 60 on the South Coast line and elsewhere, and he is to be one of the judges of designs for a bridge to the North Shore, for which the Government is now inviting tenders. This bridge may carry the railway on a grade of 1 in 36, whereas the grade of my proposed railway bridge for the same site is only 1 in 50.

In the face of these facts, it is rather difficult to take the objection to the 1 in 70 grades on my plan quite seriously, the more so as it is not imperative. Mr. Deane has probably noticed that the grades between George-street and the Markets can be made 1 in 118 and 1 in 100 without altering my proposals.

The hollowness of the objection to the 1 in 70 at Eveleigh, is emphasised by the fact subsequently admitted that on parts of the suburban lines there are already grades of 1 in 60 (Questions 3335, 3355, 3356); and that the present approach to Redfern is actually 1 in 90 and not 1 in 100.

As

As first stated, Mr. Deane says this grade is "In a position where it is, immaterial" (Question 3321). Now my 1 in 70 grades are in exactly the same "immaterial position" with regard to the terminus as the present 1 in 90, and they can be made 1 in 90 also if such is a *sine qua non*.

With a city extension down the western side, Eveleigh will become far the most important junction in the Colony, and no trains will rush through it at express speed. It does not seem to have occurred to Messrs. Deane or Parry that with the circle round the eastern suburbs the city trains would be able to run direct into the Redfern yard from the South *via* Erskineville.

Mr. Deane, however, must know that trains never run at 50 or 60 miles an hour into a terminus. It should be quite unnecessary for me to tell him, that the same exertion of horse-power by an engine as will take a train full speed on a 1 in 100 grade at 60 miles an hour, will take a 20 per cent. greater load at 50 miles an hour up a 1 in 70 grade.

If we consider slower speeds, then the horse-power required to draw a train up 1 in 100, at 40 miles an hour, is more than double the power required for the same load up a 1 in 70 grade at 20 miles an hour. As it is evident that any driver who attempted to take his train from Eveleigh into Redfern at express speed would be summarily dealt with by the Commissioners, the bottom falls out of this objection at once. I know that Mr. Deane is unable to say what are the grades of approach to the principal London stations.

In reply to Question 3322, Mr. Deane says the suburban engines might crawl up 1 in 60 "at a snail's pace." I do not know what Mr. Deane means by a "snail's pace," but he will find that if he looks into the matter that the tractive force required to draw a train 60 miles an hour up 1 in 100, is more than is necessary to take the same load 40 miles an hour up 1 in 60. In the absence of real or serious objections, Mr. Deane has, of course, done his duty in pointing out this feature on my plans.

SECTION (3).

Objection (11).

"The plans for remodelling Redfern by extending the present platforms, will perpetuate present difficulties." This statement is entirely in opposition to facts. The principal difficulties which the traffic officers of the railways have brought before the several boards of inquiry, are (a) shortness of present platforms. Well these are lengthened, and eight of them are to have triple roads. (b) Congestion, and crossing of Darling Harbour branch so close to end of platform. Well that is done away with anyhow. Without more explicit objections there is nothing more to answer that I can see here.

Objection (12).

"The introduction of parcels and baggage offices under the station would involve lowering the ground and consequent expense." As it is not said that it would be better to continue the present barbarous practice of wheeling trucks of baggage over passengers toes, and as no reason whatever is given against the introduction of such a modern manifestly convenient system as I propose, the "consequent expense" may be looked upon as justifiable. I look upon this paragraph of Mr. Deane's as equivalent to great praise for this part of my suggestions.

Objection (13).

"The whole design involves 'botching.'" To this I can only say I have carried out probably ten times as great a variety of engineering works as Mr. Deane has done, and I have never yet been accused of botching. I shall take equal care for the future that no "botching" is ever associated with my name. A bald statement of this kind, without explicitly setting out what is meant, cannot be replied to.

Objection (14).

"The disturbance to the existing lines would involve very great inconvenience," &c. Now, the quadruplication of the suburban lines involved great inconvenience, but, as in the present case, there would be a lot of virgin ground for a great part of the new work, it could be completed before the existing lines were touched, and therefore the disturbance would be minimised. "Signalling and interlocking arrangements" are here dragged in for the third time. I should have every confidence in leaving that work to Mr. Parry, seeing that he has put most of them in, and that he has clearly said a lot of them will have to go under any new arrangements that are made.

Objection (15).

"As the present Redfern station would be entirely cut out of use for suburban and semi-suburban trains, passengers wishing to change to the main line would suffer great inconvenience, which could only be met by stopping all long-distance trains at Eveleigh, in order to enable them to change there." Here is another place where Mr. Deane has forgotten something, because after the word Eveleigh he should have added "or such other station as the Commissioners may appoint for the collection of long-distance tickets."

I would answer this further by saying that in no country do trains run indiscriminately all over the lines. And in New South Wales, as in other civilised places, tickets are collected from long-distance trains before they arrive at the terminus.

Passengers from suburban stations now join or leave the long-distance trains at Strathfield, Eveleigh, and Granville. Many of the northern trains only come as far as Strathfield, and there make connection with those from Parramatta. With a proper city extension in operation, a man from Melbourne, if he keeps his seat, will go into the terminus at Redfern; but if he wants to go right at once to (say) Woolloomooloo Bay, then he will get out at Strathfield or Eveleigh when he hears the cry, "Change here for the city line," and take a city train. He will then be able, not only to go on to Woolloomooloo, but to go to any station on the city or eastern suburban line from Wynyard-square to Randwick. With the Hyde Park arrangement, however, as proposed, he would be just as far off his destination at the top of King-street as he is now at Redfern; and he would have to pay as much for a cab from the railway.

Objection (16).

Mr. Deane says, the proposal to bring the railway into the Markets "is quite impracticable." Well this statement has exactly the same value as that made by the man who said they could not hang him, but he was hung all the same. Mr. Deane, I feel sure, has not had time to look deeply into this matter. I know that when he first considered such a use of the Markets he did not think of going under George-street for the fourth line. This idea, however, since he saw it, has been incorporated into several official schemes.

Objection (17).

"The Mansion House station has been designed for passenger traffic." That is true, and I have never proposed to run goods traffic through the Victoria Markets. No doubt a line around Darling Harbour may in due course be proposed for goods; but as the now practically useless basement of the Victorian Markets, would be twice the size of the Mansion House station, and much more convenient with judicious adaptation—I am unable to see the application of the word "makeshift" in this connection.

Objection (18).

"The business done at the Mansion House station is probably much simpler than that which would have to be dealt with at the Victoria Markets."

Now the Mansion House is the principal station on the inner circle railway of the greatest city in the world. It had at least six branch connections in a very short distance fifteen years ago. A large number of the great English railway companies have running powers over it. The traffic is so intense that the trains are only a few yards apart, and follow at intervals of a minute or two all day long.

I have, therefore, no words to reply to the absurd proposition, that such a business is simpler than running the comparatively insignificant service, all under one organisation, would be which is required for Sydney.

M.I.C.E.

12 April, 1900.

Objection (19).

"One platform is 460 feet long by 28 feet wide, with heavy columns along the whole length, about 16 feet apart." Why does Mr. Deane not speak out more clearly, and say at once, "the edge of the platform is 16 feet from the centre of these columns, a very much greater clearance than there is in many places at important stations on the existing lines." Why does he not say, "the drawing is only a rough diagram, but when the matter is worked up in detail, it will be easy to give more room than the standard gauge of the railways." Such a statement would be a true one.

Objection (20).

"A heavy mass of brickwork, 63 feet x 10 feet, and only 6 feet from the rail of one line would be a most serious obstruction to passengers." Now, under Mr. Deane's standard gauge, the brickwork may stand within much less than 5 feet from one rail of a line. If the mass he refers to is on the "off" side it is much further away than necessary. If he means on the platform side, to be in the way of passengers, then a very little application of paint will alter the pencil drawing, and the brickwork thus indicated can be cleared out of the building without need for anxiety. (See reply after Objection 26.)

As *Objections 21 to 25* all refer to this Market building, it will be better in order to avoid repetition to deal with them in the aggregate, first reciting their special points *seriatim* :-

Objection (21) says: "About 72 feet of the northern end of the platform is rendered useless by a stairway obstruction."

Objection (22).—"The adaptation of the Market basement for railway purposes would involve, in my opinion, most dangerous alterations."

Objection (23).—"These alterations, considered necessary by Mr. Selve, which are probably all that could be done with any degree of safety, do not give widths to agree with standard practice."

Objection (24).—"Trains have to pass through passages 12 feet wide, whereas 14 feet is minimum practice."

Objection (25).—"Piers would stand only 5 feet from the centre line."

Objection (26).—"Piers are on the platforms only 3 ft. 6 in. from edge; it is indispensable they should be 6 feet."

There is the appearance of some very pungent criticism in these six objections, but fortunately for both the railway and the Market building, not one of them has a good leg to stand upon. In the first place, I ask the Committee to note that I have a plan of the Markets as they are now, kindly lent me by the Mayor of the City, and on this I have indicated in a general way by pencil lines and broad masses of colour, how it can be made into a railway station, and one that will have infinitely more convenience for passengers than the Mansion House station, London, affords.

I have not attempted to draw new plans of this station, and show details, at a cost, perhaps, of hundreds of pounds, and I was of opinion that Mr. Deane, like other engineers, would be able to fill in in his own mind the smaller items that are not indicated; for, after all, it is absolutely certain that the questions connected with the alteration of the Market basement are comparatively small matters, if a western site route is desired.

It is quite possible that alterations to this building may appear dangerous to Mr. Deane, which to architects and engineers having the experience of a broader school, would appear simple and safe to undertake. It is only necessary for one to refer to the records of such works as were undertaken in the construction of the Metropolitan and District Railways, London, when lofty buildings were underpinned over the unstable London clay; or to point to the more recent work of the Boston subways, at Boston, Massachusetts, mostly through drift. Such a reference shows clearly that the problems which would have to be solved in order that the whole Market building (erected over the Sydney sandstone) might be underpinned, would be as child's play in comparison.

Only a quantity of superfluous brickwork needs removal in the case of the Markets, and would be unattended with any risk.

I will now introduce a few facts. At the present Redfern station there are piers only 2 ft. 6 in. from the edge of the platform; in the Queen Victoria Markets the closest pier under my proposals is 6 ft. 4½ in., and only for a small part of the length. Where Mr. Deane says the entrances are 12 feet, he is mistaken; the pencil lines are by mistake actually drawn 13 feet apart, and are intended for 14 feet. I have as much right to call them 14 feet as he has to call them 12 feet.

He admits that 14 feet is all that he requires, and that was intended; although 13 feet was shown by mistake, yet 16 feet could be given if necessary. So that criticism is a very far-fetched one.

I would point out to the Committee that these enormous piers now contain hundreds upon hundreds of tons of useless brickwork and only support an empty dome. To cut them away sufficiently to give the standard clearance, in accordance with Mr. Deane's statement of requirements, will reduce them to a sectional area of about 165 square feet each. When that is done there will still be ten times the material left in each of the four piers to support the drum and dome overhead as there is in one of the main piers of the lofty Post Office tower. (See *Exhibit No. 28*.) To put the case in another way, it may be admitted that the drum and dome over it, with the piers between, will weigh 3,000 tons. Now, when the basement is modified to give the standard requirements as to clearance and so on, then each of these unfortunate piers, which Mr. Deane thinks would be dangerous, would still have about 160 feet of section, instead of 16 feet each as at the Post Office tower; and the crushing load of the four would be about 200,000 tons.

When carrying one-sixth of what would crush them, then the safe load would be over 30,000 tons!

Objections (21 to 26).

It seems absurd to pursue this matter further; I am absolutely certain there are plenty of engineers in the Government service who could make the required alterations to the building without showing the smallest settlement.

If it should be decided that it would be a difficult task getting through the ends without a settlement, then taking down part of the ends, and rebuilding them, as was done recently at the Post Office, would obviate the difficulty at once. These objections, however, all fall to the ground, because plenty of contractors would undertake to remove every support of the building if necessary.

If such objections as these are the best that can be brought against the proposal to utilise the Market basement, and they dissolve into thin air under such a simple investigation, what weight can any others have?

Objections (27 to 29).

Have reference to ventilation. As no details of ventilation have been shown in connection with any of the Government proposals for sunk stations, I did not go to the expense of showing any such scheme in detail, on this plan, and it seems very one-sided to bring the question up here.

It will be seen, if my evidence is looked into, that I have said enough to show that all the smoke from standing trains can be easily cleared out. The problem is so small as compared with that which attaches to the long lengths of tunnel and the deeply sunk stations on the Metropolitan and District Railway, London, and to the difficulties which would attend the 2-mile long tunnel to North Shore, as favoured by Mr. Eddy, that it is probable the subject would not have been mentioned at all in connection with the Markets, had the scheme been an official one.

Objection (30).

Mr. Rennick's opinion is quoted to the effect that "The basement of the Markets is entirely unsuited for a railway station." And further, "It would be a piece of vandalism to appropriate it."

With the first part of the quotation from Mr. Rennick I, of course, entirely agree; it is unsuited at present.

I have, however, clearly shown, and any independent and qualified expert will confirm the fact, that the alterations I have indicated are not only practicable, but could be carried out without any risk.

With regard to "vandalism," as referred to by Mr. Rennick, I thought at first that that gentleman meant to say it would be a "vandalistic treatment" of the State railways to carry them into a "market cellar." I now understand from Mr. Deane that he thinks Mr. Rennick considered the Markets were too good for a railway station. Mr. Rennick probably did not know what the building cost, and what a monument of folly it is as it stands; he, perhaps, considers that the gorgeous and costly external ornamentation (notwithstanding its utter inappropriateness as applied to a market-house), should be sufficient compensation to the citizens of Sydney for the loss of £10,000 a year, the sum of the loss, which they now suffer by the venture.

To

To my mind, any loss to the citizens such as this is a loss to the whole community. It is in many ways a magnificent building, and, therefore, every private citizen and Government officer ought to assist by every means in his power any movement for putting it to an appropriate use. So far, I understand, not one witness has ever hinted that the position is not the very best that can be found for a central railway station—convenient for the business part of the city in the day, and for attendance at the Centennial Hall and the theatres in the evening.

N. Selfe,
M.I.C.E.

12 April, 1900.

Objection (31).

"Mr. Selfe proposes to extend two lines only for suburban traffic beyond the Markets." This is a purely gratuitous assumption, with nothing to warrant it. I never contemplated anything of the sort, and there is nothing to show it either on the plans or in the evidence.

Objection (32).

"There are no shunting facilities by which some of the trains could be dropped at the Markets and sent back." Another gratuitous assumption absolutely in opposition to the facts. Exhibit 20 shows crossings both in front of the Markets and behind them, on both the fast and slow roads. Goodlet's yard is close at hand for coaling and watering engines, and there is not the slightest doubt that with the facilities there possible, a traffic manager of experience could easily work twenty trains an hour each way from the Markets as a terminus, until the rails went on to Wynyard-square.—(Mr. Eddy said forty trains each way at a similar station).

Objection (33).

This inquiry, "By what way will it be possible for trains to be stopped at the Market and sent back," has already been practically answered. I would not say further. In the same way as trams are now stopped and sent back from No. 5 and 6 platforms at Redfern, by sending in another engine after the train to take it out again; or by shunting the same engine on to the other line, and then sending it round to the other end of the train. The facilities for such shunting would be much greater at the Markets, because of the crossings as shown at the north end beyond the platform. These crossings would enable the train to come up to its place at once instead of having to move up a second time, with the consequent delay, as now obtains at Redfern.

Objection (34).

The statement that "this is not a workable proposal" does not apply to any proposal of mine, but to an hypothetical assumption which Mr. Deane appears to have set up in his own mind, in order that he might have something to knock down. I have proposed nothing, and do not intend to propose anything, that is not in accordance with every-day advanced practice in connection with railways.

Objections (35 and 36).

"Running four lines through Wynyard-square would preclude any portion of Wynyard-square being used as a station for the North Shore line." "It does not appear practicable to bring in a separate branch service at this point." "The plans show no terminal station for North Shore traffic." "A see-saw method of working must be intended." "This is unsuitable, because the railway grade on North Shore is 1 in 50, while on the suburban lines it is 1 in 100."

There is a bit of a jumble here, but I will try to make things clear, working backwards from the last objection. Mr. Deane has admitted that he has made a mistake about the 1 in 100 grade, as there is 1 in 90 grade between Redfern and Eveleigh, and a 1 in 60 about Erskineville. Neither railway men nor passengers would ever expect that the North Shore lines should be worked by an extension of the Parramatta trains, which run on the aforesaid 1 in 100. When the bridge is built, and let us hope it will be soon, then the Milson's Point line, if extended to Eveleigh through the city, will naturally connect *via* Strathfield with Hornsby Junction, thus completing a circle. On this road the grade is 1 in 45, or 22 per cent. stiffer than the Milson's Point lines; not 1 in 100.

Mr. Deane has evidently not seen my plan No. 26, showing how a station as large as that in Hyde Park or King-street schemes can be established at Wynyard-square. If the traffic in future years should warrant it, this would be the starting point for the Newcastle trains, and save 9 miles of the journey.

Objection (37).

"With regard to the two stations, Victoria Markets and Wynyard-square, which are otherwise suitably located, they would be open to the objection that passengers would have to ascend and descend considerable flights of steps." This statement that these stations are suitably located is a great admission, and it atones for many hard rubs I have received; but the part which follows takes away my breath, and I can only answer it by other questions. Can Mr. Deane say where it is possible to find through stations, worked on the European system, at which passengers have not to go up and down either ramps or steps? Look at the awful climbing the Commissioners are now providing for passengers under the improvements at Strathfield. Look at the terrible ramps and steps Mr. Deane has shown in his design for elevated terminus facing Garden Road. Look at both the King-street and the Hyde Park termini, with their stairs and ramps, and consider the people from Woolloomooloo will have to climb up and down when they come and go.

Now, under my schemes, the entrances to the new terminus at Redfern are close to the natural surface. At the Wynyard-square station I can provide what would be practically level approaches, from George-street and from Kent-street, far superior to anything on the official schemes. The City Council in its wisdom sank the Market basement 22 feet deep, and, therefore (as Mr. Deane's gauge for height is 15 feet, or, say a minimum of 17 feet to the surface), it is only necessary to make the present pavement the platform level to get height sufficient for foot-bridges over the railway lines and platforms, and under the ceiling of the station.

Let the traffic authorities just say clearly what they want in the way of staircases, ramps, lifts, booking-offices, porters' quarters, &c., &c., and then it will be an easy matter to direct the preparation of a set of working drawings for the remodelling of the Market basement. It is possible, if it is necessary, to carry the great dome on iron columns, provide lifts for arriving passengers, and an entrance on the other, or eastern, side of George-street; but to find fault with a set of outline plans because nothing but the main features are shown (albeit they are sufficient to determine the feasibility of the plan or otherwise) is very hard when they have been prepared at private cost, and purely in the interests of the community.

Objection (38).

"With regard to resumptions and interruptions, I cannot believe that Mr. Selfe has not very much under-estimated." "The difficulty of passing under Lassetter's," "the damage to business," &c., &c. I can say no more about resumptions; that matter is in the hands of the official valuator, and I understand his estimates are generally considerably below mine all round. With regard to difficulties of underpinning Lassetter's premises, it is absolutely certain that there will be no difficulty in getting contractors to undertake the work, and take all risks, should it be ever necessary to do so. As compared with the work of tunnelling in ordinary cities, such work over the solid Sydney sandstone is very plain sailing.

Objection (39).

"I understand that he proposes to resume, in its entirety, the Kidman's buildings and remove them, so as to throw the lines open to the air." This is quite correct, but, unfortunately, Mr. Deane seems to have quite overlooked the fact, when he penned his objections, Nos. 27 to 30. By the present acknowledgment those objections lose nearly all their force.

Objections (40 to 43).

Deal with my estimates and very little reply is required to show the fallacy of the method by which the sum of £1,834,000 is made up as the total cost of my scheme.

If Mr. Deane thinks it better to have an inferior terminal station at Redfern for £310,000, as he puts down, instead of the superior one, at a net cost of £70,000, as per the figures at bottom of page 75, then I must leave him to his opinion; but I quite object to the figures being used in such a way to prejudice my proposals in the eyes of the Committee.

Mr. Deane thinks my estimate of the cost of works between George-street and the Markets should be doubled, or increased by £160,000. This would make the cost, for say $\frac{3}{4}$ of a mile of quadruple line, come to £320,000, or equal to nearly £110,000 per mile for a single line. Now, on reference to my figures, I find I have put down the "cut and cover" tunnel, from Bathurst to Druiit streets, at £150 per lineal yard. While a reference to the proceedings of this Committee shows me, by the answers to questions 56 and 65, that Mr. Deane's tunnel, under the houses between King-street and the Domain, is only estimated by him at £137 per yard run. In a similar way I can show that all my estimates are ample.

By

N. Selfe,
M.I.C.E.
12 April, 1900.

By reference to Mr. Deane's general estimates for the Hyde Park scheme, for instance. On page 7 of the Report of the Public Works Committee in 1897, there is the estimate for bringing six roads—not four—from Redfern to Park-street, and Park-street is in a line with Druitt-street. The amount set down for excavation, viaducts, piers of bridges, retaining-walls, steel superstructure of bridges, and covering to the six-line tunnel in Hyde Park (which is double the length of the four-line tunnel in my scheme) with all sundry works, is the sum of £248,200. And yet my four lines, for the same length, over a much easier route, and with only half the tunnelling, are to cost 50 per cent. more than the six lines to Hyde Park. I do not think the Committee will require me to say more on this point, the figures are in print to speak for themselves. It is quite evident there is a different sauce for the goose than is allowed for the gander this time.

Mr. Deane kindly adds £60,000 to section 2, and £40,000 to section 3, without one word of explanation. The fact that the alteration of the grades at about the present tunnel would terminate south of the main road signals; and that the double "scissor" crossings, and the turn-outs to the car-roads and sheds would all be unaltered so far as the new grades are concerned, does not appear to have struck him. Quoting Mr. Deane's own words, "That is not worked out yet. There would be no difficulty in arranging it."

With all Mr. Deane's additions, he brings up my scheme to £2,100,000, and concludes with the words, "It will be seen from the foregoing that I do not consider Mr. Selfe's scheme practicable."

If we assume, for the sake of argument, that the sum of £2,100,000 can be found to make it practicable, as Mr. Deane proposes, we should, on its completion, have the equivalent, so far as the public are concerned, of the following works as proposed by him:—

The New Benevolent Asylum, terminus at	£ 561,600
The King-street scheme, terminus at	1,527,000
Three-quarters of a mile of the North Shore line, at Mr. Deane's own estimate, as applied to my scheme; works only without the resumptions and without stations.....	320,000

Or a total of £2,408,600

Nothing at all being included for the land, except that small sum of £90,000 for the properties between Elizabeth and Liverpool Streets. If £600,000 is added for the land, it will be seen my proposals come about £1,000,000 to the good.

MR. McRAE'S EVIDENCE.

Mr. McRae, the architect of the Queen Victoria Markets, has given evidence as to the conversion of the building, to which I reply as follows:—With regard to the smoke nuisance, questions 3735 to 3742 and 3763, there are two very complete answers. In the first place, my exhibit, section No. 5, and my evidence both show that perfect arrangements for ventilation can be easily made. Secondly, Mr. Parry's evidence, question 3704, shows that, in accordance with a hard-and-fast regulation, no smoke is emitted in a main station, and, therefore, there would be none to get away.

With regard to the removal of the screen wall at the George-street side of the basement, in order to leave all the eastern piers in the centre of a very wide platform, Mr. McRae says that that could be done, because "the piers carry all the weight," and "there is no difficulty in the removal of the wall" (questions 3759 to 3762).

With regard to reducing or altering the great piers of the dome, and making the 14 feet entrances at the ends of the main building, Mr. McRae may be pardoned for being a little nervous, and saying, "It would be an operation I could not possibly recommend;" "dangerous and difficult;" "I would not care to carry it out," and so on. It does not often fall to the lot of a young architect to obtain the honor and responsibility of designing a building to cost nearly £300,000, and Mr. McRae naturally, with a commendable interest in his work, cannot be expected to take kindly to any rough treatment of it. But here some ugly facts come in. In the first place, admitting that it is an ornament to the city, yet it is utterly useless, and a total failure, so far as serving the purpose for which it was built, i.e., markets. Secondly, the city—on the authority of the Mayor—is losing £10,000 a year on the venture. Thirdly, it is the most central site in the city for a railway station, and by conversion to such a purpose would be a success; and fourthly, there would be no difficulty in the world in taking out the whole of the present central supports and introducing new ones, if it were necessary, in order to effect such a conversion. The evidence of a hundred men that they could not do something would not affect the case, when other men say, "I have done it, will do it again," and give a guarantee for their work.

If this building was in America there would be no difficulty in getting tenders from contractors for lifting it bodily, and putting a couple of extra stories underneath it. As a matter of fact, the responsibility and care required would be much less than at Lasseters', and still less than has been incurred on the Metropolitan London Railway.

For strength of piers, &c., see reply to Mr. Deane's objection, No. 26.

4452. *Dr. Garran.*] What do you estimate would be the cost of your West Sydney line, pure and simple, as far as "The Rocks," from Eveleigh, after deducting what you would get back from the re-sales? £1,233,000.

Alfred Thomas Brindley, Assistant Architect, Government Architect's Branch, Department of Public Works, sworn, and examined:—

A. T.
Brindley.
12 April, 1900.

4453. *Mr. Dick.*] Have you had the opportunity of examining the non-official schemes for bringing a railway into the city? Yes; I have been engaged with Mr. Sievers in making the valuations of the buildings in connection with some of them—the Elizabeth-street scheme, for instance, and that of Mr. Selfe.

4454. With respect to Mr. Selfe's interference with the supports of the Market and the basement, do you anticipate any danger to the Market from the character of the alterations he proposes? You could do anything if you spent the money; but I agree with Mr. McRae, that it would not be advisable to do it. You would require to take the end down to do it.

4455. Would there be any danger to the building? There is the chance of settlement and vibration.

4456. The scheme of Mr. Greenwood skirts the building on the western side, and goes close to the south-west corner? It would not go below the foundations of the market.

4457. Would there be any serious danger from vibration in the case of a tunnel along George-street? There might be to buildings with shallow foundations. Mr. Selfe takes the tunnel along York-street, close up to the walls of the building on the side of the street. It becomes a question whether he would not require to resume the warehouses on both sides of the street.

4458. *Dr. Garran.*] Have the warehouses, &c., any rights under the pathway? I think that, under the City Act, they are allowed openings of 18 inches.

4459. *Mr. Watson.*] If you went right up to the boundary of the private land fronting the street, and resumed the property as you suggest, could you, without great expense, under-pin and arrange supports to the walls, sufficient to make the buildings safe? Very great expense would be incurred; you would require the walls to be very thick to retain the buildings, besides the earth which carries them.

4460. The foundations, it has been stated, are on rock? If they are on rock they will be right enough.

4461. Being rock, would it be necessary to under-pin? No.

4462. Where you have rock foundations on either side, you can go pretty close to buildings without any great danger? Yes.

4463. *Mr. Dick.*] There has been a good deal of telephone tunnelling lately;—can you say what has been the effect on buildings on rock, adjacent to that tunnelling? There has been no trouble. A case occurred in Pitt-street, where settlement took place in connection with a building on soft ground.

4464. Are telephone tunnels put below foundations? They are 8 feet below the pavement. They are level with the foundations where there is a cellar, and 4 or 5 feet below where there is none. The telephone tunnel in front of the Public Works building is lower than the foundations, and no damage has resulted. The foundations are on rock.

4465. *Mr. Shepherd.*] Is it not possible to adopt precautions to prevent injury to foundations in almost any instance? There is always the liability, if you underpin a building, of the material shrinking, and cracking occurring. You can take every precaution, and then there is likely to be a settlement.

4466. We have heard of instances of railways being run under houses and churches without doing damage? I myself have lived in a house which was built over the underground railway, London. It was built after the tunnel was completed. There was vibration, and we could hear every train which ran.

4467. Do you think there would be any danger of damage to the Market foundations, if Mr. Selge's scheme were carried out? I am of the same opinion as Mr. McRae that there would be danger. Of course you can do anything, if you spend enough money.

4468. You do not think it would be possible to provide against danger? There is always the possibility of something unforeseen happening. If you underpin with cement, there is a certain amount of shrinkage especially with a heavy building on the top.

4469. *Mr. McFarlane.*] Do you think it possible to put iron columns in the place of the existing piers? I should not care to attempt it.

4470. *Mr. Dick.*] Looking at the comparative sizes of the two piers, as outlined by Mr. Selge on plan 27, do you think there would be any danger to the dome of the Markets, if the supporting piers bore the same relation to the weight which the Post Office piers have to support? You would have to calculate the weight each of the piers is carrying. According to Mr. Selge's figures there is no danger.

4471. Would there be any danger to the dome of the Markets, if the piers bore the same relation as set forth in plan 27? I do not think so.

TUESDAY, 17 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

4472. *Chairman.*] Since you were last before the Committee I believe you have taken the opportunity to look through the various schemes submitted by witnesses, except those of Mr. Selge and Mr. Greenwood; the Committee would like you to give them your opinion upon those schemes? I have looked through these schemes, and I have gone into them as carefully as time will permit. The schemes generally have not sufficient detail to enable me to criticise them very closely; but I propose to deal with them *seriatim*, and make a few short observations on each. The first which I have on the list is Mr. A. C. Brownen's. I do not think Mr. Brownen's scheme would meet the case at all. As I understand Mr. Brownen is of opinion that the Devonshire-street site should be utilised for the main station, and he proposes besides that there shall be two circular lines. He says in a paper attached to a letter, dated 9th April, which the Secretary has handed to me, and which gives more information than was previously given:—

In accordance with my railway scheme, the line will be taken through the heart of the crowded districts around George-street West, the Glebe, Forest Lodge, Annandale, and Leichhardt, connecting with the main suburban line at Petersham. On the eastern side a similar line would tap the districts of Surry Hills, Darlinghurst, Paddington, Woollahra, and Waverley in due course.

It would be much easier if I had a plan of exactly what is proposed, so as to see how it would work out. There is so much marked on the plan that I do not know what Mr. Brownen proposes definitely for his scheme. It seems to be a circular scheme in principle; but I submit that that would not meet the circumstances at all. What people want to do is not to get from one part of the city to another so much as to be brought into their business in the morning, and to be taken away again at night. That is really the main object of the city railway.

Mr. John Shewan has a proposal to pass over Devonshire-street, and enter a tunnel under Castle-reagh-street, and go to Goulburn-street and Circular Quay, emerging at the Public Instruction Department. I am of opinion that a scheme, involving so much tunnel, could not be viewed with favour. The time has not arrived when a tunnel scheme would be acceptable.

Mr. Tuckwell has a scheme that he wrote about, but he has not appeared before the Committee. That also involves a long tunnel, and is therefore not a desirable scheme.

Mr. O. Mitride also has not appeared before the Committee, but he sent a letter which has been printed by order of the Committee. Perhaps it would be unnecessary to say anything further with regard to that. He proposes an elevated line to the south-east corner of Park-street; then to pass along College-street to the High School site; from thence to Circular Quay, Miller's Point, and North Shore. It would be very difficult to work out that scheme as an overhead proposal without incurring very great expense, and the railway would be unsightly. It could not very well be carried out; but there is not enough detail given to enable me to criticise it properly.

Mr. F. Alderson has submitted a scheme, and there is a map showing the course of the line. It might have great advantages for those who wanted to go in the particular directions which the line follows, but unfortunately it is of so serpentine a character that it would scarcely meet present requirements.

Mr. G. Neville Griffiths mentions a scheme that was recommended by Mr. Goodchap. He said it would have an underground station on the site of the Land Titles Office, the Supreme Court, and St. James' Church, and would go on from there to Fort Macquarie. I think Mr. Griffiths must be under some misapprehension about that line. Mr. Goodchap, in giving evidence before the Royal Commission in the year 1890, mentioned a scheme, and it was one that was worked out in 1885 or 1886. I was in the office at the time. But that line did not interfere with either the Land Titles Office, the Supreme Court, or St.

James'

A. T.
Brindley,
12 April, 1900.

H. Deane.
17 April, 1900.

H. Deane. James' Church. It crossed under Liverpool-street near Nithsdale-street, went across the Park nearly parallel to Elizabeth-street, and would have a station near the northern end of the Park, but as it approached the northern end, and whilst it was still in the north-west corner of the Park, it diverged to the right, clearing the Supreme Court and St. James' Church, and after passing under the Mint, curved round to the left approaching Macquarie-street again, and then went on to Fort Macquarie. That was the one marked "J" in the schemes that were considered by the Commission. That is an underground scheme, and it has all the disadvantages of a tunnel scheme. It was intended at the time to have only two lines of rails, which we now know would be altogether inadequate, and a small shunting ground and terminal station at Fort Macquarie. I have explained the objection to having a terminal station at Fort Macquarie—the principal one being that that place is wanted as a terminus for the very important tramway system of Sydney. I think it would be a great mistake to hamper the tramway system for the purpose of providing shunting grounds for trains.

17 April, 1900.

The next proposal is that of Mr. C. T. Burfitt. In this scheme he has to tunnel all the way from Wexford-street. He passes over Belmore Park, and has a tunnel from Wexford-street to the Water Police Court. I do not think he could get into a tunnel in that way—passing over Elizabeth-street, then getting under the surface at Goulburn-street. He might by going over Goulburn-street, and passing under Liverpool-street as shown on No. 10, and in the St. James' Road proposal, but not at Wexford-street. Then he proceeds from that point, where he enters the tunnel, to the Water Police Court. From there he goes overhead to Circular Quay, and thence to Dawes' Point. The shunting he proposes as an alternative may be done at Fort Macquarie. I think that so long a tunnel, even if broken by a station at the Supreme Court, would be very objectionable.

The next proposal—that of Mr. Jabez Brown—is for a western side scheme. His proposal is far too vague in character for me to say very much about it. In fact, he has a number of alternatives, therefore one does not know which to criticise or remark upon. But the start off of his line is objectionable. He starts off along the Darling Harbour branch, which has a bad grade, and a line following this location would have the disadvantages that I pointed out, and one of the disadvantages of Mr. Selfe's scheme—namely, that it would take passengers away from the main Redfern station, and would allow of no interchange. I do not think that this scheme need be considered any further.

Mr. Horbury Hunt has submitted a circular scheme, which involves a main station at Devonshire-street. I submit that a circular scheme of that kind would not meet the case. It appears to me that Mr. Hunt's proposal contains a tremendous lot of tunnel. He says there is tunnelling for 50 chains only. I presume that he means that there is a single length of 50 chains, not that that is the aggregate length. It really does mean a continuous tunnel, whatever one may say. A covered-in station between two tunnels does not give perfect ventilation, and a station of course must be covered in to protect people from the weather. Whatever may be said of the selection of the route on the western side of the city, the return on the other side would not meet the case of a city railway. It might, possibly under some circumstances, be a useful line to have; but I take it that it is not what the Government are at the present moment contemplating. That scheme has all the objections that circular lines have, that they have no proper terminus. A terminus has been explained by Mr. Parry and myself as absolutely necessary in any scheme. You are not getting rid of the difficulty of an adequate terminus by running trains round. You cannot run the people round, you have to bring them in at certain times. During the day, when the traffic is light, you can run a regular service all round, but in the morning you are bringing men into their offices, and in the evenings, when the people have to be taken away from town, they all want to go out together. You do not want to run the trains round; but you want to start from the city, and to go out to the suburbs, and *vice versa*.

4473. That really means that if you bring the railway into Sydney to accommodate the large suburban traffic, it involves a terminal station in Sydney? Yes, you want a terminal station. You do not get over the difficulty by running the trains further round, and bringing them back on another route.

Mr. F. Cavill has submitted a proposal for a western side scheme. He carries his line on arches to Erskine-street, and has a central station between Erskine-street and Margaret-street south and north, and Sussex-street and York-street, west and east. He proposes to connect Kent and Clarence Streets by subways, and the level of his station, he says, is that of Wynyard-square. Apart from the fact that it would be difficult to arrange for a station at that point, I submit that a station on that spot would be too far on—too much to the north, and too much to the west. The centre of it would be slightly further north than Wynyard-square; but it would be to the west of it. It is a question whether it would be a suitable site or not. But I do not see how a station can be built there, and if it were, it appears to me that the cost of resumptions would be very serious, and the work would be very expensive.

Mr. Charles Fry has a proposal for a circular railway. The eastern part of his loop is along the eastern side of Hyde Park. He makes a station at the south-east corner of Hyde Park, another at Chancery-square, and another near the Water Police Court. On the other side he has a station at Harrington-street, near Wynyard-square, and he has one at the Sydney end of Pyrmont bridge, and another at Engine-street or Hay-street. I fancy the location will be found on the western side of the loop to be quite impracticable, and, taking it altogether, I think that this line would not serve the purpose for which it is intended—the eastern side of the loop being too far east of the city. And, further, you would not be able to give the accommodation on the western side that would be required to bring the people in on that side.

The last proposal which I have to deal with is that of Dr. Quaife. Dr. Quaife's plan seems to show a means of getting rid of the necessity of resuming the Synagogue. I believe that Dr. Quaife was the first to propose the utilisation of the High School site, which has been adopted in this No. 10 scheme. He seems to take up a width of 200 feet of the Park, between Park-street and King-street, as compared with 80 feet in No. 10 scheme, and 140 feet in the modified No. 10 scheme, for the eleven platforms. I am doubtful whether, even by taking up so much of the Park as 200 feet as Dr. Quaife proposes, the resumption of the Synagogue could be avoided. It does not look as if it could be, but it really wants working out. I think the cab-road shown by Dr. Quaife would be a little awkward; there would be some difficulty in regulating the level, so as to get over the line which it has to cross—the lines running into the western dock. But I should prefer to give a little more time to that proposal if the Committee wish me to do so. It is very difficult to say straight off what can be done under the circumstances. If the Committee think that 200 feet of the Park should be taken, I could see what is the best that could be done with that route, but I am afraid that, in any case, the Synagogue could not be saved in making a proper

proper station. I should also think that, if the Synagogue were left there, it would not be a very suitable place of worship, because there would be a great deal of noise from the rumbling of trains which could not be avoided. I can show the difficulty that would arise by reference to plan No. 10. In order to clear the Synagogue, the lines coming into the western side of the station would have to be shifted considerably over to the east, and you would lose a good deal of the advantage and convenience of the roads that you have at present, and the standing-room which has been provided at the end of each platform for engines. You would also lose the advantage of having the south-western corner for a large parcels office. It is very necessary to have that parcels office. I see that Dr. Quaife has left a space there, probably with the idea of its being thus utilised; but before expressing a further opinion about it, I should like to have time to work it out. What Dr. Quaife proposes is really a modification of No. 10 scheme; but he gives the additional advantage of having a cab-road; on the other hand it has the disadvantage of taking up a good deal more of the Park.

H. Deane.
17 April, 1900.

4474. *Chairman.*] He says that he will take 5 acres of the Park? He probably only reckoned that portion of the Park between Park-street and King-street. I think No. 10 could be made to avoid the Synagogue if it could be set over a little and take in more of the Park; but it is a question whether it is worth while to destroy more Park property in order to avoid taking the Synagogue. I notice that Dr. Quaife has made three of his suburban platforms 27 feet wide only, instead of 30 feet; and one of them, between No. 10 and No. 11 roads, he has made only 20 feet, instead of 30 feet. On the other hand, he has a very wide platform on the western side of the station.

4475. Dr. Quaife estimates that his scheme would cost £1,000,000, as against the Government No. 10 scheme costing £1,500,000;—do you not think it is estimated rather low, his scheme being identical, apparently, up to the Park? He saves some land; but he takes St. James' Church.

4476. One of the great objections of the Department is with regard to the Synagogue;—you think it will be best to resume that site? Yes; that corner would be very useful in connection with the railway station. We should be very cramped in laying out the roads and placing the parcels office if that corner is not taken.

4477. That is the chief objection to Dr. Quaife's scheme? Yes

4478. That it would cramp your operations and interfere with the Synagogue as a place of worship? Yes.

4479. Of the two schemes would you prefer the Government scheme No. 10? I should, especially the modified one. I think the modified scheme is very much superior to the original one involving the Domain extension.

4480. *Mr. Shepherd.*] Do you prefer that to the St. James' Road scheme? No, I like the St. James' Road scheme the best.

4481. *Chairman.*] Since you were asked to give your opinion on these schemes, Mr. Hammond has been before us;—he says:

The proposed extension from Redfern to St. James' Road comes nearer to the plan I would suggest than any other, and, therefore, so far as entering the city by that route, I agree; but I widely differ from the scheme in other respects. For instance, I would not build a terminal station at St. James' Road. I am certain the quantity of land required for a large station with shunting room is not available there unless by destroying the Park. . . . I would resume the Devonshire-street Cemetery, the grounds of the Benevolent Asylum, the Inspector-General of Police's ground, and the Convent of the Good Shepherd. . . . With Belmore Park on the north-east, and Prince Alfred Park on the south-east, a large central railway station should be built on that site, suitable in size for the next fifty years, designed with a view to further extension when required. . . .

Then he proposes to separate the country or long-distance traffic from the suburban traffic, and for the suburban traffic he wants to have a railway similar to the London Metropolitan circular system. He says:—

I will ask you to follow the route recommended by the late Mr. Edly, from Redfern to Hyde Park on to the Circular Quay, somewhere about the Water Police Court. I would then, by turning to the left, pass round Circular Quay overhead, thence by tunnel through Flagstaff Hill, thence overhead round Darling Harbour, passing over all the streets leading to Darling Harbour without in any way interfering with the wharfs or the traffic leading to them, continuing that course to the present Redfern site. I would not make that the limit of the circular system, it should be extended on the Western line out as far as, say, Homebush. Thus a train passing round the route I have just described would, on its return, pass through the new central station at Devonshire-street, and continue on to St. James' Road. There would be two sets of rails, so that trains would be constantly running both ways without danger of collision.

That is Mr. Hammond's idea to have the country traffic at the Devonshire-street station, and to have a circular railway, not stopping at Redfern, but going right away up to Homebush? The map submitted by Mr. Hammond does not show that the return line goes through to the central station. That is a very serious objection.

4482. Would there be the same objection to this scheme which you have to other schemes of that character that you could not have a proper terminal station in the city? That is the case. You would have no terminus in the city. You want to bring the trains into the city, and finish with them there. It is a very great mistake to suppose that that is on the plan of the Metropolitan Railway of London. The Metropolitan Railway of London is essentially a circular line. It scarcely goes out to the suburbs, though it goes near such suburbs as Notting Hill and Kensington.

4483. The Metropolitan Circular Railway of London deals only with traffic which has come from a distance, and has been brought into some part of London, but is not a railway that goes out a long distance;—is not that so? The metropolitan line and the metropolitan district railways of London are connected together in a circle, or in an irregular oval. The metropolitan line is the northern part of the system, and the metropolitan district line is the southern part of the system; but they are worked together, and the trains are always going round and round; but there are, in addition to those lines coming in, the Great Northern trains, the Midland, the Great Western, and some others which run on the system and terminate in the city, and run back again. No arrangement that it is possible to make for the extension of our system from Redfern could be made to correspond with the Metropolitan Railway of London; it would not be the same thing at all. The Metropolitan Railway of London is not an extension of any suburban line, but it is a circle of itself.

4484. Mr. Hammond says that the suburban passenger traffic is conducted to the heart of London by a separate system now known as the metropolitan circuit system. That might convey to the mind of some people that those living out in the suburbs are brought direct into London, and then taken round London by the same trains on the circular system;—is that the case? No; that is not correct. The Metropolitan Railway of London and the Metropolitan District Railway—the two being connected—form a

- H. Deane.
17 April, 1900.
- circular line. It is not an extension of any suburban line. It is true that certain lines junction into the Metropolitan Railway, but they carry quite a separate part of the traffic, and this is not run round.
4485. *Mr. Watson.*] The passengers change, I presume? Some of the trains at the Great Northern, the Midland, and the Great Western Railway come in and run some distance on the Metropolitan Railway, and then run back, but they do not run round. The conditions are not at all similar to what they are here where a circular line would not answer the same purpose.
4486. The great bulk of those who would come in by the suburban lines then have to change into metropolitan trains to reach their destination? If they come into the termini of the Great Northern, Great Western, North-Western, and Midland railways they would have to change and go to a station on the Metropolitan Railway; but there are connections made some distance back from the termini in the case of the Great Northern, Midland, and Great Western railways, with the metropolitan lines, and it is those lines which do the chief suburban business.
4487. *Chairman.*] Is the tendency, in making railway communication in London, to bring people as nearly into the city as possible without changing trains? It is.
4488. They avoid changing by, as it were, merging the long-distance trains into an underground railway system? Yes. On the northern side of the Thames and you can get Great Northern trains, Midland trains, and Great Western trains in on the Metropolitan Railway. Then there is the North London Railway, which brings passengers into the city into Broad-street; the Great Eastern Railway, which brings passengers to their own terminus at Liverpool-street, also in the city. On the South London and South Eastern lines, and the Chatham and Dover, trains are run into Cannon-street and Charing Cross, and on the Chatham and Dover they are run to Ludgate Hill, in the city. The South-Western line, which terminates at Waterloo, and from there an underground electric line runs into the city.
4489. With regard to Mr. Hammond's scheme, one great feature of it is that it would have a large central station at Devonshire-street; if that is so it would not agree with the proposal to bring both the long-distance and suburban traffic into Sydney? No.
4490. If that were done, you must have a large terminus in Sydney? Yes.
4491. Do I understand, as regards his scheme, which is to separate the long-distance from the suburban traffic, the Department does not favour that idea? No, it does not.
4492. If the suburban traffic were brought into Sydney every day by means of a circular railway such as he suggests, it would have the objection that you could not well regulate your traffic at the busy time—the mornings and evenings? That is it.
4493. *Dr. Garran.*] Could Mr. Hammond get down from the Benevolent Asylum to Sussex-street, as he proposes, by a grade of 1 in 100? He could. I presume that his line on the western side would be carried on a viaduct. He could get the grades he wants.

TUESDAY, 24 APRIL, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.	JOHN CHRISTIAN WATSON, Esq.
THE HON. ANDREW GARRAN, LL.D.	ROBERT HENRY LEVIEN, Esq.
WILLIAM THOMAS DICK, Esq.	JOHN MCFARLANE, Esq.

The Committee further considered the expediency of extending the Railway System of the Colony from the present Terminus at Redfern into the City, including the erection of a large Central Station.

Robert Henry Gordon, Alderman, Borough of Willoughby, sworn, and examined:—

- R. H. Gordon.
24 April, 1900.
4494. *Chairman.*] You are deputed by your council to attend and give evidence regarding the proposed railway? Yes.
4495. Will you state what the evidence is which the council wish to convey to the Committee? The Willoughby Council desired me to attend and request that your Committee, in dealing with any scheme for introducing a railway into the city, will take into consideration the necessity of ultimately connecting the North Shore railway with the city railway. I represent the Corporation of Willoughby, and I also appear on behalf of the residents generally of North Shore suburbs, the population of which is considerable—over 50,000.
4496. That would be at North Sydney? North Sydney and North Shore generally. We would urge that, when this railway system which you propose is recommended, you should take into consideration the necessity of providing for this connection between the North Shore railway and the city extension. I would further add that we are unanimously of opinion that a bridge would be the preferable means of carrying the railway into the city from North Shore. Of course, the bridge would carry a tramway as well. As you are already aware, the tramway system at North Shore is very extensive, and the traffic is being carried down to the ferry which is worked by a private company. From that traffic a considerable revenue would be derived, which would go towards the cost of the construction of the bridge, if the passenger traffic were carried over it. That would, of course, mean that the bridge would have to be a high-level bridge, which would come in probably at Dawes' Point or Flagstaff Hill. We do not undertake to do anything further than ask your consideration of the claims of North Shore. We put the evidence before you as to what our requirements are, and would urge you to consider them seriously.
4497. Willoughby is on one of the most elevated portions of North Shore, is it not? Yes; Willoughby is the highest of the incorporated municipalities. It is 350 feet at Chatswood. At Turramurra and Wahroonga there is an elevation of 650 feet. Any system of railways introduced into the city would serve Willoughby, Lane Cove, and the high lands of North Sydney.
4498. How far does Willoughby come towards the south? To St. Leonard's Railway Station. It extends from there to Roseville.
4499. What is the distance between the two places? Three and a half miles.
4500. And what distance is your southern boundary from the waters of Port Jackson? Nearly 4 miles.
4501. You have mentioned that the population at North Sydney at present is about 50,000;—the bulk of that population would be situated between the southern boundary of your municipality and the waters of the Harbour? Part; say 30,000 of it.
- 4502.

4502. Are the bulk of those on the slopes of the Harbour? I do not think so. I think the bulk of them are on the high lands. R. H. Gordon.
24 April, 1900.
4503. Are not a great number on the slopes? A large proportion would be served by the ferry, no matter what railway system was introduced.
4504. This bridge, being 180 feet above the waters of the Harbour, would come well on to the high land;—do you know what the population would be between where the bridge would reach to and the waters of Port Jackson? It all depends on where you take it from. If you connect at Blue's Point it would serve two-thirds of the population I have mentioned.
4505. Two-thirds of the 50,000? Yes.
4506. Leaving about one-third that in all probability would still use the ferry? Yes; because if the bridge is connected with Blue's Point the tramway traffic would be turned on to the bridge.
4507. *Dr. Garran.*] You are sent here practically to ask the Committee to give their support to a route that will admit of the extension to North Shore? That is so.
4508. And also to advocate the making of a bridge instead of a tunnel? Yes.
4509. Perhaps you are aware that there have been put before the Committee lines running through East Sydney, and also through West Sydney? I have heard that mentioned.
4510. There are practically two parties—the West Sydney and East Sydney party? Yes, I understand that.
4511. Hardly any of the lines that go through East Sydney lend themselves to any extension to North Shore, except by way of a tunnel? I understand that.
4512. So, if we agreed to both your requests, we should be practically shut up to recommending the West Sydney route? I understand that that is so.
4513. What is the population of North Shore as compared with the population on the southern side of the water for whom the railway is to be built? You are referring to the railway bridge?
4514. No; I am referring to the railway extension now proposed into East Sydney, which will accommodate a certain number of the suburban population? I have tried to arrive at that, but cannot do so unless you indicate where the starting point of the bridge will be. If it is to come down to Lavender Bay or Blue's Point it will serve two-thirds; but I would urge that North Shore and the suburbs are increasing fast in population, and though you have only 50,000 to provide for now, I venture to say that the number will be doubled in ten years.
4515. What I have asked you about is this: The population that now comes in by railway, and for whom an extension is wanted, is a larger population than that which comes across the water from North Shore, and if that part of the population prefers the East Sydney route; you are asking that the interests of a larger population be subordinated to those of a smaller one? I am looking ahead, that is why I have come here. North Sydney, at present, has admittedly the larger proportion of the traffic coming over the ferries, and in the very near future the high lands will have a larger population than North Sydney. That is fast coming.
4516. But when that has come will it be a larger population than what comes in now on the south side? I am positive of it. The attractions over there are such that there must be a very large population in the near future.
4517. You see that nearly all the West Sydney lines run into about a million of money, and a bridge over North Shore would take perhaps another half a million; so to carry out your views we should have to spend £1,500,000;—I want to be certain that we are going to spend that in the interests of the majority? On actual figures, to-day, it would not be a majority; but in a short time it would be a majority. What we are afraid of is, that a scheme may be adopted that will preclude our railway from being brought in. It will be apparent that it will be necessary that the two railway systems should be connected in some way.
4518. Some have denied that; they say that the North Shore line may come in and have its own separate terminus? I do not think there can be any solid reason for that. It is a serious loss of time to the people, and a great drawback to the district, not having direct railway communication.
4519. Where do you suggest that a terminus for the North Shore traffic could be most conveniently placed? Somewhere about Cumberland-street; anywhere about there down as far as Market-street or King-street.
4520. You do not think it would require to go up as far as King-street? No.
4521. I want you to understand that it has been strongly held by witnesses that there is no necessity to connect the North Shore line with the line on this side? As one who uses the railway daily, I consider that the want of the connection involves a great loss of time and a handicap upon our suburbs that we cannot get a quicker mode of transit than we have at present.
4522. Do you come in by railway? Yes, every day.
4523. Does the east side suit you? I use the tram when I come to Circular Quay.
4524. When there were only steam trams I suppose you went to Elizabeth-street? No; I walked.
4525. Now that the electric tram is there you use that? Yes.
4526. Are you of opinion, travelling every day by that line, that more people want to come into West Sydney than into East Sydney? I could not say that, because I think that neither East nor West embraces the business portion of the city.
4527. No line would suit everybody? No. Quite as many people would be served by the one as by the other.
4528. Do you think it of any importance that this railway extension should connect with Circular Quay? Except for the shipping, I do not see where the advantage would come in.
4529. The bulk of your people do not want to go to the ships? No.
4530. They go to the offices and stores of the city? Yes; ours is a business population, not a working population.

EXTENSION OF THE RAILWAY INTO THE CITY OF SYDNEY.

APPENDIX.

A.

[To Evidence of J. Parry, Out-door Traffic Superintendent of Southern Lines, Department of Railways.]

TRAFFIC RETURNS, REDFERN RAILWAY STATION.

A1.

FURTHER TRAFFIC RETURNS, REDFERN RAILWAY STATION.

New South Wales Government Railways,
Outdoor Superintendent's Office, Sydney, 23 February, 1900.

Sir,

In accordance with the request of the Chairman of the Public Works Committee at the time of giving my evidence, I forward herewith:—

1. Statement showing the passenger trains arriving in Redfern, and which depart again from Redfern without the cars being shunted, during the busy hours of the morning and evening.
2. Statement showing the approximate number of passengers arriving at Sydney during the busy hours of the morning and evening by through trains, also local and suburban trains respectively. The through trains include all trains which run beyond Waterfall on the South Coast, Campbelltown on the South, Penrith on the West, and Hawkesbury River on the North.

I have, &c.,

JOHN PARRY,

Out-door Superintendent.

The Secretary, Public Works Committee, Sydney.

STATEMENT showing the approximate number of Passengers arriving at Sydney during the busy hours of morning and evening.

Between the hours of—	Monday, 22 January, 1900.		Tuesday, 23 January, 1900.		Wednesday, 24 January, 1900.

Homebush	6-33	6-37	Homebush.

(E) denotes empty trains

If any of the above trains arriving in Sydney should be several minutes late, it will be readily seen that they have to be filled and depart at the time-table times, thus reducing the time standing at the platforms. Frequently the trains arrive at the platforms, are discharged, and are loaded up in three minutes.

B.

[To Evidence of T. Alderson.]

FURTHER DETAILS OF MR. T. ALDERSON'S SCHEME.

Sir,

24 March, 1900.

Since my evidence on Friday, the 16th March, *re* my city railway extension scheme, I have examined and made some private inquiries about the engineering questions put to me *re* the electric trams and the present levels of the Redfern station, and my alterations. I find there will be ample room and little difficulty for my four special lines, besides the present goods lines grade, by making a start from or about the mortuary. I find the levels of present Redfern station is 60 feet above high-water mark; the George-street bridge about 31 feet. A new low-level passenger station, with covered platforms up to 800 feet or more, on this site, north and south sides of goods lines and the No. 11 platform, can be carried back to the signal station, leaving present head station for goods offices, or otherwise. Passengers to reach electric and steam trains will do so by steps or covered way about 15 feet, at the George-street bridge. By widening the bridge tunnel, including the present Goods Manager's office on the west side, will give ample room for both goods and passengers.

The head central station platforms can be carried from near Pitt-street to St. James' Road, with inlets and outlets at both ends, *viz.*, by resuming a small bit of property in Market and Pitt streets.

Re shunting, this can be done in the Domain or Darling Harbour for the heavy traffic, or even on the Princes-street site, if more ground is resumed. The Domain station would have to be more than the chain wide, *re* future extensions *via* Cowper's Wharf. All open cuttings here could be covered to protect trains, reserve, docks, &c.

Re time, I find, by coming in by trains, and meeting many suburban friends who travel daily by steam trams to Market-street, took fifteen to twenty minutes; electric, to same street, eight to ten minutes. All preferred not removing from their seats till they got to Drutt or Castlereagh streets. My route from Drutt-street could be taken more in a direct line to the Victoria Markets, *re* a station; but I doubt if it would be safe with large tunnels cut out of the foundation levels. This is an engineer's or architect's business.

Re excavations, if the quantity from tunnels and open cuttings can be made up by the dredging deposits, &c., like Rushcutter's Bay reserves, I have not estimated the cost, but claim my suggestion in previous evidence to be the first section of the near future of resuming all foreshores in Darling Harbour to Circular Quay.

THOMAS ALDERSON.

The Chairman, Parliamentary Standing Committee on Public Works.

C.

[To Evidence of W. Greenwood, A.M.I.C.E.]

REPLY TO MR. DEANE'S CRITICISM ON SCHEME PROPOSED BY MR. GREENWOOD.

City Railway.

Macquarie Heads, Straban, Tasmania, 14 April, 1900.

Sir,

Having been suddenly called away to Tasmania, I am compelled to trust to my memory, as I have no copy either of my evidence or the evidence of the Government officials, neither have I the printed reports of former Commissions or Committees for purposes of reference—hence I am unable to give the numbers of questions and replies to which the evidence refers; neither am I able to reply to all the criticisms of Messrs. Deane and Parry, many of which are of a frivolous nature; but I will endeavour to refute all the criticisms which are worthy of notice.

In reply to comments by various witnesses, in reference to my proposed scheme, I beg to submit the following evidence.

Mr. Deane introduces a statement by Mr. Parry which he says has only slight reference to my scheme. The only point I need notice is as to the terminal stations for the North Shore trains, which I suggest might, and probably would, be at the Redfern Station, north and south of Devonshire-street.

Referring specially to my scheme, Mr. Deane is correct in assuming that four lines of way run parallel to one another as far as Bathurst-street, then four lines continue at different levels to Wynyard-square, the upper, or western, pair being intended for the North Shore Bridge extension; and the lower, or eastern, pair going towards the eastern suburbs. From Wynyard-square to Phillip-street, Circular Quay, there are two lines of way. The estimate, as prepared, included four lines of way from Redfern to Wynyard-square, and two lines of way from Wynyard-square to Phillip-street, Circular Quay, the amount stated being £720,000, which sum included land and works.

In order to meet a suggestion made by Dr. Garran, that I might require additional length on which to do shunting (or store trains) at Circular Quay station, pending the extension to the eastern suburbs, I said a portion of the proposed eastern suburban line might be made as far as the Government House stables, at a probable cost of £10,000, which would increase the estimated cost of the City Railway to £730,000, although this would correspondingly reduce the cost of the eastern suburban line to £840,000.

In reply to Dr. Garran, I stated that the cost of the upper tunnel to North Shore would be £50 per lineal yard.

Mr. Deane says he thinks my estimate low, although he has not gone into it, but to prove that I am low he quotes the item of £50 per yard for a double-line tunnel in York-street, and suggests that it would cost double.

My estimate is made up as follows:—

		Per lineal yard.	
Excavation	cubic yards	—70 @ 6s. =	£21 0 0
Lining	"	—12 @ 35s. =	21 0 0
Relay concrete and wood blocks.....	square yards	—10 @ 8s. =	4 0 0
Permanent way and ballast—£4,000 per mile			2 5 0
			Actual estimate..... £48 5 0

Mr. Deane stated that the contract price for excavating rock, without explosives, to be 4s. 4d. per cube yard, whereas I have estimated 6s. per cube yard. In the above estimate I have assumed that the rock will be taken out and replaced by lining; but in actual construction a benching would be cut in the rock from which the arch would spring—thereby reducing the actual cost to £40 per lineal yard.

Mr. Deane made some remark in reference to girder-roof near the Town Hall. This method of construction would, no doubt, be more expensive as regards the cost of covering or arch; but it is more than compensated for by the fact that the rock dips very fast from York-street towards Bathurst-street, hence the cost of excavation will be very much reduced.

Having clearly shown that the only item in the estimate which Mr. Deane ventures to specify as being too low, and which he predicts will cost nearly £100 per lineal yard, can be done for £10 per lineal yard under my estimate, I think the Committee will attach very little credence to his general statement that he thinks my estimate too low.

As to Grades and Curves.—I would call the Committee's attention to a section issued in the Addendum to the Report of the Royal Commission, 1891, wherein it will be seen that Mr. Eddy proposes a long grade (passing through a tunnel) of 1 in 45, to get from King-street to the Custom-house; and it is very significant that, although Mr. Deane and other officials gave evidence in reference to Mr. Eddy's scheme, none of them adversely criticised the 1 in 45 grade.

Mr. Parry, in his evidence, stated that the suburban engines of various classes were used indiscriminately on any of the trams leaving Redfern, and he further stated that to Hurstville or to Homebush the trains varied from six to nine coaches on either line—nine coaches being the extreme limit.*

Now as the grade on the Hurstville line is 1 in 60 for about 150 chains, with a station on the 1 in 60 grade, and the suburban locomotives work this line daily, there can be no possible valid objection to working 30 chains of 1 in 60 grade on the line as proposed by me.

With regard to Curves.—I would point out that curves of 10 chains radius are of frequent occurrence on the New South Wales railways at places where the trains run at quick speed; whereas the short curve of 10 chains radius proposed by me is near a station at which all trains stop, consequently trains must pass over the curve at slow speed.

I may mention that between Milson's Point and St. Leonards Mr. Deane introduced a 10-chain curve on a 1 in 50 grade (I believe in a tunnel), at a place where the country was comparatively open; whereas he takes exception to my 10-chain curve being introduced, in order to avoid interference with the Town Hall, on the one hand, and the Queen Victoria Markets on the other (the latter having been built since my original design). I submit such criticism is manifestly unfair and futile. I would respectfully point out to the Committee that the metropolitan railway was constructed with curves of 6 chains radius, and these curves were worked with rolling stock having rigid wheel-base, whereas I propose to work a 10-chain curve with New South Wales Government rolling stock, which is all fitted with bogies, this latter stock admitting of much sharper curves being used.

As to Tunnels.—Mr. Deane objects to these; nevertheless, on the scheme designed by him, and known as No. 10, he introduces a tunnel 1,000 yards long, and during his examination he stated that this tunnel would form a portion of the eastern suburban line when extended.

Mr. Deane very recently prepared what he terms a "practicable western side railway"; but even this line has a tunnel—probably as long as mine.

The scheme known as L, or L modified, which was also prepared by Mr. Deane, showed a tunnel, and also a 10-chain curve, and this scheme—designed for two lines of rails—although advocated by Mr. Deane as the best he could select out of about twenty-five schemes submitted, was rejected, not on account of the tunnel or curves, but solely on account of its excessive cost of about £2,500,000.

The Public Works Committee of 1897, in their report, state that any extension of the line from the vicinity of St. James' Road rendered tunnelling inevitable.

Mr. Deane subsequently stated that he hoped to eventually work the eastern suburbs line by electricity; but to this plea I am opposed, and agree with the opinion expressed by Mr. Parry (and during previous inquiries also by Messrs. Eddy and Thow), that electric traction is impracticable where traffic from Hurstville, Homebush, and other lines has to be worked in conjunction with eastern suburban and city traffic, although it might be feasible if it were used only on a complete circular line, with distinct and separate rolling stock.

As to Ventilation.—The evidence of Messrs. Foxlee and Thow shows that they apprehend no difficulty. I maintain that the climate of Sydney cannot possibly be compared to the damp and foggy atmosphere of London, yet, in spite of all the "inconvenience," the metropolitan railways have quite as much traffic as they can carry, and will continue to have, notwithstanding the much-belauded electric railways, which are far from being perfect in the matter of ventilation.

Mr. McRae, late City Architect, stated there would be no danger in passing the tunnel near the Queen Victoria Markets, but was afraid there would be a slight risk in passing near the Town Hall. At the time he gave his evidence he assumed the railway would be at a lower level than the foundations of the Town Hall (the depth of which neither of us knew); but I have since ascertained that the Town Hall foundations are as low as the proposed tunnel, hence this anticipated risk is removed.

With

* An intimate knowledge of the working of the suburban traffic leads me to think that Mr. Parry is labouring under a mistake, as nine coaches are scarcely used once in a month, if ever.—W. G.

With regard to the site of the Circular Quay station, I would point out that all heretofore suggested sites, including Commissariat Stores on the west side of Circular Quay, Custom-house site, stations on viaduct near Bridge's store, stations in Government House grounds, one and all are situate in most inconvenient and unsuitable places, whereas the site suggested by me is an ideal one for its principal purpose, viz., to accommodate the ferry traffic.

Accommodation of Traffic on two Lines of Rails.—The evidence of Messrs. Deane and Parry sets forth clearly that provided you had regular traffic on a circular or continuous line, by shortening the length between or increasing the number of your signal-boxes (or blocks), an almost unlimited number of trains could be worked over a single pair of rails; and as these are precisely the conditions obtaining on my line, they really confirm my statement that I can carry the slow-speed suburban traffic on one pair of rails.

Mr. Parry instanced the difficulty of two trains arriving at the same time, and quoted the busiest half-hour as that from 8.30 to 9 a.m. Of the trains which did actually arrive at the same time, some of them were long-distance trains, which I do not propose to carry beyond Redfern. In the event of two suburban trains being now timed to arrive together, the difficulty would be overcome by altering the time-table to the extent of one minute, thus enabling the trains to run at two minutes intervals.

Alteration to Redfern Station.—On this point Mr. Parry appears to be under some grave misapprehension as to what I propose. For the purpose of reference I class platforms B, A, 1, 2, and 3 as eastern, and platforms 5, 6, 8, 9, 10, and 11 as western.

I propose to retain the western platforms for the use of long-distance trains, and to transfer or prolong the eastern platforms across Devonshire-street into the Benevolent Asylum grounds, at a cost of £20,000; but as there would be no interference with rails, points and crossings, or signals (save and except, perhaps, the removal of the starting signals of the eastern platforms a few hundred feet further north), I do not propose to spend a single penny on any alterations to Redfern yard south of the end or cross platform.

At the present time platforms 5 and 6 are used both for long-distance and suburban trains, and occasionally one of the eastern platforms is used for long-distance trains; but I propose to use the western platforms exclusively for long-distance traffic.

As to my estimate of traffic including 365 days in a year, I would point out that 125 trains are run on Sundays. There are also some additional trains on Saturdays and Mondays, and on holidays the excursion traffic is greatly in excess. Therefore, I consider that the excess of traffic will compensate for the fewer trains run on Sundays, and, consequently, my estimate of 365 normal days may be taken as correct.

As to dealing with holiday traffic, I propose to provide for that at Redfern Station; and for an endorsement of this idea I beg to refer the Committee to the evidence of Mr. Eddy.

In reply to Mr. Deane, I would point out that connection between the western and eastern (or North Shore and Circular Quay) lines of way can be made at any convenient point between Belmore-road and Pitt-street, but preferably where it could be worked from an existing station signal-box.

As to Mr. Deane's remarks about my line at Circular Quay interfering with the roadway traffic and some projected tramways, I would point out that the laying down of a network of tramways in George-street, near the railway bridge, or the tramway loop recently laid down at Circular Quay, causes infinitely more inconvenience to street traffic than would my line at Circular Quay, and the amount of roadway taken up by my line is only a fraction of what would be required at Market, Castlereagh, and Elizabeth streets, and St. James' Road, were the Committee to adopt any of the St. James' Road or King-street schemes. As to the projected tramways being interfered with, I think that Mr. Deane would hardly class that as an insurmountable difficulty. With regard to Mr. Deane's anticipated difficulty with the water at the Circular Quay station, it would be an insult to Mr. Deane's professional ability were I to treat his remarks seriously.

As to the time occupied by a train in passing through York-street tunnel, I would point out that the ordinary passenger trains occupy only two minutes in travelling from Croydon to Ashfield (not Burwood), which is about three-quarters of a mile, and includes starting and stoppage at station for passengers to enter and alight; therefore, as the tunnel is under half a mile, I maintain that passengers would not be in the tunnel more than one minute.

As to the Method of Shunting at Circular Quay.—I most strongly urge that I contemplate the line being continued beyond the Circular Quay to the eastern suburbs (or at any rate to the head of Rushcutter Bay Creek, where ample siding or carriage storage room may be provided), but in order to meet the contingency of the city railway terminating temporarily at the Circular Quay, I would provide storage room for six or eight trains of suburban carriages by an extension of the line in the direction of the eastern suburbs, to a point near to Government House stables.

On a train from Redfern arriving at the northern platform at Circular Quay, the passengers would alight, then the train would be drawn forward clear of a cross-over road (laid in immediately east of the Circular Quay platform), an empty engine which had been standing on the southern road would back through the cross-over road on to the train, couple on, and draw the train through the cross-over road alongside the southern platform, from which the train would proceed towards Redfern, the time-table being arranged to suit. In the meantime the engine of the last train would run through the cross-over road and stand on the southern road to await the arrival of the next incoming train, when the above process would be repeated, the whole time necessarily occupied not being more than one minute. This method of shunting is very simple, and being carried out behind the trains does not interfere with the incoming and outgoing traffic, which must of necessity be the case at all dead-end platforms or terminal stations.

In Mr. Deane's opinion sufficient accommodation is not provided for passengers and offices at Wynyard-square and Circular Quay stations. My experience tells me it is adequate; but if the traffic officials wish to provide for a parcels traffic, then extra accommodation can easily be provided.

As to Estimate of Traffic.—As the statements furnished by the Railway Commissioners are delightfully vague, I have been compelled to fall back on the yearly reports and other means for ascertaining the average fare per journey per mile; and I have come to the conclusion that, after making due allowance for season ticket-holders, workmen's weekly tickets, and return tickets—not forgetting the fact that a proportion of the passengers are first-class—the sum of ½d. per mile journey, or the average receipt per passenger journey from Redfern to any station on the city railway, is within a very slight range of ½d., which sum I have adopted in all my calculations.

As to Working Expenses.—The Railway Commissioners in their report to the Royal Commission state that the working expenses for all trains to St. James' Road will be £8,000 per annum, which is equivalent to about 16d. per train mile; and on the same basis, due allowance being made for long-distance trains not running to Circular Quay, and adding a proportion for the longer mileage to Circular Quay, makes the working expenses on my line about £10,000. (See evidence.)

It must be self-evident to the Committee that as there would be no long-distance or terminal station on my line to necessitate an expensive staff, the actual working expenses must be less per train mile on my line than on the line to St. James' Road; and Mr. Parry practically admitted that more than half the long-distance passengers would alight at Redfern, thereby endorsing my statement that the St. James' Road (or King-street) terminals would necessitate duplicate expensive staffs at each station.

I would point out that the general opinion—both professional and otherwise—is in favour of the western route, even Mr. Goodchap, Mr. Eddy, Mr. Foxlee, Mr. Deane, and Mr. Rennick being in favour of it; but they were debarred from adopting it owing to its excessive cost, and rightly so when the chosen scheme of Mr. Deane cost £2,500,000, whereas I have shown that a much superior scheme can be carried out at less than one-third the cost.

The transfer of the traffic from Elizabeth-street to George-street since the opening of the George-street tramway is a positive proof of the desire of the public to be taken further west.

In the foregoing remarks I think I have cleared away all the serious objections which have been raised against my scheme. Of course there are many trivial and minor objections which I have not answered—not because they were unanswerable, but simply because I did not wish to take up the time of the Committee.

N.B.—As I expect to be absent from Sydney for some months, I shall not be able to attend before the Committee, but am prepared to forward written information on any subject they may require.

The Secretary, Parliamentary Standing Committee on Public Works.

I am, &c.,
WILLIAM GREENWOOD.

D.

[To Evidence of H. Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works.]

CITY RAILWAY—MR. N. SELFE'S PROPOSAL.

Department of Public Works, Sydney, 18 April, 1900.

HAVING perused Mr. Norman Selfe's reply to my criticism of his City Railway Scheme, in which he charges me with a large amount of inaccuracy, I cannot allow the matter to drop without submitting some further observations to the Committee.

Mr. Selfe considers that I have formulated forty-three objections to his scheme, and I will now deal with some of his replies thereto.

Objection No. 1.—Reference to Mr. Selfe's section (Plan No. 8) will show that my statements are perfectly correct. If Mr. Selfe has drawn his plan incorrectly, that is his fault, not mine. His remarks about the grade are not very much to the point; the fact remains that he has grades of 1 in 70 compared with what is practically the ruling grade on the Homebush-Parramatta line, namely 1 in 100, which must necessarily have a serious effect upon load or speed.

Objection No. 2.—With regard to the level of Cleveland-street bridge, the raising of this bridge, as well as Wells-street, above what Mr. Selfe considers necessary, might seriously affect the road approaches to the bridge and make them impracticable.

Objection No. 3.—According to Mr. Selfe's section (Plan No. 8) the termination of the grade at Redfern station end in 320 feet from the end of the platform, and not 1,000 feet as he says. If he has plotted his section incorrectly, that is not my fault. I have simply to deal with what he submits to the Committee.

Objection No. 4.—Mr. Selfe says that I can see by plan No. 6 that the city lines can get into the running sheds; that is, of course, possible if the shunting is allowed to take place south of Eveleigh station. He states that Mr. Parry had already shown that the connection between the different lines should be further back. As a matter of fact, although Mr. Parry stated that they ought to be further away from the Redfern station, he did not say they should be removed so as to cut out the connection from the present junction with the Eveleigh running sheds. The Railway Commissioners do not wish to go south of Eveleigh station to do all their shunting.

Objections 5 and 6.—The alternative plan (No. 19) which Mr. Selfe says "Mr. Deane does not appear to have seen," shows a proposed remodelling of the new terminus and the city branches much simplified. Unfortunately it is not explained how this is to be done. Mr. Selfe has all his city lines shown on the western side on that plan, and the lines into the Redfern terminal station on the eastern side, but he does not show how they have previously been crossed over to opposite sides. If he intends this to be a substitution for the other plan which I dealt with, I would point out that the necessary crossing over of the traffic south of Eveleigh on the level would be very objectionable. With regard to the crossing of the quick trains which now run on the western side over to the eastern side, and the slow trains which now run on the eastern side over to the western side, this is necessary in Mr. Selfe's scheme, but the Departmental schemes in no way require it, because the slow traffic and the quick traffic are kept on their proper sides right into the terminus at King-street.

With regard to the last paragraph under *Objection No. 7*, where Mr. Selfe mentions that the traffic authorities say "the present Darling Harbour points are too close," and that he, therefore, proposes to give them a little more room, I repeat that the proper way to get rid of the closeness of the Darling Harbour points is to push the passenger terminus further on, and not to shift the points further back.

With regard to *Objection No. 8*, the quotation from the proof of my statement includes a clerical error, for the words "so that," before "the steps," should be "as." This makes perfectly clear what I mean.

Objections Nos. 10 and 11.—My remarks *re* grades are quite correct, and not "rubbish." I have indicated that the steepening of grades will cause undue decrease of speed. Mr. Selfe thinks this a trifle, but it is not so. I have not stated, as implied, that the ruling grade on all the suburban lines is 1 in 100, and did not have to "admit" that there are grades of 1 in 60. The ruling grade on the western suburban line is practically 1 in 100, in spite of the short length of 1 in 90 at the Redfern tunnel; and the fact that there are two grades of 1 in 60 on the Illawarra line does not clash with my statement at all. This is not the western suburban line of which I was speaking.

Objection No. 15.—With regard to changing from the main line trains to the suburban trains, Mr. Selfe suggests that passengers have an opportunity of changing at Strathfield and Granville. Mr. Parry and I have pointed out that a stop at Eveleigh for country trains would be necessary under Mr. Selfe's arrangement in all cases, because passengers for the city line would certainly not tolerate having to change at these places and then be conveyed by slow trains into the city or to Eveleigh, where they would have to change again if wishing to proceed by the Illawarra line.

Objection No. 18.—My statement that the business done at the Mansion House station is probably much simpler than that which would be dealt with at the Victoria Markets is perfectly correct. Mr. Selfe should have explained to the Committee that the plan he submitted of the Mansion House station is obsolete and not as it is to-day. Therefore, to criticise further is unnecessary, but I may remark that Mr. Selfe is mistaken as to the six branch connections bringing traffic into the Mansion House station.

Objection No. 19.—The plan exhibited to the Committee is a completed and coloured plan drawn to a scale of $\frac{1}{2}$ inch to 1 foot, and there is no endorsement that it is merely a rough diagram. The plan has been altered in several particulars since it was given to me to report upon. Mr. Selfe has furnished the Committee with twenty-five plans, and if these are rough diagrams, it is a pity that some of his energy had not been devoted towards giving those particulars, the absence of which is remarked on, and if they are only rough plans how is it possible to deal with them seriously.

Objection No. 20.—The proof from which Mr. Selfe made his quotation is incorrect. It should have read that the "heavy mass of brickwork, 63 feet by 10 feet, and only 6 feet from the centre of the rails of one line."

Objections Nos. 21 to 26.—With regard to the proposed alteration of the foundations of the dome, his reference to the construction of the metropolitan and metropolitan district railways, and the underpinning of lofty buildings, is not very applicable to the case. I notice that Mr. Selfe has now altered his plan of the Victoria Markets station so as to give the clearance which I pointed out as necessary, trimming away a lot more of the brickwork. I do not know whether the Committee are aware of this. I cannot say what the circumstances were in which piers were placed at Redfern station 2 feet 6 inches from the edge of the platform, but I will say that what might have been the practice thirty years ago is not necessarily the practice now; and the circumstances, besides, are very different. In one case the piers are near the extreme end of the dock, the other on a through line. With regard to the concentration of load on the piers of the central dome, I implied that it would be unsafe to back these about. I said the alteration would be dangerous, and I still think so. It is not a question of dividing the total load by the total superficial area, and seeing what the load per square foot is; that has nothing to do with it, and would be no guide as to the safety of the operation.

Objections Nos. 27 to 29.—The condition of portions of the long lengths of tunnel, and deeply sunk stations on the Metropolitan and Metropolitan District railways, is most objectionable, and we do not want the same conditions here, or anything approaching them. There is a great outcry against these conditions in London, and steps are being taken to introduce electricity as the tractive force. I do not see why the tunnel under the Harbour (said to have been favoured by Mr. Eddy) should be brought up as an argument against my views, as I had nothing whatever to do with that particular suggestion. There is only one way of making the Victoria Markets' site suitable for station purposes, *i.e.*, by pulling down the Markets and rebuilding them.

Objection No. 32.—I stated that there was no shunting facilities by which some of the trains could be dropped at the Markets and sent back. This is not gratuitous assumption, as Mr. Selfe suggests. Plan No. 20 referred to was submitted for the purpose of furnishing to the Committee a comparison between the Mansion House station and the Victoria Markets, and no more. Mr. Selfe's evidence is clear that he had not any definite proposal as to how the shunting was to be done. If he now intends plan No. 20 to indicate his proposal for crossings, the idea is absurdly inadequate to meet the requirements.

Objection No. 33 deals with the same matter. Putting my views on one side altogether, Mr. Selfe's views clash with those of the Railway Commissioners and Mr. Parry, and I am quite satisfied to leave the matter to them.

With regard to *Objection No. 37*, in objecting to flights of steps I make comparison with what is considered necessary for a terminal station. The passengers arriving and departing from the King-street or Hyde Park stations have not objectionable flights of steps to climb up or descend, and those stations are therefore far superior to Mr. Selfe's.

Objection.

Objection No. 33.—Mr. Selve has entirely misunderstood my meaning, I did not say that the underpinning was impossible. I said that Mr. Selve had under-estimated the difficulty of passing under Lassetter's establishment. I think I ought to know what underpinning is, seeing that I was actually employed in connection with the works of Metropolitan and Metropolitan District Railways and Widening between the years 1867 and 1869.

I have not thought it worth while to refer to a number of other objections, and with regard to the question of cost (about which Mr. Selve has much to say), a reference to my evidence will show that I do not consider it an important matter. The question is so much overshadowed by other essential considerations.

I have since seen Mr. Selve's plan No. 26, which he says shows "how a station as large as that in the Hyde Park or King-street scheme can be established at Wynyard-square."

This plan does not show a station at all, but merely an area coloured red, with no indication as to how platforms are to be placed and lines brought up to them, and till those are shown on it it is unsafe to state that the particular area is suitable for such a station. In fact it would be far safer to assert the contrary.

H. DEANE,

Engineer-in-Chief for Railway Construction.

The Secretary, Parliamentary Standing Committee on Public Works.

D1.

CITY RAILWAY EXTENSION.—MR. W. GREENWOOD'S PROPOSAL.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office, Sydney, 24 April, 1900.

HAVING been favoured with a perusal of Mr. Greenwood's proposal of the 14th April, commenting on my objections to his proposal, I beg to forward the following observations:—

With regard to his estimate of £50 per yard for a double line tunnel, in which he takes the excavation at 6s., I might point out that no contract for tunnel work in this country has ever been let for less than 10s., where explosives have been allowed. This is a question of covered way and excavation close to the surface of the streets without interfering with the traffic in the street; the conditions are much more difficult and the excavation would be very much more costly than in the ordinary tunnel. Furthermore, the cost of brick lining would be affected in the same way. If a roadway were constructed under York-street close to the surface, it would be necessary to arrange that the traffic of the street should be interfered with as little as possible, and the method adopted in Argyle-street, Glasgow, at the time of my visit in 1884, would be very suitable. Any such methods would be more expensive than carrying out the work in open cut. With reference to the grades and curves, Mr. Eddy's proposal, for a line to the Custom House with a 1 in 45 grade, was one which he lived to regret; he more than once told me that he was very sorry he had ever submitted it.

Although the Hurstville line contains grades of 1 in 60, the western suburbs line does not, and as a steeper grade would affect the speed or the load, I am of opinion that 1 in 100 should be the ruling grade.

Mr. Greenwood's statement that there are curves of 6 chains radius on the Metropolitan railway would, I think, be difficult to substantiate; but there are some sharp curves, possibly, of about 6 chains on one or two of the lines junctioning with the Metropolitan railway. I do not see why, in laying out an important city extension, the best possible conditions should not be adopted.

I have not offered any objection to curves of 10 chains radius, but such curves should have transition curves at the end, as on the Milson's Point and St. Leonard's line. I think Mr. Greenwood will see that under these circumstances it would be impossible for him to get round from George-street into York-street without seriously interfering with the foundations of the Town Hall or the Victoria Markets, or both.

With regard to the tunnel to the Domain in No. 10 scheme, this tunnel is for the use of empties only, but, as a matter of fact, I did not recommend it and would prefer to do without it. I was asked to work out a scheme on certain lines, and have already explained to the Committee that it did not originate with me.

If the eastern suburban line came to be made it would be a separate system worked electrically, and the use of electricity for traction purposes, when the power for the electric motors can be adjusted according to requirements, would enable steeper grades and sharper curves to be used without disadvantage and save a great deal of expense.

The objections to the use of electricity offered by the late Chief Commissioner and the railway staff, were to the introduction of it on any portion of the existing suburban line, and did not apply to a new line to the eastern suburbs.

As regards ventilation, I think Mr. Greenwood cannot be aware of the steps now being taken in London with a view of introducing electric traction on the metropolitan railway. The dissatisfaction on account of smoke and chokiness on that line is extreme, and it would be a great pity if anything, even remotely approaching these conditions, were introduced into Sydney.

As regards interference with the tramway system, I am afraid that unless Mr. Greenwood's line could be still further lowered at the Circular Quay, which would introduce other objections, the difficulty would be insurmountable.

Referring to the earlier proposals for city railway extension which Mr. Greenwood repeatedly mentions, such as scheme L, submitted to the first Royal Commission in 1890, I altogether repudiate the idea of its having been chosen by me, and I feel convinced that it was not the choice of my predecessor either. I have, I believe, already explained to the Committee that the survey was made and the plans prepared under instructions from the head of the Government at the time. When giving evidence before the Royal Commission I certainly did not recommend its construction.

All traffic questions I leave for Mr. Parry to deal with.

H. DEANE,

Engineer-in-Chief for Railway Construction.

The Secretary, Parliamentary Standing Committee on Public Works.

E.

1899.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

EXTENSION OF THE RAILWAY SYSTEM FROM REDFERN TO THE CIRCULAR QUAY.

(REPORT OF THE ENGINEER-IN-CHIEF FOR THE VICTORIAN RAILWAYS.)

Printed under No. 5 Report from Printing Committee, 20 March, 1899.

SCHEDULE.

NO.		PAGE.
1.	The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales. 19 December, 1898	1
2.	The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales. 5 January, 1899	2
3.	The Premier of New South Wales to The Engineer-in-Chief, Victorian Railways. 7 January, 1899	5
4.	The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales. 11 January, 1899	5

No. 1.

The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales.

Proposed Redfern and City Extension Railway.—Brief interim Report.

Board of Land and Works (Railway Construction Branch).

Engineer-in-Chief's Office, Melbourne, 19 December, 1898.

Sir,

In reply to your telegram of even date, I beg to report as follows:—

1. The most important business portion of the city of Sydney may be taken as extending from Redfern Station to Circular Quay, a length of about 1½ mile by an average width of 47 chains to the waters of Darling Harbour, to serve which, when the metropolitan population grows to twice its present number, will require two railways—one on the eastern side and the other west of George-street.

2. Redfern Station is much over-taxed now, and cannot with any safety remain the terminus for the whole of the passenger traffic much longer.

3. The extension to the northern limits of the city is highly desirable in the interests of the city, the travelling public, and the railway corporation.

4. The probabilities for expansion of traffic at no distant period, with proper railway facilities, are, I consider, three to four fold the present limit; and this should be provided for in any design worthy of acceptance.

5. If cost did not govern, a line near to and west of George-street, bisecting the business portion of the city and curving round to Circular Quay, would, in my opinion, meet the requirements best; but the evidence points to such a line being enormously costly, and not likely to pay for many a year.

6. No line located east of College-street, on the eastern side of Hyde Park, would adequately meet requirements.

7. If the cost of land resumption, or reasons of State, prevented the whole of the passenger traffic—country and suburban—being provided for at a central station on a suitable site, Redfern Station might still remain the terminus for long-journey trains without serious disadvantage beyond a slight extra cost of working; and the suburban traffic only need be carried into and through the city.

8. No city railway will suit the requirements that does not provide stations at about half-mile intervals between Redfern and Circular Quay—say, three or four additional stations.

9. If the line be extended to Circular Quay, space should be found near that station for train storage room during slack time of day and night. The number of trains requiring storage for an expansion of three times the present traffic would be very large, needing some miles of sidings. The only alternative would be to send the trains all back to Redfern or their suburban termini, which would entail empty running and great expense.

10. Any terminus short of Circular Quay should be designed with a view to speedy extension to that point, and all designs should permit a connection with North Sydney and extension to the eastern suburbs, &c. The traffic between North Sydney and the city and suburbs on the city side of Port Jackson must expand to large proportions within a short time.

11. For any midway terminus—say at Hyde Park—storage room might still be found at Redfern, but not for any large expansion of traffic without remodelling that station.

12. The basement of the new markets near the Town Hall is entirely unsuited for a railway station, and it would be a piece of vandalism to appropriate it, even if it were well adapted for the purpose.

13. The area proposed for a central station on the Commissioners' Hyde Park scheme would be perhaps adequate for thirty or forty years growth of traffic; by restricting the design to suburban traffic only, the area might be reduced by (say) 30 per cent., but not more, I think.

14. If a scheme of through running can be devised, and four lines of way are provided for, the width required at wayside stations would not be less than 132 feet, made up thus:—

Three platforms, each 30 feet wide	=	90 feet.
Space for rails, two, each 21 feet	=	42 "
Total		132 "

confined between vertical walls. Slopes, drainage, buildings, &c., might require a considerable addition to this.

Bearing on this question, the following comparison between the accommodation provided and proposed for Spencer-street and Flinders-street passenger stations, Melbourne, and that proposed in the Commissioners' scheme, Hyde Park, may be of value:—

Platform stalls for trains—

	Melbourne.	Sydney.
Flinders-street.....	14	
Spencer-street	8	
Total.....	22	11

Length, 500 ft. for through running

700 ft. dead end.

Total length of platform facing—

	Melbourne.	Sydney.
Flinders-street.....	7,000 ft.	
Spencer-street	5,100 "	
Total	12,100 "	7,430 ft.

Acres of ground covered by platforms, buildings, and lines between platforms—

	Melbourne.	Sydney.
Flinders-street.....	7½ acres.	
Spencer-street	4¼ "	
Total	11¾ "	8½ acres.

Although the number of trains now handled at Melbourne is three times the number in Sydney, it seems to me that, with good suburban facilities, Sydney must expand to an equal number with Melbourne.

I regret that time does not permit a fuller report. I shall be glad if you can give me a fortnight from now to prepare my complete statement, as I should like to peruse the bulk of the evidence taken by the various Commissions and study the topography of Sydney, which would enable me to put the matter in a much fuller and clearer light.

I have, &c.,
F. RENNICK.

No. 2.

The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales.

Proposed Redfern and City Extension Railways.

Board of Land and Works (Railway Construction Branch),

Engineer-in-Chief's Office, Melbourne, 5 January, 1899.

Sir,

I have the honor, in accordance with your request of the 5th ultimo, to submit my views on the question of Sydney city railways.

Why is a city railway necessary? Because the great bulk of the business of Sydney is done in the city between Redfern and Circular Quay, on an area of about 1½ mile long by a width, between the city reserves and Darling Harbour, of about 47 chains, and on this area—now devoid of railway facilities—on account of its configuration and surroundings, the business must increase immensely as Sydney develops.

The number of people living in the suburbs and entering the city daily for business and pleasure is now very large, growing fast, and in course of time must become enormous; hence the necessity of providing quick, cheap, safe, and comfortable daily transit to and from this portion of the city is obvious.

It may be said, generally, that omnibuses are behind the age for street traffic in large cities; that surface tramways—horse, steam, cable, or electric—are only suitable for local and short traffic; and that railways—overhead, surface, or underground, on which an average speed, inclusive of stops, of 15 or 20 miles an hour can be given—are alone suitable for a large population living at some distance from their city businesses and requiring frequent transit to and from their homes in the suburbs. To the low-paid clerk, mechanic, shop-worker, factory-hand, and labourer, whom an efficient suburb railway system enables to live amongst healthy surroundings in the suburbs, instead of being cooped up in a city, it affords a priceless boon; and to persons of every class it means a large saving in time and money.

As to tunnel working, it is a choice of evils; but with a good system of ventilation, even steam traction may be rendered tolerable. However, the day of electric traction for all suburban traffic seems near at hand—even now it is a moot point whether it is not a cheaper system for large trains, as it undoubtedly is for small ones, than steam. But even at

at a slightly increased cost the extra cleanliness and comfort which it affords would justify its adoption for any extensive system of suburban traffic. The present suburban railways do not accommodate half of the suburban population; the other portion is perforce restricted to trams and omnibuses—a slow, costly, and uncomfortable service.

If Sydney were as well provided with suburban railways as Melbourne, the number of passengers, instead of being only about 18 millions, might reach 45 millions per annum, and the trams will still be required for local or short distance traffic. The omnibuses would, of course, be almost entirely abandoned.

The following is a comparison of suburban railways and tramways within a radius of 10 miles of the two cities:—

	Melbourne.	Sydney.
Suburban Railways, double tracks	10 No., length 85 miles.	4 No., length 40 miles.
Average number of trains in and out per day	about 1,200.	about 330.
Suburban passengers per annum	39,000,000.	18,000,000.
City and Suburban Tramways	about 48 miles.	40 miles.
Passengers per annum	38,000,000.	about 30,000,000.

So the future possibilities of growth in Sydney are large indeed.

Redfern Station is too remote from city businesses to meet present requirements. Measured in time it means more than a half-hour's walk or a quarter of an hour's tram ride to the northern end of the city; and in money, for those who ride, 4d. per day. By rail the time would be reduced to six or seven minutes, and the money to 2d., or 4d., per day, depending on the class of traffic.

The capacity of Redfern as a railway terminus is now much overtaxed, and relief must be had either by extending and remodeling that station at once, or by extending the railway through the city and providing adequate wayside stations for suburban and city passengers. If one of these stations could be made the chief city station, with provision for long-distance as well as short distance traffic, the railway ideal would be realised. The Commissioners' scheme for a central station in Hyde Park, at St. James' Road, would meet this most admirably.

From a city business point of view, the best position for the city railway would obviously be one dividing the business portion equally on the east and west, and, therefore, a line a little west of George-street would appear to fulfil this condition best; but the evidence taken by the two Royal Commissions and the Public Works Committee, which thoroughly investigated the question of "city railways," appears to show conclusively that a railway to fulfil all the requirements of present and future traffic along this route, would be enormously costly and not likely to pay for years.

On economic grounds, therefore, an eastern route must be selected, and that favoured by the Railway Department close to Elizabeth-street seems to meet the economic condition best. In this scheme it is proposed to extend 6 (six) lines into a central station in Hyde Park, and to deal with the whole of the passenger traffic at 11 platforms stalls. It may be taken that the maximum capacity of these 6 lines, 3 "in" and 3 "out," would be 72 trains "in" or 72 trains "out" per hour—the platforms and shunting space being sufficient to dispose of the trains—or nearly three times the present maximum hourly traffic at holiday times at Redfern Station. With such accommodation, four times the present ordinary traffic could be safely dealt with. This means that the accommodation proposed would suffice for about 80 million suburban and long-distance passengers per annum. The Melbourne suburban railway passenger traffic is now 39,000,000, and has been as high as 43,000,000 per annum. Sydney, if adequately supplied with suburban railways, might have as large a suburban traffic as Melbourne; so that the provision deemed necessary by the Railway Commissioners for a central station in Hyde Park seems moderate in view of the probabilities of expansion in the near future. For such a traffic as this, the space for storage of trains and spare carriages would need to be four (4) times that now occupied at Redfern and Macdonaldtown— $4 \times 328 = 1,312$ carriages, or $4 \times 4,842$ yards = 19,368 yards—equal to eleven (11) miles of sidings, which, with the necessary approaches and shunts, would cover an area of about 30 acres. The total area at Redfern yard now, inclusive of both passenger and goods accommodation, is only 27 acres; and hence the almost absolute necessity of adding to this area for storage ground to meet the expected growth of traffic; and hence also the late Chief Commissioner's emphasised statement that to give additional ground to Redfern Station, under any circumstances, would be of immense advantage. Whether Redfern remain the terminus for long-distance traffic or not, this enlargement to meet the future growth of traffic seems absolutely necessary. The simplest and best way of meeting this necessity would be, it seems to me, to divert Devonshire-street to a position 9 or 10 chains north of and parallel to its present one, and appropriate a sufficient area of the Benevolent Asylum and Cemetery grounds, as proposed by the late Chief Commissioner and other railway authorities.

As to the possibilities of growth of city and suburban traffic, it is a well-known fact that in New York the yearly number of passengers by tram and train is considerably over 200 per head of the population served; in Melbourne it is at least 180 per head; and in Sydney, with equal facilities, it would be as large, or, say, 40,000,000 by suburban railways and 40,000,000 by trams. The present suburban railway traffic is about 18,000,000, and the present tram traffic, perhaps, 30,000,000.

Supposing the first city railway be from Redfern to Circular Quay by the eastern route, and that all the accommodation proposed by the Commissioners be provided, then, on the growth of the city and business requiring further accommodation, a line along the western route, even at a very high figure, might be entertained. Sydney would then have magnificent railway facilities, sufficient for a metropolitan population of, perhaps, 1,000,000 people. New York may be instanced as a city whose chief business is concentrated, by force of natural surroundings, within circumscribed limits, the same as Sydney. Its width averages 2 miles, and although there are four leading elevated railways less than half a mile apart, and trams in nearly every "up and down" street, the traffic is so enormous that relief is now sought in every direction by the conversion of horse trams to cable and electric conduit, as well as by projected underground railways. In this connection the traffic of the New York elevated system is worth quoting as an instance of immense traffic on a city railway. This system is 36 miles long; capital, £15,000,000; number of locomotives, 334; number of carriages, 1,122 (equal to more than 200 trains); train mileage per annum, 9,827,000; passengers per annum, 185,000,000 (equal to ten times the suburban railway traffic of Sydney); earnings, £1,850,000; fare, 5 cents, up to 10 miles in some cases.

As the width of the chief business portion of Sydney is not one-third that of New York, the future traffic here for a large metropolitan population must become enormous.

Any comparison of present costs of schemes for city railways should be made on the basis of equal accommodation; thus, if it be deemed necessary to provide six lines from Redfern to, and a large terminal station at, Hyde Park on the eastern side, a competing scheme on the western side should also provide for six lines and a corresponding station; the same for any proposed extension to Circular Quay. Of course, any extension into the city should be designed to suit any projected line to the eastern suburbs and a connection eventually with North Sydney. North Sydney is growing so rapidly that an extension to Circular Quay seems to be an immediate necessity, and as it is shown in evidence that the eastern line can be extended from St. James' Road to the Government House grounds, near Circular Quay, for less than £100,000, this seems the right thing to do at once. The traffic to and from the ferries and shipping, and between North Sydney and the existing railway suburbs, as well as the ordinary city business traffic which might be expected on this extension, would, it appears to me, justify its immediate construction. Any terminus at Circular Quay should provide land enough for several miles of sidings for shunting and storage of trains. For this purpose an area on the western side of Government House would appear to be well suited.

The whole cost of a large central station, providing not only full passenger accommodation but offices for the traffic and general administration staff, should not be charged to any city railway. Of the total estimated cost of the Hyde Park scheme—£650,000—nearly half would be a fair charge to the whole Railway property of New South Wales, and the other portion only should be charged to the extension for suburban traffic; and the fact that the increase of revenue expected from the proposed extension is shown to pay handsomely on the total cost does not affect this aspect of the case.

What should be done?

The western scheme, on account of the excessive cost of providing four or six lines with adequate station accommodation and a terminal station at or near the "Rocks" is, it appears to me, out of the question under present conditions of traffic.

The project of resuming 24 acres of old Sydney at the "Rocks," cutting it down to a suitable level and making new roads, &c., at an estimated cost of £800,000, and then appropriating 10 or 12 acres for a central station and disposing of the balance of the land, cut up on modern lines into building allotments fronting broad streets, for (say) £400,000, is not one that should commend itself to Railway managers, intent only on giving the best available service to the people and still making the railways pay their way.

As a scheme for city improvement the remodelling of this place would be highly desirable if it could be achieved at some gain or without loss to the promoters; and this, no doubt, would be done were there "money in it" without linking it to a scheme of city railways.

If the eastern route be adopted, and everything seems to point to this as the most suitable under present conditions, then, when this railway becomes taxed to its utmost capacity, relief may be obtained by constructing the western line with several city stations for a suburban traffic only and connecting it by an overhead railway along Circular Quay with the eastern line at the Quay station. If it be deemed best to make the connection with North Sydney by bridge, instead of by tunnel, the western route would answer better for that purpose. With a rapid advance of Sydney business and traffic, the time may not be remote when this western line, and a connection with North Sydney, may become a necessity even at a very high cost.

What shall the eastern line be? Undoubtedly the Commissioners' scheme, with a central station for all passenger traffic at Hyde Park, and a continuation to Circular Quay, with adequate storage and shunting ground there, as well as at Redfern, is the best.

Next to that is their alternative dual scheme for a suburban station on the site at Market-street, between Castle-reagh and Elizabeth streets, with a terminus for long-distance trains only in the Park, and a continuation to Circular Quay as before described.

The next best thing to be done.

The next best thing to be done, failing either of these, would be to make Redfern the chief city station, taking in a large portion of the Benevolent Asylum reserve and old Cemetery, and diverting Devonshire-street to a position parallel to and 9 or 10 chains north of its present one. This would give the necessary increase in length and area to the Redfern Yard.

The railway should then be extended to Circular Quay for suburban traffic, and stations provided at Liverpool-street, at the High School, near St. James' Road, between Castlereagh and Elizabeth streets, making Circular Quay station in the Government House grounds, opposite Albert-street, the terminus. Here sufficient of the Government Reserves should be appropriated for shunting and storage room for future growth of traffic. This extension might be carried out without appropriating any of the surface of Hyde Park. Of course, nearly the whole of the long-distance trains under this scheme would be handled at Redfern, which would not be quite so convenient for the passengers as a more central station at St. James' Road.

The inconvenience, however, would be greatly minimised by the fact that these passengers could readily change from or to suburban trains at Redfern, which must always be a stopping place for all trains, and remain one of the most important of city stations. With the frequent suburban service required for a large increase of traffic, due to development and the construction of further suburban railways, long-distance passengers requiring to change trains at Redfern would be little delayed either on arrival or departure. Whether the chief station be at Redfern or at St. James' Road, the cost of working the traffic must be sensibly the same—perhaps a little in favour of Redfern—because trains when done running would be stored at the station they arrived at or departed from, instead of incurring the cost of empty running between Redfern and St. James' Road if the latter were the terminus. The chief difference would be only the relative convenience to passengers.

These alternate schemes, with many others, have been inquired into and reported on by two Royal Commissions and the Public Works Committee, who have generally recommended the Hyde Park scheme in one form or another. I have only dealt with them in what appears to me their order of merit.

It would be presumption for me, with limited knowledge of the circumstances, surroundings, and requirements of the Sydney metropolitan district, to attempt to formulate a better scheme than any of those suggested from time to time by qualified officers of the State, who have given as many years to the consideration of the question as I have days; but I have made a close scrutiny of the physical and business features of Sydney, watched the railway, tram, and omnibus traffic to and from the Redfern Station during the busy hours of the day, read and studied the reports and a large amount of the evidence taken by the two Royal Commissions and the Committee of Public Works, listened attentively to and carefully perused information tendered by advocates of rival schemes, received pertinent information fully and freely tendered by the Railway Commissioners through their officers, and from the Engineer-in-Chief of Railway Construction, Mr. Deane; and with all due deference I submit my conclusions on the question of Sydney City Railways.

In my interim report I compared the areas for railway passenger accommodation in Melbourne and as proposed for Hyde Park, Sydney. Dealing with the whole of the areas in occupation and for extension for all kinds of railway business, the following comparison may be of interest:—

	Melbourne (including Flinders-st., Spencer-st., and Newport).	Sydney (including Redfern, Eveleigh, and Darling Harbour).
	acres.	acres.
Approximate area occupied for—		
Passenger business, including running and shunting lines.....	60	20
Goods	130	55
Carriage sidings, carriage sheds, and engine sheds.....	80	45
Workshops, including approach lines, sidings, &c.....	80	35
Spare land available for extensions.....	310	45
Totals	660	200

I have, &c.,
F. RENNICK,
Engineer-in-Chief, Victorian Railways.

No. 3.

The Premier of New South Wales to The Engineer-in-Chief, Victorian Railways.

Dear Mr. Rennick,

The Treasury, Sydney, N.S.W., 7 January, 1899.

I have just received your Report on the extension of the railway into the city, which I beg most heartily to thank you for, as a most valuable contribution on the vexed question.

The only point I wish to allude to is the fact that the scheme including the station in Hyde Park was, however admirable, not within the intentions of the present Premier, and that I wanted you to proceed on the basis of some other solution—even if not the best—of the question. On that point your Report—you will forgive me for saying so—is almost silent. For instance, take this part of a sentence: "As it is shown in evidence that the eastern line can be extended from St. James's Road to the Domain near Circular Quay for less than £100,000, this seems to be the right thing to do at once." In other words, you practically brush aside the actual position of affairs—that the Government will not deprive the people of the use of Hyde Park as a park, and as covered with a series of important city thoroughfares, and sacrifice the actual to that extent to the "ideal," with which, I can assure you, I am already most fully acquainted. The "railway ideal," when it comes into contact with a "health ideal," must, I think, take second place, if, at any rate, any other scheme is possible, and within reasonable bounds of expense.

"What shall the eastern line be?" Under that heading a few lines only as to the alternative scheme.

Now, having put the Government under many obligations by your kind visit, and the great trouble you have taken, would you object to give me a short addendum report, confined entirely to the "next alternative scheme," showing me your full opinion of it, on the basis that the Hyde Park official scheme is out of the question?

Yours, &c.,
C. H. REID.

No. 4.

The Engineer-in-Chief, Victorian Railways, to The Premier of New South Wales.

Board of Land and Works (Railway Construction Branch),

Engineer-in-Chief's Office, Melbourne, 11 January, 1899.

Dear Mr. Reid,

In reply to your letter of 7th instant, I have to state that I regret to find my meaning has been made obscure by the omission of a few words in copying my report, page 15. I now forward herewith this page corrected for substitution, with the omitted words underlined in pencil.

The alternative eastern scheme—*which would not appropriate any portion of Hyde Park*—which I recommend is briefly this: Make Redfern the terminus for long-distance trains, and extend the railway to Government grounds, near Circular Quay, for city and suburban traffic, providing stations at Liverpool-street, at the High School site, Market-street (between Castlereagh and Elizabeth streets), and in the Government House grounds, Albert-street.

The plan which I enclose will show the general features. My scheme is for a covered-way through Hyde Park, open station at Market-street, tunnel and covered-way from King to Bridge streets, open line thence to Fort Macquarie. Levels for lines and stations to be fixed definitely by Mr. Deane. Level of station opposite Albert-street would be about 30 feet above datum, or (say) 20 feet above Circular Quay. I understand that if the surface of Hyde Park be kept intact there is no objection to tunnelling or "cut and cover" work with the necessary ventilating shafts there, if the Park be deemed the best route for the line. The exact location of the railway, the extent and nature of the works, and the accommodation to be provided at stations, should be left to the Constructing Authority and the Railway Commissioners. For an outsider like myself to properly indicate these, and also estimate the cost, would require a lengthened study, as well as a survey of the project. I have no doubt whatever that the scheme thus indicated, which would not be a costly one, though inferior from a railway point of view to the Hyde Park scheme, with an extension to Circular Quay, would in practice be found an excellent one, and amply meet requirements for many years to come.

In quoting Mr. Deane, that the extension from "St. James' Road" to the Government House grounds, near Circular Quay, could be carried out for less than £100,000, it should not be inferred that this applied to the extension of the Hyde Park scheme only. Perhaps *St. James' Road* was an unfortunate expression, but I used it only to indicate the northern end of the line recommended by the Public Works Committee. Whether a station be placed in the Park or at the High School site, between Castlereagh and Elizabeth streets, the extension thence to Circular Quay would cost practically the same.

I trust you will find this correction and explanation satisfactory.

Yours, &c.,

F. RENNICK,

Engineer-in-Chief, Victorian Railways.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY EXTENSION INTO THE CITY OF
SYDNEY.

(PARTICULARS RESPECTING INQUIRY BY PUBLIC WORKS COMMITTEE.)

Printed under No. 4 Report from Printing Committee, 12 July, 1900.

[Laid upon the Table in answer to Question No. 31, Votes No. 14, 11 July, 1900.]

Question.

- (31.) Extension of the Railway into the City:—Mr. Norton asked the Colonial Secretary,—
- (1.) On what date was the question of extending the railway into the City of Sydney referred by this House last Session to the Public Works Committee?
 - (2.) On what date was the inquiry opened; and on what date was it closed?
 - (3.) On what date was the report of the Committee presented to this House?
 - (4.) How many witnesses in all were examined on the project?
 - (5.) On an average how many witnesses were examined at each meeting?

Answer.

- (1.) 20th December, 1899.
- (2.) The inquiry was opened on 6th February, the last evidence was taken on 24th April, and the resolution of the Committee was passed on 7th June, 1900. But the whole of the time represented by these dates was not occupied by this inquiry only. During the period from 6th February to 24th April, the Committee also carried on their inquiries in Sydney respecting the proposed Tuckian Flood Escape Scheme, Railway from Grafton to Casino, Railway from Wellington to Werris Creek, Railway from Narrabri to Walgett, with branch to Collarendabri, Railway from Grenfell to Wyalong, and central Railway Station and Administrative Offices on north side of Devonshire-street, as well as considering and passing their reports to the Legislative Assembly on the proposed Glebe Island Improvements, and Wharfage, Woolloomooloo Bay, and a Sectional Committee visited the Richmond and Clarence River districts to inspect, take evidence, and report with reference to the Tuckian Flood Escape Scheme and the Grafton to Casino Railway. The interval between 24th April and 7th June was, with the exception of one day, occupied by a portion of the Committee in the country inspecting and taking evidence relative to the proposed Railway from Wellington to Werris Creek and the proposed Railway from Narrabri to Walgett, with branch to Collarendabri, the Committee being desirous that this necessary visit to the western and north-western districts should be made before the present Parliamentary Session opened.
- (3.) The report has not yet been presented, but will probably be laid upon the Table next Tuesday.
- (4.) Forty witnesses were examined, ten of them more than once.
- (5.) The number of witnesses examined at each meeting was from one to four, the smaller number consisting of the official or expert witnesses, whose examination was necessarily conducted more in regard to detail than that of others, and those who submitted the more important of the private schemes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM GUNDAGAI TO TUMUT.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of Railway from Gundagai to Tumut," have, after due inquiry, resolved that it is expedient the proposed railway be carried out, provided that some satisfactory arrangement be made whereby the district benefited shall contribute to the Railway Commissioners such sum as may be necessary to make good any loss on the construction and working of the line,—and not otherwise; and, in accordance with the provisions of sub-section (IV), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

HISTORY OF THE PROPOSAL.

1. The first action in regard to the proposed railway appears to have been taken in 1883, when the Minister for Works approved of a survey being made. This survey, which, with some subsequent amendments, represents the route as now proposed, was completed in 1884, the length being 31 miles, and the estimated cost £387,267, or about £12,524 per mile. The same year £500,000 was voted on the Loan Estimates for the construction of the railway, and of that amount the sum of £34,119 was appropriated from the vote for the purpose of extending the railway from Cootamundra to Gundagai, a distance of three-quarters of a mile, into the town of Gundagai, and £2,748 was expended in survey and engineering work on the proposed Tumut extension. This expenditure upon the three-quarters of a mile extension into the town of Gundagai was, in reality, used for the construction of a part of the railway now proposed from Gundagai to Tumut. The explanation given of it is that the line towards Tumut passed nearer to the town of Gundagai than the line from Cootamundra did, and "upon the representations of the residents the Government agreed to construct a length of three-quarters of a mile, which would have formed part of the contract, Gundagai to Tumut, and the grades were altered at very considerable expense to enable a station to be made."

In 1886, the plans, &c., of the proposed line from the present Gundagai terminus to Tumut were laid upon the table of the Legislative Assembly, and approved; but in the Legislative Council it was decided to refer them to a select committee, and Parliament proroguing before the committee completed its labours, no further steps were taken. The matter rested until 1887, when the construction of the line was urged by the Member for the district. In 1889, the Railway Commissioners, in terms of the Public Works Act, reported upon the proposal unfavourably; and some alternative routes were then suggested. These, however, were found to be impracticable, and the original survey was thereupon revised and amended, with the result that, in 1896, the estimated cost, exclusive of land and compensation, was reduced to £148,310, or £4,723 per mile. Three years afterwards Ministerial approval was given to the line being included in the railway policy of the Government.

DESCRIPTION

DESCRIPTION OF THE RAILWAY.

2. The line, 31 miles 35 chains in length, would begin at the terminal point of the Cootamundra to Gundagai branch of the Great Southern Railway, at 286 miles 56 chains from Sydney, and crossing immediately the Murrumbidgee River, skirt the western side of South Gundagai, and follow generally the main road to Adelong for about 9 miles, and Adelong Creek for about 6 miles further. There it would follow up Bunnaback Creek to the summit of the line, at 22 miles from Gundagai, and thence descend *via* Gadara Creek, which would be followed to its junction with Gilmore Creek, the direction of that creek being taken to the Tumut cemetery, which would be passed on its south side, the line ending at the marked-tree road close to the township, at 318 miles 11 chains. The works, with the exception of the Murrumbidgee River bridge, would be fairly easy. The ruling grade would be 1 in 50, with frequent curves of 10 chains radius. Private land would be passed through almost the whole length of the railway.

ALTERNATIVE ROUTES.

3. The alternative routes suggested traverse the Tumut River valley, one on the west side of the river, starting from the Cootamundra-Gundagai line, at a point $4\frac{1}{2}$ miles above Gundagai, and the other on the east side, commencing about a mile beyond Coolac railway station, at 277 miles from Sydney. By these routes the Murrumbidgee River could be bridged more cheaply than by the route from Gundagai, but the creek crossings would be more numerous, and, on one of the routes, the earthworks more costly, while the junction with the existing railway would, it is pointed out, convert the portion between such junction and Gundagai into a minor branch line, worked either by a separate train and staff at a very heavy train mileage expenditure, or by running the main branch passenger trains down the small branch and back again, thus involving many miles of profitless work, and much delay to the main branch traffic. Reports from the railway surveyor who explored these routes, and minutes by the Engineer-in-Chief upon those reports, are published in the Appendix to the evidence given in the inquiry.

ESTIMATED COST.

4. The estimated cost of the railway, exclusive of land and compensation, is given as £148,310, or £4,723 per mile; but as the price of rails has gone up since this estimate was made it is necessary to add to the estimate to the extent of £155 per mile. On this point the Engineer-in-Chief says:—

I find, on looking into this estimate, that the rails and freight were taken higher than we have been in the habit of taking them at recently, and therefore, if the rails could be obtained at what I call the standard rate, £5 5s. per ton landed in the stores in Sydney, a reduction of £115 per mile might be made on this estimate. On the other hand, as the price of rails has gone up very much, a very large addition would have to be made. The price of rails landed in the stores in Sydney would probably be £7 10s., as against £5 5s.; that would be £270 per mile. Deducting £115 per mile, the present price of rails, £7 10s. landed in Sydney, would necessitate the addition to this estimate of £155 per mile.

The largest items in the estimate, apart from the permanent-way materials, are—earthworks, £29,438; bridge over the Murrumbidgee, £25,700; culverts, timber bridges, and small openings, £11,172. There are many cuttings and banks on the line, some of the former very deep, and this not only makes the cost of the earthworks a considerable item, but largely affects the cost of the culverts and the bridges. The estimated cost of land resumptions and compensation for severance is £8,000, which may, however, be reduced, the Land Valuer explains, when the line comes to be constructed. With the probable additional cost of rails, *viz.*, £4,871, and the cost of land resumption, £8,000, the total cost would be £161,181, or, in round figures, £5,200 per mile.

RAILWAY COMMISSIONERS' REPORT.

5. The Railway Commissioners have three times reported upon the proposed line—in 1889, in 1896, and in 1899. Their first report “showed that the most sanguine results, if realised, could not for many years more than meet working expenses.” They could not recommend the construction of the line, and pointed out that if it were made at some future time the residents should convey the land required free of cost. In

In 1896 they drew attention to the fact that the branch line from Cootamundra to Gundagai entailed a loss of £6,474 per annum, and it had to convey nearly all the traffic that would be carried over the proposed extension, as well as the traffic secured from its own surrounding country. This clearly indicated, they said, how unprofitable the proposed extension would be.

Their last report is equally unfavourable. "The matter," they say, "has once more been the subject of careful investigation, and while there has been an increase in the cultivation of wheat in the district, the growth of maize and tobacco has decreased, so that in the main the traffic prospects are practically the same as when the last report was submitted in May, 1896."

The revenue from the line, "based upon a liberal estimate of existing and prospective traffic and by charging local rates," would be, the report states, about £3,900 per annum, and if through rates were charged it would only be about £1,700. Interest on capital cost and working expenses would amount to £8,150. The estimated annual loss would therefore be with local rates £4,250, and with through rates £6,450. The Commissioners point out that the Cootamundra-Gundagai line, over which practically the whole of the existing traffic of the district is carried, showed a loss of £4,161 for the year ending 31st December, 1898, and for nine years the average loss has been £6,458. These figures, combined with the fact that the area of land in the district suitable for cultivation is limited, are reasons they strongly urge why the line should not be constructed.

THE INQUIRY.

6. In carrying out the inquiry respecting the proposed line, the Committee took evidence in Sydney from a number of official and other witnesses, including two former representatives of the Tumut electorate in the Legislative Assembly; they then visited the Gundagai-Tumut district, examining witnesses at Gundagai, Adelong Crossing, Adelong, Tumut, and Brungle, and, as far as practicable, inspecting the route proposed for the railway and those portions of the alternative routes which could be seen by travelling from Tumut to Gundagai, *via* Brungle, along the Tumut River valley. While at Adelong the Committee divided, and drove out from the town to inspect the country to the south and south-west, with a view to ascertain the character and extent of both agricultural and pastoral land in those directions; and at Tumut the surrounding country, which would be, more or less, within the influence of the railway, was examined in a similar manner, visits being made to the Gilmore Valley, Lacmalac and Springfield, the Tumut Plains, and Batlow.

DISTRICT TO BE SERVED BY THE RAILWAY.

7. The valley of the Tumut is one of the most fertile parts of the Colony, but the quantity of agricultural land available, compared with what is to be found in many other districts, is not extensive. Most of the land cultivated, or capable of cultivation, is near the Tumut River and its adjoining creeks, and averages from about half to three-quarters of a mile in width. These narrow areas do not extend any great distance, the longest—with the exception of the river valley, which is some 30 miles in length—being about 18 miles. The view presented of the country on either hand during a journey from Gundagai to Tumut, *via* Adelong, offers but little prospect favourable to the railway. There are beyond the ranges between which the road runs, a number of localities where settlement exists and cultivation is carried on, but, though this is the case, no one of the three railway routes would, by reason of the intervening ranges, serve the agricultural land on either of the other two. Traffic must be looked for in other directions. Information gathered during the Committee's visit of inspection mentions Windowie, Gilmore, Blowering, Tumut Plains, Lacmalac, Bumbowlee Creek, and Gocup as valleys that would be within reach of the railway, where all the land is in occupation, partly by farmers with small holdings, either freehold or leased, on which both cultivation and grazing are carried on, and partly by holders of large areas, portions of which are let to tenant farmers, and the remainder devoted chiefly to grazing purposes, including the feeding of starving stock sent to the district in times of drought. In addition to the river and creek flats

flats there is very good land on some of the ridges, most of which is used for grazing stock, and some of it for the production of cold-climate fruits. Fruit and vegetables grown in the district are equal, and, in some instances, said to be superior, to anything of the kind produced in other parts of the Colony. Maize, wheat, and tobacco have been the principal crops.

A staff surveyor of the Department of Lands, examined at Tumut, described the country in the district as for the most part flat land or ridgy, forest country—the flats being particularly good, the lower ridges admirably adapted for wheat-growing, and the higher fairly good sheep country. A statement prepared by him, classifying the whole of the land which would be more or less affected by the construction of the proposed railway, describes an area of, approximately, about 960,000 acres, 440,000 acres of which—comprising 310,000 acres of pastoral land, and 130,000 acres of arable land—are alienated. Of the unalienated land, 65,000 acres are said to be arable land, consisting almost exclusively of rising ground, scattered over the district, and not taken up owing to its remoteness and difficulty of access. The Bago table-land to the south of Tumut, this witness stated, consists largely of very good land, which, though rather cold, is suitable for wheat, oats, potatoes, and fruit. Small areas around Batlow, distant about 20 miles beyond Tumut, a locality which two members of the Committee visited, are cultivated mostly for fruit.

The people in the Batlow and Bago districts would take their produce to the line where it crosses the Gilmore Creek, between Adelong and Tumut. In the direction of Batlow, for some 9 miles from the Gilmore, the land alternates between rich agricultural flats and hills suitable for pastoral purposes, the latter predominating. The country then changes to tableland, largely of a basaltic character, with in many instances a great depth of loamy, red soil. This land, being at a high altitude, seems exceptionally adapted for the growth of cold-climate fruits, potatoes, onions, &c. The existing orchards look in excellent condition, being in many cases irrigated with water brought from higher levels by old mining races. The timber on the tableland is heavy, and, consequently, expensive to clear; but as a small area of the richer land is sufficient to support a family, the cost of clearing should not necessarily prove a bar to settlement. In the vicinity, there seems to be room for considerable development in the way of close settlement and intense culture.

The following is a summary of the figures submitted by witnesses examined at Tumut, showing the areas of land cultivated, and of land said to be capable of cultivation, in various localities in the district:—

Locality.	Area cultivated.		Area capable of cultivation.		Total. Acres.
	Acres.	Acres.	Acres.	Acres.	
Parish of Mingay	571	6,896	7,467
Tomonoma	60,000	60,000
Blowering...	905	905
Tumut Plains	1,100	13,000	13,000
Micalong... ..	400	19,600	20,000
East Blowering	406	2,424	2,830
West Blowering Station	1,095	1,255	2,350
Parish of Gilmore	2,215	6,420	8,635
" Wyangle	254	2,680	2,934
" Mondongo	2,756	2,183	4,939
" Blowering	2,147	672	2,819
" Werboldera	690	480	1,170
" Yellowin	450	6,000	6,450
Talbingo	1,000	1,000
Wondowie	1,247	1,247
Gallifat	7,000	7,000
	12,084	131,762			142,746

The maize and tobacco production has decreased of late. Why maize, which is of very good quality and impervious to weevil, should not be grown as extensively as before is not clearly explained; but it would appear that the cost of road carriage and the delay in reaching a market make the product unprofitable. Tobacco, for various reasons, is said to have almost gone out of cultivation.

Recently the dairying industry has been started, and, at the time of the Committee's visit, preparations were being made for enlarging the operations connected with it.

Mining

Mining is carried on profitably, though not nearly so extensively as in years past, at Adelong and a few other places in the district. Adelong, which is 22 miles by road from Gundagai, and the centre of a district bounded in one direction by the Gap (4 miles away), by Batlow (16 miles to the south), by Mount Adrah (14 miles to the west), and by Grahamstown (6 miles in the direction of Gundagai), depends principally on mining, there being very little agricultural land in the neighbourhood. In the opinion of the Chief Inspector of Mines, Adelong will for many years be the leading gold-field of New South Wales, as there the most permanent reefs exist that so far have been discovered in the Colony, and payable ground is being worked at a greater depth than in any other mining district; but want of capital in some of the mines, and over capitalisation in the largest, have interfered very much with the progress of mining operations.

The population of the district, or of the area that would probably be served by the railway, numbers about 6,000 or 7,000, a considerable proportion of whom appear to be in comfortable circumstances.

TRAFFIC PROSPECTS—CHIEF TRAFFIC MANAGER'S ESTIMATE.

8. In the Chief Traffic Manager's report, upon which the Railway Commissioners' estimate of the probable traffic on the railway is based, it is stated that careful inquiry made on the subject of traffic prospects indicates that the position, as far as the production of the district is concerned, has not materially altered since the Commissioners dealt with the matter in 1896:

An increase has taken place in connection with the area under cultivation for wheat; but on the other hand, the cultivation of maize and tobacco has decreased. The population of Tumut, Adelong and district is about 6,000; the residents of Adelong and districts being dependent chiefly on gold-mining. The distance from Adelong to Gundagai, by an excellent road, is 22 miles, and the existing rates for road-carriage range from 10s. to 20s. per ton. The area of land available for future cultivation is limited, and it is very questionable if any material increase in the traffic of the district can be looked forward to in the direction of agriculture.

The Chief Traffic Manager is of opinion:

That the construction of the line would not have any appreciable effect on the amount of traffic which would be created for the purpose of main-line haulage; and when it is considered that the distance by road to Tumut is 9 miles shorter than that of the proposed line, it will be readily seen that it is a very open question whether the whole of the traffic of the district would be rail-carried.

In estimating the traffic he allows 25 per cent. increase upon that which exists to-day in order to cover any additional production or trade which may follow the construction of the railway, and basing his estimate on both arbitrary local rates and ordinary through rates, he gives the results as follows:—

By charging arbitrary local rates—

	£	s.	d.
Goods, stock, and wool	2,489	0	0
Mails, 31 miles, at £12	372	0	0
Passengers, 5,000, at 1½d. per mile	968	15	0
Parcels, horses, carriages, dogs	50	0	0
Total	£3,879	15	0

By charging ordinary through rates—

	£	s.	d.
Goods, stock, and wool	305	10	6
Mails, 31 miles, at £12	372	0	0
Passengers, 5,000, at 1½d. per mile	968	15	0
Parcels, horses, carriages, dogs	50	0	0
Total	£1,696	5	6

In view of the carriage by road being 9 miles shorter than that by rail, local rates, he considers, could not be maintained, and his opinion on this point is emphasised by the fact that on certain kinds of goods the rail charges would be higher than those by road. Not until Adelong was reached, he states, would much traffic come to the line, as most of the country between Adelong and Gundagai would be served by the railway from Gundagai to Cootamundra. Even at Adelong all the traffic of the place would not necessarily go to the new railway, for as the Adelong people would have to travel about 5 miles to reach the line, when goods were once on the drays there would be a disposition to take them to Gundagai, and,

in his opinion, it is more than likely that there would be competition on the part of teams with the railway. There can be little increase in production, he considers, and in any case the possible increase, he points out, is more than covered by the 25 per cent. added to the traffic estimate. With regard to starving stock, there is not much disposition on the part of stockowners, it is explained, to send stock into the district unless they are absolutely compelled to do so, as the cost attached to the undertaking amounts to a heavy tax on owners. The proposed line, in the opinion of the railway authorities, would practically be a further extension to cater for traffic already carried by the line from Gundagai to Cootamundra.

TRAFFIC PROSPECTS—LOCAL ESTIMATE.

9. The evidence given by witnesses examined at Gundagai was to the effect that the existing railway from there to Cootamundra was quite sufficient to meet the requirements of the district, and that the proposed extension to Tumut would not pay. The increased traffic on the Cootamundra-Gundagai line, which has been apparent during the last four years, has been due, it was explained, to extended building operations in Gundagai, and to mining developments within $3\frac{1}{2}$ miles of that town, not to anything connected with the district as a whole.

At Adelong the witnesses examined favoured the construction of the line, and expressed the opinion that while it would greatly benefit the district, it would, undoubtedly, obtain a considerable quantity of traffic; but special rates, it was admitted, might make it more profitable for storckeeper and others receiving quantities of goods to continue to use the road, especially as teamsters would be able to reduce their charges on third-class goods. For teamsters the district is peculiarly favourable, as the roads—though in some places steep—are in admirable order, and fodder, which is only required in winter, is generally plentiful and cheap. Ore from the mines, it was said, would be sent away by rail in large quantities; there would be a considerable traffic, in the season, with fruit; and the timber industry of the district, which is capable of development, would also contribute to the railway traffic returns. The Chief Traffic Manager's wool estimate was regarded by Adelong witnesses as below what it was likely to prove.

At Tumut, the evidence had been arranged with some care, witnesses representing different localities attending with information respecting each. The figures submitted, however, referred for the most part to the number of acres of land under cultivation and suitable for cultivation, and the yield from the various crops grown. Evidence was not forthcoming which would enable the Committee to test in detail the traffic estimate of the Railway Commissioners, but what was given questioned that estimate as a whole, and indicated that if the railway were constructed it would be largely exceeded. The land in the district was said to be most suitable for either cultivation or grazing, a comfortable living being obtained by farming and grazing, or by fruit growing, on very small holdings. The rainfall is heavy and regular, and the yield from crops very satisfactory. Large quantities of produce—wheat, maize, hay, potatoes, vegetables, and fruit—might be sent away to Sydney regularly if railway facilities were available. Wheat pays well under existing circumstances, but maize is often unprofitable because of the charges connected with carriage by road, and the delay in getting the grain to market. Hay also, is a product the farmer finds it difficult to deal with profitably; and potatoes, though equal to those of Warrnambool, have at times rotted in tons where they have been grown, through the want of means for getting them away to where they could be sold. Fruit of the best description, and in large quantities, it was urged, could be grown, and supplied when the Sydney market was bare of fruit from other localities; at present this industry is limited to what can be disposed of with profit locally. From these sources a large and valuable railway traffic, it was contended, would arise, and, with the addition of wool and mineral traffic, make the railway earnings much larger than the Railway Commissioners' estimate represented them. The wool produced in the district that would be put upon the railway, it was urged by two or three witnesses, was in quantity much greater than represented by the Commissioners, and one witness supported his statement by giving the names of the different stations and their annual output. It was also stated that the railway would materially develop the timber industry.

Re-examined

Re-examined in regard to the Commissioners' estimate, after the Committee's return from the district, the Chief Traffic Manager explained that the traffic prospects of the line had been ascertained by examining the railway books at Wagga and Gundagai railway stations to find the actual amount of traffic coming to those stations from the Tumut district. The amount was 5,000 tons, and in the estimate allowance had been made for 7,000. Inward tonnage had been allowed for to the extent of 3,400 tons, a quantity considerably in excess of that now sent to Gundagai. In the estimate of the quantity of land under cultivation, allowance had been made for the traffic produced from 17,000 acres, 5,000 of which were included for additional cultivation. This represents 12,000 acres as at present under cultivation, an estimate that agrees very closely with both the local evidence and the Government statistics. The estimate of wool traffic accounted, he stated, for every bale of wool grown in the district likely to be carried on the railway, the figures being arrived at after an exhaustive examination of the Gundagai railway books for the last three years. For fruit production 400 tons per annum had been allowed; but the railway rates for carrying fruit are very low and fruit production would not materially increase the railway revenue. So that, giving the project credit for much of the local estimate of increased traffic, the construction of the line would still result in a heavy financial loss.

CONCLUSIONS FROM THE EVIDENCE.

10. A careful consideration of the evidence and of what was seen during the Committee's visit to the district, leads to the following conclusions:—

- (1) The most advantageous route is that now proposed.
- (2) The line is an expensive one to construct, and runs almost entirely through private property.
- (3) To construct the line means, according to the Railway Commissioners—and there is much to support their estimate, even in the evidence of local witnesses—an annual loss of £4,250 with local rates, and £6,450 with through rates. Local or special rates, experience has shown, do not find favour, and if charged in the first instance are difficult to maintain.
- (4) The roads between Gundagai, Adelong, and Tumut are very good, and the distance between those places comparatively short, the direct road from Gundagai to Tumut being only $22\frac{1}{2}$ miles. It being possible and not improbable that teamsters would reduce their charges below the railway rates, for general merchandise, it is not unlikely that a portion of the traffic expected by the railway would continue to be carried by team, especially to and from Adelong. If such should be the case, the railway earnings would be so much less than estimated, and the loss so much greater.
- (5) The reasons put forward in support of the railway are that the traffic in goods, wool, stock, and passengers would be considerable, that present holders would largely increase their cultivation areas, that much additional land would be taken up and cultivated, or otherwise profitably used, that mining would be encouraged and extended, and that the timber industry would be developed. But though, doubtless, increased cultivation would follow the construction of the railway, it is not likely that the increase would for some years be very large, and the striking fact presents itself that a considerable proportion of the alluvial flats close to or within an easy distance of the railway at Gundagai is at the present time uncultivated.
- (6) The greater part of the land suitable for agriculture has already been taken up, and, judging by past experience, the holders have not tilled their lands to any material extent, and new agriculturists would to a large extent have to lease lands from the freeholder, a state of things which some witnesses urged has largely retarded the agricultural progress of the Tumut district.
- (7) From 20 to 25 miles is the recognised distance from a railway station over which produce may be carted profitably, and this is about the distance between Gundagai and Adelong, and Gundagai and Tumut. Localities outside Adelong and Tumut, but within the district, are further away, but even some of those are not out of touch with the present line. In other districts farmers cart their produce 30 miles to a railway. (8)

- (8) The district is regarded as one useful for the feeding of starving stock in times of drought, and such stock have been sent there, the largest number, at any time, last year. But, from a traffic point of view, this does not appear to be of much importance, for so exceptional is the traffic that until last year the railways had not carried any starving stock for six years, and prior to that none for ten years, and during the last twenty years this class of stock have been carried only three times.

DECISION ARRIVED AT.

11. The weight of the evidence being, in view of the estimated serious loss, unfavourable to the construction of the railway, the Committee are of opinion that before its construction is decided upon, some satisfactory arrangement should be made by which the district shall contribute to the Railway Commissioners a sum sufficient to make good the loss which must result from the construction and working of the line. Only on that condition do they approve of the proposed work being carried out.

RESOLUTION PASSED.

12. The resolution passed by the Committee is shown in the following extract from the Minutes of Proceedings of 3rd February, 1900:—

“Mr. Shepherd moved,—‘That, in the opinion of the Committee, it is expedient the proposed Railway from Gundagai to Tumut, as referred to the Committee by the Legislative Assembly, be carried out, provided that some satisfactory arrangement be made whereby the district benefited shall contribute to the Railway Commissioners such sum as may be necessary to make good any loss on the construction and working of the line,—and not otherwise.’

“Mr. Watson seconded the motion.

“Mr. McFarlane moved,—‘That the motion be amended by the omission of all the words after the word “out.”’

“The amendment was negatived on the following division:—

Ayes, 2.		Noes, 5.
Mr. Levien,		Mr. Trickett,
Mr. McFarlane.		Mr. Shepherd,
		Dr. Garran,
		Mr. Dick,
		Mr. Watson.

“The motion was then passed.”

W. J. TRICKETT,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 6 June, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM GUNDAGAI TO TUMUT.

THURSDAY, 2 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Gundagai to Tumut.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Do you produce a statement with regard to the proposed railway? Yes; I will read it:—

GUNDAGAI TO TUMUT.

R. R. P.
Hickson.

From the papers it would appear that the first action in regard to this proposal was taken in August, 1883, when Mr. Secretary Wright approved of a survey being made.

The survey was carried out by Mr. Melrose, and its completion reported in December, 1884, the length being 31 miles, and the works estimated by the late Engineer-in-Chief (Mr. Whitton) to cost £387,267 13s., or about £12,524 1s. 4d. per mile.

A sum of £500,000 was voted on the Loans of 1884 for the construction of this line, of which a balance of £463,133 now remains.

It will thus be seen that £36,867 has already been appropriated from the vote. Of this amount, £34,119 was spent upon the extension of the Cootamundra to Gundagai line into the town of Gundagai, the balance being for survey and engineering expenses.

In explaining this expenditure, I have to point out that the contract from Cootamundra to Gundagai terminated at a point three-quarters of a mile outside the township of Gundagai where it was intended to erect the station.

The line towards Tumut passed nearer to the centre of the town of Gundagai, and, upon the representations of the residents, the Government agreed to construct a length of three-quarters of a mile which would have formed part of the contract, Gundagai to Tumut, and the grades were altered at very considerable expense to enable a station to be made.

In 1886 the plans, &c., of the proposal were laid upon the Table of the Legislative Assembly and approved; but when similar action was taken in the Legislative Council it was decided to refer the matter to a Select Committee. Parliament, however, prorogued before the Committee completed its labours, and no further steps were taken.

The matter then rested until the year 1887, when Mr. Travers Jones, M.P., wrote urging the construction of the line. The same Member, in 1888, continued to press the matter, and in June of the following year the Railway Commissioners, at the request of the Minister, forwarded their report on the proposal, in terms of the Public Works Act, which showed that the most sanguine results, if realised, could not for many years more than meet working expenses. The Commissioners at this time could not recommend the construction of the line, and pointed out that if it were made at some future time the residents should convey the land required free of cost. Statistics supplied by Mr. Travers Jones, M.P., at this time showed that there were 11,288 acres under cultivation in the district to be served by the line, the number of sheep being 368,535; and cattle, 28,577.

Towards the end of the year 1889, the Brungle Progress Committee, per Mr. Travers Jones, M.P., applied for a survey to be made of an alternative route from Coolac to Tumut. Mr. Bruce Smith approved of an examination being made, and Mr. Burge, under instructions from the Engineer-in-Chief, carried it out. Upon the report of the examination being submitted to the Minister, he raised the point that as it was contended this alternative route would cost less per mile than that from Gundagai, would Mr. Deane express his opinion on the question, and the Engineer-in-Chief, in reply, stated that as the line surveyed from Gundagai would serve Adelong, which the alternative would not, and as the saving of £1,225 in interest on capital cost, which the alternative scheme was assumed to effect would be counterbalanced by extra cost of working a separate branch, he concluded that the line as at present surveyed would be the better.

The next step of importance was taken during the year 1891 when the Minister approved of Mr. Gilliat, the Examiner of Public Works Proposals, reporting on this line, and the conclusions this officer arrived at were that there was no apparent justification in either the character of the country, its settlement, or production, to take the line as proposed round by Adelong Crossing or Adelong, and he suggested a light line or tramway of the standard gauge, starting from South Gundagai to the west bank of the Tumut River, a distance of 19 miles.

In September of the same year a deputation from the residents of Tumut, introduced by Messrs. E. G. Brown and V. Parkes, M.P., waited upon Mr. Secretary Young, and, in urging the construction of the line, drew attention to the importance of the district as an agricultural centre with great facilities for maize and tobacco cultivation, and also to its richness in auriferous metals. Mr. Secretary Young promised to give the matter consideration and mentioned the above proposal of Mr. Gilliat, upon which he asked for the opinion of the Engineer-in-Chief.

The Engineer-in-Chief stated that a line of this length was impossible, for the reason that the winding necessary to give a grade of 1 in 40, as per Mr. Gilliat's report, would bring the length (19 miles) up to 28 or 29 miles, as compared with the original survey, 31 miles, so that the difference was trifling.

In December, 1892, Mr. Burge, under instructions from the Engineer-in-Chief, made an examination with the view of obtaining the Brungle route by extension from South Gundagai, and so avoiding the Coolac-Gundagai cocks spur branch, but this route proved impracticable.

R. R. P.
Hickson.
2 Nov., 1890.

On the 23rd of December, 1892, Mr. Secretary Lyne, upon the recommendation of the Engineer-in-Chief, approved of the original survey being amended, with a view to a reduction being made in the estimate. Mr. Burge reported its completion in July, 1894, and a considerable reduction was made in the estimate, the cost being reduced to £164,777, or about £5,248 per mile.

In April, 1896, the estimate was again revised, the works being designed on the basis of the "Pioneer" principle, and it now stands at £148,310 or £4,723 per mile, exclusive of land and compensation, for a length of 31 miles 35 chains.

Mr. Travers Jones, M.P., continued to urge the construction of the line, and in July, of 1896, introduced a large and influential deputation to Mr. Secretary Young upon the subject.

They pointed out that the farmers were greatly handicapped in conveying their produce to market. Owing to climatic conditions, droughts were of rare occurrence, and good crops always assured. 150,000 acres of rich Crown lands were available for settlement, and when grass would be scarce, sheep would have to be sent to the mountains. In addition, owing to the "halves" system operating among the farmers, agricultural matters would be sure to advance.

The Minister, in reply, drew attention to a report he had received from the Railway Commissioners, dated 8th May, 1896, portion of which was as follows:—"We would draw attention to the fact that the branch line from Cootamundra to Gundagai entails a loss of £6,474 per annum, and it has to convey nearly all the traffic that would be carried over the proposed extension, as well as the traffic secured from its own surrounding country. This clearly indicates how unprofitable the proposed extension would be."

The great item of expense in connection with this proposal is the Gundagai Bridge, and, in the estimate just given, a sum of £25,100 is included for it.

The question of the use of a combined bridge for railway and road traffic was carefully gone into, and reported upon by Mr. Deane and myself in March, 1894. We reported that a combined bridge could be carried out in two ways,—

Firstly.—The railway, road, and foot passenger traffic would be carried parallel and independently of one another.

Secondly.—The railway and road traffic would be carried on the same track, and the foot traffic carried on a footpath on the outside. The cost of the former would be about £128,000, and the latter about £90,000, and the conclusions arrived at were that not only from considerations of cost, but also of inconvenience, it is most undesirable to attempt the construction of a combined bridge.

In July, 1899, Mr. Donaldson, M.P., urged the submission of the proposal to the Works Committee, and the late Minister, Mr. C. A. Lee, approved of it being included in the railway policy of the Government.

The Railway Commissioners have been asked for a report to bring the matter up to date; but this has not yet come to hand.

The following is a description of the line:—This line begins at the terminal point of the Cootamundra to Gundagai branch of the Great Southern Railway, at 286 miles 56 chains from Sydney, and crossing immediately the Murrumbidgee River, skirts the western side of South Gundagai, and follows generally the main road to Adelong for about 9 miles, and Adelong Creek for about 6 miles further. Here the line follows up Bunnaback Creek to the summit of the line, at 22 miles from Gundagai. The descent is then made *via* Gadara Creek, which is followed to its junction with Gilmore Creek, the general direction of which is then taken to the Tumut cemetery, which is passed on its south side, the line ending at the marked-tree road close to the township, at 318 miles 11 chains. The works, with the exception of the Murrumbidgee River bridge, are fairly easy. The ruling grade is 1 in 50, with frequent curves of 10 chains radius. Private land is passed through almost throughout. The line from Cootamundra to Gundagai cost £270,000.

2. You appear to know this route from personal observation? I know it as far as the main road is concerned. It leaves the main road at Adelong Crossing. The portion from there I do not know.

3. You have not been over the whole of the line? No.

4. But you have been over it as far as Adelong Crossing? Yes; and I know the Tumut end.

5. The bridge is at Gundagai, is it not? Yes.

6. That, as a railway bridge, is estimated to cost £25,000? Yes.

7. You appear, in conjunction with Mr. Deane, to have inquired into the possibility of a combined bridge for a railway and for ordinary traffic? Yes.

8. Would you explain to the Committee how this very large apparent difference is made up from £25,000 to £128,000? One is for a timber bridge, and the other is for a steel bridge. The larger amount is for the steel bridge, not only to cross the river, but to cross the Murrumbidgee flats. There is a long flat on the Gundagai side of the Murrumbidgee River over which we have put a wooden bridge as the approach to our iron bridge, at a cost of about £14,500.

9. Then there is already a bridge over the river for road traffic? Yes.

10. When was that constructed? The iron bridge was erected about twenty years ago. The wooden bridge to it is only just finished.

11. What cost did that involve? I think £14,500.

12. That was the approach to the bridge? Yes. The old approach was in a dangerous state.

13. Is that a wooden structure? Yes.

14. Was that provided for out of Loan money? Yes.

15. And were the old bridge and the old approach charged to Loans? I expect so. They were built many years ago. I know that the new one was.

16. Is the bridge across the river at present of steel or wood? It is an iron bridge.

17. Do you know the cost of it? I can get it.

18. Is that bridge of such a character that it could be altered into a railway bridge? No; I do not think it could be done at any reasonable cost.

19. When was this inquiry conducted by you and Mr. Deane, as to the possible cost of a combined bridge? In 1894.

20. Have any alterations occurred with regard to bridge-construction between then and now, that would possibly cheapen a combined structure? Yes; it would cost less now.

21. Is not a kind of bridge called a composite bridge the sort of bridge you would construct now? I understood from Mr. Deane that the £25,000 was for a wooden structure.

22. A little while ago you said that the very great increase from £25,000 to £128,000 was caused by reason of the combined bridge having to be a steel structure? Yes.

23. If, to-day, the Department were constructing a combined bridge, what would be the character of it? It would be much cheaper—a composite bridge, partly iron, partly timber.

24. Could you tell us what it would cost? Not without going into figures. Those amounts would be reduced by at least one-third.

25. And that question of the construction of composite bridges, where we construct road or railway bridges separately, has engaged the attention of the Department as a matter of policy? Yes.

26. What are the views of the Department on the subject? Their views are that in case of a large structure it is more economical to build a composite bridge. Our designs are so arranged now, that we have those members of the bridge that are in tension in steel or iron, and those members that are in compression in timber. We get the best results, as regards strength, at a minimum of cost, in that way.

27. And that principle applies to all our bridges;—you are going in for the composite principle? It applies to all bridges over a certain size.

28. In the larger type of bridge the composite principle is adopted? Yes.

29.

R. R. P.
Hickson.

2 Nov., 1899.

29. Now you refer in your statement to two kinds of combined bridges—one giving a separate track for the railway, and another for the road traffic; and one in which the road traffic would traverse the railway line? Yes.
30. In outlying districts like this, where economy is a great object in construction, would not the less expensive bridge answer all purposes, or are there grave objections to it? A good deal depends upon the railway traffic. If there is a good deal of railway traffic over the bridge, I do not care for the combined structure at all. It is very difficult to arrange a road for vehicular traffic over such a bridge. But in a place where there are only two trains a day, one going and one coming, I do not think there is any objection to it.
31. In a case of this kind there would not be frequent trains—at any rate, not for a long time to come? No.
32. So if the idea were entertained of having a combined bridge, in your opinion the cheaper class of bridge would suffice? We do not want a combined bridge now, because we have got a road bridge.
33. *Mr. Watson.*] Could the present road bridge be utilised? Not without a great deal of expenditure.
34. *Chairman.*] Is the present road bridge a high-level bridge? Yes.
35. Is the river there liable to floods? Yes; tremendous floods come down.
36. Is it a bridge above flood-level? Yes. Nothing else will do on the Murrumbidgee.
37. With regard to the character of the country that you know between Gundagai and Adelong, what is its nature as regards its surface or contour? Part of it is very rough, but there is some very good land. The extent of it on either side I could not say. I do not think that the good land is a very wide area. At Tumut there is some very fine land. The Tumut flats are very fine land.
38. Do you know what the distance is from Gundagai to Tumut by a straight line? By road, I think it is 21 miles.
39. Why is this great detour in the railway line necessary? On account of the rough country. The road goes very straight. It goes through land, some of which is patchy, but I cannot tell the width of it.
40. Is the country very ridgy? Yes, very ridgy; you get to a great height. The road is fairly straight from Gundagai to Tumut, but the country is of a broken character.
41. You say that at one part it is a considerable height;—what is the elevation? That I could not tell you.
42. It would be sufficiently high to necessitate a tunnel? It would be sufficiently high to prevent a line from coming that way at all. A railway by the route of the present coach travelling road is impracticable.
43. Taking the surveyed or red line on the map, for the distance that you know out of Gundagai, you say there is a considerable amount of good country; but you are not able to say to what extent? No. There is a great deal of good country at South Gundagai.
44. What character of country is it? It is all good agricultural land.
45. Agricultural flats? Yes.
46. Is it well watered? Yes; all that country is well watered.
47. As far as you observed, I suppose, there was a fair agricultural population there? Yes, I think so.
48. From there onwards, you do not know the country? Not until we get to Tumut. There you come into very fine country.
49. The best class of country to be served by the projected railway is, as far as you are aware, in the neighbourhood of Tumut? I think so.
50. Are you able to say what extent of country there is in and around Tumut under cultivation, or suitable for cultivation? It extends a long way from Tumut. In a north-easterly direction there are fine flats.
51. As far as the capabilities of the district to be served are concerned, your knowledge is of the Gundagai end and the Tumut end of the line? Yes.
52. You see the optional survey marked in blue to the east on the map? Yes.
53. Do you know that line? No.
54. What class of road is there between Gundagai and Tumut at present? A very good road.
55. Is it a metalled road? A great portion of it is metalled. It is an excellent travelling road the whole way.
56. I suppose you could let us know what has been expended on that road? Yes.
57. The original estimate for the railway was about £12,000 per mile? Yes.
58. Which is now reduced to £4,723 per mile;—could you tell us any reason why there has been such a very great reduction? Mr. Deane will give you the details of that.
59. *Mr. Dick.*] I see that on the parish map placed before the Committee three separate surveys are outlined;—could you indicate in what way the red line, now the official proposal, is superior to either of the other two? You can get that from the surveyor. I have not been over the line myself.
60. Do you know what officer made each of those surveys? Mr. Burgo made the last survey.
61. The one now before the Committee, coloured red? Yes.
62. Will you inform the Committee who surveyed each of the three routes? Mr. Melrose and Mr. Burgo. I think Mr. Melrose has been over them both. Mr. Burgo made the last examination of the red line.
63. You do not know who did the route marked green? No, I could not tell you; but Mr. Deane could give you all these particulars.
64. With respect to the grades and curves, has any attention been given to them since 1894;—the report says that the ruling grade is 1 in 50, with curves of 10 chains radius; each of these grades is steeper and the curves are sharper than the Railway Commissioners now propose? There are several grades of 1 in 50 proposed now. We try to get 1 in 60 against the load wherever it is possible. That is the grade that is practically fixed on this line. That grade is not suitable for very important lines, or through lines. Probably a grade of 1 in 60 may be obtained in this case.
65. Is it not a fact that even on lines of that kind the Commissioners have been cutting the grades out, and making them at least 1 in 75? Not to my knowledge.
66. Could you give an instance of a grade that is 1 in 50 on one of our railways? There is a little book here which gives all the grades.
67. *Mr. Watson.*] Do you know whether any attempt has been made to get a suitable line to touch Adelong? I believe so. I understood from Mr. Deane that you cannot get round by Adelong. If you go into Adelong you have to come out again over the same route.

- R. R. P. Hickson.
2 Nov., 1899.
68. Would it extend the distance much to go *via* Adelong? I cannot say that it would extend it very considerably.
69. *Dr. Garran.*] Taking that red route, do you know what the nearest point of the line would be to Adelong? About 3 miles, according to the scale.
70. Then a good coach road of 3 miles would practically give Adelong the benefit of a railway? Yes.
71. Then the red line would really give Adelong very great advantages? Yes.
72. What is the relative population of Adelong and Tumut? I do not know.
73. The fertile land in that district is in the valleys? Yes.
74. Which are very narrow and very rich? Yes.
75. The principal valley is the valley of the Tumut? Yes.
76. The red line does not seem to go up the valley of the Tumut, but up the valley of the Adelong Creek? Yes.
77. The best of it is from Tumut down to Gundagai? Yes.
78. You notice the blue line on the west of Tumut, and the green line on the east,—but both follow the route of the valley? Yes.
79. And either of those lines would accommodate the settlers on the rich land in that valley? Yes.
80. The red line would not be any accommodation to the settlers? No; but it would take in Adelong, which the blue and the green lines would not do.
81. The red line would suit the mining township; but the green and blue lines would suit the agricultural settlers? Yes.
82. So that, in a comparison between the two, we should have to take into consideration which class of settlers it would be the more important to accommodate? Yes; and the question of the cost of the two lines.
83. You say you have travelled over the coach roads, and you have spoken of rich land there;—is it volcanic, because it is high ground? You travel along as far as Adelong Crossing; that is practically in the valley. It is all good land there. You get into patchy land until you get down into the valley of the Tumut again.
84. Then the high ground which the coach goes over is not particularly good land? Some of it is good.
85. Is the land that is good there alluvial or volcanic? It is volcanic.
86. Is it red soil? I have really forgotten; I think so. It is volcanic, at all events.
87. You know the railway line between Gundagai and Cootamundra? Yes.
88. Was that a more difficult line to make than this extension would be? I do not know the extension along the red line at all.
89. Do you know how much the Cootamundra to Gundagai line cost per mile? No; but I can let you have the information.
90. The surveys that we have had, I suppose, practically exhaust all the possibilities? I think so.
91. The gentlemen who have done the surveying have been competent men? Yes.
92. And we may trust them to give us the best possible results? I think so.
93. Has any one officer gone over the three routes and compared them all? I am not quite sure of that. I think Mr. Burge did.
94. Has any one in the office compared the plans of all three? Yes.
95. All the gradients and curves, the amount of earthworks, bridging, and so forth? Mr. Deane has done that.
96. Is it the opinion of your best officers that the red line is decidedly the best of the three? Yes.
97. There is no doubt about that? No doubt whatever.
98. Is there much difference of opinion among the officers on the subject? I do not think so.
99. And you confirm that view? I do; I think it is the best line.
100. You spoke in your paper of a very great reduction in the expenditure which had been made by a revision of the line;—was that reduction due to increasing the grades or improving the permanent way? It was due to a combination of circumstances—first of all to the fact that, with the information before us now, we can make our estimates lower; in the second place, the cost of the bridge across the Murrumbidgee was very considerably reduced; and, in the third place, this is a line of a lighter character.
101. You refer in your paper to pioneer railways that we have been making on level country, but is it not quite impossible to make a line for £2,000 a mile in hilly country? It is quite impossible.
102. It may be a light line, but it cannot be a pioneer line? I do not think you could make it at all for that in hilly country.
103. We cannot get these very cheap lines for £2,000 a mile, except in level country? No.
104. If you have a grade of 1 in 30, such as we began with on the Western line, we must content ourselves with very small train-loads? Yes.
105. Where there is only very little traffic, would that matter very much? That is a matter of opinion. My own opinion is that it is a very great mistake to make any line with a grade of 1 in 30.
106. I have heard Mr. Whitton say, "Do not make a line of railway until you can afford to make a good line";—do you think that sound policy? I do. I do not think 1 in 50 is a bad grade for lines like this, but I should not like to see such grades on a main trunk line.
107. Are there grades of 1 in 50 on some of the Victorian trunk lines? I could not say.
108. Do you know what is the ruling grade between Cootamundra and Gundagai? The steepest grade on that line is 1 in 50.
109. Referring to the matter of railroad bridges, do you know the Penrith Bridge? Yes.
110. With your present knowledge, would you recommend again that we should have two bridges in one? I would not recommend it there, or at Singleton. We have two of these bridges.
111. Why would you not? Well, with our superior knowledge of bridges now, there would be very little difference between the cost of one bridge and the cost of building two bridges in one, and the nuisance and danger that there are from having vehicular and railway traffic on the same bridge are very considerable.
112. You would rather keep them apart? Yes.
113. If you want to keep your road bridge above the highest flood, and as you must take your foundations down to the solid rock, you have the expenses in either case, whether you make the bridges together or separately? Yes; but it is difficult to combine the two bridges economically.
114. Would there not be some economy in making one set of foundations for the whole, instead of two sets 100 yards apart? You cannot lay down a broad rule in connection with it. If there were a bridge of

of an enormous height to be erected, probably it would be cheaper to have one structure for the two, but, as a general rule, there is very little difference between the cost of two separate structures and a combined structure.

R. R. P.
Hickson.
2 Nov., 1899.

115. Is that especially the case with the method of sinking cylinders? Yes. And the nuisance of having the two together is very considerable. We are building a combined structure at Camden, but there the circumstances warrant us in doing it. It is below the flood-level.

116. Have you any cases in which there is only one roadway, and where the traffic goes over the same part as the railway lines? No.

117. You have always two separate roadways? Yes.

118. Where you have only two trains a day, you might utilise the one road? Yes. There was an estimate prepared for that in connection with this case of the Murrumbidgee.

119. You would only have to shut up the bridge against ordinary road traffic, four times a day, whilst the trains are going each way? Yes, but it would be exceedingly difficult to do that at Gundagai, because the bridge there is of great length; it goes, not only across the river, but also across the flats.

120. Now that you have made a good bridge, with approaches, I suppose that practically settled the question for Gundagai about a joint bridge? Yes.

121. Road accommodation is all that is required? Yes.

122. You have merely now to think of the cheapest railway bridge that you could make? Yes.

123. The design will be such as you think economical to make, and safe? Yes. Mr. Deane will tell you how it is worked out. I do not think the bridge can be made for less than £25,000.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

124. *Mr. Dick.*] Have you any plans to hand in? Yes; I have plans and sections of the line. Plans to the scale of 4 chains to an inch; sections to a scale of 4 chains horizontal and 40 feet vertical; Books of Reference, and a compilation of parish maps showing the lines and deviations.

H. Deane.
2 Nov., 1899.

125. *Chairman.*] Have you a description of the line? The description embodied in Mr. Hickson's statement was prepared by me.

126. Do you produce a detailed estimate of the cost? Yes.

127. Will you kindly read it? It is as follows:—

GUNDAGAI TO TUMUT.—*Amended Trial Survey.*

REVISED estimated cost of a single line of railway 31 miles 35 chains in length, with 60-lb. rails. Ruling grade, 1 in 50; sharpest curve, 10 chains radius.

Description of Work.	Estimated Cost.	Average per mile.
	£ s. d.	
Earthworks	29,438 15 0	938
Culverts, timber bridges, and small openings	11,172 19 0	356
Bridge over Murrumbidgee River.....	25,100 0 0	799
Overbridge.....	418 0 0	13
Level-crossings, cattle-stops, fencing, and road divisions	7,062 15 0	225
Permanent-way materials	26,293 19 0	837
Plate-laying at 1s. = £2,763 4s.		
Ballasting (½) at 3s. 6d. = £2,417 10s.	14,852 5 0	473
Sleepers at 2s. 6d. = £9,671 5s.		
Station works, including sidings	5,736 0 0	183
Station buildings—waiting-sheds, £625; goods-shed, £900; platforms, £400; station-master's houses, £700; loading-banks, £750; cranes, £400; weigh-bridges, £550; trucking-yards, £1,300; carriage-shed, £350; engine-shed, £700; coal-stage, £300; removing turntable, £300.....	7,275 0 0	232
Water supply	1,560 0 0	48
Telegraph	471 0 0	15
Gradient and mileage posts	471 0 0	15
Miscellaneous	1,000 0 0	32
Cost of works	£130,791 13 0
Engineering and contingencies, 12½ per cent.	16,348 19 0	520
Total cost	£147,140 12 0
Average cost per mile	£4,686 0 0

Estimate, with new fastenings, £148,310 or £4,723 5s. per mile.

I should like to say that it can easily be understood that the costs of rails and fastenings are a very variable figure. I have decided in future to take a standard price of £5 5s. for the rails landed in the stores in Sydney, and to add or deduct according as the price of the rails varies from time to time, £30 per mile for every 5s. per ton difference in the price of the rails. I find, on looking into this estimate, that the rails and freight were taken higher than we have been in the habit of taking them at recently, and, therefore, if the rails could be obtained at what I call the standard rate, £5 5s. per ton landed in the stores in Sydney, a reduction of £115 per mile might be made on this estimate. On the other hand, as the price of rails has gone up very much, a very large addition would have to be made. The price of rails landed in the stores in Sydney would probably be £7 10s. as against £5 5s., that would be £270 per mile. Deducting £115 per mile, the present price of rails, £7 10s. landed in Sydney, would necessitate the addition to this estimate of £155 per mile.

128. *Mr. Dick.*] I find that the earthworks are comparatively large, and they amount to £938 per mile;—can you explain what is the necessity for that large expenditure on earthworks? This is not a light line, there are a great many cuttings and banks on this line. I will show the Committee a portion of the section, so that they will be able to judge what the difference is between a line of this character and lines such as the Committee have lately been considering. This line starts at South Gundagai, and immediately

H. Deane. immediately after passing the Murrumbidgee River there is a cutting 23 feet in depth, then another 10 feet in depth, and another 8 feet in depth; a little further on there is one 13 feet in depth. It will be found that still further along the line there is a succession of cuttings and banks, which brings the cost up to very much more than that of the type of line which has been recently considered. For instance, a little beyond the 290 miles, there is a cutting 53 feet in depth. That is on that sharp curve which I pointed out a little while ago, where the previous survey would involve a tunnel.

2 Nov., 1899.

129. Is it an extensive cutting? It is about 20 chains. There is one portion of the line which is pretty flat; but nearly the whole of it is a succession of cuttings and banks.

130. *Chairman.*] What is the character of the soil? In the larger cutting it would be mostly rock.

131. *Mr. Dick.*] I suppose the cutting would be mainly through the foot of the spurs? Yes. Where the road turns off to Adelong we keep close to the bed of the creek; but the line would follow round the foot of small spurs running off the range.

132. I suppose this line practically runs through country consisting of small valleys and ridges? Yes. There is an immense ridge just opposite Gundagai, on the south-eastern side of the Murrumbidgee River. There is an immense ridge which the line has to follow round, before it turns up into Tumut. The coach road goes in a more direct way over the ridge, and gets into the valley of the Tumut River, and so approaches Tumut from that side. The Tumut valley is a very fine valley with fertile flats.

133. Is there no tract of fairly level plain country which that line traverses? Not for any distance.

134. The second and third items each contains an amount of timber for bridges;—will you indicate where the timber bridges would be required on the line? The bridge over the Murrumbidgee is kept separate.

135. Yes, I mean apart from that? It would be understood that the deeper the banks of a culvert are the longer the culvert would be. If timber bridges are used the higher the timber bridges will be; therefore, in a line of this character the cost of culverts and timber bridges is necessarily much higher than it would be if the banks were low. Just beyond that big cutting that I mentioned, there probably will be a culvert. The embankment just beyond the big cutting, which I stated was 53 feet in depth, is 32 feet in height. A culvert will have to be placed in that embankment. The length of that culvert will be, approximately, three times the height of the bank, plus the width of the embankment, that is to say, it would be 313 feet long. If the ground were level and the formation low, the culverts would be very little more than the width of the formation, so you see that the character of the country very largely affects the cost of culverts. It is the same with regard to bridges.

136. I find on the parish map, placed before the Committee, that there are three main surveys, one marked red, which is the proposal now before the Committee; another marked blue, on the western side of the Tumut River; and one marked green, on the eastern side of the Tumut River;—would you inform the Committee who surveyed each of those three routes, and what are the particular characteristics of each? The only route that has been surveyed is the red one. The blue and green lines are simply explorations, reports on which, of course, exist in the office. The red line was, as mentioned, I think, in Mr. Hickson's statement, first surveyed in the year 1884. That survey is very nearly the same as the latter one, but it was a more costly line. In that bend that I mentioned, there was a tunnel put, instead of going round as we do now. The original line did not curve so much; the curves were very much flatter. The practice at that time was to put much flatter curves, and not to attend to economising the work as has been done in more recent years. The first survey was made by Mr. Melrose in 1885, and a revision of that survey was made by Mr. Hixson and Mr. Martin. I went over their survey when it was about half complete, and, except in certain places, it did not differ very materially from Mr. Melrose's survey. Later on, I think between 1890 and 1894, the survey was amended, sharper curves were put in and careful grading was adopted so as to reduce the cost to the greatest possible extent, and the estimate has finally been reduced by cutting out ballast and cheapening station buildings, and so on, to make it correspond, as far as possible, with lines of a cheaper character which have recently been under consideration. Of course, as I have pointed out, the reduction as regards earthworks and bridges could only be within certain limits, depending on the character of the country. I examined that survey when it was about finished. Mr. Burge has made an examination up the Tumut River, and the results of the examination are these lines shown in blue and green. In the valley of the Tumut River there is very good land. But to carry the line up the river to Tumut would necessitate leaving the Gundagai line somewhere about Coolac, and that would mean that if a junction were made there there would be a short spur running into Gundagai which would be expensive to work. A proposal was made to run straight across from Gundagai and work round the hill into the Tumut valley, but it was found quite impracticable. There is a pencil-line on the map, not very plain, showing how such a line would have to go, and although in the general direction it makes for the Tumut valley, the windings of the line bring the total mileage up to the mileage of the red line.

137. And is there much difference other than that already indicated between the two lines—one along Adelong Creek, and the other along the Tumut—as to cost? No, I think not. If it were possible to get from Gundagai on to the Tumut River without any trouble, there cannot be two opinions as to which would be the best route in every way, because once you get on to the Tumut River you are simply following the valley, and although you have to skirt round the hills, there would be no big rise and fall, such as you have on the red line. But you cannot get through from Gundagai to the Tumut River. That has been the bar against the adoption of that route.

138. Has any estimate been made of the cost of the Coolac and Tumut route? I am inclined to think that a rough estimate was made. I would refer you to Mr. Hickson's statement, where it says:—

Towards the end of the year 1889 the Brungle Progress Committee, per Mr. Travers Jones, M.P., applied for a survey to be made of an alternative route from Coolac to Tumut. Mr. Bruce Smith approved of an examination being made, and Mr. Burge, under instructions from the Engineer-in-Chief, carried it out. Upon the report of the examination being submitted to the Minister, he raised the point that as it was contended this alternative route would cost less per mile than that from Gundagai, would Mr. Deane express his opinion on the question, and the Engineer-in-Chief in reply stated that as the line surveyed from Gundagai would serve Adelong, which the alternative would not, and as the saving of £1,225 interest on capital cost, which the alternative scheme was assumed to effect, would be counterbalanced by extra cost of working a separate plant, he concluded that the line as at present surveyed, would be the better.

That means that there was an estimated saving of £30,625 on capital cost.

139. *Mr. Watson.*] At what rate would that be at that time? Four per cent., I think.

TUESDAY, 7 NOVEMBER, 1899.

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

140. *Mr. Dick.*] What weight of rails do you propose to use on the proposed line of railway? Sixty-pound rails.

H. Deane.
7 Nov., 1899.

141. The same as those to be used on the proposed railway from Cobar to Wilcannia? Yes.

142. In that estimate of £837 per mile, have you allowed for the recent increase in the price of rails, or do you think that before the construction of the work is proceeded with the price will be reduced? I have not allowed for the increase in the price of rails. The increase in the price of rails at present would make a difference of £155 per mile.

143. At what price per ton have you taken the rails? It was higher than the £5 5s. which I intend to adopt as the standard. The price taken in this estimate was £5 15s. I think it is much more convenient to have one price for all the estimates, and to make an allowance to correspond with the existing rates. I have not done it in this case; but I have simply taken the estimates that we made in 1896.

144. It is proposed to ballast one quarter of the total length of the proposed line? Yes; that is just an estimate. You might be able to do with less than that.

145. Would you consider 3s. 6d. a yard a fair price? Yes; a good average price, because a good deal would have to be broken stone.

146. The estimate in the case of the proposed Cobar to Wilcannia railway was 5s. per yard? Yes; because we have to carry the material a considerable distance.

147. It is owing to the difficulty of getting stone? Yes.

148. Would there not be stone available along the whole length of this line? No; but in a good many cases it would be available.

149. Where would you get your sleepers from;—are there any hardwood forests handy to the line? I shall have to get them how I can. I shall get some red-gum from the Murrumbidgee. I expect there will be some other kinds of timber available. Red-box is, I think, found in the neighbourhood. I have taken an average of 2s. 6d. Some will probably cost more, some less. The red-gum sleepers will cost more, as they will have to be sawn.

150. There are two items together in the detailed estimate, totalling £13,000—"station work, including sidings and stations," and "station buildings, &c."—that is rather a large amount for this short length of line, especially as it is to be purely of a pioneer class? You have to provide for a terminal station, and a terminal station is always expensive, and as the country is uneven, the earthworks will be rather heavy.

151. What earthworks do you mean? The levelling up for platforms and sidings. The estimated cost of the station buildings is not out of the way. I have given the details, and I think it will be seen that there is nothing of an expensive character.

152. How do you differentiate the two items—"station works, including sidings," and "station buildings"? The station works are earthworks—the permanent-way and metalling. The item "station buildings" includes the buildings alone. You will see that amongst station buildings there are no earthworks; but in station works there are earthworks, sidings, cuttings, banks, and metalling.

153. *Mr. Watson.*] You put the sleepers down at 2s. 6d.;—how does that compare with what you are paying in the southern district—say, on the line from The Rock to Green's Gonyah? I think the price is 3s. 1d. on The Rock line. These are all red-gum sleepers. But I fancy that I shall be able to get some other timber off the hills such as red-box, which will be suitable. Perhaps the sleepers will come to a little more, and we may have to make it up out of some other item.

154. Then, with regard to ballasting only one-fourth of the line, is it not likely that, with the heavy rainfall there is even in that district, you will require a greater amount of ballast than you would require in a district where the rainfall is lighter? I should scarcely think that we should want any more ballast in that district, because the cuttings and banks will be for the most part made through hard stuff, so that they will stand very well.

155. It is usual though to ballast well in districts where the rainfall is great, is it not? Yes; on the coast I should ballast throughout. It would be unwise not to do so; but still in the district where this line is to run, though heavy falls do occur they are not like the falls that occur in the coast district.

156. Do you think sufficient attempts have been made to ascertain if it is not possible to get a junction between the present terminus at Gundagai, and some point on the Tumut River. I think you said a trial survey had been made across there? An exploration has been made for a line from Coolac.

157. Has there been any attempt made to get a connection with the Tumut River direct from Gundagai? Yes; but it was unsuccessful.

158. Do you think that that has been as extensive an exploration as is necessary? I am quite sure that such a project would be impracticable.

159. Is the Tumut River much more desirable from a construction point of view than the Adelong route? Yes. If we could get up the Tumut River it would be very much preferable. There is nice land along the Tumut River comprising fertile flats.

160. If we could get on to it without having to leave a dead end at Gundagai, would it not be a suitable route? Yes.

161. I mean from an engineering point of view;—is the Tumut River route an easier one? Yes, I think it would be easier. It would not be a dead level line, and it would not be an easy line, because you see from the lines shown as the result of the explorations that it is a very crooked line. There would be a series of cuttings and banks along the line.

162. It would be easy in comparison with the other? Yes.

163.

- H. Deane. 163. The land in the valley of the Tumut River is supposed to be better, and to be more extensive than the good land in the Adelong valley? Yes, the country is better on the Tumut.
- 7 Nov., 1893. 164. The width of the good land is greater? Yes, there is more of it.
165. *Chairman.*] I suppose you use the full weight of rails on the line? Yes, 60-lb. rails.
166. Are they the heaviest weight? No; the heaviest weight used at present is the 80-lb. rail. The rails used on the Gundagai line are 71½ lb.
167. Why do you make the difference? The 60-lb. rail is the weight which we are in the habit of using now for branch lines; it is a very suitable weight.
168. That is the weight of rail on the light lines, is it not? Yes. We have not been ordering the 71½-lb. rails recently. I think it is unlikely that anything between 60 and 80 lb. will be used. Eighty-pound rails would be unnecessarily heavy for this line.
169. Is 60 lb. heavy enough, except for the main lines? I think it is quite heavy enough for a line of this character where the traffic would not be very large. If the traffic were going to be very extensive, I should recommend the use of heavier rails.
170. I notice that you provide for cattle-stops;—are you going to have them at the road crossings? Yes.
171. Do you use them generally now? Yes.
172. Are they found to answer all purposes? Yes, they answer only fairly well. They sometimes give a good deal of trouble, and they are always being improved in design. They are not altogether satisfactory, but they save a lot of expense in gatekeepers.
173. There have been no accidents through cattle getting on the line owing to their use, have there? No serious accidents. Of course cattle have been injured, but there have been no accidents to any train.
174. There is an item of £1,500 for water supply;—is that what pumping costs? Yes.
175. There would not want to be any intermediate supply between Gundagai and Tumut? No; but from £1,200 to £1,500 is what the water supply would cost.
176. That would be for a pumping-engine at the Tumut end? Yes. You have to lay pipes—probably you have to make a weir or excavate a tank; you have to put down a pump and erect an overhead tank.
177. There is a sum of £471 for the telegraph;—is that for railway purposes? Yes; that is a fair price—about £15 a mile.
178. That is not the electric telegraph? Yes; it is the electric telegraph, and it includes instruments which the Electric Telegraph Department always provide. An arrangement is made with regard to that between Mr. Walker and the Railway Commissioners.
179. Do they use the Oppenheimer iron poles? Yes; in this case wooden poles are allowed for.
180. The next item is pretty heavy—gradient and mileage-posts, £471? That is about right. On the flatter lines I have cut out some of the gradient-posts, as it is unnecessary to have them on a very light grade. Gradient-posts are considered necessary by the Railway Commissioners as a guide to the engine-drivers, and mileage-posts cannot be very well dispensed with.
181. This line goes nearly all the way through private land? Yes.
182. Has any inquiry been made by the Department as to whether the owners would give the land free? I am not aware of it having been done.
183. If it were not so, I suppose the land being rather valuable, it would add greatly to the expense of the line if the land had to be paid for? Yes; I do not think it would be so easily dealt with as some lines which have been recently considered. I should like to point out that the Commissioners said that they could not recommend the construction of the line, and pointed out that if it were made at some future time, the residents should give the land required free of cost. I have not heard of any promise to give land for the line.
184. Have you any doubt in your own mind as to which you consider the best route of the three marked on the map, whether the red, the blue, or the green line? I have not the slightest doubt myself that the line now proposed is the only line to be adopted.
185. *Mr. Leven.*] Would not the telegraph line cost more than £471, if iron posts were used? I have no information about it. The telegraph is always erected by arrangement between the Commissioners and the Telegraph Department.
186. How do you come to that amount of £471? It is based on the cost of previous lines.
187. Lines on which the same kind of posts were used? I would not be certain as to the kind of posts.
188. There is a great difference between the estimate of Mr. Whitton in 1884, and this estimate of 1889;—can you account for that difference? The line was laid out originally with flatter curves, and the bridge was intended to be of steel throughout, and it was estimated to cost over £100,000.
189. Which of these surveys was it that Mr. Whitton formed his estimate on—the red, blue, or the green one? It was approximately the red one.
190. So that all the other estimates are founded almost upon the same route? Yes; but this line that is submitted has been worked up much more carefully, and contains much sharper curves—10-chain curves.
191. And with the same amount of safety for the travelling of trains? Yes.
192. You would not like to give your own individual opinion as to whether you would make this line or not? No; I have not gone into that question. I have not studied the traffic or the produce of the district.
193. It would include the instruments? Yes.
194. *Chairman.*] You have been along this line yourself? Yes; I have been over it twice.
195. And did it strike you as being a very extensive district suitable for agriculture, or is it not merely a narrow strip of land? It is a narrow strip.
196. The route through which the line would run is between two ranges of hills? Yes.
197. How far are those hills apart? There is very little ground except at the start, until where you turn off into Adelong, and from there into Tumut. You are in a narrow valley, one may say. After you leave the flats of the Murrumbidgee it does not appear to me that there is much good land for cultivation until you get on to the Tumut River.
198. In the neighbourhood of Tumut, and especially in the north and north-east, is where the land is that would be suitable for agriculture? Yes; there is very fine land there.
199. Did you go along the main road, either coming or going? Yes, I have been along the coach road.
200. Is that a good road? It is very hilly; it rises to a considerable height, then descends again.
201. But still it is a good road, is it not? It is a good road, but the gradients are steep.
202. It is a formed, metalled road? Yes.

203. When Mr. Hickson was here we asked him as to the possibility of converting the present road-bridge into a combined bridge;—would that be practicable? It would be very undesirable; it would not pay to do so.

H. Deane.
7 Nov., 1899.

204. Are there objections to combined bridges? Yes; especially in the case of such a long bridge as that one is.

205. What is the length of it? A little over 3,000 feet is provided for the bridge and viaducts.

206. The actual bridge is not very wide, is it? The length of the actual bridge is about 312 feet.

207. Is the policy at the present time against the use of combined bridges for railways and roads? Yes.

208. It is not desirable? No; they are costly to maintain, even if you can save capital expense. There would be the cost of watching the signals, and the delay to both train traffic and road traffic under the circumstances, because, unless the bridge were kept clear for the trains, the trains would be kept waiting whilst cattle or vehicles got off the bridge, and *vice versa*.

209. Would that be the case if there were two distinct roadways? No; but then that would not be cheaper than having separate bridges.

210. I suppose that in country where cattle and sheep are driven in large numbers, it is not desirable for railway trains to be running over the same bridges as the ordinary road traffic? It is far better to keep them quite distinct if you can.

211. *Mr. Levien.*] There is a big traffic over that double bridge at Singleton, and it has been there for many years, but I never knew of an accident happening on it? That is a comparatively short bridge.

212. There is a great traffic over that bridge, and both trains and other traffic go over the same track. It is on the main northern road? If that were again under consideration, a bridge of that kind would not be built. In this case there certainly would not be any saving. The road-bridge over the main channel would not be strong enough for a railway.

213. What will the bridge in this case be constructed of? I should build the channel spans of steel, and the rest of timber.

214. Would you call it a composite bridge? It would be a steel bridge—steel girders resting on iron and concrete piers, probably.

215. *Chairman.*] What has caused the very great reduction in the cost of the railway since the first estimate was obtained for this line—this drop from £12,000 a mile to £4,000 a mile? In the first place, there are differences in the cost of work. Cuttings, for instance, were put down at 2s. 6d., but I have estimated my cuttings at 1s. 9d. per cubic yard. That makes a considerable difference. Then, by carefully following the contour of the country, the quantity of earthworks has been very considerably diminished. By adopting 10-chain curves, the earthworks have been reduced down to about three-fifths of the original quantity.

216. Would altering your curves increase the distance? It makes a difference of about half a mile only. The bridges and culverts come to a good deal less than they used to, because the designs used are now much more economical than the old ones. Then the bridge over the Murrumbidgee River, I see, was put down at £113,000. That would be for a steel bridge, with steel spans right across instead of making it consist largely of a timber viaduct.

217. I expect the stations would cost more in those days, would they not? Yes. The stations are put down at £26,753, that is rather more than double what I have put down. In this estimate I have about £13,000 down for the stations. Then there are various other items which are reduced. There is a tunnel which I mentioned was cut out with closer alignment and sharper curves. It was 307 yards in length, and estimated to cost £16,276. You asked for a report on the Tumut River line. I now hand it in. There are several reports; there is a report in November, 1889, and a report in 1892. The report in 1889 is about the Tumut River proposal, and the report in 1892 is chiefly in connection with the proposal to get across from Gundagai. There are Mr. Burge's reports in those two cases, and reports of mine on the top of them. [*Vide Appendix.*] I hand in copies of the reports made in November, 1889, and in December, 1892, upon the alternative proposals of railway routes for reaching Tumut, made by Mr. Burge, then Assistant Engineer for Railway Surveys.

218. May I ask, at the same time, whether you are of the same opinion as you were then as to these two reports? I am quite of the same opinion.

219. If a railway were to be constructed, the route at present under consideration is, in your opinion, the best? Yes; that is the right one.

220. Do you regard a grade of 1 in 50 on lines of this kind as a reasonable gradient? It is the best that we can get. The flatter the grade the better, on any line.

221. Under the circumstances of the country, it is the best grade procurable? I think it is the only one procurable. The country lends itself easily to a grade of 1 in 50, and I do not think anything better is possible.

222. Is not a line of railway 31 miles 35 chains in length, to connect the two places, Gundagai and Tumut, which are only 21 miles distant in a straight line, or by the coach road, almost unique in our railway experience? I cannot call to mind any similar instance; but it is conceivable that, under like circumstances, it would be worth while to go round a long way to get an easy route.

223. Going such a long way round to reach a place at so short a distance would seem to argue that you should get something pretty good to recommend it, would it not? Yes; it does seem so.

224. You ought to tap a rich agricultural district of considerable extent, or a large mining centre that would possibly be a large feeder to the railway? Yes; of course, you have to make up your mind whether it is worth while to go to the expense to get the best route.

225. *Mr. Watson.*] I think you said you put down £18,000 for the bridge? No; £25,100.

226. Do you know what was the cost of the present road bridge with the new approaches? I could not say without inquiring from the Roads Branch.

227. I was under the impression that about £20,000 was spent on the approaches to the present road-bridge recently, without the steel structure in the centre? It is very possible. A road-bridge is more expensive than a railway bridge, on account of its width.

228. Would not the flats near Gundagai that have to be crossed be somewhat similar to the flats at Wagga Wagga, which the main Southern line crosses? Yes.

229. Have they not recently replaced the wooden structure there with a steel one? Yes.

230. Do you know for what reason? Because some of the timber had decayed. It had not been all carefully

- H. Deane.
7 Nov., 1899.
- carefully selected, and the design of the timber spans was not a very good one. They sagged under the heavy loads.
231. They replaced them with steel;—would not that argue that it was unwise to build wooden viaducts? I do not think so. When the Commissioners replaced the one at Wagga Wagga with steel they were replacing a bridge on a main line—an express line. This timber bridge, built of timber carefully selected, will last, I suppose, twenty-five or thirty years.
232. That is a pretty heavy annual charge—£1,000 a year for the bridge alone? It will very likely last a great deal longer.
233. What would approximately be the cost of a steel or iron viaduct? I have not gone into it carefully very recently; but I should think that a steel viaduct would cost a little more than double a timber viaduct.
234. Would an iron one cost the same amount as a steel one? There would be no saving in having an iron one. You can get steel work at very little more expense than iron, and it carries much more.
235. Reverting to the bridge question, the annual cost of a steel bridge would be 3 per cent. on £50,000, or £1,500? Yes.
236. Would that be practically imperishable? I do not think you could say that, because it is not known at present what the life of a steel bridge is. It is very often taken as interminable, but I think that is a very wrong thing to do. Anyhow, there are many cases of steel bridges which, after a time, have proved to be inadequate, and have had to be replaced, although not worn out. It is not safe to regard them as absolutely permanent structures.
237. Would you have to paint a steel bridge regularly to keep it in order? Yes.
238. What would it cost, roughly, to keep it going;—would it amount to 5 per cent. of its original cost? Much less than that. I should think from $\frac{1}{2}$ to 1 per cent.
239. How frequently do they paint them? They paint bridges when money can be spared. A good many bridges are only repainted when they urgently require it. They are always left as long as possible.
240. What proportion of this £25,000, to be spent on wooden viaducts with a steel bridge, would be represented by the viaducts and the bridge respectively? The steel bridge comes to £7,846, and the balance is for the timber viaduct.
241. That is, roughly, about £17,000 for the viaducts and about £8,000 for the bridge? Yes.
242. Of course, if the structure had to be replaced after twenty-five years its annual cost would be £1,750, including interest and the £1,000 that would disappear each year in depreciation. Then, when you subtract from that the steel bridge to the extent of £8,000 you would probably make it very level? It is a little cheaper to build a bridge of ironbark, allowing for depreciation, and allowing for the difference in the lives of the structures.
243. At the end of twenty-five or thirty years, you might want to increase the size or strength of the bridge, and a wooden one would give you a better opportunity of doing that? It would. You would have a better chance at the end of twenty-five or thirty years of building a heavier structure, if locomotive designs have progressed in the same way as they have done during the last twenty or thirty years.
244. And would the balance be in favour of local employment in connection with a wooden bridge? Yes; decidedly. The cost of a wooden bridge is nearly all due to labour.
245. So that, from all points of view, it seems that a wooden bridge in such a case is preferable? Yes.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and further examined:—

- R. R. P. Hickson.
7 Nov., 1899.
246. *Chairman.*] You are going to let us have some information, in the first place, about the cost of the present Gundagai bridge? The cost of the present bridge, which was completed in 1869, was £37,371, a portion being of iron and a portion of wood. The timber approach was reconstructed, being finished last year, at a cost of £14,541. You asked me the cost of the road between Gundagai and Tumut; 1864 is the first date we have of any expenditure on that road, and since that date there has been spent on making and maintenance £29,880, and the annual maintenance now is £1,000 a year for the 20 miles of road. The following is the Railway Commissioners' report on the scheme:—

Office of the Railway Commissioners of New South Wales, Sydney, 6 November, 1899.

Proposed Line Gundagai to Tumut; length, 31 miles 35 chains.

In accordance with the request of the Honorable the Minister for Public Works, that we should again report upon this proposed extension, we beg to state that the matter has once more been the subject of careful investigation, and while there has been an increase in the cultivation of wheat in the district, the growth of maize and tobacco has decreased, so that in the main the traffic prospects are practically the same as when the last report was submitted in May, 1896.

The revenue which it is expected the line would yield, based upon a liberal estimate of existing and prospective traffic, and by charging local rates, would be about £3,900 per annum; and if through rates were charged it would only be about £1,700.

The estimated capital cost of the line, exclusive of land resumption—£148,310—at 3 per cent.	
would mean a yearly charge of	£4,450
And the working expenses would amount to about.....	£3,700
Total	£8,150

We may point out that the Cootamundra-Gundagai line, over which practically the whole of the existing traffic of the district is carried, showed a loss of £4,161 for the year ending 31st December, 1898, and for nine years the average loss has been £6,458.

As the area of land in the district suitable for cultivation is limited, we would strongly advise that the line be not constructed.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this sixth day of November, one thousand eight hundred and ninety-nine, in the presence of,—	{	CHARLES OLIVER,
		Chief Commissioner.
		W. M. FEHON,
		Commissioner.
		DAVID KIRKCALDIE,
		Commissioner.

H. McLACHLAN.

247. In the statement which you have handed in you allow £1,000 a year for the maintenance of the main road between Gundagai and Tumut? Yes.

248. Would that go on all the same if the railway were constructed? Our experience has been that the reduction in the cost of maintaining a parallel road is very small indeed where we have made a railway, because

because the road has to be kept in order as an approach to the stations. The amount which we would save would be very little.

249. You have the main road from Tumut to Gundagai? Yes.

250. Do you think that would continue to be used? Not for through traffic, but it is bound to be used a good deal for local traffic, and as an approach to the various stations.

251. It would not do to let it go to ruin? No, you cannot let it go to ruin; and you cannot maintain it for very much less than is spent upon it at present.

R. R. P.
Hickson.

7 Nov., 1899.

WEDNESDAY, 8 NOVEMBER, 1899.

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

252. *Chairman.*] The Commissioners have forwarded a report on this railway, dated 6th November, 1899? Yes; I have a copy which I will read.

253. Could you give us the reason for the line from Cootamundra to Gundagai being such a losing line? As a matter of fairness it might be stated that one reason of the loss is a much heavier capital expenditure than that now proposed.

254. That was a line which was constructed under the old regime? Yes.

255. Possibly at a cost of £12,000 per mile? At a cost of £10,000 per mile.

256. Do you know the country between Cootamundra and Gundagai? I have been over the line.

257. Is it as difficult as the country between Gundagai and Tumut? I do not think it is; but I do not know much of the latter route. As far as the engineering question is concerned, I would not like to speak as to the relative cost. The cost of the line is high between Cootamundra and Gundagai.

258. If the line from Cootamundra to Gundagai were constructed under modern conditions, and at as much reduced a price as this line is likely to be constructed at, do you think that it would be such a non-paying line, or what proportion would the loss be then? If it were built at the same rate of expenditure there would be practically very little loss.

259. Has the line from Cootamundra to Gundagai since its construction become a better paying line or otherwise? There is a statement made in the last paragraph but one of the Commissioners' report, that the loss which for nine years has averaged £6,450 was reduced last year to £4,161.

260. Indicating that it is improving? It was better last year.

261. As compared with the two previous years? I have not an analysis of the traffic. I think the improvement was to some considerable extent due to the increased stock traffic. A large number of stock was sent by that line for the pasturage, particularly from the south-west to the district beyond Gundagai.

262. What is the chief item of traffic on the Cootamundra to Gundagai line? Mixed goods business,—that is, quantities of ore, produce, maize, tobacco, general goods, wool, and stock.

263. Is it a cattle district? No; we have been carrying sheep principally.

264. That line was constructed, I think, before the Commissioners held office? Yes.

265. Is that one of the lines that the Commissioners looked upon as undesirable? No; I would not say that.

266. Coming on from Gundagai to Tumut, the Commissioners' report was very unfavourable;—how have they arrived at this result? They sent a traffic officer into the district.

267. Did you send Mr. Harper? One of his officers was sent, and the traffic returns were prepared through Mr. Harper. The officer was sent to collect information as to the traffic which would belong to the line, and he gave a return of the traffic which we might expect. As a matter of fact, 25 per cent. was added for development, and the results are shown in the Commissioners' figures.

268. By local rates, do you mean a special rate from Tumut to Gundagai and back? No. What is meant is charging a fresh rate from Gundagai; if you take a through rate, the through rate always tapers off. The local rate would start *de novo*. It is the same as if you were paying a rate from Sydney. The rate for grain from 1 to 30 miles would be about 2s. 6d., but if it were a continuing through rate the charge would be only 3d.; so it makes a very big alteration. That accounts for the difference in the figures.

269. That local rate is one which you adopt generally on lines which, at the outset, are not likely to be paying? Yes. We have on several occasions adopted this rate, although in regard to grain it has more often than not been waived, in order to encourage the growth of grain. Local rates were adopted on the Jerilderie, Berrigan, and Finley lines, but have been modified.

270. Then, if this line were constructed, there would be an absolute necessity that there should be special local rates? Yes.

271. Is there anything in that district which would lead the Commissioners to think that the traffic might be increased considerably by reason of the increased railway facilities? In the estimate they allow for an increase of 25 per cent.

272. And with that 25 per cent., what would be the annual loss? That is shown by the figures. £9,900 is the value of the traffic as against £8,150 for working expenses and interest.

273. Making an annual loss of about £4,000? Yes.

274. This direct road from Gundagai to Tumut appears to be only 20 miles? Twenty-two miles, I believe.

275. Whereas the distance by the proposed railway is 31½ miles? Yes; 31 miles 35 chains.

276. I suppose that that being so, the distance itself being so short, there ought to be something special to induce the construction of a railway at such a large expense? Yes.

H.
McLachlan.

8 Nov., 1899.

H.
McLachlan.
8 Nov., 1899.

277. Do you know the country between Gundagai and Tumut, along the proposed line? Not personally.
 278. The book of reference shows that the line passes all the way through private lands? Yes.
 279. That item is not taken into consideration in estimating the cost of the line if constructed? No.
 280. If it were thought desirable to construct a line, I suppose the Commissioners would advocate that the land for the railway should be given free? Yes; they mentioned that in their previous report. They say in their report of 1889:—"If the line is made at some future date, we consider the residents should combine to have the land necessary conveyed free of cost."
 281. Have you the Commissioners' previous reports on this extension? Yes, they were as under. On the 5th May, 1896, they reported:—

The only favourable change that has occurred since that date has been the revision by the Public Works Department of the estimate of construction, which is now materially reduced.

In our report made in 1889 we stated that if the most sanguine expectations were realised, in our opinion the line could not, for many years, more than meet working expenses, and that it was doubtful whether that could be accomplished. We also stated that, looking at the matter from a commercial point of view, the construction of the line could not be recommended.

Since that date the district has not improved in any way; in fact the trade is less than it was on the date the matter was previously under consideration, and we therefore strongly recommend the Government not to entertain the proposal.

We would draw attention to the fact that the branch line from Cootamundra to Gundagai entails a loss of £6,474 per annum, and it has to convey nearly all the traffic that would be carried over this extension, as well as the traffic secured from its own surrounding country. This clearly indicates how unprofitable the proposed extension would be.

In their report, dated 20th June, 1889, the Railway Commissioners say:—

In accordance with section 13 of the "Public Works Act, 1888," we beg to report as follows:—

Cost of construction—

The Engineer-in-Chief estimates the cost of construction of a single line of railway (exclusive of land and compensation) at £383,500

Annual cost—

Interest of construction, at 3½ per cent. £13,422

The cost of working the line is estimated as under:—

Traffic expenses..... £1,027

Permanent way expenses 3,876

Locomotive expenses 1,580

6,482

Total annual cost £19,904

It will be seen from the above figures that the interest on the capital expended in the construction of the line would be £13,422, and estimated working expenses £6,482, making a total annual expenditure, without taking into consideration the interest upon the amount required for the purchase of land and rolling stock, of £19,904. This sum there is no hope of realising from the revenue derivable from the line if constructed, as, although there is no sound basis upon which an accurate estimate of the traffic can be given, the most sanguine results, if realised, could not for many years more than meet working expenses, and it is doubtful whether that could be accomplished.

As to the district, there can be no question as to its fertility and its natural advantages for agricultural pursuits, and also as a pasturage ground for stock from the plains country during periods of drought; yet, giving the project the most favourable consideration, an annual loss would have to be for some years met from the revenue now derived from existing lines. Bearing this fact in mind, and dealing with the matter from a commercial point of view, the construction of the line cannot be recommended. At the same time, being the only mode of opening up a district possessed of great natural advantages, the residents, in a national sense, are not unreasonable in urging its construction.

If the line is made at some future date we consider that the residents in the district should combine together to have the land necessary for the construction of the line conveyed to the Department free of cost.

282. That report is dated the 20th June, 1889? Yes.

283. And the previous one was dated May, 1896.

284. So that these figures appear in 1889;—the total annual cost, interest at 3½ per cent. and working expenses, amount to £19,904? Yes. The cost of construction then was considerably more than it is now.

285. The same figures were given by the Commissioners in July, 1896? They gave no figures in 1896.

286. No figures were given in 1896, but in the report of the 6th November your estimate of the working expenses and interest is reduced to £8,150;—is not that a very marked reduction? Yes.

287. There is one paragraph in your report of 1889 which concludes with the following:—

At the same time, being the only mode of opening up a district possessed of great natural advantages, the residents, in a national sense, are not unreasonable in urging its construction.

—? Yes.

288. Do the Commissioners still maintain that view? I hardly think they do.

289. They do not look upon this line now exactly in a national sense? I do not think so.

290. But looking at it as a business transaction, and from a commercial point of view, the Commissioners do not recommend it? They do not.

291. *Mr. Levin.*] Can you tell us of any lines which have been submitted for some time, the construction of which the Commissioners have recommended? Yes; they recommended the Coonamble line.

292. They recommended the Warren line, did they not? They recommended the Warren line as being the best and cheapest; but they said that Coonamble was entitled to a railway.

293. Do you know how many lines they have recommended the construction of? They recommended the Narrabri to Moree line, the Grenfell line, and the Green's Gunyah line.

294. How many have they recommended of those that are about to be constructed? They did not recommend the Wilcannia line, but they recommended the Coonamble line.

295. What about the line from Narrabri to Walgett? They intend to go over that. The report with regard to that line is not yet ready.

296. Have they given consideration to the fact that the railways are bringing about population and settlement? Certainly; that is why they indicate that there is fair consideration to be given to a branch railway, from a national point of view, outside what you may call the strictly commercial point of view; and

and they have on more than one occasion laid it down that they do not wish to tie the Committee to the strictly commercial aspect of the matter where it can be shown that there is a prospect of a big development in a district, with consequent assistance to the parent lines.

II.
McLachlan.
8 Nov., 1899.

297. Tumut has a splendid climate, said to be one of the best in the Colony, and it is likely to bring about settlement, and to bring population there on account of their health;—do they take that into consideration? We have got equally choice health resorts within a couple of hours of Sydney. If you want a favourable climate you can find it on the Southern and Western lines at such resorts as Bowral, Moss Vale, Mittagong, and Katoomba.

298. Better climates than they have at Tumut? I think quite as good. Mount Victoria is much higher than Tumut, and Tumut is too far away.

299. You say that there is a falling off in the production of maize and tobacco in the Tumut district? Yes.

300. Can you tell us what the maize crops generally were about there? We had figures showing it. In 1896, according to the return that we had, the number of acres under wheat was only about 2,000 in that district. There were 5,000 acres under maize and about 1,000 under tobacco.

301. Can you tell me what is the reason of the falling off in the maize crop? No.

302. Do they grow as much maize as formerly without sending by railway, because of the competition of road carriage? I am not quite certain. The probability is that the greater quantity of maize goes into local consumption. In regard to wheat, I believe the flour that is grown is only sufficient for local consumption. There is not a big export of flour from that district.

303. I am talking about maize? I am not certain of the cause of the decrease.

304. Do you know the reason of the falling off of the production of the tobacco in that district? I think that was due to lower prices.

305. And to the greater growth of tobacco in other parts of the Colony? I could not say. The tobacco crop has been going back for some years. The officer sent up to report on the produce of the district says:—

In 1890, I am informed, the tobacco was at its best, and the estimated production then was 750 tons yearly, whilst now it is only about 350 tons. The falling off was due to two causes, namely, crops failing, and the lower price realised.

306. If they had railway carriage, so that they could bring their crops down to compete in the market, would not that help them? The estimate of the traffic allows for an increase of 25 per cent.

307. Do you think that that is sufficient? I should think so.

308. Does your officer report anything as to the quality of the tobacco at all? No.

309. What is the population of that district? The population of the district is about 6,000.

310. When was that? That was at a comparatively recent date. Mr. Harper, in a report only three days ago, says: "The population of Tumut and outlying districts is about 6,000."

311. Is there much wool produced in that district? The traffic in wool which we expect to get from Adelong and Tumut is 306 tons.

312. Has the drought any effect upon the supply of wool locally? I think not.

313. Is the country so good there that they do not lose much stock in time of drought? I do not think they suffer much from drought there.

314. Is the rainfall more certain there than in other parts of the Colony? They generally have a fair rainfall.

315. What would you depend upon principally to support a railway in that part? Maize, tobacco, and perhaps a little wheat, and general goods, wool and stock traffic, and passengers.

316. How about the mining and out that way? About Adelong it is principally gold-mining. A great deal of chrome ore has been coming from that district, but I do not think that the proposed line would take much of it. There has been a large traffic in chrome ore on the Gundagai railway.

317. Would there be any special rates charged along this line? The Commissioners' report points out that if we charge a special rate the earnings will be £3,900, but if we charge a through rate the earnings will only come to £1,700.

318. So a special rate would be more to the advantage of the railway revenue than a through rate? It would be about £2,000 better.

319. Do you think it is advisable, according to your experience, to make these, what I may call, invidious charges, because the railway is built on national principles for the advantage of all? Still it is only reasonable that where you give a concession or advantage to local people they should help to bear the burden of it rather than throw it upon the whole community.

320. Suppose the people give their land for the railway, do you not think that that is a *quid pro quo*? No. It is only a few people who would give the land, and the great number would benefit—people living back from the railway. The people who give the land would merely be those through whose land the line would run. There would be many people living away from the line who would get the benefit of the railway practically without paying anything.

321. I admit that that would occur in most instances; but in this case those through whose land the line will run would give their land in the interests of the country, and do you not think that it is a fair concession to make? They say, "Why should we be charged special rates who have given our land for the benefit of all concerned?" I think it is quite reasonable that where a line would entail a big loss the people to whom the accommodation is granted should pay some little extra charge rather than that the whole community should pay. The people on the sea coast are not benefited by the construction of the railway, but it will bring competitors against them, and yet they have to bear some part of the burden.

322. Water-carriage is cheaper than land-carriage;—can they not always compete against a railway? You are taxing them to assist their competitors.

323. A railway will bring population; do you think it is fair that when a railway is opened and the land-owners pay a special rate that they should suffer loss? I think that the special rate is a fair thing. If the district develops the Commissioners will always wipe out the special charge.

324. But they would not make a concession for past payments made by those people who brought the railway there? No; those people have had the benefit of the railway. According to our present figures, the loss on this line will amount to about £4,000 per year; but it would be a direct advantage to everybody in the district. The wheat-grower will be able to get his wheat carried from Tumut to Gundagai at about 2s. 6d. per ton; at present, I suppose, he is charged 15s. per ton.

325.

H.
McLachlan.
8 Nov., 1899.

325. How many of these railways made within the last fifteen years are absolutely paying? Information is published in the Commissioners' report each year regarding some non-paying lines. I hand in the following statement, showing the earnings and expenditure upon the railways for the year ending 31st December, 1898:—

Line.	Length.	Capital cost.	Interest on capital.	Working expenses.		Total earnings.		Loss after providing for working expenses and interest.	
				Year ending December, 1898.	Year ending December, 1897.	Year ending December, 1898.	Year ending December, 1897.	Year ending December, 1898.	Year ending December, 1897.
Narrandera to Jerilderie, Berrigan, and Finley.	100 3/4	514,230	16,772	11,585	10,101	15,821	14,863	12,536	11,747

	1,368 15 1/2	14,430,154	521,533	380,870	367,880	572,594	536,866	329,859	349,754

- 326-7. What do you say will be the amount of the annual loss upon this railway? About £4,200.
328. Do you know any line of railway of the same length on which the loss amounts to that sum? Yes; we have lines losing proportionately more money.
329. And this has been strongly recommended as having better prospects? I would not say that. Take the Cootamundra to Gundagai line. On that line we are losing £5,000 per year.
330. What is its length? Thirty-three miles. There is the line from Blacktown to Richmond, only half the distance of this proposed railway, and we are losing £4,000 per year on that. On the line from Hornsby to Milson's Point we are losing £13,000 per year.
331. And that is where all the land has been paid for by the Commissioners, but not on the betterment principle, and the railways are still working at these great losses? Yes. Of course, most of these lines were made before the Commissioners took office.
332. *Mr. Shepherd.*] About these special rates: when goods are sent the whole distance from Gundagai to Sydney is a special rate charged on the whole distance or only from Gundagai? No; a special rate would commence from Gundagai. It would be exactly the same thing as if you sent traffic from Sydney to Camden. You would pay the same rate as you would pay if sending goods from Sydney to Camden. You commence *de novo* from 1 to 30 miles again.
333. About the falling off in the maize crop, has no good reason been given for that? I daresay there has been. We sent an officer up there, and Mr. Harper will be able to give you full details.
334. I presume that the produce from Tumut all goes to Gundagai? Yes.
335. Is it not rather a rough road for some considerable distance? Yes; it is 22 miles by road.
336. I suppose that you are aware that Tumut maize generally commands the highest price in the Sydney market? I am not aware.
337. Are you aware that any overtures have been made to the owners of land as to their giving the land free for the railway? No; that would be received by the Works Department.
338. So that really has not been taken into consideration so far? No.
339. Can we look forward to any hope of enlarging the trade in the event of this railway being constructed? The Commissioners see no immediate prospect of a growth of traffic that would justify the construction of the line. They added 25 per cent. to their estimate for any increase of the existing traffic.
340. *Mr. Dick.*] Can you state whether the construction of the Cootamundra to Gundagai line was followed by any satisfactory increase in settlement and in agriculture? There has been an increase in the trade within the last few years, but I am inclined to think that it is largely due to the extra stock traffic.
341. You do not think that the increase in agriculture is commensurate with the expenditure on the railway? Personally, I think not.
342. The report which you handed in states that the country to be served by the line is undoubtedly highly fertile? Yes; but limited in area.
343. As a rule it is the practice to include within the traffic area of the proposed railway, as far as agriculture is concerned, a stretch of country 20 miles on each side of the line? That altogether depends upon circumstances. If you look at this line you will see that you will get too near to the Southern Railway in one part.
344. Is not that the usual practice? It is if there is no competing line.
345. Could you get 20 miles on each side of this line to draw traffic from? I hardly think so, because once you get beyond Tumut the country commences to be rough. It is not productive country.
346. Is it a fact that fairly high mountain ranges run almost parallel with this line on each side of it and not far from it? I do not know enough of the locality to answer that question.
- 347.

H.
McLachlan.
8 Nov., 1899.

347. South of Tumut there is not an area of country likely to afford much traffic to the proposed railway? I believe not.
348. In taking evidence on the proposed extension to Wyalong we were assured by several pastoralists that the Tumut district is very favourably situated for the transfer thereto of starving stock in time of drought. Yes.
349. If this line were constructed would any material amount of revenue, year in and year out, be derived from such a source? There will be a certain revenue, and that has been allowed for; but there would be no great advantage in making a line for that purpose, as the stock goes there to-day.
350. Is it a fact that most of the traffic to be carried by this line is already carried over the Gundagai extension? Yes.
351. And that not much new traffic could be expected from the further extension of the line? I think not.
352. Do you think that the conditions of the country between Gundagai and Tumut are such as to offer an opportunity for exacting a local tax on the land in liquidation of the annual loss on the railway? The Commissioners recommended the same thing, practically, in connection with the Green's Gonyah line. They proposed that there should be a tax on the whole of the land that would be benefited. I have not had an opportunity of speaking with the Commissioners on the point, in connection with this line, and I am not aware whether they think it would be a fair thing to recommend.
353. Do you know anything of land values in the district? No.
354. I find from your report that since 1889, practically ten years, the district has not made much progress from a railway point of view? No; I do not think there has been a wonderful increase in the production.
355. And you see little or nothing to warrant any very great increase or development of the country? Not sufficient, the Commissioners think, to justify the making of a railway.
356. *Mr. Watson.*] Did the Commissioners make any attempt to get information about the prospect of either of the alternative routes which were surveyed from Coolac to Tumut? They did in 1896; but not when they were making this report.
357. Well, they say in this report, "Circumstances have not changed materially, respecting the line now proposed, since 1896"? No.
358. The general result is much the same as you expected then? Yes.
359. Would that apply also to the alternatives? Yes. The results were got in 1896, when the Commissioners were rather in favour of the route as now suggested if you are to adopt any route at all.
360. Is that intrinsically or after allowing for the extra cost of working the dead end between Coolac and Gundagai? I am speaking of it from a purely traffic point of view and of the traffic on the section.
361. And the prospect of revenue? Yes; I am speaking of the probable revenue to be got by going from Coolac or from Gundagai.
362. And you say that the results were in favour of the line now before us? Yes.
363. Is that owing to the better serving of the Adelong population by the proposed route? I think that that is to some extent the reason of it. The distance was the same, I believe, in both cases.
364. Of course, from a railway point of view, the working of the dead end from Coolac to Gundagai, which would be one result of making the line from Coolac, would be a bad thing? It would be inconvenient.
365. Would it mean much additional expense as compared with running trains right through? It would mean very awkward working. It would be preferable for us to have straightaway work.
366. Do you know if your officer inquired into the question of the possible competition of the existing road for some distance with the railway? That might happen for a small distance out; but anything close to the railway, if near Adelong or Tumut, would be sent by railway. The roads are pretty heavy, and the cost of the road-carriage in 1896 showed that road-carriage is pretty high.
367. So you think that we can actually compete, notwithstanding that the railway-carriage will be 10 miles longer from Tumut to Gundagai? Yes.
368. Whatever road you adopt to reach Tumut you lose a certain portion of the traffic that would accrue to the other road from Coolac? Yes. You would lose some mineral traffic, but it would come to the line ultimately. It comes to the Gundagai line. Then, of course, you would like to know which section gets the bigger traffic. The returns we adopt seem to indicate that the best results will be attained by making the line from Gundagai to Tumut.
369. Whatever route is adopted it will not completely serve the country included in both routes? No, I think not.
370. Possibly the traffic would still grow by road? That would apply to one large item—that of chrome ore.
371. Where does that come from now? It comes from nearer Brungle, I believe—that is to the right of Gundagai.
372. It is close to the Tumut River, is it not? Yes; this is the note we have of it:
- 2,685 tons of chrome ore were despatched from Gundagai by rail during 1895, but as it is produced near Brungle, the proposed line *via* Adelong to Tumut would not get it, consequently the traffic would be forwarded from Gundagai as at present, but if the line went from Coolac to Tumut *via* Brungle these ores would then be trucked from the latter.
373. In that case you would miss a large portion of traffic by the other route? Yes; but the general result seems to be in favour of the line *via* Adelong to Tumut.
374. Do you know whether the Commissioners or their officers have gone beyond Tumut, with the view of seeing whether there is any suitable country that would be tapped by the line? The Commissioners know, though they have not gone beyond there, that the country gets rough and mountainous. You get on the mountains in that direction. Mr. Levien suggested a sanatorium. The Yarrangobilly Caves are not far from there.
375. Would the tourists' traffic in summer-time be of any material importance? No, I think not, for this reason, that you have already got a nearer route to Sydney *via* Cooma. Cooma is only 264 miles from Sydney, but Tumut will be fully 50 miles further.
376. Would leaving the train at Tumut afford any great saving in coaching towards the caves, as compared with leaving the train at Cooma? It would be nearer to the Yarrangobilly Caves.
377. I suppose that a portion of those engaged in touring would look upon coaching as a thing to be avoided? Yes; but Cooma has other advantages—it is near the Kosciusko country. This would be advantageous as an alternative route—people would go one way and come back the other—but there would not be enough of that traffic to justify the making of a railway.

H. McLachlan.
8 Nov., 1899.

378. As regards the cost of working the proposed extension, would the same staff in charge of the rolling stock now employed on the Cootamundra and Gundagai line be sufficient to work this extension? No; we should have to get additional sets of men. The same men would work it one day, but those men would have to be changed the next day. It would be too long to work from Cootamundra to Tumut and back each day. It would be equal to appointing new men. Of course, the same locomotives would work the line through. Consideration has been given to that. We are simply charging what would be the actual cost of working it, and the officers have borne in mind what they could do in regard to working the present staff and existing engines.

379. With regard to Adelong, Grahamstown, and places such as those, which would be served by the projected line, is the population there understood to be permanent? There is a good deal of mining. The mining prospects of the district are good; I know that there are some good mines in the district likely, I should think, to be permanent.

380. I imagine that from their estimate the Commissioners expect a continuance of the present population at least? They do; and, as I said, they allow 25 per cent. increase in the goods business for development.

381. That is not a very large increase? Twenty-five per cent. is a fairly good increase to allow for a few years. There is no large back traffic likely to come in.

382. That is, no increase on the goods now known to be received from the Tumut and Adelong districts? Yes.

William Henry Hall, sub-editor, Statistical Year Books, Government Statistician's Office, sworn, and examined:—

W. H. Hall.
8 Nov., 1899.

383. Mr. Dick.] Have you prepared any statistics concerning the districts to be served by this proposed railway? I have.

384. Will you kindly read them?

Estimated population that would be served by the construction of the line—7,900.

ESTIMATED population of towns that would be served by construction of the line.

Town.	Estimated Population.	Town.	Estimated Population.
Adelong	1,400	Tumut	1,540
Adelong Crossing	300	Wondalga	100
Batlow	180	Blowering	290
Goonp	350	Brungle	270
Grahamstown	120	Mundongo	120
Tarcutta	240	Bombowlee	140

385. Has there been recently an increase or decrease in the population of that district? The population has simply grown along with the natural increase of the population of the Colony. There has been nothing out of the normal increase of the population. We made the estimate from the figures taken at the census, so then I took the police figures for the district, and I found that my number came within five of the number given by the police, showing that their collection by patrols came within five of the annual increase added on to the census of the population.

386. Could you define the limit of the area within which you have made that calculation? I have taken it as 20 miles on each side of the red line on the map.

387. What would the population be with Brungle omitted? The population of Brungle is only 270, and the population of Bombowlee is 140.

388. Is there not a fairly concentrated farming population round those centres? I could not say.

389. Leaving out those two it would bring the estimate down to 7,500? Yes. I have taken out the agricultural statistics for the last four years. They are as follows:—

AGRICULTURAL STATISTICS—1896-99.

Districts.	Year ended—	Cultivation												Dairy produce.			
		Total area cultivated.	Wheat		Maize.		Other grains.	Hay.		Green food.	Area under—				Butter made.	Cheese made.

W. H. Hall. 390. *Mr. Levien.*] The land under cultivation in 1898 was 11,565 acres, and for the last year 12,538½ acres, so there has been an increase? Yes, during the last four years there has been an increase from 8,850 acres to 12,538½ acres.

8 Nov., 1899.

391. *Mr. Dick.*] Taking the district from which the figures have been furnished, what is the general prospect that the statistics convey;—is the district stationary or progressive? Judging from the figures of the past four years it is progressive. In the Adelong district there has been an increase considerably over 30 per cent. in the four years, and in the Reedy Flat or Balrow district there is an increase of over 50 per cent. In the Tarcutta district, which would be very slightly affected by the railway, production is more than double.

392. In what item do you find the increase most apparent? In wheat.

393. Is it the same with regard to maize? The production of maize in the Tumut district has gone down 50 per cent. The yield in 1896 was 201,402 bushels, whereas in 1899 it was 109,430 bushels.

394. Have you got the return with regard to the production of tobacco? No; but I will get it. [*Vide Appendix.*]

395. Has the production of butter in the district increased or decreased? As far as Tumut is concerned, during the last year it has been very little more than half what it was in 1896, but the production in 1898 was larger than that in 1896 by about 7 per cent.

396. Could you state whether the falling off in the production of maize and other agricultural products has been due to the drought? I could not say.

397. *Mr. Levien.*] Have you ever been round the Tumut district? No.

398. How many acres are under maize in the Tumut district? During 1899 the area was 4,172½ acres.

399. What was the yield? 109,430 bushels.

400. I want to make a comparison between the return in that particular district and the average for the colony during the last ten years? The average for the colony was 32·2 bushels and the average in Tumut 31·66 for the four years. In 1896 the average yield at Tumut was 37·56; in 1897, 36·31; in 1898, 25·55; and it rose in 1899 to 26·23.

401. So it compares favourably with any other part? It is above the average of any other part of the colony within the last ten years.

402. *Mr. Dick.*] I suppose it is only reasonable to conclude that that district, in common with the rest of the colony, has, during the last four or five years, suffered severely from drought? I should say so.

403. And the falling off in the staple product of the district may be fairly attributable to that fact? I think so.

404. Do you think it reasonable to conclude that the rate of increase which in fair seasons has been exhibited by that district would, as long as land was available there, be maintained? I cannot speak from personal knowledge, but from what I have heard I believe that the character of the soil is such that it ought to give a far larger return than is indicated by these figures.

405. *Mr. Levien.*] Do you know anything as to the quality of the maize, wheat, or butter produced there? No.

406. Do the returns in your Department show the amount that the butter realises? Not at all.

407. How do you get your returns? They are collected by the police.

408. I suppose you can take them as being fairly accurate? Where we have an opportunity of checking them we find that they can be accepted as reliable. Here is a case in point. In that particular district there has been nothing out of the ordinary to increase the population, there has been no land thrown open to selection, consequently the increase in population should be only the normal increase shown from the date of the census, and when they were worked out with the police returns they corroborated those returns.

409. No doubt there has been a great increase of population although no land has been thrown open? There has been the ordinary increase.

410. *Mr. Dick.*] Do your statistics of population extend over any lengthy period? I only took them out for the most recent dates.

411. The figures disclose at any rate that the district is a fairly prosperous one and is exhibiting a fair rate of progress? Yes.

412. Have you any mining statistics? Only the gold production. Unfortunately the returns as to that are very defective in the Mines Department. They give no particulars in regard to Tumut or Tarcutta, but only for Adelong and Reedy Flat. The returns are as follows:—

MINERAL PRODUCTION 1897-8.

District.	Year.	Quantity of Gold won.	Value of gold won.	District.	Year.	Quantity of Gold won.	Value of gold won.
		Oz.	£			Oz.	£
Adelong	1897	19,691	76,795	Tumut	1897	Not obtainable.
	1898	18,268	71,247		1898		
Balrow (Reedy Flat)...	1897	1,000	3,875	Tarcutta	1897	Not obtainable.
	1898	1,301	5,042		1898		

TUESDAY, 14 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

William Henry John Slee, Chief Inspector of Mines, Department of Mines, sworn, and examined:—

413. *Mr. Watson.*] You have a knowledge of the district proposed to be served by the proposed railway from Gundagai to Tumut, *via* Adelong? Yes. W. H. J. Slee.
414. There is considerable mining near Gundagai, is there not? Yes; right through from Gundagai to Adelong. 14 Nov., 1899.
415. About Gundagai it is principally reefing, is it not? Yes; it is principally gold-mining. There has been a good deal of alluvial mining.
416. Do you think that the railway to Tumut would have any effect upon the mines of Gundagai? It would have no effect upon mining at Gundagai, because Gundagai has a railway already.
417. Going from Gundagai there is, I understand, a considerable quantity of alluvial mining carried on before you get to Adelong? There is the whole of the Adelong flats, which formerly turned out such large deposits. They are unworked, and have been very little prospected.
418. They have been a little prospected? Very little. The prospecting done is mostly by boring, owing to the fact that there is too much underground water.
419. That is alluvial? Yes.
420. At what depth has the wash been found there when they have bored? As far down as 80 feet.
421. Do they find any at shallower depths than that? Yes; gold has been found right from the surface downwards.
422. Have the prospects been encouraging? The result has been to send several men away from Australia very rich. A. D. Shepard's mine, Grahamstown, turned out an enormous quantity of gold.
423. Are there any alluvial prospects between Gundagai and Grahamstown? Yes, right along these flats. I believe that, sooner or later, gold will be got, and worked in the alluvial, from Grahamstown right down to the junction of the Murrumbidgee, probably on the Murrumbidgee itself.
424. Do you know whether any attempt has been made recently to take up those flats for dredging purposes? Yes, I think so. Attempts were made before dredging came in, even to take it up on the old system of pumping.
425. But the water would be too strong for that? Yes; and the land is freehold, therefore it cannot be got at for dredging so easily as one would wish.
426. Would not a depth of 80 feet be rather difficult to work? That is on the deepest part. The average is 40 or 50 feet; 60 feet is considered the limit for actual dredging; it is not the limit for pumping.
427. At Adelong itself the reefing is more permanent? At Adelong there are the most permanent reefs that we have so far discovered in New South Wales. Payable ground is being worked at a greater depth there than in any other part of New South Wales.
428. Do you remember the depth? In March, 1877, the Great Victoria Company received the reward for being the first company to find payable gold at a depth of 800 feet. Two years afterwards the reward was got at Adelong for getting payable gold at a depth of 1,000 feet. The shaft is 1,140 feet in depth. That is the deepest place in New South Wales where payable gold has been obtained.
429. Is that Great Victoria mine being worked now? No. Unfortunately it was taken up with the Gibraltar mine, with the large capital of £300,000, and it was held back. They just cleared out the top levels, and there they left it. Very little has been done to any of these mines at a greater depth for the last eighteen or twenty years.
430. Is the Gibraltar mine, which is now the largest which is working there, being worked to any great depth? Not to a very great depth. The greatest depth would be about 600 feet; a good deal of it is tunnelling. The Gibraltar mine was idle for about two years, like the Great Victoria mine. Then it was retaken, and within 18 inches of the very levels where the former company left off, the proprietors got 4 ounces to the ton from a reef over 2 feet in thickness, and they kept that up for three years.
431. Of what nature is the country that they are in now—the Gibraltar mine? It is very hard. The ore now is refractory; so much so that they had 8 or 10 ounces out of concentrates after they had got 4 ounces of free gold to the ton of quartz.
432. How do you regard the prospect of the permanency of the Adelong field as a whole? I say now, as I said, I think, in 1876, in one of my reports, that Adelong will for many years be the leading gold-field of New South Wales, and I feel quite confident that the youngest man here will be very old indeed if he lives to see Adelong out. There are fluctuations there, as we have on all our gold-fields, but the Adelong reefs are defined, and it is in channels such as we have in no other parts of New South Wales. The channel cuts right through the country for 3 or 4 miles, in some places 8 or 10 feet in width, in other places 50 or 60 feet in width, and in those channels is the quartz. The principal mine at Adelong is on a high hill, and on the western side of the hill there is a reef called the old reef, and another called the Victoria reef. In the middle there is a reef going straight down. The other two reefs underlie that which must intersect them, and the general opinion is that if such is the case there will be very rich gold got. A little gold has been got in the middle reef, but not of a payable character.
433. Have you been to the bottom level of the Victoria shaft? Yes.
434. What were the indications then; were they such as to justify them in going on? Yes; they were quite sufficient; but the money all went in dividends, and when any money was wanted nobody would put their hands into their pockets to repay. There was nothing left for development. That is the true cause of the failure.
435. Are there any mines working now at Adelong besides the Gibraltar? Yes; there is a mine called the Caledonia. I recommended that they should receive assistance from the prospecting vote three or four years ago, and they have paid back the whole of the money to the Government, besides declaring very large dividends. It was only a syndicate of twenty or twenty-five persons. They have declared very good dividends ever since.

- W. H. J. Slee. 436. It is rather unique, is it not, to get money back that has been advanced out of a prospecting vote? Yes; it is a very few that can repay it.
- 14 Nov., 1899. 437. Are they on the same line as the Gibraltar mine? They are on the old line of reef. The Victorian line of reef is in the opposite direction. You can trace the old line of reef right into Gibraltar and right over to a place called Monkey Hill. There are three or four mines working on the top of Monkey Hill.
438. All on the same line? No.
439. It does not appear that the Victoria line of reef is being worked at the present time? The Victoria line of reef has been neglected of late years. There are also the Williams and Annat's mines.
440. Altogether there are a considerable number of miners employed about Adelong? Yes; two years ago there was a very large number of miners employed in Adelong. There are not so many now owing to the fact that the company having such a large capital, £300,000, they could not keep up the dividends, even with 2 oz. of gold to the ton.
441. There are a considerable number of men employed between Gundagai and Adelong at alluvial mining? Yes.
442. And there are also a large number about Adelong employed in reefing? Yes; both on wages and on their own account. They are their own masters. I believe the men at Adelong are more independent than most of their class.
443. Are the men working in small parties at reefing? Yes. They have leases of their own and they have formed themselves into parties of eight, ten, or twelve.
444. Will those small parties of miners be able to get as good results as those who are using air-drills, and so on? Yes; we have one of the best crushing plants in Adelong, the most improved, I think, that you will find anywhere.
445. Is it worked by water power? Yes; the owners Messrs. Wilson and Ritchie were engineer and far-seeing Scotchmen. They could see when a little thing was wanted, and they did not wait for others to tell them. I often used to say to Mr. Wilson, "I have seen something better than you have got," and he would say, "Well, let us have it," and he would soon have it too. They get their gold crushed, and keep their concentrates and send them away just as the Company does.
446. Does not the Gibraltar mine now do a lot of cyaniding? Yes.
447. But formerly it sent its concentrates away? Yes.
448. Do you anticipate that any large number of men are likely to be employed in dredging on the creeks? Yes. I think that sooner or later the Adelong reefs will be retaken at a greater depth. I have no doubt that they will again pour forth their wealth. Adelong to-day, if not ahead of Wyalong, is very close up to it in regard to gold production. Until Wyalong broke out it was for years the highest of our gold-producing districts.
449. Do you think there is any large development in dredging likely to occur along the creeks? There are several miles of country suitable for dredging, but it is freehold property.
450. Are there any indications of minerals towards Tumut? Yes, at the back of Tumut. I have been from Tumut to Kiandra three or four times, in fact through the whole Wee Jasper, and through the whole of those ranges there is a great deal of alluvial. There are many quartz veins there which have not been tested, because the country is too rough. There is a large area of basaltic country, which deserves to be tested. That of itself would bring a large population to the back (or mountainous country) of Tumut.
451. How far from Tumut would those indications begin? The nearest gold is within 10 miles of Tumut, and of Laemalac and Sandy Creek, where every gully has a little gold, and where you find in every gully a few men making a living at gold-getting.
452. Is it alluvial? Yes.
453. Are there any people there working quartz? There have been; but the country is rough, and it costs much to get the quartz away from the workings. As a rule, down to about 50 or 60 feet they get water; there is so much water in the hills. That prevents them from working.
454. Do you think the proposed railway would be of any assistance to people beyond Tumut? I have no doubt that a railway to the Tumut district would be of great benefit. It is a rich agricultural district. Adelong is a rich mining and agricultural district combined. Adelong is the treasury, as it were, for Tumut. They get their cash from Adelong. I have no doubt whatever that the railway would benefit the district if carried out, and that it would benefit the country at large.
455. Looking at it from a mining standpoint, more particularly if a railway were taken to Tumut, do you think it would be of any advantage to those people who are attempting to work quartz reefs 10 miles away? I think so; and we know that there are small veins of copper in the district. We do not know whether there is payable copper. People may go in for copper-mining or prospecting. At present they are only getting gold in that locality. We had one good copper mine, called the Snowball, between Adelong and Gundagai, but it has been idle for years now.
456. Do you know the country between Tumut and Coolac, down the Tumut River, to Brungle? Yes.
457. Is there any mining going on there? Sluicing has been going on there for years. You cannot find a gully where sluicing has not been carried on. The ground may not have been very rich, but it paid men to work it.
458. I believe there is chrome ore at Brungle? Yes. That is on the back route going to Gundagai, not on the road going to Adelong.
459. There is a proposal before the Committee for alternate routes, to start from Coolac and go towards Tumut, leaving Adelong out of count;—I want to know whether there are any mining developments on the Tumut River worth considering? They are working quartz reefs; but so far the shoots of gold have been very short. That means that three or four men could occupy the whole length of the shoot on gold; but at Adelong you could put 100 men alongside each other, and they would all be on payable gold.
460. Has your Department taken any note of the chrome mines at Brungle? I could not say. That business belongs to the geological surveyor. Mr. Carne, Geological Surveyor, reported on all the chrome mines in the district about two years ago.
461. From the point of view of gold-mining, I gather that there would be no comparison between the possibilities on the Tumut River, and those on the Adelong Creek? No. I do not know of any district which has the same promising features as regards permanency that the Adelong district has. That was the opinion of Mr. Wilkinson, the late Government Geologist, and we used to travel together a great deal.

462. *Mr. Dick.*] Do you think that with the construction of the railway there would be any considerable amount of revenue derived from the carriage of concentrates or of ore? I would not say that, because the time is not very far distant when every one of our gold-fields will have their own works, therefore it will not be necessary to send away any concentrates. If we find silver ore it may be different. W. H. J. Sloc.
14 Nov., 1899.
463. You think, however, that with the development of the country, a revenue would be obtained from the carriage of supplies to the mines? Yes. I believe that a railway going to Tumut, taking in Adelong, ought to pay almost from the very first. Of course the condition of a mining district always fluctuates.
464. Do you anticipate that between Gundagai and Adelong there is a possibility of reefs of a similar character to those at Adelong being discovered? No. The Adelong reefs seem to terminate within 10 miles of Gundagai; they seem to spread out there. There is a large number of reefs there now under different conditions. Going to Adelong, if you leave the main route, you can find mines working all the way.
465. The country is practically auriferous all the way? It is.
466. In what way does the private ownership of land retard dredging? The land belongs to two or three parties, or is supposed to belong to them; but I am afraid the owners cannot do exactly what they would wish to do.
467. *Mr. Levien.*] You say that right away from Gundagai down to Adelong mining is going on? Yes; it is auriferous country right through.
468. Suppose capital were expended there, do you think that payable mines could be discovered right through? I think so, provided the money were properly applied.
469. If the money were expended in a judicious way, there would be payable mines from Gundagai right to Adelong? Yes.
470. What knowledge have you of the Adelong, Gundagai, and Tumut district? I have known that district since 1874. I first went there officially in 1876.
471. So that you have a thorough knowledge of the district? Yes.
472. What is your opinion of that district, as far as mining and agriculture are concerned;—would you recommend the construction of this railway? Yes; I would recommend the construction of the railway, provided that Adelong got full interest in it.
473. What do you mean by full interest in it? I mean that the railway should come close to Adelong. That is where the population is. Tumut is an agricultural district. The mining district of Adelong is the main producing district. Adelong affords a market for the Tumut people.
474. Have those mines, in your opinion, been sunk far enough down? No. I believe that the time will come when we shall have those mines working at a depth of over 2,000 feet. They got into the hands, first of all, of people who had not more money than was sufficient to pay for the mines. Then they ran down to Sydney, having a great thing in their hands, and wanted to give somebody else a tremendous benefit, but those people would not take it. The consequence is that the mines remain idle—they have no money.
475. Then, taking your view of it, if that district were within a short distance of Melbourne or Ballarat, you think those mines would be all at work? They would be.
476. Your opinion, then, is absolutely that that is the best reef-mining district in New South Wales? Yes, and the mines would be all at work if they were in Victoria, and would be worked in a style different from that in which we work our mines in New South Wales. Instead of having a capital of £300,000, they would have a capital of £25,000 or £50,000.
477. What is the deepest mine there? The Great Victoria mine, 1,140 feet. They got a reward from the Government for finding payable gold at a depth of 1,000 feet. Mr. Wilkinson and I got out the stone and tested it.
478. How long ago is that? It was in 1877.
479. What depth is the mine now? They have not gone any deeper for the last twenty years. They are not working.
480. You think that if they had continued on that would have been a paying mine? Yes. They have all been hanging on, waiting for some one to take it up and invest a lot of money, the rest to come in blackmailing.
481. The Gibraltar mine is 600 feet down? Yes; that is about 2½ miles from the Great Victoria.
482. What is your opinion of that? That is a permanent mine; there is no doubt about it.
483. When were you last up that way? At the beginning of this year.
484. What signs did it show then? It looked very well.
485. Are the Government giving any aid to any of those mines? Yes; but unfortunately most of them are shallow.
486. How many have they given aid to? To several parties. As I have already said, they gave aid to one party who have already paid the money back without being asked, and have declared good dividends.
487. How many are there now receiving Government aid? Around Adelong there may be about five parties receiving aid.
488. Do you think that if a greater amount were voted by Parliament it would lead to the development of the mines? Yes; but I am rather in favour of having our mines developed at the greatest depth. I am not in favour of this system of going 50 feet down, but of testing the lower levels.
489. The people who get the aid frequently test the ground for the purpose of selling out? That is all.
490. If aid is given it should be on the understanding that the mine is carried on so as to make it payable? Yes.
491. You know that money is voted by Parliament to assist in developing the mines; but after the people have discovered gold they sell out? That is frequently the case.
492. Your object is to see that the mine is not only tested, but that they will go on and make it what you conceive to be in the interests of the country, a mine that will develop itself? Yes.
493. They would want further aid if successful? If they are successful, we expect our money back.
494. The moment they come on payable gold they cease to get aid? They cease to get aid; and we expect the money back that we have lent them.
495. Are there many alluvial mines in that district? There is a great deal of alluvial being worked now and again, but it is like the quartz, unless they have water they can do no good. Last year they found several nice nuggets about Gundagai. There are several good claims about Upper Adelong.

- W. H. J. Slee. 496. Is there any place where they could conserve water there? Yes; but the land has been nearly all sold. There is very little Crown land in that district.
- 14 Nov., 1899. 497. Suppose an Act were passed compelling the owners of land to let water-races go through their properties at a mere nominal charge, could it be carried out? Yes; we could commence sluicing. I believe the Government intended to start with a water supply at Shoalhaven some years ago. Several surveys were made for the purpose.
498. Races for mining purposes could be taken through private land for a merely nominal rent, could they not? The rent should be very little.
499. Then they could conserve the water, and make a charge accordingly? Yes. The rent would be less, no doubt, if they had covered races. The objects on the part of the owners is that open races are dangerous to the stock, which fall into them.
500. Have you heard of any accidents really occurring in connection with these races? Not of late; but some accidents occurred when the races were first cut. I knew of cases in which stock were drowned.
501. But, as a rule, is there any real danger from these races? No. The water for mining purposes could be brought in at a nominal charge. It is a thing that ought to be done in the interests of the mining population of the Colony.
502. Is there any copper in the Tumut district? There are copper stains there. There is a certain area of country where you will see the rock stained with copper. By sinking you might find a lode.
503. Do you think there is any copper there? There may be. There is one thing certain, that unless you have iron at the back of your copper lodes it never turns out to be any good.
504. You would be quite willing, having a full knowledge of that district, to give further prospecting aid there? Yes, I should be willing to recommend it.
505. With your strong belief that it is one of the best mineral fields in the Colony, you think it ought to be further developed by sinking to a greater depth, and to have this carried out aid should be given by the Government? Yes. In reports of mine in 1876, 1878, and 1880, you would find that I gave a description of Adelong, and made predictions that have come out almost correct up to this date.
506. Those reports are in the Mines Department? Yes.
507. If you could see the reports that you made in 1876, 1878, and 1880, would it enable you to give more information to the Committee as to the mineral resources of that district? I could only say as I said before, that I feel sure that before long Adelong will again rank with the first gold-producing districts in New South Wales. It has done so since I reported.
508. Has it kept up its prestige ever since? Adelong is our best gold-producing district. I am not sure whether it was beaten by Wyalong last year.
509. Having a good knowledge of mining, I suppose you have a fair idea of the agricultural capabilities of the district? I think that Tumut is one of the best agricultural districts that we have, except Richmond or Byron Bay. They can grow anything at Tumut. I think they could supply the whole of Australia with preserved fruits.
510. How about cereals? Wheat, oats, and potatoes grow well there. At Tumut a farmer can go in for all classes of farming.
511. The area of good land is limited, is it not? Yes; but it extends into the snow country.
512. It is very good for growing fruit and cereals? It is not inferior to any other land in the country.
513. And it is a healthy district? It is.
514. *Mr. Shepherd.*] Is this shaft 1,140 feet deep, sunk vertically;—you spoke of coming from the crown of the hill? That is following all the way down from the surface. It is faulted in one part into a foot-wall; but there again it is followed all the way down.
515. You spoke of reefs coming in towards that deep reef from each side? Yes.
516. Have they junctioned yet? No; but they may join in time.
517. Is there much trouble with water at that depth? No; the water comes in at a higher level. The lowest level, 1,000 feet deep, is a dry level. It is wet where fissures come through the hill. They used to run the water down into the bottom, then pull it up all the way from the bottom.
518. I think you said that the reef is about 2 feet thick? Yes.
519. Is it that thickness all the way down? No; in some parts it is far wider.
520. The walls are well defined? Yes; there is a hard wall of granite there, forming a channel, and inside the granite there is a black slate formation in which the reef occurs; sometimes there are three or four veins in that channel.
521. Has the stone been of the same richness all the way down, or has it varied much? It has been the richest near the surface.
522. Do you think that fact has been the reason why they have not gone deeper? The reason, I think, has been that there has been no money kept for any bad time. When they had a crushing they declared a dividend.
523. Can you account in any other way for the apathy that exists? It is really downright want of enterprise that the Adelong reefs are not tested at a greater depth. A gentleman named Mollineux went into it rather extensively some years ago, but unfortunately he did not succeed.
524. Do you know when the Adelong reef was first discovered? Yes; I think it was in 1859 or 1860. In a report which I made in 1876 I gave the history of it.
525. Has the field made regular progress ever since? Yes. At one time it was enormously rich, and employed a lot of men. That was when it was first discovered, and worked by individual miners under miners' rights. That was all very fine until they got the cream off; then, when they had to go lower down, it did not pay them, the consequence being that they had to tackle it with capital.
526. Do you know what the output was last year? No; but the report of the Department will give that. I am under the impression that it was a little above or a little below that of Wyalong.
527. I think you said there are fewer miners there now than there were two years ago? Yes.
528. How do you account for that falling off? In this way: The Gibraltar mine was bought for a low price, and was floated in England for £300,000. They had satisfactory crushings, giving sufficient returns, and the mine would have paid good dividends on £60,000 or £100,000, but not on £300,000. The shareholders at Home, considering that dividends ought to come in on the £300,000, were continually forcing the hands of the manager here, and he resigned, knocking off a lot of men before he left, and the men they have left are prospecting.

529. But that, I suppose, affects only the one mine? Yes; the rest of the mines have still about the same number of persons employed; but the Gibraltar mine was the chief wage-paying mine. W. H. J. Slec.

530. But surely 4 oz. to the ton in a 2-foot reef ought to pay enormously? Yes, they paid dividends; but if anyone will go and see the enormous machinery they have erected, they will see a good deal of surface decorations which should not have been gone into. I know of one instance in New South Wales where twenty-five stamp-batteries and concentrating machinery were put up, and the mine is only 80 feet in depth. It is not the mine that causes failure, but mismanagement. 14 Nov., 1899.

531. Insufficient capital to carry on? It requires certain knowledge as well.

532. You seem to favour the idea of prospecting in that locality? I must let you have the report, so that you may see what I said about the district two or three years ago.

533. Is not the Prospecting Vote usually intended for finding out new country? We generally give assistance wherever it is most beneficial. People might not think so, but we have a large number at work in the back blocks of New South Wales, so far back that some people think that a white man has not been there.

534. With regard to agriculture, you seem to have a very high opinion of the Tumut district? Yes.

535. Is the agriculture which is carried on there chiefly to the north or to the south of Tumut? Chiefly to the south. It was out Kiandra way; it spreads out 12 or 14 miles from Tumut, towards Kiandra.

536. What is the nature of the country there? There is a good deal of volcanic country, slate, porphyry, and granite. There are dykes here and there of diorite. Of course, the basaltic country, as a rule, is the best for agriculture.

537. What are the principal crops that are grown there? I believe the principal crops are oats, wheat, maize, and potatoes. There are a few very good orchards there. They can grow beautiful grapes and the best of apples.

538. I suppose you have thought over this proposed railway;—what effect do you think it would have on the mining and agricultural industries? I think that mining and agriculture throughout the district would be largely benefited by the line. About 16 miles from Tumut, at a place called Batlow, which used to be called Reedy Creek, from 1½ acres of land 12 tons of potatoes were got. That was done in this way: A miner had a race running above his land, and he used to irrigate the land. I was sent to make some inquiries into the matter, as there was some objection raised to the man doing this sort of thing. I recommended that it should be encouraged.

539. Have you heard any complaints from agriculturists there as to the expense of getting their produce to the railway? Yes; I have often heard them say that they wished they had a railway.

540. And you think it would result in a larger area being cultivated? Yes; I believe that a railway, if made there, would not only do good to Tumut, but also to a large extent of country at the back of Tumut. It will cause settlement. You could never carry a railway up to Kiandra, but it would make the Kiandra district a good deal nearer to the market.

541. You are aware that all the land between Gundagai and Tumut is alienated? I think so, with little exceptions.

542. When mixing amongst the people there, could you form any idea as to whether they would be willing to give free of charge the land that would be required for the railway? I could not say that; but they have always been very anxious to have mining carried on on their land, and to give land almost for nothing for the purpose; but whether they would give land free for a railway I could not say.

543. It would add very greatly to the cost of a railway if the Government had to compensate them for the land? Yes.

544. With regard to the alluvial mining, what depth have they had to sink? It is very shallow. They are not down further than 30 or 40 feet. Most of the sinking is from 5 feet to 10 feet.

545. I suppose that most of the alluvial has been worked out? Yes.

546. *Chairman.*] Will you read from the report of the Department of Mines for 1898 the paragraph as to the returns from the Adelong mining district? Yes. It says:

The Adelong gold-field is still producing a large quantity of gold, the figures for 1898 being 18,268 oz. as compared with 19,690 oz. during 1897. The Gibraltar Consolidated Company's mines contributed the bulk of the gold, having produced 13,450 oz. from 12,836 tons of stone. On the average this company employ 280 men all the year, and are operating from three shafts.

547. On page 57 it says that the value of the gold got at Adelong in 1898 was £71,264? Yes.

548. The report states that there were 512 men employed at Adelong? Yes.

549. And 107 men at Tumut? Yes.

550. And the Gibraltar Company employ 280 men all the year round? Yes.

551. That is, one mine alone employs 280 out of the 512 men? Yes.

552. Will you read from page 26 the paragraph about the gold got from the different districts? Yes. It is as follows:—

The Wyalong field holds the position of premier gold-producer of the Colony, its total yield for the year being 34,582 oz.; Lucknow produced 27,536 oz.; Cobar, 22,253 oz.; and Adelong, 18,268 oz.

553. So that for 1898 Adelong came fourth as a gold-producing district of the Colony? Yes. But may I be allowed to enlighten you a little with regard to Wyalong. It is forgotten that when last year we reckoned the yield of the Wyalong gold-field a great deal of the yield obtained really belonged to former years—that is to say, that the tailings which had been accumulating in the past were subjected to the cyanide process. Therefore, you cannot say that the gold thus obtained was actually last year's yield. That must be considered. If Wyalong can keep up that return, all right; but the extra yield obtained by the cyanide process must have been very considerable.

554. *Mr. Dick.*] I think you said that the dullness in the mining industry in this district was due, in a large measure, to over-capitalising, and to mismanagement? Yes.

555. By over-capitalisation, you mean that there was not enough of the subscribed capital devoted to the legitimate purpose of mining? There was too much nominal capital, but not sufficient working capital.

556. You also said you thought that the construction of this line would lead to an improvement in mining in that district? Yes; I think it would.

557. In what way would it affect the question of the insufficiency of the working capital and the mismanagement? It would not affect the capital, but it might cause mines that are now idle to be taken up by other parties, who can get machinery at a lower rate. If a man come to New South Wales and buy a mine for £35,000, then go Home and float it for £300,000, you have no control in the matter; but still it is a wrong to the people concerned, and a wrong to the country. 558.

W. H. J. Sles. 558. *Mr. Shepherd.*] Is there abundance of timber yet in the vicinity of Adelong? Yes; there is beautiful timber—plenty of straight, high, tallow timber.

14 Nov., 1899. 559. Is it accessible from the line? Yes; it is close to it, and there is a good road.

Charles Ormsby Burge, Principal Assistant Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined—

C. O. Burge. 560. *Mr. Dick.*] I believe you made two trial surveys down the valley of the Tumut River, with a view to the construction of a railway to Tumut? No; I simply explored the route.

14 Nov., 1899. 561. Will you give us a description of the blue line on the map, to the west of the Tumut River, and point out in what way that route is unsuitable for railway construction? I would not say that it is unsuitable for railway construction, but it seemed to me that, as compared with the route indicated by the red line, it had certain inferior features. It is certainly not unsuitable.

562. Will you indicate what those inferior features are? The earthworks, I imagine, would be considerably heavier on the blue line than on the proposed route indicated by the red line. At the time that I compared the two lines there was an old survey of the ground shown by the red line. That survey has been very much improved since, so that the comparison that I made then in favour of the red line would be still more intensified.

563. Are there any great engineering difficulties along the blue line? No, none that one would call grave engineering difficulties; but the earthworks, generally, are heavier on the blue line than on the red line, and there are a good many crossings of creeks on that route. I think, also, there would have to be a tunnel. Of course, "engineering difficulty" is a comparative term. A tunnel is not, strictly speaking, an engineering difficulty; but if there is a tunnel required on one line and not on the other, that is greatly in favour of the line on which no tunnel is required.

564. What we understand by engineering difficulties would be any work that would make the line unprofitable;—does that description apply generally to the explored route on the east side of the Tumut River? The explored line on the east of the river would have involved a great number of creek crossings, but rather a moderate extent of earthworks. On the western side there would be more earthworks, but fewer creek crossings.

565. The green line is the Coolac to Tumut route, is it not? Yes.

566. The third paragraph of your report, dated 22nd November, 1889, is as follows:—

An examination of the estimate of the Gundagai to Tumut Extension shows that the bridge over the Murrumbidgee at Gundagai has been put down at £113,148. I consider this amount excessive; in fact, by adopting an economical method of construction, I am of opinion that it need not cost more than £64,000, and a saving would thus be effected of £49,148, which would reduce the estimate of the whole line, which now stands at £387,300, to £338,152.

The bridging of the river near Coolac would probably cost £29,000, or £35,000 less than the Gundagai bridge.

I understand now that the Gundagai bridge will be built for £25,000? That is Mr. Deane's report, not mine. The whole of that paragraph is more or less out of date now, because we have reduced the cost of designs for bridges, and materials are very much cheaper than they were. As regards the bridge, those figures would not at all represent the comparison now. There has been almost a revolution—a system of light railways has been introduced, and the estimate for the bridge at Gundagai, I believe, now stands before the Committee at £25,100. I do not know whether Mr. Deane has told you that that £25,100 ought to be increased now, because the price of steel has gone up very considerably, and wages have gone up. The cost of the bridge would probably amount to £30,000 now. If we were asked to estimate it again, I should think, judging by what I am asked, that the probable saving on the present estimate would be about £8,000 or £9,000 for the Coolac bridge, as against the Gundagai bridge.

567. On the second page of your report you state that, in your opinion, the construction of the Tumut-Coolac route would "involve the making of a tunnel of most gigantic dimensions, which is practically impossible";—that is what you refer to when you speak of the Tumut-Coolac railway? No; that has reference to the extension to Adelong.

568. *Mr. Watson.*] Supposing you had to go into Adelong, you would not follow the Adelong Creek? No.

569. Would the tunnel referred to be intended to get out of Adelong towards Tumut? Yes; it was a scheme which had been proposed, and which I alluded to as being impracticable. It does not in any way refer to anything on the blue or green line.

570. *Mr. Dick.*] Would some difficulty be encountered in coming from Tumut to Adelong? Yes; there would be something of the same sort. A very big ridge comes across to the east of Adelong, which would have to be intersected somewhere.

571. *Chairman.*] I suppose the great objection to either the blue or the green line is that either of them would start to the north of the proposed red line, and there would be a certain amount of dead line to be worked? That is really the main objection.

572. There would be no getting over that? No.

573. If you were to adopt either the green or the blue line you would start away towards Cootamundra? Yes.

574. In your report of 13th December, 1892, in the last paragraph but one, you strongly urge the construction of a low-level bridge—over the Murrumbidgee, I suppose? I referred to it, but did not strongly urge it.

575. What do you think of that idea now? I think it is very possible, but at the same time circumstances have altered. The prices of bridge construction have been greatly brought down. The necessity for doing it is not so very great, but still I think it quite practicable.

576. That low-level bridge means a bridge which flood-waters would go right over? Yes.

577. But I suppose that is a thing to be avoided, if possible? Yes.

578. Such a bridge is only to be used where the cost of a dry one would be prohibitive? Yes.

579. A bridge that would be above flood-level is preferable? Certainly.

580. You also say, in that same report, that when you were at Adelong the Progress Committee there were quite indifferent as to getting a railway at all to Adelong? Yes.

581. Did they give any reason for that? As far as I can remember they considered that having got a good road into Gundagai it need not trouble them very much, and they knew that the line could not possibly come very close to them, and that in any case they would have a considerable amount of cartage. My experience in country towns has been that the inhabitants are so very anxious to get railway communication on any terms that they express themselves very strongly about it; but in this case the people seemed rather indifferent. I thought that was a feature which should be mentioned in my report.

582. In regard to the red line which is now under consideration, where would be the most convenient place on that line for the Adelong traffic to reach it? It would be at a place called Callifat Swamp, about midway between Gundagai and Tumut. The red line rises over a summit at 303 miles. The people of Adelong have a very good road for about 6 miles, a well-metalled road. C. O. Burge.
14 Nov., 1889.
583. That would be much more convenient than having to go 20 miles to Gundagai? Yes.
584. Does the Adelong road strike the Tumut to Gundagai road? No; the principal road which they use from Tumut to Gundagai is what they call the "Marked-tree Road."
585. We know that the mail road from Tumut to Gundagai is about 21 miles;—does the road from Adelong to Gundagai strike that road? No, not until you get just close to Gundagai.
586. It keeps to the westward? Yes.
587. Is that also a good metalled road from Adelong to Gundagai? Yes; part of it is the old main road between Sydney and Melbourne.
588. I suppose that is a road on which a good deal of money has been expended? I think so; it is a level road.
589. Have you surveyed the red line? I have not surveyed anything myself; I have been inspecting the surveys.
590. Is it not possible to get a better grade than 1 in 50 on that red line? No; that was very carefully looked into.
591. Are you able to say whether the surveyed line is, in your opinion, the best obtainable? I think so. I went over it very carefully, and Mr. Deane also went over it.
592. At the Gundagai end it would be pretty expensive by reason of the bridge and the long viaduct? Yes.
593. What would be the construction of that viaduct which you recommend? Over the flooded portion, apart from the channel of the river, it would be an ordinary timber construction of 24-foot spans, then over the main channel there would be three spans of 104 feet each, I think, of steel, corresponding with the present road bridge, so that we should have our piers in the same line with those of the road bridge, so as to offer the least possible obstruction to the current.
594. I notice in your earlier report of 1889 you speak of a combined bridge for the use of road traffic, and for the railway as well? Yes.
595. Now that they have got a good road bridge over the river, would you advocate the conversion of that road bridge into a combined bridge, or would you advocate a separate bridge for the railway traffic? I had in my mind a more expensive bridge. I also had in mind the fact that the old bridge wanted a considerable amount of repair, and I knew that it had to be repaired in a very substantial way within two or three years. Therefore, I thought that when repairing the bridge, it might be a good opportunity to make it a combined bridge. Since then they have repaired the bridge, but without having in view any railway arrangements, because it would have to be built specially to combine the two. So that altered my opinion completely. I believe that Mr. Hickson and Mr. Deane are very strongly against the combination of bridges for road and railway traffic, and they have gone into it more closely than I have, though I still think it might be done in many cases.
596. I want your opinion, as a practical engineer, whether it would be more economical to convert the present road bridge into a combined road and railway bridge, or whether it would be better and more economical to construct a separate railway bridge? That is a matter that requires going into very closely, because you would have to look into the whole thing, and see how the present bridge could be adapted. I am doubtful whether any economy would arise from it now.
597. The conversion would be costly? I think it would; but it is a matter that would require more consideration.
598. Do you remember whether better grades could be got on either the green or blue line than 1 in 50, the lowest on the red line? No. My impression is that we should have more severe grades on the eastern lines, because we have to get over some very sharp summits. There is a special place which I have in my mind going up from the Murrumbidgee to the first summit on the blue line, and on the green line going down to the Murrumbidgee. I think we should have very great difficulty in getting down—I doubt if we could do it with a grade of 1 in 50. I had 1 in 40 grades in view when investigating these lines, that being the usual grade on country lines in those days.
599. Would you care to give an opinion as to which would be the better class of country to be served by the railway from a farming or productive point of view;—that is to say, whether the eastern or the western line? I am hardly an expert on that; but I think they are both very good. I should not like to say that one was superior to the other.
600. They are both good; but the productive land is somewhat limited in area? Yes; it consists of narrow strips in both cases.
601. As one of the heads of the Department, do you advise that the red line is the best practicable route? I do.
602. *Mr. Levis.*] You have a thorough knowledge of both of those lines? Yes.
603. Would you recommend the construction of the railway to Tumut? That is rather a difficult question for me to answer. I have not gone into the question as to the probable traffic.
604. I suppose you have inquired as to the capabilities of the district, the agricultural pursuits, and the mining? It seems to me to be very good country; but beyond that I should not like to give an opinion. There are many lines which are good for the country which do not pay, from the Traffic Manager's point of view.
605. What is your opinion from your point of view? From my point of view I should say that it would be a good line; but I should not like to say that it would pay working expenses. I do not think it is absolutely necessary that a line which is good for the country should pay working expenses and interest.
606. Are there any extraordinary curves, or very great engineering difficulties, in connection with the line? No.
607. It is a line that would be easy of construction? Yes, except, of course, as regards the bridge over the Murrumbidgee River. The cost of that is a large amount of money with which to charge a small branch.
608. You find that sort of thing throughout the Colony, do you not? It is not often you have a big bridge on a line only 30 miles long. It is a defect, there is no doubt about that.
609. Which route is the more difficult, the one represented by the blue or by the red line? The red line is the easier route, mile per mile, with the sole exception of the crossing of the river.

- C. O. Burge. 610. Of the two you would recommend the red line? I think on the whole that the red line is the better.
 14 Nov., 1899. 611. Both as to engineering and also with reference to the agricultural and mineral industries? With regard to agriculture and minerals, I should not like to form an opinion in favour of one line as against the other. They both go through very fair country.
 612. Mr. Watson.] Have you made an estimate of the cost of either the blue or the green line? No; we never had a survey made.
 613. There has been a suggestion made at some date, apparently, that the line, instead of going to Tumut, might be taken up the Adelong Creek, and from there on to Tumbarumba;—do you know whether any exploration has been made of the country from Adelong towards Tumbarumba? I am not quite sure; but I think that a survey was made.*
 614. There is a proposal now before the Department to reach Tumbarumba from Wagga Wagga? Yes.
 615. Could you give any particulars to the Committee as to the practicability of reaching Tumbarumba from Adelong? It is quite practicable. On the occasion when Mr. Deane and I went over the Gundagai to Tumut line, we went along to Tumbarumba and saw the country.
 616. What was it like from the point of view of railway construction? It was fairly rough.
 617. That was following up the Creek? Yes; but the route from the upper end of the Wagga Wagga line is rough also.
 618. From the map it looks as though you have a creek or valley to follow from Adelong to Tumbarumba, but nothing of the kind from Wagga Wagga? It is fairly rough, it winds about very much, and there are a good many hills. From Wagga Wagga to Humula it is a fairly easy line, not a very easy line, but from Humula to Tumbarumba it is very rough, and from Adelong to Tumbarumba I should say it is something of the same character.
 619. It is no better than the latter portion of the Wagga Wagga line? Not as far as I recollect.

WEDNESDAY, 15 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT, (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
 WILLIAM THOMAS DICK, Esq. | ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

- J. Harper. 620. Chairman.] From a statement which has been handed in, it would appear that the interest and working expenses of this line will amount to £8,150, and the probable revenue is £3,900, leaving a loss of £4,250 per annum;—have you the details of the possible traffic and revenue? Yes; I will read my report:—
 15 Nov., 1899.

3 November, 1899.

PROPOSED RAILWAY, GUNDAGAI TO TUMUT.

Length, 31 miles 32 chains; estimated cost, £148,310, equal to £4,723 per mile, exclusive of land and compensation.

CAREFUL inquiry has been made as to the probable traffic on this proposed line, and the result indicates that the position, as far as the production of the district is concerned, has not materially altered since the Commission was dealt with the matter in 1896. An increase has taken place in connection with the area under cultivation for wheat; but, on the other hand, the cultivation of maize and tobacco has decreased. The population of Tumut, Adelong and district is about 6,000; the residents of Adelong and district being dependent chiefly on gold-mining. The distance from Adelong to Gundagai, by an excellent road, is 22 miles, and the existing rates for road-carriage range from 10s. to 20s. per ton. The area of land available for future cultivation is limited, and it is very questionable if any material increase in the traffic of the district can be looked forward to in the direction of agriculture. I am of opinion that the construction of this line would not have any appreciable effect on the amount of traffic which would be created for the purpose of main-line haulage; and when it is considered that the distance by road to Tumut is 9 miles shorter than that of the proposed line, it will be readily seen that it is a very open question whether the whole of the traffic of the district would be rail-carried. The estimated cost of the line indicates that it can scarcely be classed as a pioneer one, and, with a ruling grade of 1 in 50, it would be an expensive one to work.

The estimate of the traffic, allowing for 25 per cent. increase upon that which exists to-day, and assuming that arbitrary local rates were charged, is as follows:—

	£	s.	d.
Goods, stock, and wool	2,489	0	0
Mails, 31 miles, at £12	372	0	0
Passengers, 5,000, at 1½d. per mile	968	15	0
Parcels, horses, carriages, dogs	50	0	0
Total.....	£3,879	15	0

The rates on which the above estimate is formed are local ones, and it is quite an open question whether, under the circumstances of shorter road-carriage, such rates could be maintained, and if, as I consider probable, ordinary through rates were charged for the purpose of securing the traffic the estimate would be:—

	£	s.	d.
Goods, stock and wool	305	10	6
Mails, 31 miles, at £12	372	0	0
Passengers, 5,000, at 1½d. per mile	968	15	0
Parcels, horses, carriages, dogs	50	0	0
Total.....	£1,696	5	6

I enclose a statement showing details of the traffic upon which these estimates are based.

621. Then, in the absence of local rates, the loss would be very great indeed? Yes, I think so.
 622. Is there any instance of a similar short line of railway competing with a shorter ordinary road in which local rates are imposed on the railway? I think not.
 623. It would hardly seem likely that the people would submit to local rates under the circumstances? I do not think they would. Certainly they would not on certain classes of goods. On certain classes of goods

* NOTE (on revision):—I find that no survey has been made.

goods local rates would mean a charge as high as 19s. 3d. per ton, practically what is being paid to-day; and to that would have to be added the cost of cartage from the railway-station to the stores, whereas, in other cases, it would be direct delivery.

J. Harper.
15 Nov., 1899.

624. That would be dearer than the road carriage? It would be, including the cost of delivery from the railway-station.

625. On the Berrigan line, I believe, you did start with local rates, but they have been modified? They were maintained for only one season.

626. Were they modified in response to a request from the people? Yes. The people asked that it should be done, and it was done for the purpose of attracting traffic that was closer to the Victorian border than had been anticipated.

627. I suppose you are not really getting the traffic with the local rates? No.

628. The drays and waggons were still competing? We were getting the traffic in the immediate vicinity of the railway-station, but we were not getting it from the Victorian border.

629. Have you lately been along this line? No; I have not been there myself for the last three years.

630. But you have been there? Yes, several times.

631. Do you know the routes? Yes, there is a route by Brungle and one by Adelong.

632. Start from Gundagai and tell us what you know of the character of the country along the route marked red on the map? To the south of Tumut there is a considerable quantity of cultivation, and also to the north-east and to the north. The greater part of the cultivation is in those localities. I do not think that very much traffic will come on to the line till you get nearly to Adelong. A certain portion of traffic will come in about 10 miles from Gundagai, but that will not be very heavy. The first traffic of any consequence would be in the neighbourhood of Adelong.

633. The country that the line passes through has not got a wide extent of good land? No, it is a narrow strip; it consists of a series of pockets.

634. Is the cultivation pretty continuous? No; the cultivation extends about 15 or 20 miles south of Tumut, but the area is very limited.

635. Then as far as Adelong we cannot look for very much traffic in the way of agricultural produce? No.

636. When you get to Adelong the chief item would consist of store goods for the mines? Yes.

637. And that does not appear to be a very large item, seeing that there are only about 1,600 people there? That is the population of the Adelong district.

638. For the Adelong people to take advantage of that red line, they would have to go well in towards Gundagai? Yes.

639. They could not make for it at right angles owing to the nature of the country? No.

640. Therefore the railway freight and fares from Adelong would be for little more than about half the length of the line? We should only get credit for it over 22 miles. To reach the railway they would have to cart a distance of about 5 miles. They would reach the line at a point about 22 miles by rail from Gundagai.

641. As regards the population of Adelong and the carriage of goods, the railway would get the benefit of about 22 miles? We credit the line with the 22 miles.

642. And the passengers about 16 miles? It is the other way about; credit has been given for the full mileage.

643. Owing to the formation of the country, it is impossible to get a short cut from Adelong over to Tumut, it being very hilly? It would be very costly to get it. I should not like to say that they could not get it. The disposition would be to come down in the direction of Gundagai.

644. I think you give the population of that district as 6,000? Yes, 6,000; that is the population of Tumut, Adelong, and the district.

645. With regard to the Tumut district, what area is there that is good for cultivation, the traffic from which would be attracted to the line? I could not say. There are about 15,000 acres under cultivation. Owing to the character of the country it is difficult to tell, but I do not think the traffic would be increased very much by reason of the railway connection.

646. It appears that, latterly, the cultivation of tobacco there has fallen off a good deal? Yes, the cultivation of both tobacco and maize has fallen off in that district.

647. That was a considerable item, was it not? It was, in value, but it never represented much railway freight. The largest quantity of tobacco ever grown there was about 500 tons.

648. There has also been a falling off in the cultivation of maize? Yes. I took the trouble to obtain some information from the Year Book, which shows that in 1896 there were 223,000 bushels of maize grown in the district; in 1897, 190,689 bushels of maize; in 1898, 151,257 bushels; in 1899, 146,455 bushels. The production of tobacco was, in 1896, 237 tons; in 1897, 520 tons; in 1898, 401 tons; in 1899, 290 tons. As far as tobacco is concerned, by charging local rates on the most that has ever been grown, we should obtain a revenue of only £100.

649. Is that a very large sheep-growing district? No.

650. What do you allow there for wool and live stock? We estimate that there would be 140 tons of wool per annum from Adelong, and 166 tons from Tumut, or about 1,800 bales, and there would be 250 tons of stock, which is a very liberal estimate for that district.

651. Is it a district from which they send much fat stock to market? Yes, at certain times of the year we get a considerable quantity from there.

652. What would be the charge from Tumut to Gundagai for a truck of fat stock? I may mention that we never charge local rates on stock traffic. £10 would be the charge through to Sydney for a truck of fat stock.

653. *Mr. Watson.*] How much extra would you get for the extra 31 miles? The charge would be 9s. 1d. per truck over that distance. I may say that if this applied to starving stock the rate would be 4s. 6d. per truck.

654. *Mr. Levien.*] Is that the charge for either sheep or cattle? Yes, for every truck load of sheep or cattle. As regards maize and wheat, in all cases—Berrigan was an exception—it has been usual to charge a through rate for agricultural produce. We get 3d. a ton for it as a through rate; but by charging a local rate we should get 3s. 6d.

655. *Chairman.*] Can you give us the same information with regard to the charge for wool for the extra distance? The charge would be 1d. per ton per mile, or for the whole distance 2s. 7d.

- J. Harper. 656. You have never charged local rates for agricultural produce? The local rates would be 3s. 6d.; through rates, 3d. per ton.
- 15 Nov., 1899. 657. Do you think that it is a district that is likely to expand in regard to agriculture? I do not think there is land there for much further cultivation.
658. Do you know the eastern routes? There is the Brungle route. I do not know that route; but in 1896 I had an estimate prepared which showed £800 less than the estimate for the Gundagai connection. Of course, a great deal of Adelong traffic would be lost if the line went *via* Brungle.
659. Either of those eastern routes would be through purely agricultural and pastoral country? Yes. The Brungle route would miss the Adelong traffic altogether.
660. And I suppose, as has been stated by former witnesses, the junction being to the north of Gundagai is a very grave objection? It would be.
661. From a running point of view? Yes; it would necessitate an independent junction at that point. It would be more costly to work.
662. *Mr. Shepherd.*] With regard to these local or special rates, they, of course, only affect the proposed new line? Yes.
663. The through rates would be charged as they exist on the main line? Yes.
664. Is that 19s. 3d. a ton for the whole distance, or only for the 31 miles? It would be for the 31 miles only.
665. What would the rate be from Gundagai to Sydney per ton? Through to Sydney it would be £7 17s. 4d. per ton from Tumut—that is, for goods of the third class, consisting of articles of general consumption—groceries, drapery, and things of that kind. It is a very comprehensive list. There are included square galvanised-iron tanks, shafting, certain ironwork, machinery, and so on. That class covers a very large proportion of goods.
666. Of course, the charge for agricultural produce is very much less? Yes; the local charge from Tumut to Gundagai for agricultural produce would be 3s. 6d. per ton; whereas the charge from Gundagai through to Sydney would be 15s. 10d. If, on the other hand, through rates were charged from Tumut to Sydney the rate would be 12s. 7d.—that is, 3d. more than the rate from Gundagai to Sydney.
667. Can you assign any cause for the decrease in the cultivation of maize in that district? I am inclined to think that it has been due to a great extent to the competition of the Northern rivers, and I assume that it has not paid the growers.
668. Do you not think it possible that the expense of cartage from Tumut to Gundagai might have something to do with it? As long as it paid to cart it in, and they got a price to cover it, that is not a very important item. As far as the cartage is concerned, the probability is that the charges in 1896 for road-carriage were greater than they are to-day. In 1896, notwithstanding that charge, there were 223,411 bushels of maize grown. In 1897 there were 190,689 bushels; in 1898, 151,257 bushels grown; against 146,455 bushels in 1899.
669. *Mr. Levien.*] Have you been in the district yourself making inquiries as to the traffic? Not since 1896.
670. Did you wait on the farmers and get the statistics as to agricultural production from them? No; the items were taken from the statistical records.
671. Not from information that you got direct from those people? No; I took the records collected by the police.
672. Does it appear from the Statistician's figures that the production of the district was enormously increased from the time when Mr. Travers Jones first made representations on this subject? My figures are from the Government Statistician, and whilst it may be that there has been an increase as compared with what was represented by Mr. Travers Jones, there has certainly not been an increase since 1896. The figures show a marked decrease. If the production was less than that when Mr. Jones supplied his statement, all I can say is that the position would be worse than we represent it now, from a traffic point of view.
673. *Mr. Watson.*] Do you think it possible that the number of stock sent to the district whilst drought prevailed in other parts would have the effect of reducing the area under cultivation? I scarcely think so, because the same area is still under cultivation, but it has been devoted to wheat instead of to maize. There is a large increase in the area under wheat.
674. *Mr. Levien.*] It has paid them better to grow wheat than to grow maize? Yes; wheat has superseded maize.
675. Is it not a fact that the maize grown at Tumut is the best which is produced in the whole Colony? It is very good maize, but I cannot say anything about that as a reason for constructing a railway.
676. I see that in 1896, 223,000 bushels of maize were produced; was not that a very wet season—a season that would suit maize? I do not know; but the fact remains that the area under maize is less now than it was in 1896.
677. You cannot give us the number of acres under cultivation? No.
678. And you do not know what the absolute yield per acre was? No; but it can easily be got. The same area is under cultivation, but more of it has been devoted to wheat instead of maize, which shows that they have found that wheat pays better than maize, I should think.
679. Do you know whether the wheat grown in that district is of extra quality? I do not.
680. You say that tobacco would not pay, 500 tons being all that has been grown in one year? £100 is all the freight that we should get from that quantity.
681. Did the quantity ever exceed that at any time? I never knew it to exceed that. It is supposed to be the largest quantity produced in that district.
682. Take the Maitland district—you know that a tremendous quantity is grown at Wollumbine? Yes. I may add, in connection with maize, assuming that through rates were charged upon it, the freight would not amount to very much, because the through rates would be 3d. per ton, and if you had 4,000 tons of maize in addition to what is grown to-day the freight would only come to £50.
683. I suppose there is every chance of this district progressing instead of retrograding? I should hope that all the districts of the Colony would progress, but I do not think that the want of a railway there will keep it in a backward state. There are very few districts which are favoured with so good an average rainfall as this district is. It has a remarkably good rainfall, and I think that that is quite enough to counteract any disadvantages arising from cartage over 22 miles of road. We have many districts in the Colony

Colony where the farmers are carting wheat 30 miles over worse roads than that one. I will now put in a statement by Mr. Russell, the Government Astronomer, showing the rainfall. Average annual rainfall of all available places:—Gundagai, 24·05 inches; Tumut, 33·27 inches; Kimo, 23·78 inches; Red Hill, 36·36 inches; Rosemount, 33·17 inches; Adelong, 30·83 inches; Fern Hill, 35·60 inches; Glenrock, 48·86 inches; Tareutta, 26·90 inches.

J. Harper.
15 Nov., 1890.

684. Suppose they get trucks to carry their stock, even though it was at half the rate you have mentioned—4s. 6d.—do you not think there would be a greater number of stock taken into that district? I do not think so. There is not much disposition to take stock into that district, unless they are absolutely compelled to send them. By the time that the sheep have been handled, and the cost of railway carriage has been paid, it amounts to a heavy tax on the stockowners. They only remove their stock under stress of circumstances.

685. What is the greatest distance you have known them to remove starving stock? I think that 350 miles is as far as we have carried any starving stock by rail, and that is quite exceptional. Until last year we had not carried any for six years, and prior to that we had not carried any for ten years, and we have only carried starving stock three times in twenty years.

686. That is an astonishing thing, considering the reductions made in freight, and the bad seasons we have had? The stock have not been starving apparently, for in twenty years we have only had occasion to give rebates on starving stock three times.

687. You say there is no great area of land in the district, either for cultivation or for stock? They cannot extend the area under cultivation very much, and the area available for stock is not a very large one.

688. What is the largest run in that district? I could not tell you offhand. You may judge what kind of country it is from the fact that under normal conditions it produces 140 tons of wool. That is equal to 1,000 bales.

689. How do stock fatten there? They fatten very well.

690. Do fat stock from that part fetch any higher price than other stock? I do not know. I do not think it matters much where the stock are fattened; as long as they are fat they will fetch a fair price.

691. *Mr. Dick.*] As a general rule, you consider that a district, the maximum distance of which is about 20 miles from a railway station, if provided with good roads, is not suffering any great hardship for want of railway communication? No. I think that many other districts in the Colony are suffering greater hardships than the Tumut district in that respect.

692. That would apply to the district to be served by the proposed railway? Yes.

693. Do you think that even if the line were constructed the teams would be able to successfully compete with it? I should fully expect competition to be maintained, especially as far as Adelong is concerned. The disposition would be, when the traffic was put on the drays moving from that direction, to continue on into Gundagai.

694. As far as the Adelong traffic is concerned, it ought to be a very large item;—it seems that they would have to put their goods on to carts at Adelong, cart it to the railway, then trans-ship it and have it carted into Gundagai? Yes; but the light in which I look upon it is this: it is practically about a day's journey for a team from Adelong to Gundagai; anything going in that direction they will carry at reduced rates.

695. Then, would not the fact that Adelong is not on the line, and that any goods sent to the railway for Adelong would have to be trans-shipped and carried by team some miles, have the effect of establishing a constant and probably successful rivalry on the part of the teams against the railway? It would certainly tend in that direction.

696. From what you have stated, I think the local rate which would be imposed practically approximates to the present charge for road carriage over the whole distance? That is on the class of goods from which we derive the most profit; they would inevitably go by the road.

697. In the course of another inquiry, which we held some time ago, we were assured that if this line were constructed a good deal of starving stock would be taken from the district of which Wyalong is the centre, to the Tumut district;—from your previous answers, I gather that you do not expect any revenue, except in times of exceptional drought, from such a source? I cannot get the information as to the absolute number of stock carried during last drought—the worst drought we have ever had. We carried ten times more stock than we ever carried before. I will get a return of the stock which we carried during the last season. The number of starving stock carried into that district was quite exceptional. Mr. McCaughey sent stock into a lot of country there.

698. I think you said you were of opinion that the available area which would be served by this railway is such that no material increase in the output could be anticipated? No; I am sure that the increase would be more than covered by the 25 per cent. addition that I have credited to the existing products.

699. Would the construction of this line have any effect in reducing the loss on the Gundagai extension? I am rather inclined to think it would increase it. What I mean to say is, that it would not create any new traffic.

700. It would practically mean making a further extension to cater for the traffic which is already catered for by the Gundagai extension? Yes.

701. *Mr. Watson.*] In the statement you read to the Committee, I think you gave the rate of road carriage between Gundagai and Adelong;—but I do not think you mentioned the rate of carriage between Gundagai and Tumut? I can give those rates. These are the rates to both Adelong and Tumut. It is practically the same distance to both places, and in each case the rates are the same. Adelong to Tumut, 10s. for grain; and for heavy loading, machinery, &c., 10s. or 15s. per ton; £1 per ton for general merchandise.

702. The general merchandise for which the teamsters get £1 a ton is a class of goods which you get 19s. 6d. for? Yes.

703. What would the line be credited with on that class of goods if you charged through rates? 11s. 4d. per ton. Then, of course, this must be borne in mind that you would have to add the carriage from the station to Adelong. At Tumut the goods would be delivered in the town practically.

704. You would have to add to that probably another 2s. 6d. per ton? They would not carry the traffic from Adelong to any point on the line for 2s. 6d. They would have to pay that much at Tumut to get their goods from the station.

- J. Harper. 705. If you are referring only to Adelong, the other rate would not be as much as 11s. 4d. ? It would be a little less.
- 15 Nov., 1899. 706. Assuming that on the down journey the goods go right up to Adelong, or to the nearest point ? There would be a difference of 3s., which would be about 8s. 4d.
707. And you would have to add on to that 8s. 4d., taking the Adelong traffic, how much do you think ? It would be 4 or 5 miles, I should think, to Adelong. I do not think that the goods would be carried much under 4s. or 5s.
708. That would bring it up to 13s. ? Yes.
709. Do you think that with a charge of 13s. to Adelong, and, roughly, a charge of 12s. to Tumut, road carriage could compete against the railway ? Yes ; and I can tell you another reason why they would compete : We have a reduction of the rate for truck loads of goods. The effect of that is that perhaps a storekeeper in one small town is not able to manage it by reason of the way that he purchases his supply. At Gundagai they are always able, by reason of the local trade, to get enough to fill a 6-ton truck. The result of that is that they get a very material discount on the ordinary rates, so the disposition would be, as far as the agents are concerned, to get the goods as far as Gundagai, and then distribute them from there.
710. In that case, would it not be possibly as cheap to reship a portion of the goods over the Tumut line ? I question that, because I think they would probably then make up the loading for Adelong and Tumut with the one team.
711. Have you been beyond Tumut in a southerly or south-easterly direction ? No ; but I have been out to Tumbarumba from Wagga Wagga.
712. Of course, if there is land beyond Tumut suitable for agriculture, that, with the construction of a railway to Tumut, would be more likely to be utilised than it is at present ? Decidedly ; they would be much closer to railway communication.
713. We have been informed that there is some good land beyond Tumut ? Yes ; I could not say what the extent of it is.
714. Whether you would get new traffic would depend on the amount of available land which now is too far away from a railway for profitable cultivation ? Yes ; and for which I have added 25 per cent. to my estimate.
715. I think you stated that you thought Tumut fairly well served as far as the district itself is concerned ? Yes.
716. In a previous inquiry I understood you to say that in an agricultural country any distance beyond 15 miles was rather too far from a railway ? Yes—that is to say, assuming that the cost of the line is such as to warrant the railway being built. But I do not look on this line as in any sense a pioneer line, as it is a railway which will cost between £4,000 and £5,000 a mile. I think I made a reservation at the time to the effect that that was where the roads were not available.
717. Of course, the cost of the construction of the line would not enter into any question as to what would be the greatest distance from a railway at which it would be profitable to grow wheat ? No ; but it would enter into the policy of the construction of the line.
718. Speaking as to the advisability of developing certain areas, you have to look at what would be the farthest point from a line at which a man can get a living by growing wheat ? Yes. People living 30 miles from a railway have made a living by growing wheat. A great many are doing so to-day, or they are supposed to be doing so.
719. If you regard 15 miles as a fair range for the influence of a railway in an agricultural country, it can hardly be said that Tumut, a distance of 22 miles from the railway, is properly served ? I say it is a fair distance. I am not prepared to say that it is a wise policy to bring all the agricultural areas in the country within 15 miles of a railway.
720. In any case, one would have to be governed by the amount of agricultural country available for development ? Decidedly.
721. From what you have seen of this district, you do not seem to think that the area of agricultural country is large enough to support a railway if it is going to cost so much as this line ? No. I cannot see that anything can arise to make it pay if the extension is carried out. I think that all these lines should be carried out with a view to their possible extension to other equally good or better districts beyond ; but I do not see anything in this district.
722. You say you have been to Tumbarumba ? Yes.
723. There has been a statement made that the line, instead of going to Tumut, might be taken up the Adelong valley, past Adelong, towards Tumbarumba ? I think there was an idea of that kind at one time.
724. If it were taken that way, there would be a possibility of its extension ;—is it good country about Tumbarumba ? It is very broken. It would be very expensive country in which to construct a railway.
725. It seems that all the good country about there is amongst ridges ? Yes ; practically it is in pockets amongst the mountains.
726. This estimate of £305, to be derived from goods, stock, and wool,—do you think they are calculated on the probability of getting all the traffic from the two points mentioned ? Yes ; and there is 25 per cent. added for the produce.
727. And that £305 represents the whole of the traffic ? Yes—that is, merchandise, stock, and wool.
728. This merchandise, stock, and wool, less the 25 per cent. increase, now goes over the Cootamundra line ? Yes.
729. There would not be that percentage of new traffic ? No ; it goes over the line to-day.
730. Are through rates now charged on the Gundagai line ? Yes ; there have been only through rates charged on the Gundagai line.
731. When that line was opened, local rates were not thought of ? No.
732. *Mr. Dick.*] We were assured, in evidence yesterday, that the permanency of this district as a mining field was assured, and that it is more than likely that further mineral developments will take place there ;—would you care to offer an opinion as to the prospect of the railway revenue increasing ? I should unhesitatingly say that the future of that district is assured. It is a rich mining district.
733. *Chairman.*] When you look on the map you see that when the line gets opposite Adelong it takes a right-angled turn into Tumut ;—do you think it would be any improvement if we followed the creek right down to Adelong, with a view of getting to Tumbarumba ? I could not say ; that is an engineering question.

734. I mean independently of the engineering aspect of the matter—I mean from the traffic point of view? There is nothing at Tumberumba of any consequence.

735. Then there is the probability of losing the Tumut traffic? Yes.

736. If you went towards Adelong that would increase the distance to Tumut, and the people would be sure to go into Gundagai? Yes.

737. So your view is that the line from Cootamundra to Gundagai is a mistake, and that it would not help that line to carry it further on? That is my impression. The following is a statement showing the production of maize and tobacco in the Tumut district for the four years ended 31st March, 1899:—

J. Harper.
15 Nov., 1899.

	Maize.				Tobacco.			
	1896.	1897.	1898.	1899.	1896.	1897.	1898.	1899.
	bushels.	bushels.	bushels.	bushels.	tons.	tons.	tons.	tons.
Adelong	13,304	14,220	10,550	19,780	53	116	126	37

Tarcutta	2,290	120	470	480	33	69	33	43
Tumut	201,402	168,654	128,192	109,420	151	335	242	210
Total	223,411	190,689	151,257	146,455	237	520	401	290

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

738. *Chairman*] Have you a statement to make with regard to this line? Yes; the map shows the tenure of the different classes of land 10 miles on each side of the proposed line of railway from Gundagai to Tumut. The amounts are as follows:—

C. E. Rennie.
15 Nov., 1899.

Alienated land	585,900 acres.
Reserves	217,800 "
Settlement leases	650 acres
Improvement leases	3,200 "
Snow leases	17,000 "
Crown land { Occupation license	108,700 "
{ Untenanted	55,700 "
	164,400 "

739. The route of the proposed railway, almost without exception, goes through private property? Yes; with very trifling exceptions.

740. *Mr. Shepherd*] Are you thoroughly acquainted with that district? I have no personal knowledge of the place at all.

741. *Chairman*] There is a reserve as you approach Tumut on the western side of the line;—is that a mineral reserve? That is the Adelong temporary common, and other adjoining reserves.

742. What is the area of it? About 18,000 acres, I suppose.

743. *Mr. Watson*] Is it available for mining, or does it include mining reserves? It includes mining reserves.

744. *Chairman*] Is it somewhat patchy country? I have no personal knowledge of that country at all.

745. *Mr. Watson*] Are those forest reserves held there under any form of occupation at present—annual license or occupation license? I could not answer that question without looking the matter up. I believe those lands are held under occupation license *

746. It is probable that the large area tinted brown on the plan, being unoccupied Crown lands, is of rather a broken character? Yes. There is a comparatively small area untenanted—only about 55,000 acres. The rest is under occupation license.

TUESDAY, 21 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Christian Peterson, Assistant Dairy Expert, Department of Mines and Agriculture, sworn, and examined:—

747. *Chairman*] I believe that you are acquainted with the district between Gundagai and Tumut? I spent five or six days in the district in September last.

748. In what part of the district? I went from Gundagai to Tumut, and through the Gilmore valley, and back from Tumut through Adelong to Gundagai.

749. Leaving Gundagai, you went in a south-easterly direction through Brungle to Tumut, and from Tumut you returned through Adelong to Gundagai? Yes.

750. What kind of country is it between Gundagai and Brungle? About Brungle the country is very good.

751. What is it like? There is a good deal of flat country there, though I did not see more of it than could be seen from the road, as I did not leave the coach.

752. Was it more suitable for agriculture or for dairying? It is particularly suitable for maize-growing, and very well adapted for dairying.

753. Do you speak of the country all the way into Tumut? No; there is a lot of barren country before coming to, and after leaving, Brungle.

754. Country suitable only for grazing. Yes.

755.

* NOTE (on revision):—Forest Reserve 2,040 is held under occupation license. Forest Reserve 1,961 is not under occupation.

- C. Peterson. 755. How far does that country extend south? I could not say, because I did not leave the coach.
756. But so far as your observation went? Two or 3 miles.
- 21 Nov., 1899. 757. Then you get into good country again? Yes; there is good country about Tumut.
758. Good agricultural and grazing country? Yes.
759. What is the width of the area of good land;—did you make inquiries on the subject? No; but I know that there is a lot of good land about Brungle.
760. How far does it extend—10 or 20 miles? On one side of the road, as far as one can see.
761. Then you get on to ridgy country? Yes.
762. When you get to Tumut, what extent of country is there suitable for agriculture and for dairying? I went along the Tumut River for a distance of about 4 miles above Tumut, and I saw there a lot of land which is adapted for dairying and for maize-growing.
763. Is it largely under cultivation? No.
764. What crops did you see there? Maize is practically all I saw.
765. Any tobacco? I did not see any tobacco.
766. We have been told that the tobacco crops have been allowed to drop off there considerably;—did you make any inquiries on the subject? No; because my business is connected entirely with the dairying industry. I went there to give instruction in pasteurization and butter-making.
767. Did you make a written report on the subject? Yes; I sent in a report.
768. Have you a copy of it? No. I do not think that I dealt in my report with the area of land available for dairying.
769. What is the country like above Tumut? It is black-soil country.
770. Is it flat? There are the river-flats—long narrow strips of flat land beside the river, and behind it there is ridgy country.
771. In your report to the Department what did you say about the character of the country in relation to dairying? I did not report upon the Tumut River flats. I went to see them rather because a gentleman in the district wanted to show them to me.
772. And what was the result of your visit? I saw that that land was well adapted for dairying.
773. Was it suitable for dairying rather than for agriculture? It was suitable for both purposes.
774. Can you tell us what extent of land there is in the district suitable for dairying? There is a good deal of country there suitable for dairying. The dairying land is rather scattered.
775. Does the good country cease 4 miles out of Tumut? (Going up the river, you get to ridgy country at that distance. The gentleman who drove me out informed me that there is a lot of good country beyond again.)
776. You did not go out to see it? No; I had no time to go further.
777. Did you go to any other part of the Tumut district? The object of my visit to the district was to give instruction in butter-making at the Rosebank Creamery, in the Gilmore valley. That valley is about 7 miles long.
778. And how wide? It is about 2 miles wide in the widest part.
779. How is it occupied? The land is used chiefly for corn-growing, and for dairying.
780. Is the factory an extensive one? No; it has only recently been erected.
781. Is it a co-operative factory? No; it is a private concern.
782. Are there any other dairy factories there? No; that is the only one that is started, so far.
783. Did you ascertain the number of dairy cattle in the district? No; I did not make any inquiry into that subject. I believe that information on that head is collected by the police, and forwarded to the Board of Health.
784. What quantity of milk can be dealt with by the factory to which you have referred? When I was there the factory was dealing with the milk of about 150 cows. The proprietor at the present time uses only the milk of his own cows; but he intends to erect creameries, and to deal with the milk of other producers.
785. So that at the present time the factory is a very small concern? Yes.
786. Did you gather any other information whilst in the district? No; I was not aware that I should be called upon to give evidence in regard to the character and resources of the district.
787. What kind of country did you travel through on your way back to Gundagai, by way of Adelong? That is not very good country for dairying.
788. Is the milk used in the factory you have spoken of good in quality? It makes good butter. At the present time they only manufacture for local consumption; there is no over-production.
789. Is the district a specially good one for the feeding of cows, and for dairying? Yes, a very good one.
790. Do you think dairying would be entered into there to a very large extent if the district had ready access to a market? I think so.
791. As a dairying district, how does it compare with the South Coast? I should say that they should be able to make butter equal to any on the South Coast.
792. Then, the district can be looked upon as a first-class dairying district? Yes.
793. Coming back by way of Adelong, did you make any inquiries as to the extent of country there suitable for dairying? No.
794. *Mr. Lavien.*] What kind of grass grows in the district? It is mostly natural grass that is growing there.
795. But grass of what kind? There are white grass, trefoil, couch, and rye-grass.
796. Any clover? I did not see any clover.
797. Are the grasses you have named good milk-producing grasses? Yes; very good.
798. What is the quality of the milk produced in the district? It is very good.
799. Is it as good as the South Coast milk? Yes. The climate is a cold one, and better milk is produced in a cold climate than in a warm climate, and on high land rather than on low land. The milk is as good as I have met with anywhere.
800. How is it for cheese-making—better than the milk down the coast? Equal to any on the coast.
801. What did you go to the district for? To give instructions in butter-making, not to make inquiries about the country. Butter-making is my particular line.
802. I suppose anyone can make good butter if they can get good cream;—there is no particular science in butter-making? Yes, there is. Everybody cannot make good butter.
803. Some grasses are better for milk-production than others, but it does not come within your province to

C. Peterson.

21 Nov., 1899.

- to inquire into the nature of the grasses in a district? No.
804. You are merely concerned with the making of butter? Yes.
805. Do you report upon cheese-making too? No; I have nothing to do with cheese.
806. Your business lies wholly with butter-making? Yes, and the management of butter factories. I give instructions in the pasteurisation of milk and cream and in butter-making. I visit all the factories and creameries.
807. You have no qualifications for judging as to the capabilities of different grasses for milk-production? I am not a grass expert, though I know the difference between rye-grass, clover, and lucerne, in regard to milk-production.
808. When you are sent to a district, is it not your duty to say that the grass there is or is not good for dairying purposes? Yes. In my report I state what grasses there are, and what weeds are commencing to appear.
809. But one does not feed cows on weeds in order to produce milk? That is so. My report refers to weeds which are likely to injure the milk and butter of the cows eating them.
810. Is this district a district in which you would be ready to start yourself if you wanted to commence dairying? Yes; it is a district which I should recommend.
811. *Mr. Shepherd.*] Is the dairy to which you have referred the only dairy in the district? No; though it is the only one connected with the butter factory.
812. How many other dairies are there in the district? Six or eight.
813. Do you know how many cows they milk? At the most about 400.
814. Have you any idea as to the area of land they use? Some of the farms contain 3,000 or 4,000 acres; that on which the factory is erected contains 3,000 acres.
815. Have they any other kind of stock besides milking cows there? They had some fat stock; but they intend to go in only for dairying stock.
816. Are there no sheep there? I did not see any, though there might be some on the higher country.
817. Did you go south from Tumut for any distance? No.
818. Whereabouts is the principal cultivation? Along the river above Tumut; and there is a good deal in the Gilmore valley.
819. What is cultivated, chiefly? Maize, and there is also a good deal of wheat grown.
820. Have you any idea as to the area of land under wheat or maize? No.
821. Do the people there seem to be pretty prosperous? Yes.
822. Did you question them at all about the proposed railway? No. I did not know until after I left the district that it was proposed to make a railway there.
823. Had you been to the district before last September? No. I was away from Sydney about six days on the occasion of my only visit to the district, and I was working in the butter factory nearly the whole time, so that I could not see very much of the country.
824. Do you think that the district is capable of producing a much larger quantity of butter than it now produces? Yes.
825. Are they manufacturing cheese there? Very little, and only for local consumption.
826. The people of the district would have to take all their produce to Gundagai? Yes, if they wanted an outside market.
827. Did they not speak to you about the distance which they had to travel to get there? No; those with whom I came in contact did not complain much; but I do not think they produce very much.
828. Did they express any opinion as to the advantage which the railway would give them? I think that the gentleman who has the factory said that it would be well if there were a railway.
829. Did they say that they could produce more if they had a railway? They would produce more if they had better means of communication.
830. Is there much cultivation to the west of Tumut? I have not been out that way.
831. What is the country like between Tumut and Gundagai;—is it fairly good all the way? Not all the way; a good deal of it is poor country.
832. With stony ridges? Yes.
833. There is not a great deal of land fit for cultivation? There is good land at Brungle; but then you come to poor land again.
834. What kind of timber grows in the district? I did not take much note of the timber; but it is mostly hardwood.
835. Box or gum? Mostly gum.
836. Did you notice if the trees were straight? There are some good straight trees there.
837. And trees of good size? Yes.
838. You went to Adelong? I came through Adelong.
839. Does the mining seem to be going on there prosperously? With the exception of the Adelong mine I should not think it prosperous. I saw a few shafts there.
840. You did not inquire into the state of the mining industry there? No.
841. *Mr. Dick.*] Can you tell us in general terms what led you to conclude that the district was a good dairying district? The area of good grazing country there.
842. Do you consider the hilly country there as being not only available, but good for dairying purposes? Some of it is good for dairying, while other parts of it are not. I did not go over much of the country besides that traversed by the road.
843. You had not much opportunity to see what the country was like, but what you saw was good for dairying purposes? What I saw of dairying land was good for that purpose.
844. You cannot give us any idea as to the extent of good dairying land in that district? No.
845. Can you offer an opinion as to whether the dairying industry, or the growing of maize and other cereals, would create the greater amount of railway traffic? I think that the dairying interest would create more traffic than the growing of cereals, because, in addition to the butter which would have to be sent by rail, there would also be the pigs which would be raised, and the pig traffic alone would probably be as large as the cereal traffic.
846. Dairying is practically a new departure in the Tumut district? Yes.
847. What directed the attention of the people of that district to dairying? I think they look upon dairying as likely to pay better than grain-growing.

- C. Peterson.
21 Nov., 1899.
848. Has the dairying industry had a fair trial there yet? I should not say that it has had a fair trial yet.
849. Have you seen the dairying country on the Northern rivers? Yes.
850. How does this country compare with that? There is not so much good country in the Tumut district as on the northern rivers, but what country there is is as good as any dairying country I have seen elsewhere.
851. Has it not been the practice in that district, when maize was low in price, to use it to feed pigs, and thus make bacon? I cannot say.
852. I understand you think that with dairying there will be a new departure, in the raising of pigs in the district? The raising of pigs always follows the dairying industry.
853. And you anticipate that a railway would obtain more revenue from the carriage of butter and pigs than from the carriage of grain if the district continued to be used for grain-growing? I do. Dairying requires more labour than agriculture, and will therefore bring more people into the district. That will increase the quantity of commodities needed, and the passenger traffic too.
854. On what acreage of land in the district could a man make a fair living if he went in for dairying? I should think a man would make a fair living on 150 acres of such land as I saw in the valley.
855. Is the land held in larger areas than that? Yes; it is held in large areas.
856. Then one advantage of the railway would be that it would bring about closer settlement upon smaller areas? Yes.

WEDNESDAY, 22 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.		JOHN CHRISTIAN WATSON, Esq.
WILLIAM THOMAS DICK, Esq.		ROBERT HENRY LEVICK, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Hon. James Hoskins, M.L.C., sworn, and examined:—

- Hon. J. Hoskins,
M.L.C.
22 Nov., 1899.
857. *Chairman.*] I understand that you represented the electorate of Tumut in the Legislative Assembly for a considerable number of years? For seven or eight years.
858. I suppose you are fairly well acquainted with the character of the district, and its agricultural and mineral resources? I have not been in the district for eight or nine years, but I was elected to represent it four or five times, and I have travelled through it repeatedly, so that I know fairly well what its capabilities are. The valley of the Tumut contains very rich land, but the extent of good land is limited, because of the narrowness of the valley. The same remark would apply to the land in the Gilmore valley. I never saw any cultivation on the ridges in the Tumut district, though that land may have been cultivated in recent years. When I represented the district the ridge-land was devoted to pastoral uses. The people there looked forward to a rush of sheep from the low country whenever there was a spell of dry weather.
859. The district provides a good feeding-ground for poor stock in dry seasons? Yes. Stock come up from the Riverina plains in dry seasons.
860. And a good many stock are depastured in the district all the year round? The country did not appear to me to be very heavily stocked—not the ridge country.
861. But in dry seasons the district is largely availed of as a place to send poor stock? Yes, from Riverina.
862. What is the nature of the ridgy country? Ordinary grass-land, but I do not think the grass is very nutritious. The grass on the flats at Brungle and other places, and on the land along the rivers, is very nutritious, but such land is limited in area.
863. When you speak of the Tumut valley, what district does the term include? I was referring to flats on the banks of the river.
864. Starting from where? I have never been down the river to its junction with the Murrumbidgee, but I know it from Tarrabandra to Tumut, and above Tumut.
865. Are we to understand that the best country is in the neighbourhood of Tumut and beyond? It does not extend very much beyond Tumut.
866. Five or 6 miles, perhaps? Rather more than that.
867. Is not that land well suited for agricultural and for dairying purposes? It is for agricultural purposes; I do not know enough about dairying to be able to speak in regard to it.
868. When you knew the district, was much corn and tobacco grown there? Maize was the principal crop there then, and a good deal of it was sent to Wagga direct, because that was shorter than to send it by team to Gundagai, and then by rail from Gundagai to Cootamundra, and from Cootamundra to Wagga. Wagga is the best market the Tumut people have for their maize. I have heard people say that Tumut maize is the best maize grown in the Colony, because it is not subject to destruction by weevil, whereas the maize sent from the Macleay, the Manning, the Hunter, the Richmond, the Clarence, and other rivers is very much damaged by weevil. At the same time, the Tumut people require a good price for their maize, in order to pay for the long carriage, and therefore they are generally undersold in Sydney by maize coming from the rivers.
869. I suppose that when you represented Tumut you generally travelled by the main coach road from Gundagai to Tumut? Once or twice I travelled by the southern road from Bowning, near Yass, to Gundagai, and thence to Tumut. Subsequently, when the railway was extended to Cootamundra, I used to take the coach from Cootamundra. When I was Secretary for Lands in a Parkes administration, and the Government was about to submit railway proposals to Parliament, I suggested the construction of a branch line from the southern railway towards Tumut. My proposal met with favour at the hands of the Government, and was sanctioned by Parliament, with the result that the line from Cootamundra to Gundagai

Gundagai was constructed. Since then I have been very much surprised—and I may almost say grieved—to learn from the reports of the Railway Commissioners, that that line entails a loss of about £4,000 per annum. When I submitted the proposal to the Government, I considered that the country between Cootamundra and Gundagai was very well suited for railway construction. There were no considerable streams to cross, and no ridges of any consequence, and the land was tolerably fertile, and, to a certain extent, cultivated. As the existing line receives, in addition to the traffic from Tumut and Adelong, traffic from the settlement between Gundagai and Adelong Crossing, I do not see how the proposed extension to Tumut can pay, while there is a loss on the existing line. When I used to visit the district, the cost of conveyance from Tumut to Gundagai was £1 a ton. The rate has of late years been reduced to some 10s. a ton. Now, the distance from Tumut to Gundagai is barely 21 miles by road, but by the proposed railway it would be 31 miles, and, it seems to me, that by competition the teamsters' rates will be reduced to 7s. 6d. a ton, which is not less than is charged in some other parts of the country, and on these terms I think the teamsters' competition will seriously affect the railway. The road from Tumut is a fairly good road. It is well culverted, and good lengths of it are macadamised.

Hon.
J. Hoskins,
M.L.C.
22 Nov., 1899.

870. Three routes have been surveyed between Gundagai and Tumut—a western route following Adelong Creek for some distance, and two eastern routes, one on each side of the Tumut River;—from what you know of the country, do you think the western route will serve as large an agricultural district as either of the eastern routes? No.

871. Either of the eastern routes would serve more agricultural country than would be served by the western route? Yes.

872. Does the good agricultural country extend pretty well all the way along the Tumut River, from Gundagai to Tumut? I cannot say, because I have not been all along the river. I know that in some places the ridges abut more upon the river than in others, so that there are no flats worth speaking of.

873. Is it not a fact that the best agricultural land is in the vicinity of Tumut, and to the north-east of Tumut? It is good land all about Tumut, where it is flat. There is good land up as far as Tarrabandra.

874. All the way up the river? Yes; but in narrow strips.

875. Strips of 3 or 4 miles wide? In some cases not more than a mile wide; in other cases as much as 2 miles wide.

876. How far does the good land extend east from Tumut—3 or 4 miles? Not so far as that.

877. And south from Tumut? South from Tumut the country is very rough and ridgy.

878. Between Tumut and Adelong the country is pretty hilly and rough? Yes, except close to Tumut; and even there it is very ridgy on one side of the road; it slopes down gradually to the Gilmore Creek.

879. Was Adelong in your electorate? Yes.

880. What are your opinions in regard to Adelong as a gold-field? I cannot express an opinion in regard to it.

881. Is Adelong looked upon as one of the prominent gold-fields of the Colony? There will always be people getting gold there. An English company holds the Gibraltar mine there; but it does not pay.

882. The mining is mostly quartz reefing now? Yes, and there is alluvial working on the Upper Adelong.

883. When you advocated the construction of a railway from Cootamundra to Gundagai, had you in view the probable extension of the line to Tumut? I thought that if the line proved profitable, it would be wise to extend it to Tumut; but with the information which I now have in regard to it, I do not think it should be extended. I cannot understand that there should be a loss upon the Gundagai line, because that line serves an extensive district lying round both Tumut and Gundagai.

884. It is not very rich country beyond Tumut, out towards Tumbarumba? Some of the ridges are richer than those about Adelong. I believe that there is a little cultivation round about Tumbarumba, but very little.

885. I suppose you recognise that it is a somewhat unusual thing to propose the construction of 31 miles of railway to connect two places which are only 21 miles apart? I consider that the people of Tumut cannot find it difficult, seeing that they have a partly macadamised road, to carry their produce to Gundagai. Plenty of small towns in England, and still more in America, have to carry their produce 20 miles to get to a railway station.

886. Is the district such that you think the Government should construct this railway;—do you think that if the railway were extended to Tumut there would be a very great development of the district? I do not think so.

887. *Mr. Shepherd.*] Have you any idea as to the area of the available land about Tumut? No, I have not. I was only asked to come here yesterday; and therefore I have not made any inquiries into the subject.

888. Can you tell us what is the length of the Tumut valley, in which the strips of good land are situated, is? I am not well acquainted with the lower part of the river.

889. Narrow strips, such as you have described, could hardly furnish much traffic for a railway, if used either for agriculture or for dairying? I do not think they could.

890. Was any dairying carried on in the district in your time? Not that I am aware of.

891. We have been told that there is now a butter factory in the district, and from six to eight dairies; none of them existed in your time? No.

892. Was tobacco not grown in the district in your time? Yes; but its cultivation has diminished considerably, because the price came down too low. The Chinese were the main growers of tobacco, and they have largely discontinued to grow it.

893. Do you think that the proposed railway would assist Adelong at all? If it enabled the people there to get loading more cheaply from Sydney, it would, of course, assist them; and, with regard to the passenger traffic, it is, of course, more easy to ride in a train than to ride in a coach.

894. Do you think that the construction of a railway would increase the development of the mines? I cannot see why it should do so, because there is now a railway within 20 miles of Adelong, and a good road connecting Adelong with the Railway station.

895. And you do not consider the proposed extension desirable? I do not, because of the smallness of the return obtained by the Cootamundra to Gundagai railway. I do not think the Colony will be justified in extending the railway to Tumut until there has been an improvement of the traffic on the Gundagai line.

896. *Mr. Watson.*] I suppose you are aware that through rates are charged on the Gundagai line, although local rates are charged on many other branch lines;—if local rates were charged, might not the line

Hon.
J. Hoskins,
M.L.C.
22 Nov., 1899.

line come nearer to being a profitable concern? I cannot tell you. I fancy that if the Government had charged local rates, and they were higher than the through rates, a large number of persons would have used their teams to compete with the railway in the carriage of goods from Gundagai to Cootamundra.

897. There is no competition of that kind between Temora and Cootamundra? The Temora line cost less than the Gundagai line, and therefore requires a smaller return to show a profit.

898. I think you said that there is a narrow strip of good land on both the Adelong and the Tumut Creeks? I did not say that there was much good land on the Adelong Creek, though on the lower part of the creek, near Adelong Crossing, there are a good few farmers, and there is a flour-mill there, though the man who built it lost a lot of money by it. There is a narrow strip of inferior land between the Adelong Creek and the Tumut River.

899. The farmers about Adelong Crossing are within easy distance of Gundagai? Yes. They would not contribute to the traffic of the proposed extension, neither would the farmers about Gundagai itself.

900. Is any of the country between the Adelong and Tumut Rivers good land, or is it all ridgy land? I cannot tell you. There is good land on the Gilmore Creek, though it is a narrow strip.

901. Are you aware of the existence of good land lower down, between the Adelong and Tumut Creeks? There may be patches of good land there, but I do not know of any.

902. It would seem to be mostly ridgy country? Yes. Going from Gundagai to Tumut, by way of Brungle, you go up very steep ridges, until you get to the flats at Tarrabandra.

903. The main coach road from Gundagai to Tumut goes over very heavy ridges nearly all the way? Yes.

904. *Chairman.*] Have you read the evidence of Mr. Harper? I saw the report of his evidence in the newspaper. I thought his evidence very truthful and just, and untinged with bias.

905. Do you think that the public would be prepared to pay special rates upon the proposed extension, seeing that it is 10 miles longer than the road? I think that if the railway were made the carriers would take loading for less than 10s. a ton, and many farmers would do their own carrying. There is some very fine land in the Tumut valley, but the settlement there is a mere nothing, compared with the settlement in the Temora, Young, and Tamworth districts.

Travers Jones, sworn, and examined:—

T. Jones.
22 Nov., 1899.

906. *Chairman.*] You are well acquainted with the district between Gundagai and Tumut? Yes; I represented the Tumut electorate in the Legislative Assembly for about fourteen years, with a break of three years.

907. Would you like to make a statement in regard to the proposal now under the investigation of the Committee? Yes. I was the proprietor of a mine on the Adelong Creek when the staked line, which it is now proposed to construct, was measured. At that time I was on the Adelong Progress Committee, and the Adelong people wished for the construction of a railway which would go through the town of Adelong. They therefore induced the Government, acting through me, as their chairman, to make a flying survey from Adelong to Bago, and from Bago to Tumbarumba. Mr. Hobson reported upon that project, and I travelled with him over the proposed route. So far as I remember, he reported that there was no engineering difficulty in the way of an extension of the line from Adelong to Tumbarumba; but, with regard to bringing the line into the Adelong township, it would be very expensive to construct a railway through what is known as the Gap, to Tumut. Some time after that, I went into Parliament, and while I was supporting the Jennings-Dibbs Government, something like £500,000 was voted by the Assembly, without debate or division, for the construction of a line to Tumut. The proposal then went to the Upper Chamber, and was there referred to a Railway Committee; but before the Committee had time to deliberate, Sir Patrick Jennings, because of some difference of opinion with his colleagues, threw up the sponge, although the Government had a majority of twenty or twenty-two. Thereupon the Tumut railway proposal, and other railway proposals, went overboard. Later on, I tried, on several occasions, to bring the matter before Parliament again, but the great obstacle in the way of the construction of the line was the necessity of bridging the Murrumbidgee, which it was estimated would cost an enormous sum, though the estimate has since been reduced very much by the Department, and now, from what I can learn, the cost of a bridge would not stand very much in the way of the construction of the line. To get over the bridge difficulty, I suggested that the existing bridge at Gundagai should be reported upon, so that it might be known if it could carry both the railway and the road traffic. It was known at the time that new approaches would have to be made to that bridge, because the old approaches were costing about £1,500 a year to keep in repair, and were dangerous to traffic. Mr. De Burgh, however, reported that the bridge had not been put up according to contract, and was not strong enough to carry a railway. I believe there was some dummy bolting in it, and that in many places where there should have been a bolt, there were only a nut and a head, a thing which has occurred in the construction of other bridges. The late Mr. Bennett backed me up in the opinion that it was possible to utilise one bridge for both railway and general traffic, and, so far as the argument that the trains would frighten horses is concerned, I would point out that the railway bridge now proposed is not a stone's throw away from the existing bridge. However, the Railway Construction Department opposed my suggestion, and some time afterwards the Adelong people actually told the Government that they would not be in favour of any railway which did not go through the town of Adelong. Now the staked line leaves Adelong at some distance on one side, and my constituents were therefore divided as to what was the proper route for the railway. I suggested that a branch line should be made from Coolac, and upon its being decided to erect a bridge at Gobarralong within 4½ miles or 5 miles of Coolac, I suggested that that bridge should be made suitable for both the railway and road traffic because, in my opinion, if trams can be run through the streets of Sydney without interfering with the other traffic, a train crossing a country bridge twice a day would not interfere with the traffic on a country road, and a material saving would be effected by using the same bridge for both railway and road traffic. One bridge is used in this way in other countries, and Mr. De Burgh refers to the fact that it is the custom to build such bridges in India. My opinion is that a line might be taken from Coolac through Brungle to Tumut, and afterwards might be extended from Tumut to Bago, and on to Tumbarumba, because the future market for Tumut produce is western Riverina. So far as the resources of the Tumut district go, we have all there that is required, both in the way of soil and of climate, for the production of crops, vegetables, and fruit. I was brought up to farming in the old country, so that I know what I am talking about when I make a statement of

of that kind. There is no better soil in the Colony than we have in the river flats about Tumut. The droughts, which cause so much hardship and loss in the Colony generally, have proved the salvation of Tumut. In a wet season the soil on the river flats is so rich that if you put in wheat or oats, it will go to straw, and you will get no head upon it; but, in a dry season, it will produce from 40 to 60 bushels per acre. They have been growing wheat on the river flats for the last five years to my knowledge, and have been getting very large yields, because the seasons have been dry. When the seasons are wet they put in corn, and the average yield per acre is from 40 to 60, and as much as 100, bushels per acre. Then there is a large area of forest land, in which there is rich chocolate soil. In many cases very good timber grows on this land, and land which produces good timber is fit for agriculture, and will grow crops. I have seen a very heavy crop of oats at Red Hill, which is a pastoral holding, where very little is grown except for the use of the station. I have also seen good crops at Sandy Creek. There is very rich soil there; but the country is used chiefly for pastoral purposes, because of its distance from a market. At Nottingham Forest I saw as fine potatoes as I ever saw grown anywhere, and fine vegetables too. Then I have seen good crops at Bago, and at Reedy Flat, though both of those places are too far from market to allow crops to be profitably grown there. No place in the Colony will grow better potatoes than are grown at Reedy Flat, and at Tumarumba. At Three Brooks I have seen turnips as large and as fine as I ever saw in the old country. At Tarcutta I have seen oats equal to those I saw at Red Hill. All the way into Tumarumba there is rich chocolate volcanic soil, fit to grow anything that can be grown in an English climate. The fruit grown in the district cannot be excelled in any part of the Colony. In the season, strawberries are as plentiful as blackberries are in many other places; but there is no market for the fruit grown there. When I was in Parliament, I tried to induce the late Hon. John Sutherland (who was then Secretary for Public Works), to have a special car sent to Gundagai for the carriage of fruit; and I have exhibited in the Legislative Assembly buildings specimens of apples and other fruits grown in the district, which could not be excelled. There are two drawbacks, however, to the progress of the district. One of them is the want of a Closer Settlement Act. If the Government were to resume large estates, such as the Bombowlee estate, the district would carry five times its present population, and would produce five times as much as it now produces. One great curse there—a curse which drove me out of the old country—is that of tenant farming. Under the system of tenant farming, men hold their land on sufferance from year to year, and the area at their disposition is limited. If the Committee visit the district, they will see what a difference there is between the happiness and comfort of the homes of farmers who own their own land, and the condition of the homes of the tenant farmers,—men who are paying £1 per acre per annum for land which was alienated by the Crown for £1 per acre. If the Government gave proper inducements, many of these tenant farmers would become landholders, but at the present time they have no energy, and no inducement to improve their homes. Another drawback to the district is its distance from a railway. The route which has been staked out by the Department simply runs into Tumut, and stops there, and I do not see how it is to be got any further. If the proposed line is made, the Brungle and Red Hill portion of the electorate, where there is a great deal of fertile land, will not be served by it, but will continue to use the existing line, and Tumarumba and Adlong Creek will be too far away to use it. I think that a railway, to meet the convenience of the inhabitants generally, should start from Coolac, and go through Brungle to Tumut, and thence, at a later date, to Adelong and further on. Another proposal is to cross at Sandy Fall, though I do not know so much about that route.

908. *Mr. Watson.*] We were told that it was practicable to get a route from Gundagai down the Tumut River? I do not think that there is anything to prevent the construction of a branch line from Coolac, and such a line would serve the whole electorate. I sent in very voluminous reports on the subject when I represented the electorate. In my opinion, Tumut is entitled to a railway. Any line which is made may not be such a commercial success as the Commissioners would like, but it will increase settlement and population. I know a good deal about the Riverina country, and I have had practical experience of several droughts there, and it is my opinion that agriculture will never be a success in that district, because of the insufficiency of the rainfall. You may have a good crop one year, but then you may not get another good crop for two or three years more. If New South Wales is to supply her own people with produce she will have to depend upon the old agricultural districts, such as Tumut. There is never a failure of the crops in that district. There was a failure of the potato-crop there two years ago, but that was owing to the destruction caused by a fly. I know a man, living back as far as Tumarumba, who supplied Tarcutta with potatoes, and he made from £80 to £100 an acre. It is a very poor crop of potatoes there which will not go 8, 12, and 15 tons to the acre. Because of the failure of the crop on the occasion I mentioned, Tumut had to depend upon imported potatoes. We have some of the best farmers in the Colony in the district, and they have gained prizes with their produce at Sydney, at Gundagai, and at Wagga. They have model farms, and carry on their farms on scientific principles; but it is very hard to get the old farmers out of the old grooves, and they continue to grow either wheat or corn, according to the seasons. I have done my best to improve the system of farming there. I got Mr. Thompson, of the Agricultural Department, to deliver lectures in the district on farming, and Mr. O'Callaghan to lecture on dairy-farming, and I got a person to go there to show them how to grow tobacco. There is no place in the Colony better suited for butter-making, bacon-curing, or jam-making than the Tumut district. From what I know of dairy farming, 10 acres of cultivation are worth 100 acres of grass, and you can keep as many sheep on 1 acre of artificial grass as on 20 acres of natural grass. Greasy wool is selling at the present time at prices which it has not reached before for twenty years. A gentleman to whom I was speaking recently, told me that he was selling his wool for 1s. 3½d. per lb.; and he told me that he had not lost any of his stock this year. With regard to the mining resources of the district I can say, as a practical miner, that in Adelong we have the Charters Towers of New South Wales, if there is sufficient encouragement given for the development of the field. The Caledonian mine has been lying dormant for years, though several of the local miners have tackled it; but the water was too much for them, and the ground was too hard, so that they had to give it up as a failure. Some little time ago, however, the Government were induced to give assistance to the party at work there, and I learn by this morning's newspaper, that they have had 10 tons treated at Dapto, and have got 9½ oz. of gold per ton. They have been getting rich dirt for some time past, and they have paid back to the Government a good part of the money advanced to them. I have never known a quartz reef to be worked out.

909. *Mr. Shepherd.*] What is the thickness of the reef? Between 2 and 3 feet. As a general rule, the reef in Adelong is not very wide. The gold is got chiefly in the pyrites ore. The Gibraltar mine has been

T. Jones.
22 Nov., 1899.

T. Jones.
22 Nov., 1899.

been a great success, because of the assistance it has received by the spending of capital. They have channels north and south, and from 12 to 20 and 30 feet wide; but the ore there is of low grade, averaging from 8 to 10 dwt. The rich gold got in the Gibraltar mine is obtained from the east and west quartz reef. The last escort took away between 1,100 and 1,200 oz. of gold, and that came from only a few mines. I am convinced that there is a large future before the Adelong field, if sufficient inducements are given for its development. At the present time the insecurity of tenure causes a great deal of trouble. In Victoria, where they are working places like Bendigo and Pleasant Creek, they are getting as good gold now as ever they got, and at Bendigo they are down 3,500 feet. I have not the slightest doubt, but that at Adelong the reef will go down that depth, and will be found payable.

910. *Mr. Dick.*] You have stated that the Tumut district will grow anything? Anything that can be grown in an English climate.

911. If you look at the parish map, which is now before the Committee, you will see three routes marked, one following the Adelong Creek for some distance, and the other two the Tumut Creek; between the Adelong Creek and the Tumut Creek there is a fairly large tract of land;—how much of that land is fit for agriculture? The land between the Adelong Creek and the Tumut River is pastoral country, but there is some agricultural land on the branch creeks.

912. Then, whichever route is selected, it will draw agricultural traffic only from the narrow strips of flat land alongside the watercourses? The rich river flats are limited in width. The Tumut River flat extends for some 30 miles, but I do not know that its width will be much more than a mile. The staked line would shut out the country which would be served by taking a line from Coolac.

913. Would the Coolac route serve the agricultural country on both the Adelong and the Tumut creeks? It would serve the greater area of good country, but it would not serve the country on the Adelong Creek. The principal agricultural land on the western side is between Gundagai and Adelong Crossing, a distance of about 10 miles, and on to Grahamstown, another 12 miles. That country will always be served by the existing line. The best road in the Colony is that from Gundagai to Adelong.

914. You said that there is good land to the south of Tumut as far as Tumberumba;—now, if a railway were taken to Tumut, how would you get it on to Tumberumba? It would go *via* Adelong, and up the Bago. A flying survey was made of the route, and it has been reported that there are no engineering difficulties. The land there is forest land, with chocolate volcanic soil.

915. If the line stopped at Tumut, and the forest country you speak of were brought under cultivation, would the produce from it be taken to Tumut, or to the southern line towards Wagga? The difficulty which prevents the growing of produce there now will still continue to exist, even if the line is taken to Tumut. The country you speak of will still be too far from a railway to allow produce to be profitably grown there.

916. So that, even if the line is taken as far as Tumut, it will not bring into cultivation the forest land between Tumut and Tumberumba? I do not think so.

917. How far would the greater part of that forest land be from Tumut? The boundary of the electorate is, I believe, about 40 miles from Tumut, and within about 3 miles of Tumberumba.

918. How far would you have to go from Tumut to reach this good forest land? You would pass through the Gilmore valley, and you would get good land all the way into Adelong.

919. But that is going east? That is going towards Tumberumba. There are 12 miles of good agricultural land going into Adelong. Then you get on to what is called the Gap; and when you descend again you go up the Adelong Creek until you cross the range to Bago.

920. And then do you come to this good forest land, or is it still some distance away? We have very fair land up the Adelong Creek, though there is not any great area of it fronting the creek. Still the land between the creek and the range is fair agricultural land. Then you get up to Middle Adelong, a distance of about 9 miles. There is some good agricultural land there. You go up a steep range into Reedy Flat, and you get some of the best agricultural land in the Colony, and there is rather an extensive area of it. From Middle Adelong you go up a steep range, and then you get on to the tableland, and that is where the forest land is.

921. How far from Adelong? Fourteen or 15 miles.

922. And how far does the good land extend? All the way into Tumberumba.

923. It has been suggested that the Adelong Creek should be followed all the way down, and the line taken on to Tumberumba;—have you considered that as a possible route? I had a flying survey made of it. It is quite possible to take the line down West Creek, which leaves the Adelong Creek, to Tumberumba; but such a line would not serve Tumut or Brungle, or that side of the electorate at all.

924. But Tumut would be within 8 or 9 miles of a railway-station, instead of 20 miles, as it is now, and would have an easy grade instead of a heavy grade? Yes.

925. *Mr. Watson.*] If the Tumut people had to go to Adelong they would have a more level road than they have now to Gundagai? Yes, the grade would be very easy all the way to the Gap and into Adelong.

926. *Mr. Dick.*] You have stated that one thing necessary to make the proposed line pay is the resumption of the large estates in the district by the Government, and the cutting of them up into small holdings;—are we to understand that the large land-owners there are not at present putting their land to the best use? My private opinion is that all the people in the Colony have too much land, and that these large estates, except where the land is let out to tenant farmers are not put to proper use.

927. What would you call a large estate in the Tumut valley? I could not tell you the area of the Bombowlee estate; but it is pretty large. Nearly all the towns in the Colony are handicapped by the large estates which surround them.

928. If the Government resumed land in the Tumut district, what would they have to pay per acre for it? The last land sold there fetched £17 or £17 10s. an acre. The usual price for river flats is about £25 an acre.

929. Then, the resumption of this land by the State would be rather an expensive undertaking? If the Government resumed a large estate, they would not pay that price for it, because it would include a great deal of inferior land. A few years ago you could readily get £25 an acre for the land on the Tumut flats.

930. Is much of this good agricultural land lying idle at the present time? No; I think that most of it has been cultivated either by the owner or by a tenant farmer. A few years ago, when Chinamen were growing tobacco very successfully in the district, and were getting a very good price for it, the holder of land got as much as £6 an acre per annum rent for it, he doing the ploughing and harrowing; and the usual price when the Chinamen undertook all the labour was from 30s. to £2 an acre.

931.

T. Jones.
22 Nov., 1899.

931. If all the flats are being cultivated now, how would the construction of a railway lead to a greatly-increased production? There is a good deal that is not cultivated, though the farmers rent what they can of it. On the Bombowlee estate, I think the Europeans pay 30s. an acre, and the Chinamen £2 an acre.

932. Do you know the extent of that estate? No. There is another estate—Laemolac—where the land is very rich too. That land is largely in the occupation of Chinamen, who grow very large crops of corn on it.

933. Do you think that the development of dairying will lead to the forest country being used to pasture cattle? No. If I were going in for dairying, I should use the very best land. To dairy successfully, you must grow feed for the cattle. Ten acres of green crops are worth for dairying purposes 100 acres of grass.

934. With the extension of dairying, there must be a diminution of agriculture; which produces more revenue for a railway—dairying or agriculture? I have just returned from a visit to the Beechworth and Yackandandah district, in Victoria, and there the farmers have all given up agriculture for dairying. They told me that dairying has saved Victoria. One man told me that he milked seventy cows, and that their produce was worth from £2 to £2 10s. per day, and the money is coming in every week.

935. But which provides the more traffic for a railway? Agricultural produce. There is a great deal of difference between the value of a ton of butter, which is about £80, or a ton of cheese or bacon, which is about £30 or £40, and a ton of agricultural produce, but there would not be any great difference in the railway rates.

936. *Mr. Shepherd.*] You say that the reefs at Adelong are from 2 to 3 feet wide, and that there has been a considerable yield of gold to the ton? The last crushing in the Caledonia mine gave 9½ oz. per ton from 10 tons. They will crush the seconds at Adelong, and get between 3 or 4 oz. per ton from them. I have known the Gibraltar mine for the last twenty years. When they were in full work there before the strike they were employing something like 260 men in the mine alone, though I do not know how many they are employing now. I am informed, by men who ought to know, that the mine looks just as well in the lower levels now as it ever did. When it was in full work it averaged 2 oz. to the ton.

937. You say that the Adelong mines want encouraging;—what encouragement do they want? It takes a great deal of money to prospect and to open up a mine. Sometimes, after £100,000 or £150,000 have been invested in a mine, and a plant worth £10,000 or £20,000 has been put down, the capital becomes exhausted, and then it is necessary to apply for the suspension of labour conditions, while an attempt is made to obtain more capital. A suspension is given for a certain time, and then, if the labour conditions are not complied with, the lease is forfeited, and some man comes along and orders the company to remove its machinery within six months. These provisions of the law cause the whole trouble. In America you have to comply with labour conditions for a certain length of time, but if the mine becomes a payable one, and you are giving large employment, you can convert your leasehold into a freehold. Then, again, £1 an acre per annum is too much to pay for rent when land is leased for agricultural purposes for much less, and for pastoral purposes for as low as 1d. per acre. I consider that the mineral resources of this country will prove its salvation, and they have proved its salvation since the Banks smashed. Since a large number of men were sent out fossicking by the Government our mineral yield has increased tremendously, and it would increase still more if proper encouragement were given to mining. We are 100 years behind the other colonies in regard to mining.

938. If these mines are as rich as you say they are, why should they be idle? In all mines the gold is found in shoots. The shoot may be only 5 feet, or it may be 30 or 40 feet in length, and, after you get out of it, the stone in the reef will not go more than 2 or 3 dwts. You have to search for these rich shoots. At Adelong the rich gold is got in the pyrites ore. These pyritic shoots carry down until they lodge in a big white barren reef, and this white quartz has had to be sunk in 50, 80, and 100 feet before any more gold is obtained. When you get down a certain depth the shoots spread out like the roots of a tree. In the Gibraltar mine, they have got beyond the zone where the gold used to be found only in patches, and now the ore is generally payable.

939. What is the greatest depth that they have reached? The Victoria mine obtained £1,000 from the Government when it got down 800 feet, as the first mine to obtain payable gold at that depth. They then sank 1,000 feet, and got another £500. The board of directors, however, divided all the profits in dividends to keep up the price of the scrip; and, therefore, when they got into a fault, they had no money to carry on with; and that mine is shut down now, though it is one of the best in Adelong.

940. What is the population of Adelong now? At the last general election there were about 2,200 people on the roll for the Tumut electorate. When I was working an alluvial mine on Adelong Creek, Mr. Shepard was working the adjoining mine, and we employed between us something like 148 men. At that time the population, including women and children, was over 500 at Shepard's Town and Grahamstown alone.

THURSDAY, 23 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.WILLIAM THOMAS DICK, Esq.
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Ernest Macartney De Burgh, M. Inst. C.E., Assistant Engineer, Bridges Branch, Department of Public Works, sworn, and examined:—

E. M.
De Burgh,
M.I.C.E.
23 Nov., 1899.

941. *Mr. Watson.*] It has been suggested to the Committee, in connection with the proposal to extend a railway from Gundagai to Tumut, that it would be possible to minimise the expense of construction by using the existing road bridge for railway purposes;—from your knowledge of the bridge will you tell us what you think of the suggestion? *Mr. Burge*, of the Railway Department, spoke to me about this matter some years ago, and since then I have rebuilt the timber viaduct which leads to the bridge. After considering the whole matter carefully, I have come to the conclusion that the difficulties in the way of carrying a railway across the bridge more than counterbalanced the advantages which might be gained by doing so.

942. What is the nature of those difficulties? The original iron bridge across the Murrumbidgee at Gundagai, and a timber viaduct approaching it, were opened for traffic in 1869.

943. What is the character of the iron bridge? It is an iron-latticed girder bridge of three spans, resting upon iron cylinders, and each span is 103 feet in length. The total length of the whole structure is 3,025 feet—the timber viaduct being 2,716 feet and the iron bridge 309 feet in length. The roadway across the structure is 20 feet 6 inches wide. The viaduct however, is not straight, there being a curve in it of $8\frac{1}{2}$ chains radius, and a grade of 1 in 34 for a length of five spans. After thirty years' life, the old viaduct decayed, and last year I replaced it with a new viaduct.

944. Is there a viaduct only on the Gundagai side, or is there also another viaduct on the Tumut side of the river? There is very little timber work on the Tumut side of the river—only two spans; so that practically the whole of the timber work is on the Gundagai side.

945. Will you indicate the nature of the difficulties which would operate against using the bridge and viaduct for railway purposes? The difficulties are exactly the same in this case as I indicated to exist in connection with the Wilcannia bridge. Although the structure is amply strong for all ordinary traffic loads, even including a traction engine, it has not been designed to carry the concentrated load given by a train composed of a heavy engine and closely packed trucks.

946. Could the bridge and its approaches be strengthened at a minimum of expense to meet the conditions required by railway traffic? I have looked into the matter, and I have come to the opinion that the expense would be so great that the undertaking would not be economical. So far as the viaduct is concerned, the spans would have to be shortened, and we should practically have to build an additional pier for every pier that there is there now. A more serious thing still is that we should have to construct a new deck, in order that the rails might be flush with the roadway. The only bridge of the kind existing in New South Wales—leaving out the Camden bridge, which is crossed by a tramway and not by a railway—is a bridge between Moama and Echuca.

947. Is there not a similar bridge at Singleton? In the case of the Singleton bridge the road traffic and the railway traffic run on separate sides. On the Moama-Echuca bridge the rails are flush with the roadway so as not to interfere with the vehicular traffic.

948. The railway at Moama is a private line? There is a private railway from Moama to Deniliquin; but it is the Victorian rolling stock that is run over the bridge I am speaking of. That bridge is an endless source of trouble, because it is very difficult to keep the roadway in repair. It had a timber deck similar to that of the Gundagai bridge, but it was so unsatisfactory that last year we spent £4,000 in putting in a new floor with a view to getting rid of the annoyance.

949. Is there nothing in the private company's Act to require that they shall keep the bridge in repair? The bridge is kept in repair under an agreement between the Governments of New South Wales and of Victoria. New South Wales paid half the cost of construction and pays half the cost of maintenance. The Victorian railways run across the bridge into Moama. I do not think the private company's line extends beyond Moama, so that the bridge is not in their length.

950. Do you think that the cost of converting the existing Gundagai road bridge into a road and railway bridge would be greater than the convenience thereby obtainable would justify? Yes, and, not only that, but I am afraid that it would not be a satisfactory job when we had done it. The viaduct at Gundagai is amply strong for a traction engine, but even a traction engine is a little bit more for the iron bridge than we care about. The factor of safety there is not quite so high as we should have in one of our modern bridges. The Gundagai bridge is in a worse position for carrying railway traffic than the Wilcannia bridge or any of our new steel bridges.

951. Would it cost much to strengthen the bridge to enable it to carry a railway? I do not think you could do it at all with economy; it would be a very difficult task and the result would be unsatisfactory.

952. It is to be expected that the road traffic would largely diminish if the railway were constructed to carry the traffic between Tumut, Adelong and Gundagai? You would still have to keep the floorway in repair, and it would be bad economy to cut up the deck to make the rails flush. Even though the traffic might be smaller you could not let the roadway get into bad condition.

953. But with a smaller traffic less inconvenience would arise? Of course, the fewer the people going over the bridge the less the inconvenience. As a matter of fact we now try to keep the road traffic off the viaduct as much as possible, by making it go across the flats. We give access to the bridge near the river, so that the traffic can get on to it without crossing the viaduct.

954. While you do not compel the traffic to cross the flat, you encourage it to do so? Yes; in order to save the wear on the deck of the viaduct.

E. M.
De Burgh,
M.I.C.E.
23 Nov., 1899.

955. What was the reason for the curve in the viaduct? In order to bring the bridge itself at right angles to the current of the river.
956. Could not that have been done equally well by making the viaduct straight? If that had been done, the viaduct would have been longer, because more of the flat would have to be crossed.
957. Can you tell us what the new viaduct cost? £12,292.
958. What was the original cost of the iron bridge? I cannot tell you.
959. What would you estimate the cost of putting up a similar structure to be? About £7,000.
960. Piers and everything complete? Yes.
961. That would make the cost of the whole structure about £20,000? Yes.
962. Did the £12,292 come out of revenue, or out of Loan Votes? Out of Loan Votes.
963. And the original cost of the viaduct and bridge too? I cannot speak positively, but I think that that is very probable. The last expenditure was taken from what we call a 30 years' loan, which is redeemable.
964. By so much each year? Yes; it is supposed to be so.
965. It is estimated that the proposed railway bridge, inclusive of whatever viaduct may be necessary to cross the flats, would cost about £25,000;—would you care to express an opinion upon that estimate? No, because, no doubt, the railway engineers have worked the matter out in detail.
966. Can you tell us whether a railway bridge should cost a great deal more than a road bridge? It ought not to do so. If you were to take the material used in the viaduct and distribute it so that it would meet railway loads, I think you would probably find that you had sufficient timber to make the viaduct suitable for a railway.
967. Would the same remark apply to the bridge also? No; not quite. It would cost a little bit more to make an iron bridge suitable for railway traffic.
968. I think you told us, when we were considering the advisability of using the Wilcannia bridge for railway purposes, that a saving was made in constructing railway bridges by not decking them;—would that saving be a considerable item in a bridge 300 feet long? The deck of an iron bridge is a small matter in comparison with the total cost of the structure, whereas the deck of a viaduct forms a very important part of the whole structure.
969. I gather, then, that a railway bridge would not cost a great deal more than a road bridge would cost? Not a great deal more.
970. You say that the iron part of the structure would cost more if erected for railway purposes than if erected for road traffic;—would a railway bridge involve longer spans? No; they would probably use more spans. In a timber viaduct you would have twice as many spans for a railway as for road traffic.
971. In your opinion it would not be advisable to use the present road bridge for railway purposes, even if it could be so used at a small cost? Of course, if the bridge could be made suitable for railway traffic at a small cost, I would say that it should be converted; but I do not think that it could be converted, except at a very considerable cost, a cost that in my opinion would not justify the undertaking.
972. *Dr. Garran.*] Any railway bridge will require a viaduct, just as the road bridge does? Yes; because they have to get across the flooded flats.
973. A viaduct of the same length? Yes; of about the same length.
974. Your bridge is above flood-level? Yes.
975. Then the railway engineers will not have to make their bridge any higher than your bridge? No.
976. How near will their bridge be to yours? I have not seen the survey. I do not know where they intend to cross the river.
977. If the two bridges are to be pretty close together, would it not be well to have the same number of piers in each, so that one set may lie exactly in front of the other, and not impede the stream? It would be an advantage; but I do not think it would be a matter of any serious importance, so far as the flats are concerned.
978. I am referring only to the iron part of the structure? If the iron bridges were near together it would be important that the piers should be in alignment, as nearly as possible.
979. If in the railway bridge they had to increase the spans to do that, it would slightly increase the cost of the work? By making the spans a little longer, they might save a pier, and the saving of the pier might compensate for any increase in the cost of the spans. It would be very difficult to give an answer to your question without making detailed calculations.
980. If it did not cost any more, there would be so much more reason for keeping the piers in alignment? If it did not cost any more, it would be a great advantage to keep them in line.
981. You do not know how the piers of the new bridge are planned? No; I have not seen the plans.
982. Should there not be a consultation between the two Departments, if the bridges are going to be placed close to each other? I have no doubt that there will be, if the work is carried out. At the present time we are building a bridge at Camden, which will be used by the railway authorities, and, of course, they consult us in regard to it.
983. It is a matter of some little importance that the stream should not be obstructed;—the river brings down a good deal of timber occasionally? Yes; a large quantity of timber comes down the Murrumbidgee.
984. Then, the clearer the way the better? Yes.
985. There is no possibility of avoiding the expense of a new railway bridge? The railway authorities must build a new structure, though I do not know whether they could find a crossing where they could build a more economical bridge.
986. There are several lattice-girder bridges on our railway lines? Yes.
987. Do you know what their spans are? There is a great variety of span in the bridges of the Colony.
988. And with lattice-girder bridges the part between each span is really, I suppose, a separate bridge? There is a class of bridge, called continuous, where that is not so.
989. In such bridges the strain is thrown a little backward and a little forward? The strain is continuous, and the bridge balances on the piers.
990. But, generally, lattice-girder bridges are separate structures between each span? Yes.
991. Each portion of the bridge carries its own load independently? Yes. The old Gundagai bridge is neither independent nor continuous. I do not know which style they meant to make it.
992. Is there anything to show whether it is wearing at any definable rate? No. I had the bridge cleaned and painted recently, and there is no apparent deterioration of the iron. I do not consider that the traffic over it is sufficiently frequent and heavy to cause any molecular alteration in the iron.

E. M.
De Burgh,
M.I.C.E.
23 Nov., 1899.

993. There is no vibration? The loads are not sufficiently sudden to cause any alteration in the iron itself.

994. Then the existing traffic does not sufficiently test it? No; but in the event of a heavy traction engine using it, it would stress it more than we are in the habit of allowing.

995. Has any traction engine been over it? Not that I am aware of.

996. Has any machinery from the Adelong mines gone over it? A 10-ton boiler went over it recently.

997. Were any observations made as to the deflection on that occasion? No, but 10 tons is well within the load.

998. *Mr. Dick.*] Do you know if floods are of frequent occurrence on that part of the Murrumbidgee? Speaking from memory only, I think there have been no serious floods there of late years. There was a very big flood in the Murrumbidgee in 1886 or 1887, but since then I have no record of any flood of sufficient importance to cause us to make inquiries as to how the bridges were standing.

999. That being so, do you think it would be of any advantage, from the point of view of economy, to construct a low-level bridge, and to cut out the viaduct? Well, instead of rebuilding the viaduct, I should have liked to take the road across the flat, and to climb up on to the iron bridge with an inclined approach. As I have already said, the bulk of the traffic does not use the viaduct now. The railway people, however, do not like to have their traffic interrupted.

1000. Do you know how long the water is up in time of flood? I should say that it would not lie on the flat for more than about four days at the outside.

1001. Would the construction of a low-level bridge, without a viaduct, be considerably cheaper than the proposed construction? Yes, very much.

1002. Would there be any difficulty in making the bridge low because of a rise on the other side of the river? They would have a difficulty in getting up on the Tumut side, because it is pretty steep there.

1003. Would that involve very much cutting? I have not seen the railway section; but I know that on our road it would not involve any serious work, as we use a much steeper grade. If they were working on a ruling grade of 1 in 70, or something like that, they might have to make a long cutting.

1004. Do you think the construction of a low-level bridge is worth considering, or is it out of consideration because of the rise on the Tumut side of the river? I could not say, because I have not seen the railway section. The Camden bridge, in flood-time, is submerged many feet, and the river which it spans rises much more frequently than the Murrumbidgee rises. We are building a new bridge at Camden now, but we are not thinking of putting it above flood-level, because that would involve the construction of an enormous viaduct. The traffic on the Camden line is probably stopped six or seven times in the year; but I do not think it would be stopped on the Gundagai line more than once a year.

1005. *Mr. Levien.*] At Singleton they have a traffic and railway bridge combined? Yes; but the railway runs on one part of the bridge and the road on another. The railway and the road traffic are not together.

1006. But it is all one bridge, built of stone? It is a timber bridge, upon stone piers.

1007. Has not each roadway the same strength? Yes, in that case; but more for appearance than for anything else.

1008. What is the difference in width? The railway portion is about 13 feet wide, and the road portion about 18 feet wide.

1009. Could the road portion carry the railway? Yes, with a certain amount of alteration.

1010. And the railway portion could carry the road traffic? Yes, with alterations.

1011. So that one portion is as strong as the other;—how many years has that bridge been standing? I do not know, but I should think about twenty years.

1012. I think it was the first bridge of any importance built in the Colony? Well, the original arches are there still. I repaired some of them lately.

1013. There is an enormous traffic over the Singleton bridge? Yes, a very heavy traffic.

1014. The bridge is crossed by the main north road, and is within three-quarters of a mile of the town of Singleton? Yes.

1015. No complaint has been made about the combination arrangement? Yes; there have been a great many complaints.

1016. Is it complained that the trains cause horses to shy? Yes.

1017. Can you tell me how many accidents there have been there? I cannot tell you how many accidents there have been, but I know that complaints are numerous.

1018. Have you ever heard of as many as two accidents occurring there during the last twenty-five years? I have no recollection of any.

1019. Has the Government ever had to pay one farthing compensation for accidents which have occurred there? I do not know.

1020. Is there any one in charge of the bridge? There used to be a signalman there; but he was not there the last time I had the bridge under my notice.

1021. I suppose he has been done away with because he was not necessary? I do not know.

1022. Have you ever been there when trains were crossing? Yes, often.

1023. Have you ever seen any accidents there? I would not like to be on the bridge with a flash horse when a train was passing.

1024. How many trains cross the bridge in a day—twenty? Yes, certainly.

1025. And yet you have never heard of an accident? No.

1026. *Chairman.*] If it were necessary to construct a new road bridge over the Murrumbidgee, the question of making a combined road and railway bridge might be one for serious consideration? Yes.

1027. But as we already have a road bridge there, and inasmuch as a new railway bridge would only cost £25,000, it would appear to be better to keep the traffic apart? Yes.

1028. To alter the present bridge so as to make it capable of carrying both road and railway traffic would entail a very large expenditure? Yes.

1029. So that in your opinion it would be better to have two separate bridges? Yes.

1030. Did you ever consider the question of constructing a low-level bridge at Gundagai? No; though, as I have said, I considered the question of doing away with the viaduct.

1031. If it were necessary to make a saving, would a low-level bridge answer? There is no objection to a low-level bridge, except that it occasionally causes an interruption of the traffic. 1032.

1032. Is there much traffic at Gundagai? You will have to get that information from some other source. From an engineer's point of view, there is no difficulty in constructing a low-level bridge.

1033. The question was seriously put forward by Mr. Burge, whether low-level bridges, such as they have used with considerable success in Queensland, should not be adopted in this case? I see no reason against it, if they can get a sufficiently good grade on the Tumut side.

1034. With a low-level bridge you save a great deal of construction? Yes; you only require to make about 300 feet of bridge, instead of about 3,000 feet. I should not like any misapprehension to remain in the minds of the Committee in regard to the road bridges of the Colony. People may say, "It is a very curious thing that when we ask, 'Will these bridges carry a railway?' we are told that they are not strong enough." There are about 52 miles of road bridges in this country, and they are thoroughly strong and in every way proper structures for the loads which they have to carry. They are in no way inferior bridges. But if we designed them to carry railways where there were no railways, we should be guilty of a great waste of public money. The bridges are perfectly good for any road traffic you can bring on them—people, stock, or even traction engines; but they are not designed to carry locomotive engines and trains.

1035. What is the utmost carrying power of the Gundagai bridge? It is designed to carry as dense a crowd of people as can be crowded on to it from end to end—that is 84 lb. to every square foot of deck; and it will carry a traction engine weighing 16 tons. It would take five times as much as either of these loads to break down the viaduct, or four times either of these loads to break down any portion of the main bridge, 5 and 4 being the factors of safety in each case.

1036. *Mr. Levien.*] What was the Singleton bridge built for? The Singleton bridge was built especially to carry a railway, and in making one part of it strong, they had to make the other part strong, or otherwise the whole structure would have looked ugly.

1037. Why should not other bridges be constructed in the same way, in anticipation of future requirements? It would cost immensely more to build all our road bridges in that way. The Singleton bridge was built for railway traffic rather than for road traffic. They would not have thought of building the bridge had it not been for the railway.

1038. *Mr. Shepherd.*] When you construct a bridge for a railway, it is stronger than a bridge designed for ordinary traffic? Yes.

1039. And a bridge designed for ordinary traffic would not be suitable for a railway? No.

George Charles Yeo, draftsman, Stock Branch, Department of Mines and Agriculture, sworn, and examined:—

1040. *Mr. Levien.*] Do you know the country which would be traversed by a line from Gundagai to Tumut? Not personally.

1041. You appear here to give us information in regard to the stock of the district? Yes: I have here a description of the area likely to be affected by the construction of the proposed railway and a return of the stock in the area described. The area of the district to which my returns refer comprises about 492,000 acres. The boundary of the district commences at a point on the proposed railway about 10 miles from Gundagai, and goes thence by a line south-easterly; on the east the district is bounded by the range dividing the waters of the Tumut and the Baloo arm, or the Peak River; on the south by the range dividing the waters of the Tumbarumba and Bago Creeks; and on the west by the range dividing the waters of the Yaven Yaven and Tarcutta Creeks; thence the boundary continues north-westerly to the point of commencement. The following is the return of the stock in that district:—

Year.	Horses.	Cattle.	Sheep.
1896	684	6,724	123,600
1897	678	6,560	121,300
1898	700	7,055	128,330

Stock Traffic.

Year.	To and from—	Horses.	Cattle	Sheep.
1896	Gundagai and Tumbarumba and Yarrangobilly	580	1,200	220,000
1897	" " " "	620	1,515	385,000
1898	" " " "	760	4,300	582,000

Average clip—280 to 300 tons.

1042. How many sheep-owners are there in the district? I suppose there are about 200 people owning the 128,000 sheep mentioned in the return.

1043. Is 128,000 the largest number of sheep that have been in the district? Yes, for the three years I mention.

1044. Who are the largest owners in the district? Petersen and Sargood, J. F. McEvoy, and Dalgety & Co. The others are small holders.

1045. Are there any large breeders of cattle in that district? At Tuma, a little further south, they breed a good number of cattle, and those cattle are taken to Victoria or to Sydney, according to the state of the market.

1046. Is the district a healthy stock district;—do the sheep suffer much from foot-rot, fluke, and other ailments, or the cattle from Cumberland disease and tuberculosis? I have heard nothing of anthrax in the district, though tuberculosis is present more or less everywhere throughout the Colony. We have no complaints, however, about the unhealthiness of the district.

1047. How many travelling stock reserves are there between Gundagai and Tumut? I do not know that there are any.

1048. Then, how is the stock travelled? It travels mostly through the lanes. As a rule, the stock travel up the Adelong Creek, a little to the west of Tumut, and then branch off.

- G. C. Yeo. 1049. Are there any travelling stock reserves along that route? There is a travelling stock route from Tumut down towards Yarrangobilly. It varies from 20 chains to half a mile wide, and extends for a distance of, I suppose, about 60 miles.
- 23 Nov., 1899. 1050. Are there any commons intervening? No.
1051. Any annual leases, or any holdings of that kind? I could not say.
1052. *Chairman.*] The Tumut district is one to which starving stock are sent in great numbers in bad seasons? Yes.
1053. It is looked upon as one of the most reliable sheep districts in the Colony? Yes; the Riverina sheep are sent there.
1054. The district to which starving sheep are sent extends as far as Tumbarumba? Yes.
1055. Is the whole district a pastoral rather than an agricultural district? It is a pastoral district in summer-time, but in the winter-time, down towards Yarrangobilly and Kiandra, the country is empty, as it is too cold for stock.
1056. But are not the agricultural portions of the district limited in extent? Certainly.
1057. *Mr. Shepherd.*] Is the hilly country good grazing land? I cannot say, because I have not been in the locality.
1058. They do not appear to have suffered from drought in the Tumut district as much as in other districts? No. The returns for the Gundagai sheep district will show you how the district generally has been affected during the last few years. The following table shows the number of sheep and cattle in the Gundagai sheep district during the years 1894 to 1898:—

Year.	Sheep.	Cattle.
1894	1,054,595	54,310
1895	968,640	45,503
1896	927,769	43,926
1897	907,590	41,159
1898	1,136,900	51,862

- Those figures show that 1897 was a bad year in the district, and it was a bad year pretty well everywhere.
1059. Was not 1898 a worse year? No. In 1898, in that particular district, things improved a great deal, because of an early rainfall.
1060. Do you know if they have to feed their stock there artificially at times? I cannot say.
1061. I suppose there is generally sufficient pasturage for the stock there? I think so.
1062. *Dr. Garran.*] Do your figures show the number of starving stock sent to the district? No, but they give an idea as to the number.
1063. Do you know where the stock came from? No.
1064. But mostly from the Murrumbidgee country? I think so. In 1896 there were 220,000 sheep travelling to and from Gundagai, Tumbarumba, and Yarrangobilly; in 1897, 385,000; and in 1898, 582,000.
1065. Have there ever been that number travelling before? I have not made a comparison with other years.
1066. Have you the figures for 1899? No. That return will not come in until the 31st December.
1067. If another 500,000 sheep were sent to the district, could they be taken in there? I cannot say. I do not think the district could have carried any more stock last year. I think pretty well all the Riverina stock were sent there then.
1068. In what other parts of the country could starving stock be taken? A lot of stock went up on to the Hunter, towards New England, last year.
1069. Could more stock have been taken there? I do not think so. From conversation which I had with people who sent sheep there, I learnt that they had to keep moving their stock about, because the grass was failing, and that in some cases they had to take them home again and feed them artificially.
1070. Do you think that we had as many starving stock on the high lands of the Colony last year as could be taken there? Yes.
1071. So that a dozen railways from the Darling would not have improved the position? No; because I do not think any more could have been taken.
1072. *Mr. Watson.*] Does it not sometimes happen that there are droughty conditions in Riverina, south of Wagga, and quite other conditions north of Wagga, and *vice versa*? Yes.
1073. So that although Riverina last year took up all the mountain area available for starving stock, it might happen next year that only part of Riverina would want to send stock away? Yes; I daresay that might happen.
1074. So that the fact that the whole of the country available was taken up last year is not necessarily a reason against the construction of railways into dry districts? Of course last year the drought extended all over the western district, whereas sometimes there is a good season in the north, although there is a drought in the south.

William John Hanna, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined.

- W. J. Hanna. 1075. *Chairman.*] You produce a tracing showing the roads branching out in a southerly direction from Gundagai? Yes.
- 23 Nov., 1899. 1076. Can you tell us the length of the various roads, and what they cost to maintain? Not from memory; but I will prepare a statement giving that information.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined.

- J. Clarke. 1077. *Chairman.*] Will you furnish the Committee with the usual statistical information at your disposal in regard to the railway proposal which they are now investigating? The letter received from the Committee asks for full particulars of the mail contracts on and about the lines between Gundagai

Gundagai and Tumut. I have prepared a list of the mail contracts on the road from Gundagai to Tumut by three different routes, and by the lines branching out in all directions on both sides. The particulars are as follows—

J. Clarke.
23 Nov., 1890.

PARTICULARS of Mail Services between Gundagai and Tumut, and the branch lines therefrom.

Contractors'		Postal Lines.	Dis- tance in Miles.	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount pay- able to Contractors.	Date of Termination of Contracts.
Names.	Addresses.						
243 Wm. R. Elliott	Gundagai	Railway Station and Post Office, Gundagai.	4	No. of times per week. Once or oftener daily.	Spring-cart, 1 horse.	£ 33 0 0	31 Dec., 1901.
245 Andrew Paterson	Adelong	Gundagai, South Gundagai, Adelong Crossing-place, Grahamstown, Shepard's Town, Adelong, Gilmore, and Tumut.	36	Six	Coach, 3 or more horses.	184 0 0	31 Dec. 1901.
250 Cornelius McInerney.	Tarcutta	Adelong Crossing-place, Mundarlo, Hillas Creek, Lower Tarcutta, and Tarcutta.	27	Three	Sulky	74 10 0	31 Dec., 1900.
251 Michael J. Phelan	Batlow	Adelong, Middle Adelong, Balloo, Laurel Hill, Courabyra, and Tumberumba, via Hastedt's, Parrot Hill, and McBowling's, of Upper Tumberumba; with a branch mail to and from Tumberumba, Taradale, Upper Bago, and Batlow, via Bago, and Bago Station.	46	Two ...	Coach, 2 or more horses.	181 15 0	31 Dec., 1899.
			32	One ...			
252 John Hilton, jun.	Tarcutta	Adelong, Mount Adral, and Hillas Creek.	21	One	2-wheeled vehicle.	36 15 0	31 Dec., 1899.
253 George W. Lawson.	Sharp's Creek, Adelong.	Adelong and Sharp's Creek, via John Roche's and Green Hill station.	10	Two	Horseback	25 0 0	31 Dec., 1899.
254 Robert G. Reily	Wondalga near Adelong.	Gilmore, Upper Gilmore, and Batlow, via Windowie Public School, and along the eastern side of Gilmore Creek to Fern Gully Crossing.	18	Two	Horseback	29 17 6	31 Dec., 1899.
255 Michael J. Phelan	Batlow	Batlow and Quartzville, via Hides' Saw-mills.	16	One	Horseback	19 18 0	31 Dec., 1899.
246 George Danvers, jun.	Tumut	Gundagai, Gocup, and Tumut, via the marked-tree line; and	20	Three	Coach, 2 or more horses.	159 10 0	31 Dec., 1901.
		Gundagai, Tarrabandra, Brungle, and Tumut.	24	Three			
249 Alexander McKenzie.	Brungle	Brungle and Rosemount ...	8	Three	Horseback	27 0 0	31 Dec., 1899.
Receiving Office Keeper.	Wagragobilly ...	Brungle Bridge (on the Gundagai—Tumut Mail Line) and Wagragobilly.	2	Six	10 0 0
256 Edward Lynch.	Argalong	Tumut and Argalong	15	One	20 0 0	31 Dec., 1899.
257 Henry G. W. Wilkinson.	Yellowin	Tumut, West Blowering, and Yellowin.	19	Two	Horseback	39 0 0	31 Dec., 1901.
258 Mrs. Ellen O'Shea.	Tumut	Tumut and Blowering; and Blowering, Talbingo, Yarrangobilly, Yarrangobilly Caves, and Kiandra.	12	Two ...	1 or 2 horse conveyance; when snow is heavy, on snow shoes or horseback.	90 0 0	31 Dec., 1899.
			54	One ...			
A. G. Bennett...	Spring Flat, Tumut.	Blowering, Talbingo, and Yarrangobilly; and to extend service to Yarrangobilly Caves from 1 November to 30 April (7 miles extra).	31	One	30 0 0	31 Dec., 1899.
Total cost per annum						£ 963 5 6	

In all cases where the contracts end this year provision has been made for the continuance of the service next year.

1078. Many of these contracts would still have to be carried out if the proposed railway were made? The service between Adelong and similar places would require alterations, but it is probable that it would cost as much as, or more than, we now pay, because the passenger traffic obtained by the coaches reduces the amount that we have to pay. On the other side, towards Brungle and Gocup, we should probably make the service only bi-weekly, but at the present time we run the mails to and from Tumut by what is known as the marked-tree line, because it is shorter than the other road.

J. Clarke. 1079. Mr. Harper estimates the revenue from mails, &c., at £372—£12 a mile for 31 miles? Yes; that is the usual allowance. I have also here a statement showing the number of letters posted at the post offices, and the revenue derived from the post and receiving offices on the mail lines between Gundagai and Tumut, and the branch services therefrom, in the year 1898:—

Name of Office.	Number of Letters posted.	Revenue.			
		Postal.	Telegraphic.	Money Order and Postal Notes.	Total.
Gundagai	199,620	£ 1,437	£ 551	£ 108	£ 2,096
South Gundagai	6,980	37	37
Adelong Crossing-place	7,360	60	8	68
Grahamstown	5,420	11	11
Shepard's Town	13,870	88	3	91
Adelong	90,520	806	341	76	1,223
Gilmore	3,590	22	22
Tumut	129,860	1,126	410	72	1,608
Mundarlo	5	5
Hillas Creek	5	5
Lower Tarcutta	2,420	19	19
Tarcutta	12,770	120	33	9	162
Middle Adelong	5	5
Batlow	10,210	136	27	7	170
Laurel Hill	5	5
Courabyra	1,580	29	29
Tumbarumba	45,540	526	156	57	739
Upper Bago	5	5
Taradale	5	5
Quartzville	5	5
Mount Adrah	560	5	5
Sharp's Creek	5	5
Upper Gilmore	5	5
Brungle	3,260	32	32
Gocup	2,080	30	30

Tumut and Yellowin	4 "
Tumut and Kiandra	9 "
Blowering and Yarrangobilly Caves	3 "

1080. *Mr. Shepherd.*] Has there been any increase in the revenue obtained from the district? I have not made any comparison in past years. The time at my disposal was not sufficient to enable me to do more than I have done, but I will forward the information asked for. [*Vide Appendix.*]

WEDNESDAY, 29 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Travers Jones, sworn, and further examined:—

T. Jones. 1081. *Chairman.*] I understand that you wish to add to the evidence which you have already laid before the Committee? Since I was last examined, I have written the following letter to you, sir, as Chairman of the Committee, and I should like it to be embodied in my evidence:

On being examined by your Committee *re* Tumut railway extension, it was my intention to suggest a route for consideration that would give railway communication to the greatest number of the inhabitants in the Tumut electorate and

and be more in the public interest than any of the proposed lines now under consideration; but seeing that my statement occupied about an hour, and fearing that if I prolonged it by going into this matter I might trespass too much on the time of the Committee, I decided that I would write you fully on the subject instead; and should the Committee take a favourable view of the information given in this letter, I can be further examined, and it can be put in as evidence, if necessary; and I now take the liberty of placing my views before you for consideration, viz.:—Since I advocated the extension of the railway from Adelong to Tumbarumba, via Bago, Humula and Tarcutta have been taken from the Wagga Wagga electorate and added to the Tumut electorate, and are known as the Humula Division, which I had the honor of representing in Parliament for six years. Having travelled to these via Tumbarumba and Tarcutta, and been through the length and breadth of the district and surrounding country on several occasions, I am in a position to state that it contains an extensive tract of land most suitable for agriculture and stock-farming. The district is blessed with a permanent supply of surface water, a copious rainfall, and most fertile soil, suitable for producing any crops or fruit that can be grown in a similar humid climate; and, seeing that this portion of the Tumut electorate is again agitating for railway communication, I consider that an extension from Wagga Wagga Railway station to Tumbarumba via Alfredtown, Lower and Upper Tarcutta, Humula, and Rosewood, would serve their purpose best; and in that case to connect it by rail with the rest of the electorate it would be advisable to adopt the staked line from Gundagai up the Adelong Creek to where it turns off to Tumut up to Moon's old water-mill on the creek above Adelong Crossing, and from that point extend the line into or near Adelong, up the creek, with the object in view of connecting this line of railway at Tarcutta with the extension coming from Wagga Wagga to Tumbarumba, which would not be over 25 miles in length, and would go through good agricultural and grass lands all the way. I do not think there would be any engineering difficulty in the way of extending the line from Adelong in that direction. The Nackie Nackie and Yaven Yaven Creeks would have to be bridged, and as they are much required for general traffic, being the main road to Wagga Wagga, they could be constructed (as I have already suggested) to carry both railway and other traffic. The Tarcutta gap on the range may require tunnelling, but, being slate formation, it would not be expensive; and on the whole, I consider that on a flying survey being made (which I strongly recommend) it will be found to be the most suitable for all parties interested. As the Railway Construction Branch is opposed to the proposed line branching off at Coolac, the Brungle end of the electorate will have to continue sending their produce to Gundagai, as the surveyed line would not benefit them. The extension to Adelong Crossing would bring Mundarlo and the rich river flats in that direction 10 miles nearer to railway. By extending it to Adelong, Tumut would be within 12 miles of it by a good road; and the Batlow and Bago inhabitants would be better served by a railway station at Adelong than by having to go a greater distance to Tumut, which terminus, I understand, they are supporting. The extension to Tarcutta would give the Mount Adrah and Hillas Creek (Tumut) electors an opportunity of getting their produce to market. A good extent of rich soil exists in this district, which produced valuable crops of tobacco leaf, when there was sale for it, a few years back. The extension from Wagga to Tumbarumba would serve Tarcutta, Oberne, Humula, Carabost, and Courahyra (Tumut) electors; and would also bring Book Book and Kyamba, in the adjoining electorate, nearer to the railway at Alfred Town.

The above facts must clearly show that railway extension into the Tumut electorate will have to be constructed in the best interests of the majority of the electors as a whole, and not in the interest of any one portion; and, to do justice to the whole electorate, I consider it necessary that the Committee's inquiry should extend into the Humula Division before arriving at a decision on the Gundagai extension, which cannot be allowed to terminate at Tumut or Adelong, in the general interest of the country at large.

In conclusion, sir, I may state that, in recommending this route, I have no personal interest to serve, having no stake in the electorate, and having made up my mind not to again enter Parliament as a representative of any electorate; and my only object in writing is to assist your Committee, if possible, in their deliberations in recommending the extension of the railway in the most suitable way to enable the majority of the electors of Tumut to get their produce to the best market, and to advance the progress and prosperity of the Colony.

I might point out that there will always be a market in Riverina for the produce of Tumut and the surrounding districts. Last year Adelaide buyers visited Albury and Tocumwal, and bought all the produce they could get there, conveying it down the river to Adelaide, where the crops are not so certain as they are in the Tumut district. I made a slight mistake in my evidence the other day which I should like to correct. I was asked the extent of the fertile land on the Tumut River, and I think I said that there were about 30 miles of such land. I have since ascertained, however, that the fertile land extends for a distance of 36 miles, from a place called Yarrawin right down to the Murrumbidgee, with an average width of 1 mile. The area of that land has been computed at 23,000 acres. Besides that land, there is good forest land at Gilmore, Mindary, and other places, of which it is computed there are about 170,000 acres fit for agriculture. Besides that land, again, there is grass land. The crop at Tumut in 1897 was the largest ever known in the district. In that year, from 20 to 40 bushels of wheat were obtained per acre, and from 20 to 60 bushels of oats, while the hay crop was 4 tons to the acre. It was computed that the wheat crop reached 100,000 bushels, and the maize crop 300,000 bushels. At the present time, the Tumut farmers have to pay 3d. per bushel to get their grain to Gundagai, and 15s. a ton for chaff, whereas the charge for carrying grain from Gundagai to Sydney by rail is only 4d. per bushel, and for carrying chaff only 9s. 6d. a ton. It would be a great advantage to the farmers of the district if the Commissioners would do at Gundagai what has been done at several railway stations in Victoria, and put up large sheds in which the farmers could store their produce. At the present time, when a rise in grain takes place, the farmers have to get their grain to the railway station from their farms, and it is probably a week before they can deliver it, and by that time the market has gone down again. If, however, they could store their grain at Gundagai, they would be able to rush it down to Sydney to meet a rising market. The erection of storage sheds at different railway stations would be of great advantage to the farmers in many districts.

1082. It seems to me that you have suggested to the Committee what is practically a net-work of railways? The line I advocated all through is a line from Adelong to Tumbarumba. That line would commence at Coolac, and would serve the greater part of the Tumut electorate. I was under the impression that the proposed line from Wagga to Tumbarumba went nearer to Tarcutta.

1083. For the carrying out of your project, the line from Wagga to Tumbarumba would have to be kept more to the east, so as to go near Tarcutta? Yes. Then it could be easily connected with Adelong. A line could not be taken from Adelong to Humula, because of the character of the intervening country.

1084. Do you think that Tumut might be avoided with advantage in extending the line from Gundagai? I should not like to see Tumut avoided, if the line could be extended from Coolac.

1085. But if the proposed western route is adopted, you think that it will be a mistake to take the line into Tumut? Yes, because if you take it into Tumut you will not be able to get it any further.

1086. If the line were taken from Gundagai to Adelong, and on to Tumbarumba, would the Tumut people be able to send their produce to Adelong without much difficulty? They would have only 12 miles of road to travel, and the road is a good one.

1087. Is it a level road? It is a level road until you get to The Gap. About 10 miles of it is pretty level.

1088. We have been told that the best patch of agricultural land in the district is north-east of Tumut? The land around Tumut is much richer than the land on the Adelong Creek. There is rich land for a distance of 15 or 16 miles up the river from Tumut.

1089.

T. Jones.
29 Nov., 1899.

T. Jones. 1089. If the line avoided Tumut, and went no nearer than Adelong, would not the farmers at Tumut, and to the east and north-east, prefer to go to Gundagai by road rather than to Adelong? No, because in going to Gundagai they would have to travel over 22 miles of bad road.

29 Nov., 1899.

1090. Farmers living 5 or 6 miles to the east of Tumut would only have to go about 15 miles to get to Gundagai, so that would be as near Gundagai as Adelong? Yes; but, on the other hand, people further up the river would have to travel more than 22 miles to get to Gundagai. There is very little farming on the lower part of the Tumut River. Most of the farming is above Tumut.

1091. How do the people of Tumut get their produce to market now? They follow the marked tree line; but on several occasions I have known teams in wet winters, when that road has been in bad condition, to go round by way of Adelong, a distance of 32 miles. For years I obtained a special vote of £1,000, in addition to the ordinary vote of £1,000 or £1,200, for the marked tree line; but that road is not a good one even now. The Brungle road has had very little money spent upon it. Of course, when a carrier has his waggon loaded, a few miles do not make much difference to him, so that probably there would not be much difference between the rates to Gundagai and to Adelong. I still hold the opinion that a line from Coolac to Tumut, extended thence to Adelong and Tumberumba, would best serve the whole electorate.

1092. Are we to understand that you are not quite so strong upon the Tarcutta route as you were? I see now that the Wagga extension would be further away than I thought it.

1093. Then you modify the opinion you have already expressed? Yes. I was under the belief that the Wagga to Tumberumba line would touch Lower Tarcutta, and that Tarcutta and Adelong should be connected. Upper Tarcutta is about 27 miles from Adelong, and about 8 miles from the surveyed line from Wagga to Tumberumba.

John James Miller, manager, Farmers and Settlers' Co-operative Association, sworn, and examined:—

J. J. Miller.

29 Nov., 1899.

1094. *Chairman.*] Your association has an office in Sydney? Yes.

1095. *Dr. Garran.*] Is there any special evidence which you wish to bring before the Committee? I was living at Cootamundra for twenty-five years, and my business has frequently taken me into the district which would be served by the proposed line, so that I know it very well. I wish to give evidence in support of the extension of the line to Tumut, and even beyond Tumut.

1096. What is the real market for the Tumut produce;—where is that produce consumed? Most of the maize comes to Sydney. The Tumut maize is the best on the market, and brings the best prices.

1097. And it is consumed in Sydney? Yes. During the last few years a good deal of maize has gone to Wyalong from the Tumut district.

1098. Is it used for horse feed? Yes.

1099. The Tumut maize can stand the long rail carriage, and yet compete with the coast maize? Yes, it tops the market; it grows prolifically, and is of good quality, and it is free from weevil.

1100. Its quality is due to the climate and the soil combined? Yes.

1101. The last witness intimated that the real market of the district was to the west? Yes, in dry seasons.

1102. Do they grow much lucerne or other hay in the district? No. The cost of carriage is too great to make the growing of hay profitable.

1103. Do they grow oats? It is good country for oats, and Tumut oats have taken the prize at the Sydney Show; but they have never gone in very extensively for oats.

1104. If there is a market to the west, would it not be better to extend the railway from Wagga Wagga to Tumut rather than from Gundagai? In my opinion the railway should be extended from Gundagai. Junee is about the centre of the Riverina district, so far as a western market is concerned, and a connection with the Southern line at Cootamundra would, therefore, be as convenient as a connection at Wagga. About 2,000 tons of produce were sent from the Gundagai district to feed starving stock last year.

1105. Even if the Cootamundra-Gundagai line were not in existence, you would recommend the extension of a railway from Cootamundra to Tumut rather than from Wagga to Tumut? Undoubtedly.

1106. Do the large landholders in the district use their land simply for grazing purposes? Principally.

1107. They do not cultivate? Very little. Some of the large landholders have allowed Chinamen to grow tobacco and maize on their land; but most of them go in for fattening stock.

1108. Which pays the better, pasturing or tillage? A combination of the two pursuits is the safest. In some seasons, when grain is low, it is better to go in for fattening stock. During the last two seasons beef has been a good price, so that it has paid to fatten, while, on the other hand, wheat has been low, and maize has not been high. In some seasons it pays to fatten, while, in others, it pays to grow crops. In wet seasons the land is too rich for wheat.

1109. Then you have to cut it for hay? Yes; otherwise it would be no good at all.

1110. And there is no market for hay? No, because of the heavy road carriage; but the district would be able to compete with other districts if it had railway communication.

1111. Then, the best thing to grow is maize, which will bear the cost of carriage, and fat stock, which will take themselves to market? Yes.

1112. Do you fatten sheep in the district? Yes. It is good country for sheep, and especially for crossbreds.

1113. It is not too wet for sheep? No; I think it is fairly sound country for sheep. In the wet season they may be a little liable to foot-rot; but, taking it all through, the district is good sheep country.

1114. During the last bad season was there plenty of grass in the district? The Tumut district was relied upon to save the Riverina sheep.

1115. Where did the sheep come from? By rail, from places west of Cootamundra.

1116. From as far as Deniliquin? From Howlong, Hay, and from as far as Barmadman.

1117. Were there as many sheep in the district as it could accommodate? In the present unimproved state of the country there could not have been more; but the country is capable of vast improvement.

1118. In what way? The timber could be cleared off. South-east of Tumut there are thousands of acres of hilly country which is suitable for stock, and, if it were improved, it would carry millions of sheep

J. J. Miller.
29 Nov., 1890.

sheep in the summer months. Of course, the sheep would have to be shifted away before the cold weather came on. The district could only be worked in conjunction with country west of Cootamundra, but, worked in that way, it would save thousands and thousands of sheep.

1119. Could it take 50 per cent. more than it took last year? In five years you might, by improving it, increase its capacity 100 per cent. What is needed is to clear away the timber, so that the grass may grow. There is no difficulty about obtaining water.

1120. Is the grass there naturally sweet? It is not sweet until the country has been improved.

1121. You do not have to sow artificial grass? Artificial grasses are the best. Both red and white clover grow well there, and, if artificial grass were laid down on the volcanic land, it would become rich pastoral country. At the present time, however, I do not think much artificial grass has been introduced. I do not know of any place where paddocks have been laid down, though you can see clover growing along the roads.

1122. Do you mean to tell us that, although the country is so capable of improvement, the people who have held it for years have not improved it? The land to which I am referring is nearly all Crown land. I am referring to the country which was occupied by sheep during last summer.

1123. The land on the flats is, I suppose, nearly all freehold? Yes.

1124. But not the land on the surrounding hills? No; that is nearly all Crown land.

1125. Is the soil on those hills volcanic? Yes; and is capable of growing any kind of English fruit—raspberries, gooseberries, and all fruits of that kind grow there.

1126. Is the timber good? Yes; you can get trees 50, 60, and 70 feet high, and as straight as possible.

1127. *Mr. Watson.*] What kind of trees? Gum, messmate, and other mountain timbers.

1128. *Dr. Garran.*] But it is too expensive to get it out? You could not get it away very well by road.

1129. You had as many stock there last year as you could carry, in the present state of the district? Yes. The mountains were nearly full of sheep, and the sheep went away very well.

1130. They all went back in the winter time? Yes. Half of them have returned again this summer.

1131. Were they depastured upon Crown land? Yes, chiefly. Some people, of course, sublet their holdings in different paddocks to persons requiring them.

1132. The lessees found it more profitable to sublet than to use the land themselves? Yes; because they cannot keep sheep there in the winter time. It pays them better to allow others to bring sheep there during the summer months; and people holding runs west of Cootamundra are now securing land in snow leases and in other ways around Kiandra, and as far as Mount Kosciusko, to take their sheep to in summer time.

1133. Did the sheep coming into the district come by rail to Gundagai? Yes; most of them.

1134. If the line were extended to Tumut would they come to Tumut? Yes, and that would save the lives of many weak sheep. It is 22 or 23 miles by road from Gundagai to Tumut, and as a great many sheep had to travel as far again before they reach the pastures, very many died on the road.

1135. You do not favour the construction of a line from Wagga through Tarcutta to Adelong? No. The extension of the line from Gundagai is what is wanted.

1136. Do you think we should take Adelong into consideration? Yes; I think the line should go to Adelong, although that requires a detour. There is not much agricultural land around Adelong; but there is good grazing country there. Then you could take the line into Tumut, and eventually go up the Tumut River in the direction of Yarrangobilly. It is all good agricultural land up the river, though the width of the flats is limited. Tumbarumba is much nearer to Tumut than to Wagga, and by going from Tumut to Tumbarumba you go nearer Yarrangobilly, which will become a great pleasure and health resort, because of its caves.

1137. At the present time Wagga is the outlet for the Tumbarumba traffic? That is the way the mail coaches go.

1138. Is there a coach route from Tumbarumba to Adelong? Yes. It is not a bad mountain road. I have frequently driven over it.

1139. It is not the agricultural part of the district in which the improvement you speak of will take place, so much as the pastoral area—the hilly country? Yes. The river flats are limited in acreage, and are chiefly under maize at the present time, except on some of the large holdings. A good deal of cultivation and dairying will take place in the higher country about Batlow, Reedy Flat, and right on to Yarrangobilly.

1140. The grazing land, you think, will be improved? Yes. The grazing land in the district is more valuable than many people think, because it can be worked in conjunction with the grazing land in the drier parts of the colony, but not without an adequate railway service. After the shearing, the ewes and rams are turned out together into the paddocks, and, of course, when the ewes are heavy in lamb, later on in the season, you cannot take them home too easily. If the railway were extended, they would be able to get home in a very short time.

1141. But the railway would only get the traffic you speak of once each way in the year? Yes; but I think that many people would come into the district with their families. People go there now, and as the accommodation improves, it will become a sanatorium, and persons sending their stock will also send their wives and families.

1142. *Mr. Shepherd.*] What is the extent of the agricultural country at Tumut? The flats are from half a mile to 2 miles wide, and extend from Brungle to 10 miles above Tumut. The flats on the Gilmore Creek are about half a mile wide, and some very rich crops of maize have been obtained there.

1143. What is the rest of the country? Hilly country; but for the most part not barren rocky hills, but hills composed of rich volcanic soil. In some places ferns and timber grow very strongly; but the soil is really good.

1144. Do you think that the district will furnish a sufficient amount of traffic to justify the extension of the railway? Yes; I strongly advocate the extension of the line. I believe that it will ultimately pay, and that it will assist the present line to Gundagai. At the present time Gundagai is one of the most important stations in the colony. I think they sent away more fat stock from there this season than from any other station in the colony, and a good deal of that fat stock came from Tumut.

1145. Has there not been a falling off in the agricultural produce of the district of late years—in the case of tobacco, for instance? They have given up the growing of tobacco very largely; but they still grow wheat and maize. Nearly all the seed used about Cootamundra and that part of Riverina this year came from Tumut.

- J. J. Miller. 1146. Has there not been a falling off in the quantity of maize produced in the district? I do not know. In dry seasons some people have gone in more for wheat. If the land has gone out of maize, it has gone under wheat.
- 29 Nov., 1899. 1147. Which crop pays best? Maize is the standard crop there.
1148. How can you account for the falling off in the maize crop if the maize grown there brings the highest price in the market? Because they have gone in more for wheat in dry seasons. Last year the wheat crop at Tumut was a large one. Those who give up maize-growing go in for wheat.
1149. Is there much rich agricultural land which has not been brought under cultivation? Nearly the whole of the river flats have been brought under cultivation, though some of the land which was at one time cultivated is now used for fattening.
1150. Are the holdings large? No; a great many of them are small. A great many of the farmers there are tenant farmers.
1151. So that there is really not much room for extension? There is not much room for extension on the river flats. The improvement will take place further back, in the hilly country.
1152. Are you well acquainted with Adelong? Yes.
1153. Do you think that it is likely that Adelong will benefit much by the construction of this railway? I think it would be a pity to leave it off the railway line. It is a good mining district, and a good grazing district, and in some parts of it there is good cattle country.
1154. Have you been in the district lately? I have not been at Tumut for a couple of months.
1155. Have you heard the prospects of a railway discussed there? Yes, during the last twenty years.
1156. What do the people think about it? They think that they are entitled to a railway.
1157. And that it would be a great advantage to them? Yes.
1158. You say that there is not much opportunity for extending the agricultural operations of the district? Not on the river flats; but there are hundreds of acres of table-land which have a rich, red, volcanic soil, suitable for agriculture.
1159. And you think that the construction of the railway would lead to a great deal of cultivation? Yes, and to a great deal of dairying. You can grow anything there, and if you put in fodder for your dairy cattle you need have no difficulty in irrigating your cultivation paddocks, because suitable streams are available everywhere.

FRIDAY, 1 DECEMBER, 1899.

[The Committee met at the Court-house, Gundagai, at 11 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LUNDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Morgan Ryan, Mayor of Gundagai, sworn, and examined:—

- M. Ryan. 1160. *Vice-Chairman.*] You have been a resident of this district for a long time? About eighteen years.
- 1 Dec., 1899. 1161. You are pretty well acquainted with the country to be served by the proposed railway? Yes, as far as Tumut.
1162. Can you give the Committee a general idea of the area of land now settled upon, or which could be settled upon, if a railway were constructed from Gundagai to Tumut, by way of what is known as the Adelong valley route? No; but I think that there is scarcely any unalienated land upon that route. Nearly all the land there is occupied.
1163. What would be the general effect upon the district of the construction of the proposed railway? It might slightly increase the production of the district, as might be expected from the additional convenience which a railway would afford.
1164. What particular lines of produce do you think would be most affected? The railway might increase dairying slightly.
1165. And maize-growing? Not between here and Tumut. So far as I know, all the available maize land is in use. The alluvial flats in the district contain some of the richest land in the Colony, and that land has been in use for a long time. I do not consider that the proposed extension of the railway would increase the area of land in use, though land now being used for one purpose might, if a railway were constructed, be used for another. At the present time a good deal of the river land is used only for grazing, and they might convert this land into corn-growing land.
1166. Is it more profitable to use this land for grazing than for agriculture? It should be more profitable to use it for agriculture. It should be more profitable to till the land than to use it in its natural state.
1167. Has the fact that pastoralists of other districts have competed for the leasing of this land during the last few years prevented the holders from using it for agricultural purposes? I do not think so.
1168. Then, why do you think that the construction of a railway would lead to the conversion of the land from pastoral to agricultural use? The river flats in some places are used for pasturage because they are attached to pastoral estates, and form only a small portion of the whole property. If, however, a railway offered facilities for taking produce away, and it were found profitable to do so, the holders of these estates might till the flat land, and graze only upon the hilly country. In our district, where there is flat land in a pastoral property it is not broken up, but all the land on the estate is used for grazing.
1169. It is to be presumed that the holders of land will, under ordinary circumstances, put it to its most profitable use? Yes.
1170. Is it necessary to keep a little flat land for winter pasturage? Very little grass grows upon the flat land during the winter; but it is often necessary to retain that land for grazing purposes in order to secure access to water.
1171. There are three projected routes for an extension to Tumut—one following, to some extent, the Adelong Creek, and the two others going one on each side of the Tumut river. It would seem that the valleys

M. Ryan.
1 Dec., 1899.

valleys of the Tumut and of the Adelong Creek each contain a certain area of good agricultural land; but if the line is taken along one valley it must exclude the other? Yes. Between the valleys to which you refer there is hilly country, very much of which is barren. That country is fit only for grazing.

1172. Then it is not likely that it will give a large amount of traffic to a railway? No.

1173. Taking Tumut as a centre, is there a large area of country to the east, south, and west which is likely to give traffic to a railway? On the west, and on the south, the Tumut River is bounded by the Kiandra Mountains, and that country is used only for summer grazing. They have to bring the stock away early in the autumn to prevent them perishing from cold and want of feed. It is entirely barren country. There is nothing to feed a railway, unless it is what is grown on the flats, along the banks of the Tumut River. These flats are of very limited extent; they are not nearly so large as the flats on the Murrumbidgee, at Gundagai.

1174. Do you think the extension of the railway to Tumut would increase the stock-carrying capacity of the district? Well, when stock reach Gundagai they have a very short distance to travel by road before reaching the highlands.

1175. Has this district been stocked to its utmost capacity during the last two years? I do not know that it has been overstocked; but it has been stocked to about its full capacity. The stock-owners here have found it profitable to sell their own stock, and to lease their paddocks to pastoralists from other districts. Many of the local sheep were sold as fat stock to make room for hungry stock coming here from other districts.

1176. What is the character of the road between Gundagai and Tumut? Going *via* Adelong, there is a first-class road for the first 16 or 17 miles, and people living along that road would be likely to continue to bring their produce into Gundagai, because they are not very large growers. They carry on a combination of sheep-farming and small agriculture, and they would bring their produce by road, even if there were a railway. It is only a few hours' journey for them to come into Gundagai by team, and they could return the same afternoon; so I do not think they would use the railway.

1177. *Mr. Shepherd.*] The estimated cost of the proposed extension is £147,140. From what you know of the character of the district, and the probabilities of its development in agriculture, mining, and pastoral pursuits, do you think that the line would pay a fair amount of interest? I do not think I could offer an opinion upon that subject, because I have not gone into the figures. I am aware that there has been a loss upon the Cootamundra to Gundagai line ever since it was opened, and that, according to the official figures, that loss will be increased by the proposed extension. I think that people living 5 or 6 miles on this side of Tumut, once they have put their produce upon their drays, will not go back to Tumut to a railway station; but that they will come on to Gundagai. Then, too, if you adopt the Adelong Creek route, all the traffic from Brungle and the district about there will still come to Gundagai. Gundagai is the proper outlet for all the country on both sides of the river, as far as Brungle.

1178. Is the road between Gundagai and Tumut fairly good? Yes; I believe that the roads between the two places are in first-class condition.

1179. The distance between Gundagai and Tumut is about 20 miles by road and about 31 miles by railway? Yes, and that is a handicap to the railway. There are three roads from here to Tumut—the road *via* Adelong, the road *via* Brungle, and the marked-tree line.

1180. *Mr. Watson.*] Is the marked-tree line the road ordinarily used by the coaches? Yes.

1181. *Mr. Shepherd.*] I understand that the flats are the only portions of land supposed to be fit for agriculture? For maize-growing.

1182. The ridges are used more for pasturing? Yes; but between some of the hills they cultivate wheat.

1183. What is the soil on the ridges? It is fairly good.

1184. They are not rocky ridges? They are rocky in parts; but the soil is fairly good.

1185. Are the stock carried sheep or cattle? Both are reared in the district.

1186. Is the dairying industry now being largely entered upon? No; there is not sufficient dairy produce made in the district to supply local wants. A great deal of the butter, and nearly all the cheese consumed in the district, are purchased in the Sydney market.

1187. A butter factory has recently been established here? There are a few little creameries, where the produce of small herds of cattle is dealt with. People are taking to dairying slightly of late.

1188. Up to the present time not much attention has been given to butter-making? Not very much.

1189. Do you think that the construction of the proposed railway would induce people to go in for butter-making more largely? No. I am of opinion that the people who now hold the land will never become dairymen, but that it will be necessary to import persons specially trained to the work. The people here do not take to it. They stick to the old methods of cultivating the land, or they graze sheep and cattle.

1190. Do they appear to be an industrious, pushing class of people, as a rule? Yes. They are the general run of colonists.

1191. What are the principal crops grown between Gundagai and Tumut? On the Tumut River the principal crop is maize.

1192. They grow a good deal of wheat too? They perhaps grow as much as they consume; but I do not think they very much exceed that quantity.

1193. The tobacco-growing industry was a rather large one here at one time? The tobacco-growing and the maize-growing are chiefly in the hands of the Chinese. I think you will find from the Railway people that the Chinese are the largest consignors of maize in the district. They cultivate land, which they either rent or purchase, with the assistance of their own countrymen, and supply the southern market, or send the grain to Sydney. There are a few Europeans; but their output is very small as compared with that of the Chinese.

1194. Is there much land suitable for cultivation which has not yet been cultivated? I cannot tell you. I have not been to Tumut for some time, so that I cannot tell you if every available acre is or is not under cultivation.

1195. Are you acquainted with Adelong? I have been through the district.

1196. How does the mining industry seem to be progressing there? It is at present not so good a district as it has been for some time past. It depends almost entirely upon the Gibraltar mine, which is a big concern, worked by English capital, and maintaining a large population. As in all mining districts, if they get gold the population remains; if they fail to get gold, the population leaves. It is not by any means an agricultural district.

- M. Ryan.
1 Dec., 1899.
1197. Have any of the mines there been worked to any considerable depth? Yes; I think they are the deepest in New South Wales. Some of them are over 1,000 feet in depth.
1198. Do you think the construction of the proposed railway would assist the development of these mines? No, I do not think it can. The value of gold is so great in proportion to the cost of carrying it, and the carriage of produce to the district is so low, that I do not think much could be gained by the construction of a railway.
1199. Do you think it is desirable to construct this line? I do not think so, because you have no means of extending it beyond Tumut. There is no country to be served beyond Tumut, because the hills there rise to the Kiandra mountains. There are a few flats and plains along the river bank; but they are very small, and they are already worked to their full extent for the production of maize, or by graziers. I cannot see that there is any justification at all for the construction of the proposed railway. They are within 20 miles of a railway station at the present time, and it seems to me that they are therefore not badly off.
1200. Do you think that a farming district should be satisfied to have a railway station within 20 miles? Well, there are people who use the Gundagai station who are 16 or 17 miles away to the south-west. Some who are a little further away go to Bethungra.
1201. You think that the farmers of Tumut are fairly well served at the present time? I do. They must have teams to cultivate their land, and to harvest their crops. At the end of the harvesting they use their animals to haul their produce to the railway station, and between times they do carrying for their neighbours. These teams have to be maintained all the year round in any case, whether they have to haul their produce into Gundagai, or have only 3 or 4 miles to go to get to a railway station. Last year there was a sudden rise in the price of wheat, and it went up to 4s. a bushel. Mr. McInerney, a large farmer, a few miles from here, could not get teams to deliver his wheat straight away; and several others, situated within 4 or 5 miles of the railway, were also unable to get teams, and, as the rise only lasted for a week or two, they lost their opportunity, and had to sell for 2s. 7d. a bushel. I mention this to show that farmers cannot take advantage of every rise in the market, even though they have a railway within a few miles of their holdings.
1202. *Mr. Watson.*] I think you stated that the ridges in this district were composed of fairly good soil? Yes, where there is soil.
1203. What is that land used for at the present time? For grazing.
1204. For the grazing of cattle and sheep? Yes.
1205. Is there any large proportion of the land used solely for cattle? When you reach Tumut there is not so much sheep country as upon the Murrumbidgee. The sheep over there get fluke, and they have to get rid of them. They run cattle in the forest country.
1206. Mr. Harper estimates that the proposed extension will only get 1,000 bales of wool;—that does not look as though a large number of sheep were being carried in the district? Well, if you increase the wool traffic on this line you will take it away from the Wagga line. By taking the line to Adelong you will be going 10 miles nearer to Tarcutta, Mlerslie, and other places in that district.
1207. If the ridges are as good as you say they are, why is there not a greater yield of wool, seeing that the rainfall of the district is so good;—is it because of the greater number of cattle carried? I could not enlighten you upon that subject.
1208. You told the Vice-Chairman that there might be an increase in the wheat production of the district by a number of holders converting their grazing land to agricultural purposes, and, later on, you said that a number of people might go in for dairying;—which industry do you think people would be most likely to go in for? People may clear more of their land and devote it to wheat-growing.
1209. Do you know sufficient of the land in the valley of the Tumut and the Adelong Creek to be able to express an opinion as to which would be the better route for a railway to take? I cannot see that a railway to Tumut would serve any purpose, except to benefit the producers on the other side of Tumut.
1210. Do you think that the people between here and Tumut are sufficiently well served at the present time? People living within a short distance on this side of Tumut will not go back to Tumut with their produce.
1211. Which do you think is the better route, supposing there is anything to choose between them? I could not tell you. I do not know the country from Coolac to Brungle.

Frederick John Clements, Railway station-master, Gundagai, sworn, and examined:—

- F. J. Clements.
1 Dec., 1899.
1212. *Mr. Shepherd.*] Are you prepared with any statistics as to the business done with Tumut at the Gundagai station? Most of my local returns are in Sydney, and the traffic manager can supply the information you want more accurately than I can; but I can give you a rough estimate. The following statement shows the traffic for the years 1898 and 1899:—

Years.	Special Class.			1st, 2nd, and 3rd Class.			General, in truck-loads.			Total.														
	tons.	c.	q.	£	s.	d.	tons.	c.	q.	£	s.	d.	tons.	c.	q.	£	s.	d.						
1898 ...	3,053	13	2	4,377	11	9	2,769	2	1	11,259	6	4	1,179	16	2	5,535	18	3	7,002	12	1	21,182	16	4
1899 ...	3,000	10	2	3,356	11	5	2,867	12	0	11,611	0	2	1,376	9	2	6,028	2	7	7,250	12	0	20,995	14	2

1213. How long have you been located here? For two years.
1214. So that you cannot speak with certainty as to the increase of the traffic? In compiling my returns for the Commissioners I have obtained a very fair idea of the traffic for previous years. The increase commenced within the last four years. Prior to that the traffic was stationary.
1215. Has the drought had any effect upon the traffic here? Yes, upon the inward stock traffic.
1216. Was there a larger business being done six years ago than there is now? No.
1217. So that the drought has not injured the traffic? No.
1218. Have you conversed with many people living between Gundagai and Tumut as to the probability of the district being benefited by railway construction, to any extent? No; I have no interest in it.
The

F. J.
Clements.
1 Dec., 1899.

The increase to which I have referred is due to the improvement of Gundagai township, not to the increased traffic of Adelong or of Tumut. They may wish to attribute the increase to the whole district, but it has not been due to the whole district. During the last three years the building operations of this town have increased considerably, and most of our traffic increase is due to the amount of building materials brought by railway, the increase of population here, and the operations at the Prince of Wales mine, 3½ miles from here. At the present time the teamsters could compete with the main-line rates on a railway from Gundagai to Tumut. The teamsters are now carrying for 10s. a ton, and the cheapest rate for grain on the railway from Tumut to Gundagai would be 3s. 6d. a ton, and for back loading 19s. 3d. a ton, or 22s. 9d. altogether, as against £1.

1219. So that the teamsters could carry much more cheaply than the railway? Yes; if local rates were imposed, we could not compete at all with the teamsters.

1220. The special rates are rather more than double the through rates? I have not worked that out. Coal for the Gibraltar mine would cost 3s. 2d. a ton; grain, 3s. 6d.; building material, dressed, 6s., and undressed, 5s. 8d. The teamsters at the present time are carting both ways for £1, which would be 5s. 3d. less than the railway rates both ways would come to.

1221. You say that the increased traffic of the railway is due to an increase in building operations at Gundagai? Yes; and to the development of the Prince of Wales mine. I am of opinion that the traffic is likely to increase for the next twelve months, but that after that it will be stationary, or will fall back. That is my report to the Railway Commissioners. During the last eighteen months we have received over 1,000 tons of machinery for the mine, the freight upon which was very heavy, and to it the increase in the railway revenue was very largely due. Since the mine was established there has been a population there of 600 or 700 people, and the supplies and building material they have required have gone to swell the railway traffic. Since I have been here I have known fifteen new shops to be built upon one side of the street, and all the material used in their construction came by railway.

1222. The proposed extension of the railway would not serve the mine you speak of? No.

1223. What is your opinion of the proposed extension? That it would be a dead loss.

1224. *Mr. Watson.*] The total earnings of the Cootamundra to Gundagai line from freight and passengers was set down by the Secretary to the Commissioners as £11,278 for the year 1898;—he takes, I presume, that proportion of the freight which can properly be credited to the Gundagai branch, while you, in stating the Gundagai receipts as £21,182, put down the total revenue received at your office? Yes.

1225. From that amount something has to be deducted to credit the main line? Yes.

1226. To whom is the bulk of the goods consigned here? Most of the goods are consigned through agents; chiefly through Wright, Heaton, & Co.

1227. Do you know the consignees? Mandelson & Co., Pearce and Long, Myles and Park, the Gibraltar Mining Co., and others.

1228. *Mr. Ryan* indicated that the greater part of the traffic was done through Chinese firms? He referred to the despatch of produce, such as maize. Virtually, there are two firms through whom the maize is despatched—Ah Chee and Sanderson and Taylor, of Tumut. I do not know whether the Chinese grow the maize, but they are the chief buyers of it, and of tobacco as well.

1229. It mostly goes through their hands? Yes; through Ah Chee & Co.'s. I think you will find that there are only six regular teamsters on the road between Gundagai, Tumut, and Adelong, except when the rush comes. The wool and grain are carried by the farmers themselves.

1230. But six teamsters manage to cope with the carriage of store goods and the ordinary produce traffic? Yes. If I were a farmer, it would be my policy to get into the books of the storekeeper, so as to make him give me back cartage. I think that 15s. is the highest rate paid to the teamsters at the present time, though some of them are carting for 10s. a ton.

1231. Do they make any distinction between the different classes of goods? Yes. I have been informed by the teamsters that the existing rates would come down considerably if the proposed railway were made.

1232. About how much did you obtain for the carriage of starving stock during the last two years? I do not know. The freight was paid at the stations where the sheep were trucked.

1233. How many truckloads of starving stock came to Gundagai last year? 2,500 truckloads, each containing 100 sheep.

1234. What was the average rate per truck? They got 50 per cent. rebate, and some of the stations paid £4 16s. per truck.

1235. Can you tell us the average distance the sheep were brought, and the average price paid? All you could take would be so many trucks for 34 miles. Possibly, it would not be more than 7s. 6d. a truck. Some people obtained a rebate of 75 per cent. returning, and 50 per cent. coming.

1236. That would be a total revenue of about £1,500? Yes.

1237. Can you expect to retain that revenue year in and year out? No.

1238. For how long have you obtained a fairly large revenue from the carriage of starving stock? This is the first time.

1239. Do you think that that traffic has been entirely due to the exceptional duration of the recent drought? Yes.

1240. Are you likely to have a repetition of the traffic if there are tolerable seasons in Riverina? No. They are having a repetition of the drought in Riverina at the present time; but not one-fourth of the number of stock is coming to Gundagai this year that came last year.

1241. With ordinarily good seasons, do they travel many sheep by road to this district? Not to my knowledge.

George Woodbridge, land-owner, South Gundagai, sworn, and examined:—

1242. *Mr. Watson.*] You are an old resident of the district? Yes. I have lived within 12 miles of the town for a great many years.

1243. And you have had experience in farming and grazing? Yes; I have had a go at everything.

1244. What is your opinion as to the probable result of railway extension from Gundagai to Tumut? In my opinion it would be a great loss to the Government to extend the line to Tumut. If the Gundagai branch will not pay, I cannot see how matters will be improved by extending the line to Tumut.

1245. Do you think that all the traffic that could possibly come to a line from Gundagai to Tumut now comes to the existing line? Yes. All the traffic from the surrounding districts, from as far out as Tumbarumba, comes here. This is the depôt for the whole district.

G.
Woodbridge.
1 Dec., 1899.

- G.
Woodbridge.
1 Dec., 1899.
1246. Do you think there will be any considerable development of the country by the extension of the line to Tumut or beyond Tumut? So far as I can see the line could go no further than Tumut.
1247. But would its influence extend further? It might, to a certain extent; but I do not think it would be of great importance.
1248. Do you think that the land between here and Tumut is now being cultivated to as great an extent as it would be if the proposed railway were constructed? I can hardly say, but I do not think the construction of the proposed railway would make any great difference. If agriculture there would pay with a railway it would pay without it.
1249. That proposition will not apply generally; a point is reached at which a railway ceases to have influence, and where an extension would bring more land into cultivation;—you do not think that that applies in this instance? It is bound to apply to some extent. I know every valley and every hill. Whatever way you take the railway, though it may be a convenience to a great number of people, there will be a number of others whom it will not convenience, and who may as well come to Gundagai as go to any platform on the extension.
1250. The valleys of Tumut and Adelong are separated by country which one can hardly expect people to travel over to get to a railway? Yes. You might go to Tumut from Coolac through Gobarralong and Brungle.
1251. What is the character of that country? There is a good deal of flat country there.
1252. Are the flats of any width? In some parts they are pretty fair. I suppose in some places the flats are pretty well a mile or three-quarters of a mile in width, while in other places they are very narrow. Behind them it is principally hilly country.
1253. Do you think that is the best country for agricultural purposes? I think it is the biggest agricultural area between the existing line and Tumut.
1254. We have been informed that around Tumut there is a large area of good agricultural land? So there is. There is a lot of good land about Tumut.
1255. Is that land under cultivation now? A great part of it is used for grazing purposes.
1256. Is it suitable for agriculture? All the flats are.
1257. So that it is possible that if the railway were extended to Tumut that land would be brought under cultivation? It might be; but I do not say that it would be all brought under cultivation if there were a railway.
1258. How far does the good land extend beyond Tumut? There is a lot of good land extending for miles on the other side of Tumut. There must be 15 or 20 miles of agricultural land running up the river; but it is narrow.
1259. Would you consider that country beyond the influence of the Gundagai line;—do you think it would pay people there to grow maize and wheat, and to bring their produce to Gundagai? They do it now.
1260. But, inasmuch as all of the land is not cultivated, something must be keeping them from developing it properly? Some years stock is of no value, and other years grain is of no value, so that it is hard to know what will pay best. Just at the present time, stock is of great value; but I think that this year there are fewer sheep in the district than I have seen for many years. That accounts for the production of wool not being very large. About here they have sold most of their sheep.
1261. How would you class the land on the ridges and hills between the valleys;—would you say that the soil there is fair or that it is poor? Some of it is poor.
1262. And some of it is fair? Yes.
1263. Is any of it good? There is some good grazing land on the hills. It is good sheep country.
1264. How do you account for the small production of wool in the district? Because a great number of the sheep have been sold and sent away.
1265. And have the holders been allowing their land to lie idle? A great portion of the land is leased to pastoralists from other districts. For the last two years, I have leased my land to two graziers from Riverina. They drove their sheep down to Riverina, and shorn them there.
1266. So that, although a great deal of wool is grown in this district, it is shorn in other districts, and not credited to this district? Yes; the sheep are taken away in thousands, and shorn elsewhere. Mr. McCaughey had 50,000 or 60,000 sheep trucked to these parts last year; but I think we shorn only fifty odd sheep.
1267. The balance were shorn out of the district? Yes. The fifty sheep we shorn were stragglers. They are the only sheep coming into the district in that way which I have known to be shorn in the district.
1268. What do you estimate the average carrying capacity of the ridges to be? Where the land is rung and kept clean, it will carry about two sheep to the acre.
1269. All the year round? Yes. The land will not carry so much when it is in a rough state.
1270. Is it the practice to keep it clean? I am sorry to say that a lot of the land about here is in its rough state; but, if the scrub is kept down, it will run about two sheep to the acre. The river frontage at Gundagai will run seven or eight sheep to the acre. On the racecourse here they have run about nine sheep to the acre.
1271. For how long? For the year.
1272. Are many cattle depastured between here and Tumut? A good many.
1273. For fattening purposes? Yes.
1274. Do they breed the cattle here, or do they bring them in as stores from other districts? During the last year or two they have generally bought them.
1275. Is it a fact that the Gundagai district generally has been supplying most of the surrounding districts with fat stock? Yes. There are a good many on the rivers.
1276. In an ordinary season do many sheep coming to the summer pastures travel along the stock routes? They have often done so; but, during the last two years, it has been so dry that a great many sheep have been brought to Gundagai by train.
1277. But, prior to that, while the seasons were fair? In fair seasons the sheep have often travelled here.
1278. The fact that no store stock were brought here by rail in fair seasons does not prove that none were sent here for agistment? Yes. Sheep come here nearly every summer, unless it is an exceedingly good one.
1279. *Vice-Chairman.*] What is the size of your holding? I have about 800 acres.

1280. Is it mostly river flats? No; it is ridgy country generally.
1281. You have not had an opportunity to use it for agriculture? No; but I have had a go at agriculture in a number of other places.
1282. On the flat land? Yes.
1283. And what has been your experience as to the capabilities of the district in that direction? My opinion is that if I had left the river flats alone I should have been in pocket. I have been growing corn and crops of all sorts during the last seven years, and I know that I should have had money in pocket if I had not done so.
1284. Your seven years' experience embraces the worst drought that the Colony has ever seen? Yes; but I have been farming ever since I was a boy.
1285. *Mr. Watson.*] The drought did not affect the district as much as other districts? No; it has been rather an advantage to this district.
1286. *Vice-Chairman.*] How do you account for the fact that farming does not pay? Some years you will get a good crop of hay and a big price for it, but, after a time, you will find a deficiency somewhere, and you will say, "This is not half the game I thought it was." I have had forty years experience of farming in this district, and I have had not made anything at it, nor have I seen anyone else who has.
1287. Are you trying to discount the statement of those who say that the river-flat land is amongst the best agricultural land in the Colony? It is when you get a year that suits. I have obtained 100 bushels of corn to the acre; but I have also gone through years when I have not got 100 cobs to the acre.
1288. *Mr. Watson.*] Because the season was too dry? Yes.
1289. There is no other cause to account for it? No. I have known a paddock, which my son has, to give 3,000 bushels of corn in a year, and I have known it to give only thirty bags of cobs in the year. That paddock contains about 33 acres. If a man were grazing on this land, he would do very well.
1290. *Vice-Chairman.*] Which of the three routes before the Committee would serve the largest extent of agricultural land? I believe that the most eastern route would serve the best land.
1291. What are your views as to the mineral prospects of the district between Gundagai and Tumut;—can we expect any further development such as has taken place at Adelong? Adelong is, I suppose, one of the most prominent mining districts in the Colony, and I believe they will be mining there when all the rest fail. Beyond that, I do not know of a great deal of mining going on there.
1292. We were informed by one witness that many of the gullies and small valleys to the south of Tumut showed prospects of gold, and that when there was water there were always small parties of men working there;—do you anticipate that the extension of the railway would give a stimulus to the gold production of the district? I do not think so. I fancy that a man could bring in any gold that he might get without requiring a railway. I do not think the Government should extend the railway on that account.
1293. But to go in for mining on a large scale requires expensive machinery? Yes; a great deal of machinery has gone to Adelong; but once the machinery has got to a place I do not see what benefit the Government is going to get from it.
1294. Do the people between Tumut and Tumbarumba send their wool and agricultural produce to Wagga or to Gundagai? All that is grown there is not very much, so that I do not think it matters very much which way it is sent. In some years you could grow good potatoes there; but it does not do very well for wheat or grain. I know the district very well, because I owned a place there for years and I was very glad to sell out.
1295. So that we cannot expect a large amount of traffic from that part of the country? No; there is a lovely lot of land about Tumut; but a few miles further on you have pretty well done with the good country.
1296. There is a lot of forest land there? Yes.
1297. I think *Mr. Travers Jones* informed the Committee that if that country were improved, by ringing and clearing the timber, even the highlands would be suitable for agriculture, and that at any rate its carrying capacity would be increased? Well, I should not like to undertake its improvement. I had a go at it myself once, but I believe that it would break the Bank of New South Wales to keep that country clean.
1298. Can you give the Committee any account of the movement of stock south of Tumut in dry seasons? A great many stock instead of going up the north side of the river come up the south side to Ellis' Creek, through Lower Tarcutta, along the Yaven Yaven Creek, and then on towards Adelong. When they get to Adelong they can go to Tumut, Kiandra, Tumbarumba, or anywhere else. Thousands and thousands of animals go that way.
1299. The extension of the railway would not interfere with the movements of that stock? Not a bit.

G.
Woodbridge.
1 Dec., 1899.

William Matchett, J.P., Postmaster, South Gundagai, sworn, and examined:—

1300. *Vice-Chairman.*] You have resided in the district for twenty years? Yes.
1301. Can you give the Committee a short statement embodying your views as to the expediency of constructing this line of railway, and the prospects of a profitable return? Yes. Having resided for so long a period in the district, and having traversed the whole of it, my opinion is that there is not sufficient land available to warrant the proposed expenditure, no matter what route is adopted. I have a thorough knowledge of the extent to which agricultural and pastoral pursuits are followed in this district.
1302. Is it your opinion that the area of agricultural land to be served by the proposed extension is very limited? From my knowledge of the district, I am thoroughly convinced that four-fifths of the available agricultural land is now under crop.
1303. And it is only reasonable to assume that the produce of that land is at present trucked at Gundagai? It passes my door on the way to the railway station. I live in the main street of South Gundagai.
1304. In your opinion, the proposed extension will only mean adding £147,000 to the capital cost of our Railways without there being any hope of a proportionately large amount of new traffic being attracted to them? Yes.
1305. Have you anything to suggest for the information of the Committee? I wish to endorse what has been said by previous witnesses to the effect that there is no prospect of opening up any new country which would tend to feed a railway once you get to Tumut.

W. Matchett,
J.P.
1 Dec., 1899.

- W. Matchett, J.P.
1 Dec., 1899.
1306. So that the extension of the line to Tumut would simply mean an extension to the extreme edge of the traffic-producing district? That is so.
1307. What is there to prevent the country beyond Tumut giving traffic to a railway? The rough, hilly, rocky, and scrubby nature of the ground. Going into Tumut, the first thing that meets you is a tier of mountains; beyond them you get another tier; and so on until you get to the Yarrangobilly Caves.
1308. You hold the opinion that the district between Gundagai and Tumut has approached very closely to its limit of agricultural development? I think so. I was round the district recently, and I noticed large paddocks, which two or three years ago were used to depasture sheep and cattle, under cultivation; but, knowing how the hills come in on both sides of the valley of the Tumut, I believe that there is very little land available beyond what is now being used. A considerable quantity of tobacco is grown in the district, but not so much as was previously grown. The principal agricultural product of the river flats is maize. The land is not suitable for wheat. While the land grows good straw, the cars will not fill, because the soil is too rich.
1309. Are not the river flats suitable for wheat-growing in a dry season? No; they would not be suitable for wheat in any season—not so suitable as good forest land would be.
1310. Do you think that the district has reached the limit of its pastoral development? I believe that it has. It was my business recently to look out for land available for settlement for a person who wanted some land; but I could not find anything like an area worth applying for.
1311. For pastoral occupation? For farming and pastoral occupation; for pastoral occupation chiefly.
1312. *Mr. Shepherd.*] Is the land in this district nearly all alienated? Yes.
1313. What is the average size of a holding? The holdings here are of various sizes. Some of them are fairly large. Where the holdings are large they extend back into the mountainous country. That country is used for sheep.
1314. What distance from Tumut is the bad country to which you refer? There are 70 or 80 miles of broken country beyond Tumut. That country goes right through to the Snowy River.
1315. Before you come to good country again? Yes; until you get to the fall of the ground towards Cooma.
1316. Do you know if that country is taken up? I believe that a number of squatters have taken up a good deal of land above Tumut for what they call "summer country"; but they are only able to use it for sheep during four months of the year.
1317. Do many squatters avail themselves of these summer pastures? In dry seasons they are fairly well availed of; but not in good seasons.
1318. I suppose water is plentiful there? Yes.
1319. You are not in favour of the proposed extension? I think that, financially, it would be a failure.
1320. Your reason being that the extent of country suitable for agriculture is too small to justify the extension? Yes, that is my opinion.
1321. While the country available for stock is at the present time within easy reach of Gundagai? Yes; there are good roads and every facility in the way of reserves and camping-places for the travelling of stock.
1322. Do you know anything about Adelong? Yes; I am frequently in Adelong.
1323. What do you think of Adelong as a mining district? It is a very old mining district, and there are two or three mines at work there now. The Gibraltar mine—the principal mine there—is worked by English capital, and employs a large number of men. There are smaller mines also at work there, some of which I believe are paying, while others are not.
1324. The district is considered to be a pretty extensive mineral district? It is not so extensive as it has been represented to be. A great deal of capital has been expended in prospecting in the district, but away from the Adelong Creek, the Donkey Hills, and the other hills immediately around Adelong, they cannot get anything to pay.
1325. Have you been connected with any of the mining properties there? Not there; I have been connected with mining properties in this district.
1326. Can you give us any reason why there has not been such a development at Adelong as one would be led to look for from the richness of the field? No; except that the country is very hard, so that in many instances it is not found profitable to work it. If the ground could be worked more easily, I have no doubt that several more mines would pay handsomely; but, in consequence of the extreme hardness of the ground, and the expense of working it, mining is not generally found to pay there.
1327. You do not consider it a poor man's field? It is not by any means a poor man's field.
1328. Some of the reefs there are pretty rich? Yes.
1329. And pretty wide? The Gibraltar mine is one of the best. In former days, I believe, the old Victoria mine went as high as 30 oz. or 40 oz. to the ton; but that would be only in shoots.
1330. Do you think that the field is nearly worked out? It would require an enormous amount of capital to discover very much more worth going for there.
1331. So that we cannot look to the Adelong mining-field for a large increase of railway traffic? No; I do not think that the traffic from that field would be worth considering, seeing that there is such a good road between Adelong and Gundagai.
1332. You think that Adelong is sufficiently well served by the existing railways? I think that it is.
1333. *Mr. Watson.*] What would your estimate be of the carrying capacity for sheep of the country between here and Tumut? Taking it the whole year round, I do not think the hilly country would carry more than a sheep to the acre, on the average.
1334. *Mr. Shepherd.*] That would be about 6 acres to a large beast? Cattle will not do well in the hills.
1335. *Mr. Watson.*] Do you think that the hilly country beyond Tumut is as good as that between Gundagai and Tumut? Some of it is.
1336. Much of it? Not very much of it. Some of it is quite as good, the only difference being that above Tumut the feed is rather rough for sheep. Between Gundagai and Tumut the feed is finer and better for sheep.
1337. As you get higher the feed becomes coarser and scarcer? Yes; though, of course, it is better in the hollows.
1338. *Vice-Chairman.*] Have you had any experience in cattle-raising? I have.
1339. What sort of a district is this for cattle-raising? Very fair.

1340. Does that include the ridges, or only the alluvial flats? There are portions of the ridges from which they can get access to the flats, and the water which is very suitable for large stock. Other portions of the ridgy country are too rocky and rough to be suitable for large stock, and are better adapted for sheep. W. Matchett,
J.P.
1 Dec., 1899.

1341. Do you know anything concerning the number of stock which come to this district by road? I have a fair knowledge of it. Most of the stock that travel to the mountains by road have to pass my door. Only small flocks travel any distance to get to this district; most of the sheep come by train.

1342. Is any considerable number of stock sent by rail from the lower to the higher country? Yes; in some seasons. When it is very dry, a considerable number is sent by rail.

1343. Where do they come from, chiefly? I could not tell you exactly. Sometimes I know from conversations with the drivers from what points they have started, what is their destination, and what number of stock they have in charge. Some of the stock come from the Lachlan and down the Murrumbidgee; but, during the last year or two, they have come from Hay, and the country in that direction, by rail.

Walter Edward Cox, Railway goods-porter, Gundagai, sworn, and examined:—

1344. *Mr. Shepherd.*] How long have you been here? Six years. W. E. Cox.
1 Dec., 1899.

1345. Have you occupied your present position all that time? Yes.

1346. What description of goods have been received at Gundagai since you have been here? Provisions, groceries, mining machinery, and timber.

1347. Has there not been a good deal of building material? Yes.

1348. Have you noticed any fluctuation in the traffic since you have been here? No; there has been one general increase. The traffic has increased more and more every year; it has not gone back.

1349. Where do you generally get the goods from? From Sydney and Granville.

1350. What do you generally send away from here? Wheat, maize, copper ore, mundic, concentrates, and tobacco.

1351. What part of the district contributes most to the traffic? The concentrates come chiefly from out Reno way, and from the Gibraltar mine, about 3 miles this side of Adelong.

1352. Is that the only mine which contributes to the traffic? Well, the others contribute nothing to speak of; they only send dray-loads.

1353. Is butter one of the articles sent away? No; I do not think ten boxes of butter go away in a month. Last week about six boxes of butter came from Tumut; but they were the first I have had for two years.

1354. And no cheese? No; I have never sent cheese away.

1355. Are you acquainted with the country between here and Tumut? I have been up there once or twice; but I do not know the country sufficiently well to be able to say anything about it.

1356. Do you know what the people along there think in regard to the proposed extension;—have you had any conversation with them about it? Not of any importance. From what I have heard they seem to be against it.

1357. I mean the people some distance back from Gundagai, and out towards Tumut? Well, as for the general carriers that come in from Tumut, I do not think I have heard one speak in favour of the line.

1358. But the railway would do away with their business? I think they could compete against it. They all seem to fancy that they could.

1359. Can you give us any particulars as to the stock traffic here? I had nothing to do with the stock traffic, except the starving stock that come by night. Last year was the first year that we had any starving stock brought here.

1360. Has there been a falling off during the last few years in the quantity of maize and wheat sent from here? I should say that there has been a falling off in maize, but not in wheat.

1361. What about tobacco? During the last three years there has been a large falling off in tobacco.

1362. Can you account for that in any way? They tell me that it is because of the low price obtainable for it.

1363. You say that you are pretty well acquainted with the country between here and Tumut;—will you describe the general features of the country within a few miles of the proposed extension? I do not think I know the country along the route of the proposed line. That line does not follow the road to Tumut.

1364. You know the flats where the cultivation is? No; you go Brungle way to pass them. I have been the other way.

1365. *Vice-Chairman.*] During the last few years have any consignments of farming implements been sent to this district? Yes.

1366. Do they come in rushes or are they gradual? Gradual.

1367. What about building material? We have had building material sent here in large quantities.

1368. And machinery for mining? Yes, in very large quantities—in consignments of 100 and 200 tons.

1369. Do you anticipate still further consignments of building materials for the town? Yes.

1370. Has the major portion of this building material been for the town of Gundagai, or for places further on? For the town of Gundagai and places round about, such as Reno.

1371. Has much of it been sent out towards Tumut? No; very little has been sent out towards Tumut.

1372. With regard to the goods sent away from Gundagai, which district produces the more—Adelong or Tumut? Tumut.

1373. Is there much difference between them? So far as regards weight, I do not think there is. From Adelong they send quartz residue, which weighs very heavily. From Tumut they send wheat and corn.

1374. Has there been much variation in the quantities of agricultural produce sent from the Tumut district during the last six years? Yes.

1375. In what direction? About three years ago we had a very good season, and about six years ago the season was very good. In between those times things have been very flat, and hardly any corn has been sent down, because the people have gone in for wheat.

1376. Have the consignments of quartz been fairly uniform in character? Yes.

1377. Are they likely to be maintained? Yes; we are getting more and more every week.

1378. *Mr. Watson.*] Can you tell us what proportion of traffic to and from Gundagai belongs to Tumut, and what proportion belongs to Adelong? The traffic from beyond 10 miles of the town of Gundagai would

- W. E. Cox. would not amount to more than half of the whole traffic, taking in Nangus, Brungle, and Reno. We get a lot of produce from Nangus.
 1 Dec., 1899. 1379. In what direction is Nangus? West from here.
 1380. And how far? About 10 miles.
 1381. If the proposed railway were constructed would you still continue to get the Brungle traffic at Gundagai? Yes.
 1382. Nangus would not be affected by the construction of the proposed line? No.

Harold Braine, stationer, Gundagai, sworn, and examined:—

- H. Braine. 1383. *Mr. Watson.*] You have been a resident in this and the Cootamundra district for a considerable time? For five years.
 1 Dec., 1899. 1384. And you have been through the Tumut district pretty frequently? Yes, several times.
 1385. Is there anything you can tell the Committee which you think will assist them in coming to a decision in regard to the proposed railway? Living in the main street of Gundagai, I am in a position to see the traffic that goes through the town, and I am certainly of opinion that it is not sufficient to justify the extension of the line to Tumut.
 1386. You refer to the traffic to and from the Tumut and Adelong districts? Yes.
 1387. Do you know enough of those districts to hazard the opinion that the construction of the line is likely to bring into effective use an area of land sufficient to make good any deficiency in the revenue that may now exist? From what I can see of the country round Tumut, I do not think there is much fresh land to open up. I have been all along the river as far as Talbingo, and I think the country there is all opened up.
 1388. How far would that be beyond Tumut? About 20 miles beyond Tumut. All the country worth opening up seems to have been opened up.
 1389. So that you do not think that much more land would be put under cultivation if the railway were taken to Tumut? I do not think so.
 1390. If the present traffic is as small as you say, and practically the whole of the district has been opened up, there is very little chance of the railway paying? That is my opinion. I may state that it appears to me that a good many of the residents of this town, who are competent to give an opinion as to whether the railway would pay, do not care to come forward. I have been speaking to two or three people who have business relations with people in the Tumut district.
 1391. Is it possible that they are afraid of being accused of bias? Prominent residents of Gundagai do not care to hazard an opinion as to whether the railway should be extended to Tumut, as they are afraid of creating ill-feeling between the two towns, and of losing business from the Tumut side.
 1392. The Tumut people are naturally anxious to have the railway constructed? Yes. One very prominent man told me that one waggon a week would carry all the necessaries required from here to Tumut, and bring the Tumut produce back. He is one of those who do not care to come forward and give evidence. I have lived nearly all my life on the South Coast. That is an agricultural district, similar to the Tumut district; yet when, some years ago, it was proposed to construct a railway for a far larger district than Tumut—the Bega district—to Eden, which I suppose is the second natural port in the Colony, it was considered that that line would not pay, although it would tap the adjacent Monaro country.
 1393. You think that that line had a greater likelihood of paying, owing to the larger area of country that would have been served by it? Yes. A good deal of traffic goes from Monaro to Eden and Merimbula, and that line would have tapped that traffic.
 1394. You argue that if the construction of that line was not justified the construction of the proposed line is still less justified? Just so. There is no mining around Tumut itself. Tumut is exclusively an agricultural district.
 1395. It is proposed that the railway should go fairly close to Adelong, where there is mining being carried on? Yes; but I think that the mining round Adelong is pretty well worked out.
 1396. The consensus of opinion expressed to us seems to be rather that there is every probability of Adelong continuing to be a mining-field? There is practically only one mine there,—the big Gibraltar mine.
 1397. Has there been any falling off in the prospects of the Gibraltar mine? I understand that there has been a falling off in its returns.
 1398. Summed up, you think that the proposed extension is not justifiable, either as being a line likely to open up new country, or as a line likely to pay? Just so.

SATURDAY, 2 DECEMBER, 1899.

[The Committee met at the "Coach and Horses" Hotel, Adelong Crossing, at 11:30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD.		JOHN CHRISTIAN WATSON, Esq.
WILLIAM THOMAS DICK, Esq.		ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

James Edward Chard Turner, farmer and grazier, Adelong Crossing, sworn, and examined:—

- J. E. C. 1399. *Chairman.*] How many years have you been here? Thirty-nine years.
 Turner. 1400. I understand that you have a holding of about 2,000 acres? Yes.
 2 Dec., 1899. 1401. How many cattle have you upon it? About 250 cattle.
 1402. And how many sheep? About 1,000 sheep.

1403. How many acres have you under cultivation? About 140 acres under wheat and oats.
1404. What opinion have you of the district as regards its agricultural and pastoral possibilities? I do not think you can beat this district for a farming district, or for a sheep and cattle district.
1405. Is your land flat land, or is part of it ridgy land? Some of it is ridgy land, and some of it is flat land. The land on the flats is good cultivation land.
1406. Is the land on the flats the only land suitable for cultivation? Yes.
1407. Is it liable to be flooded? No.
1408. What is the carrying capacity of the grazing land? It will carry about a sheep to the acre, taking the flats and the hills together.
1409. All the year round? Yes.
1410. The climate is very favourable? Yes.
1411. What is your rainfall? I cannot tell you, but I never had a failure of the crops through drought. The only failure I have had has been caused by too much wet.
1412. The district is a peculiarly favourable one for keeping stock in good condition? Yes; in very good condition. If you do not keep too many they thrive well.
1413. Has this district suffered very much during the last five years' drought? No.
1414. It has given an outlet for large numbers of poor stock from other districts? There are a lot coming in now, not to this particular part of the district, but round about, a few miles away.
1415. Have your operations been satisfactory from a financial point of view? Yes.
1416. Are there many holders of moderate extent in the district like yourself? There are a few men between this place and where I live who hold 500 or 600 acres.
1417. Is the district between Gundagai and Tumut occupied by persons with small or moderate holdings or by persons with large holdings? Three miles beyond Adelong Crossing the holdings are large, but when you come to the Gilmore you get small holdings again.
1418. What is the width of the valleys in which the land is suitable for agriculture? Three miles up they run about a mile in width, but further up still the hills close in more.
1419. Then this valley is not of very great width? No; but further up it spreads and contains good wheat land.
1420. How do you get your stock to market? By sending them to Gundagai.
1421. How far is that? Twelve miles from my place, and 10 miles from here.
1422. Do you think that the people between your place and Gundagai require a railway for the conveyance of their produce to market, and the bringing back of their goods? Well, we are not badly off at the present time.
1423. If a railway were constructed from Gundagai to Tumut, from what distance beyond Gundagai would it be used? For about 12 miles out of Gundagai.
1424. Then you think that the railway traffic will commence about 12 miles on this side of Gundagai? I think so.
1425. For any intermediate distance it would not be worth while, having put one's produce on the waggon, to go anywhere than to Gundagai? It would not be worth a man's while to come 2 miles back on the line, instead of going only 4 miles further on.
1426. Seeing that the land here is so largely alienated, do you think that the construction of the proposed line would lead to an increase of population? No, I do not think it would increase the population of the district, though it might lead to the cutting-up of the large holdings so that better use could be made of them.
1427. Do you think that people, instead of going in for grazing so much, would go in for mixed farming? Yes.
1428. Would it pay a large holder better to cut up his holding and sublet it, or sell portions of it, than to keep it merely to depasture sheep and cattle? Sometimes it would. A few years ago it paid very well.
1429. Is there a sufficient area of flat land in the hands of large holders to enable them to sublet any number of farms? Well, there are a good many thousand acres between this place and Shepard's Town, about 8 miles up.
1430. That land is not being farmed at the present time? No.
1431. What area of flat land could a man reasonably live upon? A man ought to make a decent living out of 200 or 300 acres.
1432. Do you know the value of these alluvial flats? No.
1433. What rental do the farmers pay? Some of them pay as much as £1 an acre.
1434. Are they able to make a living at that rental? Yes, by growing corn, until the last two or three years; but lately the corn crop has missed in this part of the district, though it has never missed at Tumut.
1435. Is that because of the drought? Yes. Corn wants a good rainfall at this time of the year.
1436. The Tumut corn is about the best that goes to the Sydney market? Yes; and there seems to be always enough rain for it.
1437. Is it chiefly because of a possible larger use of the neighbouring land that you think the proposed railway would be beneficial? Yes.
1438. Do you think that the construction of the railway would directly or indirectly increase the revenue to be obtained from the purely pastoral country? Only by bringing weak sheep into the district.
1439. Last year a great number of weak sheep were brought into the Tumut district? Yes.
1440. Do you know whether the district was taxed to its fullest extent last year, or could it have carried more starving stock than it did carry? The accommodation has not been overtaxed so far, because none of the stock have died in the district.
1441. Do you think that this part of the district could have taken more starving stock, or was the country pretty well all occupied? I think that last year it was pretty well all used.
1442. How far have they to drive stock from Gundagai to get on to the good country? Some of the stock that come to Gundagai have only a few miles to travel from there, while other stock travel 8 miles, and other stock, again, 10 or 20 miles.
1443. If a railway had gone further out in the direction of Tumut, could they have taken more sheep into the country about Tumut and towards Tumbarumba? Yes, I think they could.
1444. *Mr. Shepherd.*] You say that £1 an acre is about the outside rental paid for land at Tumut? No, I was not talking of Tumut; I was talking of the district round Adelong Crossing.

J. E. C.
Turner.
2 Dec., 1899.

- J. E. C. Turner.
2 Dec., 1899.
1445. Nearly all the land between here and Tumut is alienated? Yes.
1446. And a great many small farmers at Tumut lease their land from the large holders? Odd farmers do.
1447. Do you know what rent they pay? I think as much as £2 an acre, if not more, has been paid by Chinamen for land in Tumut for tobacco-growing.
1448. Are there many large holders round Tumut? I cannot say.
1449. I noticed this morning, in coming from Gundagai, that a large extent of the rich land on the flats is covered with thistle;—why is that valuable land allowed to be smothered in that way? That might be Government land.
1450. Is there any Government land between here and Gundagai? There is some on the flats.
1451. Do they use the thistle at all? The cattle eat it, but the farmers do not cut it down to make ensilage of it.
1452. Do your stock keep in good condition? Yes; I never have any losses.
1453. You consider that you are fairly well served by the existing railway? Yes.
1454. So that the proposed extension would not be of any great advantage to you? Yes; it would come within a mile of my place.
1455. I notice that, in the paddocks about here, the wheat and oats are very much mixed? The wheat has been very dirty during the last two or three years.
1456. Is it used for milling or for hay? Mostly for hay. There is too much oats in it now to use it for milling.
1457. Do you think that the Government would be justified in constructing the proposed line, seeing that it will entail an annual expenditure of about £8,150, and will cost about £147,000? Well, the expense is rather heavy for the distance.
1458. Would it be possible to extend the line beyond Tumut? I have always heard that it could not be taken any further.
1459. There are almost inaccessible hills beyond Tumut? Yes.
1460. Do you think that the railway would obtain sufficient traffic to justify its construction? I think the question is too big a one for me to go into; but a good deal of produce would be sent by the line.
1461. In what way would the railway business be increased? By the carriage of cattle and produce in drouthy seasons.
1462. Is it not a fact that nearly all the good land in the district is now under cultivation? I daresay that most of it is. From here further on there are flats which are not cultivated. Between here and the Gilmore there is a good deal of land which used to be cultivated, but which is not cultivated now.
1463. Was it cultivated for any length of time? No.
1464. Why was its cultivation discontinued? The selectors sold out. They thought that when everyone was farming there was nothing in it.
1465. *Mr. Levis.*] How many bushels do you get to the acre? In a dry season from 20 to 25, and in a wet season about 12. Last year I think I had 30 bushels right through.
1466. That pays well? Yes.
1467. I suppose you are in favour of the construction of the line? Yes; it will do no harm, and in time to come it will do a great deal of good.
1468. *Mr. Watson.*] Can you give us any idea as to how much of the land in this district is devoted to agriculture, and how much to pastoral pursuits;—is one-third or one-tenth devoted to agriculture? I should think somewhere about one-tenth; but it might be a little less.
1469. According to Mr. Harper, the proposed railway would carry about 1,000 bales—that is, 140 tons—of wool in the year; but if a tract of country about 40 miles by 45 miles is carrying a sheep to the acre, the return should be about 3,000 bales of wool, and, even if 10 per cent. of the land is devoted to agriculture, the return of wool should greatly exceed Mr. Harper's figures? At the present time there would not be 10 per cent. of the land under cultivation.
1470. Would what was left of the land be devoted mostly to sheep or to cattle? To sheep, mostly.
1471. If the ridge land will carry a sheep to the acre?—? I do not say that the ridge land will carry a sheep to the acre. What I said was that on my own holding, the flats and the ridge land taken together, will carry a sheep to the acre.
1472. Do you think that 1,000 bales should be the total yield of wool from the country within the influence of the proposed railway? No; I should think it would be much more than that. From Mount Horeb they send away 120 or 130 bales, and they have more cattle than sheep.
1473. How far is that from Tumut? It is about 3 miles from Adelong Crossing, and about 13 miles from Gundagai. It adjoins my place.
1474. Do you think it probable that that wool would be carried on the proposed line? Yes.
1475. Where does it go at the present time? To Gundagai, and thence on to Sydney.
1476. So that it would appear that the estimate of 1,000 bales for this line is rather low? I should think it would be.
1477. *Mr. Dick.*] In Sydney a witness informed us that if the proposed railway were constructed, the farmers of the district would resort to pig-raising? They might do so. A great many pigs are sent away from the district even now.
1478. If the proposed railway were constructed, do you think it would pay better to grow maize for pigs than to grow it to send to market? I do not know whether it would or not.
1479. I suppose that when maize was at a low price, it would be more profitable to give it to the pigs? Yes; a good many farmers feed their pigs with maize when the price is low.
1480. Do you think we can anticipate much revenue from the carriage of live stock and bacon? I could not say what that revenue would be.
1481. What do you think of the prospects of the district, from a dairying point of view? It is a very fair district for dairying; but there are no large dairying places in it.
1482. How is it that hitherto they have not resorted to dairying in the district? It is too far from a railway, and the local consumption is not large enough. I have been dairying ever since I have been on the farm.
1483. Would the construction of the proposed railway enable you to compete in the Sydney market? I think it would.

1484. Do you think it would lead to an increase in the number of cattle run on the ridges, or is only the flat land suitable for dairying? It is only the flat land that is suitable for dairying. The Gilmore valley would be a great place for dairying.

J. E. C.
Turner.

1485. Is a certain number of stock brought into the district, year in and year out, or do they come only in times of drought? Stock come here mostly in the season for grass.

2 Dec., 1899.

MONDAY, 4 DECEMBER, 1899.

[The Committee met at the "Royal" Hotel, Adelong, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKEIT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Frederick Charles Park, storekeeper, Adelong, sworn, and examined:—

1486. *Chairman.*] How long have you been here? About sixteen years.

1487. You are acquainted with the proposal before the Committee? Fairly well.

1488. What are your views in regard to the proposed railway;—do you think that its construction would be of advantage to the district? Undoubtedly.

1489. In what way? As a storekeeper, I think it would make it more convenient for us to get our goods up, and I presume it would lessen the cost of living in the district. Secondly, produce could be sent away much more cheaply than at the present time, when it has to be carted into Gundagai.

1490. How are goods brought here from Gundagai? By teamsters, along the main road, *via* Adelong Crossing.

1491. How many miles is that? Twenty-two miles.

1492. What rate of carriage do you now pay from Gundagai? The rate of carriage varies from 12s. 6d. a ton upon stuff like sugar, salt, and flour, to £1 a ton on what are termed case goods—ironmongery, drapery, &c., packed in cases.

1493. What is the rate of freight for wool? I do not think it is lower than 12s. 6d. a ton from Adelong. A good deal of wool is sent from distances varying from 4 to 20 miles from Adelong, so that, of course, the price varies; but I think you could average it very fairly at 12s. 6d. a ton for distances up to 30 miles from Gundagai.

1494. I suppose you are aware that if the proposed railway is constructed special rates will be charged upon all the goods carried between Gundagai and Tumut? Higher rates.

1495. Yes? Then it would pay us better to get our stuff from Gundagai by team. When we carted our stuff from Bowring, a distance of 80 miles, I am not certain whether it cost us 2s. 6d. a ton more or 2s. 6d. a ton less than the present highest rate for third-class goods.

1496. The Commissioners say that with special rates the proposed railway would return a revenue of £3,879 a year gross, and with ordinary rates £1,696 a year gross, while the interest and working expenses would amount to £8,150 a year, so that to get any reasonable return it would be necessary to impose special rates;—can you tell me what those special rates would be? When we had differential rates to Wagga we found it cheaper to cart our stuff from Wagga, a distance of 50 miles, than from Gundagai, a distance of 22 miles. Of course, if the rates on the proposed railway were higher than the road rates from Gundagai it would pay us better to continue to use the road.

1497. Mr. Harper says that—"On certain classes of goods local rates would mean a charge as high as 19s. 3d. a ton—practically what is being paid to-day; and to that would have to be added the cost of cartage from the railway-station to the stores, whereas in other cases it would be direct delivery." Then, later on he is asked—

Do you think that, with a charge of 13s. to Adelong, and, roughly, a charge of 12s. to Tumut, road-carriage could compete against the railway? Yes.

? Does the 13s. apply to all classes of goods?

1498. No, that would be the maximum? Then it seems to me that the advantage would be in favour of Adelong, because we should get third-class goods which now cost £1, for, practically, 17s.

1499. You think that under those circumstances it would pay you to use the railway? Yes, because on those figures we could save 3s. a ton.

1500. Do you think that with railway competition the teamsters could afford to reduce their charges? I am quite sure that they could on third-class stuff.

1501. Therefore, you agree with Mr. Harper, that if the Commissioners imposed special rates, they would be likely to induce competition? I am sure of it. If we were to have a railway here within twelve months, it would throw our teamsters out of employment, and they would then have to find either fresh occupation or fresh fields; and I think that rather than go away they would reduce their charges. If you can only show us a difference of 3s. a ton between the present rate by team and the railway rate to the nearest station, plus 4s. from that station to Adelong, it is a very open question whether the teamsters could not successfully compete. During the last six months it has been suggested that we should attempt to reduce the charge for third-class goods. There are many lines upon which we might hope for a much cheaper rate than £1 a ton.

1502. Is this a favourable district for teamsters; are the roads good and fodder easily obtained? Undoubtedly it is a good district so far as the roads go? I do not think you could get a better road than that between Adelong and Gundagai. Then too, we have a good average rainfall, so that I think the price of fodder here compares favourably with the price in other districts.

1503. We have always regarded this as a district beyond all others into which stock could be sent *ad libitum* in dry seasons? Perhaps you could form a better idea as to the position of the teamsters here

if

F. C. Park.

4 Dec., 1899.

- F. C. Park. if I gave you the prices of fodder. We are now selling corn retail at 3s. per bushel, chaff at £3 to £3 10s. per ton, bran and pollard at about 7½d. per bushel, and wheat at about 2s. 3d. Oats we get from Sydney.
- 4 Dec., 1899. 1504. *Mr. Watson.*] Where do you get your bran and pollard from? From Tumut.
1505. *Chairman.*] Those are fairly reasonable prices? We consider them low prices. I have known corn to be 4s. and 4s. 6d. a bushel, chaff £5 and £5 10s. a ton, and bran and pollard from 10d. to 1s. a bushel.
1506. Do you think that the railway would result in a large increase of traffic? The traffic might increase to a small extent.
1507. What do you think is the capacity of the district? I think that the prospects of Adelong as an agricultural district are limited. If you have a station within reasonable distance, there is plenty of land round Batlow and Upper Adelong which might be used. I think that that is one of the best districts in the Colony for fruit-growing, and especially for English fruits, such as pears and apples.
1508. But you think the output would be limited, owing to the limited area of land available? There is plenty of land available there, but it would cost so much to clear that I do not think men of only reasonable means could afford to clear it. We have always considered that instead of the Government asking £1 an acre for that land they should pay people £1 an acre to live on it. The land is undoubtedly good; but it is very heavily timbered. The fruit-growing land would cost about £10 an acre to clear, and after you cleared it you would get about £3 an acre for it.
1509. *Mr. Watson.*] Does your estimate for clearing land apply to land which has been ringbarked? I think so. I do not think there is any better land in the country for the purposes I speak of; but when it is ringbarked the bracken and wattle spring up, so that nothing can be done with it until it has been ploughed.
1510. *Chairman.*] Leaving that part of the country out of consideration, are the alluvial flats extensive? I do not know where you would find them, unless it is down the Adelong Creek, from Grahamstown to the Murrumbidgee. Then, too, on the Yaven you get a fair area of flat land.
1511. Do the flats widen out very much? Not very much; but the land is good grazing land.
1512. Is there much opportunity for the development of agriculture there? I should be sorry to give an opinion upon the subject.
1513. Is the agricultural land limited in extent? The agricultural land in the Adelong district is limited in extent.
1514. If a railway were constructed from Gundagai to Adelong, from what point would the people begin to use it for the carriage of produce? That would depend upon the location of the various stations. I should very much doubt whether farmers in the vicinity of the Adelong Crossing would take the trouble to unload there. I think that, having a fair road, they would go right into Gundagai.
1515. Then you think that the railway traffic would commence at a point 10 or 12 miles from Gundagai? Certainly not less than 10 miles from Gundagai. Of course, Adelong draws no trade from below Grahamstown, so that my answer is not biased in any way.
1516. Have the residents of this district at any time suffered any great inconvenience by reason of the want of railway communication? Well, I am bound to say yes, that we really want the railway.
1517. But have your goods ever been delayed on the road between Gundagai and Adelong? No: we get our goods fairly regularly. We are served by four or five teams, and I can send a wire to Sydney to-day and have my stuff up to-morrow.
1518. There is a daily coach from Adelong *via* the Adelong Crossing? Yes.
1519. What are the fares? 12s. 6d. return from Adelong to Gundagai.
1520. And how much single? I suppose 7s. 6d. I think that some of the coaches are a little cheaper than that.
1521. *Mr. Dick.*] Can you give the Committee some idea of the inward tonnage of Adelong? I should think the inwards tonnage of Adelong would be covered by £6,000.
1522. *Mr. Watson.*] Is that the freight paid? That is the freight paid to the Railway Commissioners. I base the figures upon what I know of my own business.
1523. And what would the freight from Gundagai to Adelong amount to? I should think to about £1,000 a year.
1524. *Mr. Dick.*] That is for general merchandise, exclusive of mining machinery, and carriage of that kind? Yes.
1525. *Mr. Levien.*] But does not a good deal of stuff come here from Gundagai that did not come to Gundagai by railway? No; I think everything comes from Sydney originally.
1526. *Chairman.*] Is Adelong a large distributing centre, or are the goods sent here consumed within a small radius of the town? Our district is bounded on the one side by the Gap, about 4 miles away; by Batlow, 16 miles to the south; by Mount Adrah, 14 miles to the west; and, going along the Gundagai Road, by Grahamstown, about 6 miles out.

Walter Whitley Webb, Manager, Bank of New South Wales, Adelong, sworn, and examined:—

- W. W. Webb. 1527. *Mr. Dick.*] Your business relations will enable you to state whether the district is or is not fairly prosperous? It is a very sound district.
- 4 Dec., 1899. 1528. Can you say whether it is progressing or stationary? I think it is progressing. Judging from my own business here, it is progressing.
1529. With any degree of rapidity? No; the mining operations largely influence the actual business of the town; but the district, as a whole, is certainly not going back.
1530. Do you know whether the agriculturists in the immediate neighbourhood of Adelong rent or own the land upon which they are working? I think that they are the owners of it, but there are not many of them, speaking for Adelong itself. I do not know anything about Tumut. The climate here is a good one, the rainfall is good, and the soil is good, so that, given the facilities which a railway would give, I think the population ought to increase.
1531. Do you think that the present method of sending goods to market puts difficulties in the way of the producer? I think so. There are fruit-growers in Adelong who, I think, would increase their orchards if they could get their fruit away more easily. Between here and Batlow, about 19 miles away in a southerly direction, the country is noted for its good potatoes, and for its fruit.

1532. What market would you expect the fruit-growers to cater for? The Sydney market, and also the Riverina market. W. W. Webb.
1533. Do you think that the conditions are so favourable that fruit-growers here could compete in the Sydney market with fruit-growers from other parts of the Colony? Well, one man at Batlow sends to the "Australian Club" and to "Tattersall's." He has a contract for supplying apples and other fruit. We are very late here, and Batlow is 800 or 900 feet higher than we are. 4 Dec., 1890.
1534. Has there been any increase in agricultural settlement here recently? No; the agricultural area round Adelong is limited.
1535. Do you look upon the ridgy country as suitable for fruit-growing? Yes; the hill slopes are very suitable.
1536. Can you tell us of producers who are making a success of fruit-growing in the district? There is a man named Barberie at Batlow who does very well with his fruit, and another man named Basham. He takes a team through to Wagga and to Cootamundra, and sells his fruit in the Riverina country. I think that a railway here would aid the mining industry, by allowing us to send ore away more cheaply, and that, in turn, the traffic in ore would aid the railway. At the present time we pay 12s. 6d. a ton to send quartz from the mines to Gundagai, and about 14s. 9d. a ton as railway freight from Gundagai to Dapto, the first distance being 22 miles, and the second considerably over 300 miles, so that there is a considerable disproportion between the two charges. Smelting seems now to be coming into favour more than ordinary battery treatment, and miners are therefore inclined to send more of their ore away to be treated. Of course, stone containing free gold is crushed locally.
1537. What would be the general effect upon the mining industry of a considerable reduction in the cost of carriage to the place of treatment? I am connected with one or two of the mines here, and I think that if the freight were much reduced we should be likely to send away for treatment stone that we now crush locally, in the hope of thus getting better returns, and having to pay less.
1538. Do you think that cheaper conveyance of ore from the district would give a stimulus to mining here? It would certainly be an advantage to mining operations here. The presence of smelting-works at Cockle Creek and Dapto gives us an inducement to send away our ore. Until lately we sent away only the concentrates; but if proper facilities were offered, we should probably send our stone away, not in tens of tons as now, but in hundreds of tons.
1539. Are there any mines which would be brought into practical working by the lowering of the price of carriage? There are a good many mines awaiting development, and the success of one would lead to the opening up of others.
1540. Inasmuch as you would still have to pay for the cartage of your stone a distance of 3 or 4 miles to get to a railway-station, you would not make a saving of 12s. a ton, even if the proposed railway were made;—how much would your saving be? It would be about half that.
1541. I suppose you get the stone carted to the railway-station for about 4s. a ton? It would depend upon the location of the mine from which it was sent; but I think that it would be easier to send it to a station somewhere on the proposed line than to take it down to Adelong Crossing.
1542. Can you give us a general idea of the cost of mining development in the district during your residence here;—has it fluctuated? The Gibraltar mine is the only mine that has made any stir since I have been here. Some of the other mines have been used up, and have dropped out; but there are one or two that are very promising just now—the Caledonia mine in particular.
1543. Do you anticipate any development of the mining industry here in the way of dredging? Yes.
1544. Is this looked upon as a good field for such operations? Yes, a very good field.
1545. Are many leases being taken up here? Yes. The Jennings Company have got their plant ready to start, and some other people have taken up 137 acres, and they are only waiting for developments.
1546. Is it a fact that anywhere along the course of the creek you can get good gold; but that continuous operations have been prevented by the water? I cannot say. Fossicking has always been going on; but I am not prepared to say whether operations have been troubled by the water. At the Bank here we buy a good deal of gold every week.
1547. *Mr. Watson.*] Alluvial gold? Yes.
1548. *Mr. Dick.*] Do you anticipate an increase in mining operations here in the way of dredging? Yes. I think we shall make a very good start after Christmas.

Thomas Arragon, grazier, Adelong Creek, sworn, and examined:—

1549. *Mr. Shepherd.*] How long have you been residing here? About six years. I have spent nearly all my life on the Nacka Nacka Creek. T. Arragon.
1550. What is the extent of your holding? There are about 3,000 acres in the holding I am living on. 4 Dec., 1890.
1551. Is it all on the Adelong Creek? Yes.
1552. What industries are you carrying on there, chiefly? I am growing wheat and wool.
1553. What number of sheep have you? About 5,000.
1554. That would be over a sheep to the acre? Yes. For the most part the land would carry nearly two sheep to the acre.
1555. What return of wool do you get? This year we have not yet finished shearing, but we shall send away about 9 tons of wool.
1556. Do you run any cattle? I have no cattle at all.
1557. What area of land have you under cultivation? About 200 acres.
1558. Is it all under wheat? Wheat and maize.
1559. In about equal proportions? No; there are about 25 acres under corn.
1560. What return of wheat do you get per acre? Last year we got about 12 bushels to the acre.
1561. And how much maize? I think about 50 bushels to the acre.
1562. How far are you from Gundagai? About 25 miles.
1563. What does it cost you to cart your produce to Gundagai? Fifteen shillings a ton.
1564. Do you find that charge a drag upon you? Not very much. Of course, if the proposed railway were made the charge would be less.
1565. What is the average distance from a railway at which farming can be successfully carried on? I think that the closer the railway the more successful the farming.
1566. But what do you think is the limit? I suppose 6 or 7 miles. 1567.

- T. Arragon. 1567. You can cart wool a much greater distance than you can cart agricultural produce? Yes.
- 4 Dec., 1899. 1568. Wool-growing is your chief industry? Yes; but a great deal of the land upon which the sheep are running would grow wheat.
1569. Can you form any rough estimate as to the quantity of land on the Adelong Creek which is suitable for cultivation? I think there are about 1,600 acres on our own place which would grow wheat.
1570. I suppose it is chiefly the flat land that is fit for cultivation? Yes; and the ridgy land as well.
1571. As a rule, is the land on the hills suitable for cultivation? The ridges will grow wheat very well. Wheat will grow up this way almost anywhere you can put the plough.
1572. Is there much cultivation on the hills at any distance from the creek? Yes.
1573. Do you cultivate fruit at all? Very little, except for domestic use.
1574. What kind of fruit is chiefly cultivated up the creek? Apples mostly. Quinces grow very well.
1575. And cherries? Yes.
1576. Is this fruit grown chiefly for home consumption, or is much of it sent to market? A good deal of it is sent to market.
1577. How do you think the construction of the proposed railway would affect the various industries here? I think it would improve the position of wheat-growing very greatly. The land west of Adelong is well adapted for wheat.
1578. Do you think that the present rates of carriage are to a certain extent prohibitive? Yes.
1579. The Commissioners estimate that there will be a deficiency of about £6,450 a-year if the proposed railway is constructed;—do you think there is any prospect of that deficiency being made up by the increased production of the district? I do not know; but I think that the loss on the line would be very greatly reduced after a while.
1580. Is not the land here rather difficult to clear? Yes.
1581. What does it cost per acre? The land immediately about here is not so difficult to clear as the land further up the creek—12 or 14 miles up; there it is very difficult.
1582. What is the average cost of clearing that land so as to make it fit for agriculture? About here I think that land which has been rung could be cleared for about £1 an acre, if the timber is dead.
1583. How long should the timber be rung before the land is cleared? Eighteen months or two years.
1584. Do those who are cultivating the land seem pretty well satisfied with the result? Yes.
1585. Do you think that the area under cultivation would be largely increased if the proposed railway were constructed? Yes.
1586. Are you connected with mining at all? No.
1587. Can you account for the apparent apathy displayed here in regard to mining operations? No.
1588. Mining operations here have fallen off a good deal of late? I think so; but I think that mining is likely to come on again very soon.
1589. Can you account for it having fallen off? No.
1590. Is mining still being carried on up the Adelong Creek? Yes, in places. There are fossickers all along the creek, and further up some people have claims.
1591. I suppose the mining there is chiefly alluvial? Yes.
1592. Is there anything else upon which you can inform the Committee having a bearing upon the proposed railway? I think that if the railway were extended the timber industry here would improve. There is good timber about Batlow and Bago, 15 or 16 miles further up. The timber there is very good and very useful.
1593. What kinds of timber are there there? Stringybark, white gum, messmate, and mountain ash.
1594. Is the district fairly well stocked with sheep and cattle? I think so, as a rule; but at the present time it is not a quarter stocked. Last year a great number of stock were sent up here from the droughty parts of the colony.
1595. If the district were fairly stocked, how could it accommodate the starving stock which it is said will be sent up here every year, and will provide traffic for the railway? Up here the people thought that they would have a bad season this year until the rain came, and now they are understocked.
1596. What are the principal grasses up here? They are all native grasses.
1597. Is there good feed all the winter time? Yes. The runs are not nearly stocked this year, nor were they nearly stocked last year.
1598. Can you form any idea as to the cost of clearing land about Batlow? At Batlow it would cost £5 or £6 an acre to clear land for a crop.
1599. Is it the usual plan here to ringbark before clearing? Yes.
1600. Do you think that a year and a half or two years is too short a period to allow for the dying off of the timber? I think that you can ring the timber so that it will die in two or three months. Of course, if you only take off the bark it will probably live longer than that.
1601. Do the people generally use the forest devil, or do they grub out the trees? They grub them out, or, if it is box country, burn them out.
1602. Is it possible to get that done for £1 an acre? I think so.
1603. Have you any idea as to the number of cattle and sheep in the district? No.
1604. Is dairying carried on here to any extent? Not to any great extent.
1605. Do you think it would be encouraged by the construction of the proposed railway? I think so.
1606. As a rule, is the grass here good grass for dairy stock? Yes.
1607. I suppose the difficulty of getting produce to market is somewhat against dairying here at the present time? Yes.

George Thomas Kenney Cole, miner, Mount Adrah, sworn, and examined:—

- G. T. K. Cole. 1608. *Mr. Watson.*] How far is Mount Adrah from Adelong? About 17 miles.
- 4 Dec., 1899. 1609. Have you a general acquaintance with the mining operations of the district, or is your knowledge of the subject confined to the country in the vicinity of Mount Adrah? I have a general practical knowledge of the subject.
1610. In what direction is Mount Adrah from here? I think about north-west. It is on the Wagga Wagga road.
1611. Is Adelong the business centre for people living round about Mount Adrah? Yes; all their business is done with Adelong.

1612. What are the prospects of Mount Adrah as a mining district? They are very promising indeed at the present time. Ninety-one acres of Crown lands have been applied for for dredging purposes, and I think that all the leases applied for with the exception of one have been granted. I think that about 400 acres have been applied for for dredging altogether, and the applicants are coming to terms with the landed proprietors. G. T. K. Cole.
4 Dec., 1899.

1613. Are there any mining developments there besides the dredging? There are a few reefs being worked.

1614. What is the character of the work? Jordan and Williams are down about 100 feet. They had a crushing of 12 tons, and they got about 18 oz. from the bulk, or about 1½ oz. to the ton. That was when they were down about 30 feet. On the bottom of the reef the stone is expected to average about 5 or 6 dwt. to the ton.

1615. Is any gold held in the mineral? Yes; there is a certain amount of pyrites.

1616. For the mineralised ore probably some higher treatment would be required? Yes; smelting or chlorination.

1617. What is your present idea as to the outlet for that class of ore? We bring it by road to Adelong, and have it treated at Rich and Wilson's battery here. The quantity of ore is so small that it does not pay to apply any saving method.

1618. The battery you speak of could not deal with pyrites ore? No.

1619. Then the proposed railway would be of great advantage to you in enabling that ore to be sent away? Yes. From the middle of Mount Adrah to the Adelong Crossing is a distance of about 14 miles.

1620. But it would be quicker for you to go to Adelong Crossing than to go to Gundagai? Yes; and it is good level country. The only drawback just now is that there is no bridge over Hillas Creek, but we are hoping to have a bridge constructed over the Yaven Yaven Creek during the present winter. If Hillas Creek were bridged as well, there would be nothing to stop us from going to Adelong Crossing. The teams can now go that way in dry weather.

1621. What freight do you think you will have to pay for the conveyance of ore from Mount Adrah to Adelong Crossing by the road you mention? We pay about 12s. a ton to have ore conveyed to Adelong, a distance of about 17 miles, and we could get it conveyed to Adelong Crossing for about 11s. a ton.

1622. How much would you have to pay to send ore to Gundagai by way of Adelong Crossing? About 14s. or 15s. a ton. The distance would be about 22 miles. Sometimes we should have to pay more than 14s. or 15s. a ton. The charge would vary with the seasons. Sometimes no teams are available, because they are all away carting grain or wool. I have paid as much as 30s. a ton to Adelong, and the lowest rate I ever paid was 10s. a ton, the week before last, for back carriage.

1623. The difficulty of securing teams might occur whether the railway were constructed or not? Yes.

1624. I suppose the cartage to Adelong Crossing would be higher, because there would be no back loading? If the train came to Adelong Crossing there would be a good deal of back loading. They get a lot of their heavy goods up now from Wagga. They send their wool down there, and get their goods back.

1625. Where do their goods come from—from Sydney or from Melbourne? Some from Melbourne, and some from Sydney.

1626. Does it pay better to bring goods from Wagga than to bring them from Gundagai? They think so, because of the differential rates. I came from Queensland to Mount Adrah in 1882, and I have obtained a good deal of gold there—I think more than any other person. I have had offers to go prospecting to West Australia, Queensland, and other places; but I fancy that there is something at Mount Adrah yet, and I am sticking to it. I got about £5,000 from a mine there. We treated altogether about 400 tons, and obtained over 1,100 oz. of gold. Some of the reefs have gone as high as 6 oz. to the ton.

1627. Do the reefs go down satisfactorily? After they have gone down a few feet, a kind of flaw comes in, and cuts them out; but they generally make again. In one case we went down about 40 feet, and then we had to go through a blank of about 50 feet, when we got a crushing which gave about 5 dwt. of free gold, and there is every appearance of the reef becoming larger.

1628. What are the prospects of mining immediately around Adelong? I think that they are very promising. I have been on the Palmer, the Etheridge, and other places, and there you would see from ten to twenty miners prospecting, for every one you see in this part of the country. In this part of the country they are all wages men, and when they are out of wages they will not prospect, but just hang about the town. I think that if there were more prospecting more reefs would be developed.

1629. Do you regard the mines at Adelong which have been unworked for a long period as worked out? Most decidedly not. When I went to Queensland in 1875, I met plenty of men who had been on Gympie, and they told me that Gympie was worked out. I have heard the same thing of Charters Towers, and the Etheridge; but we know that Charters Towers has since produced tons of gold; and so, too, has Gympie. At Gympie they came upon a very hard green slate, which it cost from £6 to £10 a ton to get through. From what I have seen in other places, I consider that the reefs here are not worked out yet.

1630. Then why have a number of these mines been practically abandoned? I think it is greatly due to bad management. When they were on good gold, they simply followed it down, making only small shafts, and they drank a lot of the money. Then, when they came to poorer stone, they could not afford to sink deeper, and when the workings were allowed to lie idle for a number of years the timber gave way, and the shafts collapsed.

1631. Are any of these mines now open for speculators to take up if they think fit? There are plenty of mines ready to be taken up. There is the Victoria mine lying idle, and there is a mine at Donkey Hill. A lot of properties are merely being held, while others are let on tribute. In many cases the holders are waiting for speculators to come along, or to see how other mines develop. I suppose a lot of people have not sufficient funds to carry on the work themselves.

1632. All the mines are not being worked on tribute? No; but most of them are now. The Challenger mine is doing well, and a lot of money has been put into it by local people. The Caledonia is another mine which is doing well. In 1885 or 1886 I was prospecting on the Gibraltar property, and we were told then that the mine was worked out; but since that time it has given satisfactory returns.

1633. Tributors are not expected to develop a mine very much? No; they only go in and clear out the old stopes.

- G. T. K. Cole. 1634. Their work is of very little value from a prospecting point of view? They do no prospecting at all; they only take out what is left. It would require capital to put the shafts into order, and to erect machinery—more capital than local syndicates seem to care about expending, though it is a local syndicate that has opened up the Caledonia mine again.
- 4 Dec., 1899. 1635. Do you think that the prospects of the district are encouraging, from a miner's standpoint? Yes. At Mount Adrah there are very few prospectors besides myself. We have ironstone lodes there, and on the banks of the Murrumbidgee there is a lot of good lime. People now complain that it is too far to cart into Gundagai; but Adelong Crossing would only be about half the distance.
1636. Do you think it is likely that the ore traffic will assume large proportions within a reasonable time? I believe so. I am living in hopes of it.
1637. How are the Gibraltar people treating their ores at the present time? I believe that they are treating them themselves. They have a cyanide and a chlorination plant.
1638. Then they would not require the railway for the conveyance of their ores? I do not think so.
1639. Is there as much mineral in their ore as you appear likely to get at Mount Adrah? Eighty per cent. more. Mount Adrah has not got to the mineral level. It is slate and sandstone country. My experience teaches me that granite always carries more mineral, while slate and sandstone are freer.
1640. If the Gibraltar people are able to treat their mineralised ores locally, would it not be possible for others similarly circumstanced to do the same thing? They would not have sufficient capital to erect a suitable plant.
1641. If large companies with sufficient capital were formed, they could do what the Gibraltar people are doing? Yes; they could treat their mineral on the ground.
1642. In that case the railway traffic would be very little? Yes.

Charles Purcell, farmer and grazier, Adelong Creek, sworn, and examined:—

- C. Purcell. 1643. *Mr. Levien.*] How long have you been a resident of this district? I have been here ever since Adelong was first opened up—forty years or more.
- 4 Dec., 1899. 1644. How many acres have you? 2,900 acres.
1645. How much land is under cultivation? About 400 acres.
1646. What do you generally cultivate? Wheat and hay, but mostly wheat.
1647. And oats? A small quantity of oats; but I grow chiefly wheat and corn.
1648. What number of stock have you? On the average about 4,000 sheep, or sometimes 5,000 with the lambs.
1649. And how many cattle? About 100 head.
1650. And horses? I have thirty or thirty-five horses.
1651. How many sheep to the acre will your grazing-land carry? I have no leased land—it is all selected land—and the 2,900 acres carry 4,000 sheep. After the lambing, I get rid of about as many old sheep as I have lambs, so that on the average we run somewhere over 4,000 sheep through the year. We sometimes feed them on the cultivated land after the crop has been taken off.
1652. What do you think of the district as one to send starving stock to? I do not think it can be equalled in any part of New South Wales.
1653. Do many stock come here? They come here from all parts.
1654. What is the country like in the winter? It is very good in the winter.
1655. Have you plenty of feed here, winter and summer? Yes; I have not been compelled to move my sheep for eighteen years.
1656. Is there much grass-seed here? Only when you spell the paddocks.
1657. What yield of wheat do you generally get? On the average, from 12½ to 15 bushels to the acre.
1658. What is the best yield you have got? I have got as high as 35 and 40 bushels to the acre, but in some years it is much less.
1659. What yield of maize do you get? On the average, about 30 bushels to the acre.
1660. Have you ever sent any wheat to market? I have sold wheat to Taylor. That wheat was sent to Sydney.
1661. What did you get for it? 2s. 2d. a bushel in Adelong.
1662. You delivered it here? Yes.
1663. And it was then carted to Gundagai? Yes.
1664. What do you get for your corn? From 3s. to 2s. 6d. a bushel.
1665. What is the quality of your corn? It is pretty good, I think. I grow Clarence River corn.
1666. What do you think of this district for dairying? I think it is very suitable for dairying. We make very good butter, and the cows milk well.
1667. What is the timber like? We have very good timber higher up in the Bago country—mountain ash and urabbie, a very useful wood.
1668. Is there much land up there uncultivated, which would be cultivated if there were a railway? Yes. I think the land up there would be very good for farming, but it is very heavily timbered at the present time.
1669. What do you think it would cost to clear? On some patches the timber is very heavy, while on other patches it is lighter. I should think it would cost £6 or £7 an acre to clear.
1670. What do you think it would be worth after it was cleared? I can hardly say, but the crops there have been very heavy. Nearly every one who has cleared that land is satisfied that he can make a good living on it.
1671. What is your opinion in regard to the assistance which the proposed railway would give to the district? I think that the railway would do a great deal of good; it would give employment, and it would cause more land to be cultivated. There is money in wheat-growing at 2s. 2d. a bushel, or a little more, if we had a cheaper means of getting it away. We do a lot in chaff, too.
1672. The difficulty from which the farmers are suffering is the want of a quick means of transit to market? Yes; we are handicapped.
1673. Is your crop later here than in most places? Yes, much later.
1674. A letter written by a person signing himself "Maize-grower" states that the Tumut season being late,

late, the local farmer is slow in getting his produce to market, so that when he gets there there is a glut, and prices are, consequently, low? I have not had much to do with the Sydney market. C. Purcell.

1675. But you think that railway communication would facilitate settlement here? Yes. I would put 4 Dec., 1899.

1676. Do you think a railway would be of great assistance to you in sending sheep away? Yes. At the present time we have to send to Gundagai.

1677. How long does that take? It takes about four days to send sheep there.

1678. And you have to wait for notice from your agent before you can muster? Yes.

1679. So that I suppose it is five or six days altogether before you can get stock into the market, and by that time the prices may have gone down? Yes.

1680. The Chief Railway Traffic Manager has told us that there has been a great falling off in the output of tobacco from this district? The people here are under the impression that a ring has been formed who can do as they like in regard to the tobacco. I have had tobacco for four years past, but I am afraid to send it away. Two pence is the best offer I can get for it.

1681. What used you to get for it? As high as 9d., in the early days.

1682. Is the quality now as good as it was then? Yes; but we cannot sell it if we send it away.

1683. Do you think there is any opposition to the colonial leaf? No. We can still grow good enough tobacco.

1684. Would your sons increase their area if there were better facilities for getting to market? We are all working together. Although sheep pay fairly well, we find that we can make more money by doing a little cultivation, and one industry helps the other. I think that every farmer should have sheep, because they make the land stronger, instead of allowing it to get worse.

1685. Do you think that there are many besides yourself who would put more land under cultivation if the railway were made? Yes.

1686. What do you think are the prospects of fruit-growing in this district? We have one of the best climates for fruit-growing that you can get anywhere.

1687. I suppose that those who now grow fruit suffer from not being able to get it to market? Yes; especially those in the Bago country. There, our fruit is coming in when similar fruit is going out in other parts of the country.

1688. That is the time when the growers should be able to realise a good profit? Yes. The same thing applies to the potatoes. Potatoes are coming in there when they are done at places not further away than my own place.

1689. Do you think much land will be cultivated for fruit-growing if the proposed railway is made? I think so. If I were not in the position in which I am, the first thing I should do would be to take up, say, 20 acres of land in the Bago country for fruit-growing. Many others, besides myself, have thought that it would be a good thing to go in for fruit-growing there, and to start a jam factory. We have never known the fruit in that district to be bad; and wherever a miner has planted a few trees they are to be seen there still. It is a wonderful fruit-growing district.

1690. What is the quality of the fruit? The fruit is a good quality. There are thousands of acres of Crown lands in that district, and the land is well watered with little creeks, so that you can get water on to nearly every little holding. There is a small amount of gold in all the creeks. The greater part of Sharp's run, there, is Crown lands. It is a forest reserve. With regard to the Gibraltar mine, I should like to say that they send away tons of concentrates that they cannot treat here. I know that the manager of the mine is sorry that the railway is not coming to Adelong.

1691. Have you anything to do with mining yourself? Yes, I do a little in it myself.

1692. *Chairman.*] If the proposed railway were constructed, where do you think the traffic from the country you have been describing would strike the line? Either here or at the Gilmore; but I should think at Adelong. Mr. Hides has a saw-mill there, and he sends his timber to Wagga, and from there to Narrandera. The country is a splendid district for timber, and in years to come will provide accommodation for thousands of families.

1693. But it is very expensive country to clear? Yes; but you could grow crops in amongst the timber. The miners used to do that in the early days. They grew fruit and vegetables, and whatever they wanted. As the colonies become populated people will have to go there.

1694. Do you think it would pay a person to grow fruit there and send it to Sydney? Yes; it must pay. I have seen nothing like what can be grown up there. The great advantage of that district is that everything is late there. I have seen people dairying almost in the heart of the country I speak of. A Mr. Mitchell had a dairy up there, and got splendid butter; but things went to the bad with him, and the dairy had to be shut up. You can grow anything up there. The rent asked for some of the high land there for sheep is too high. They put as much as 9d. an acre on some of that land; but it is more suitable for small farming. I know men who had nothing when they started there years ago, but who are pretty well independent now. Mr. Basham is quite satisfied with what he gets off his 8 acres.

1695. Do you know the district thoroughly? Yes.

1696. Do you know the alternative routes for the proposed extension? Yes.

1697. What is the country like near Brungle? It is very good country. The river flats are very good; but the hills are not so good as the hills here.

1698. Do you think there is more land suitable for agriculture there than on the route *via* Adelong? No; the forest land here is better and flatter. While the river-flats there are better than ours, the land on the hills is not so good. We have many creeks here—Sharp's Creek, Yaven Yaven Creek, and others—upon which you could grow nearly anything. As Sharp's Creek there is a reserve upon which no doubt hundreds of families could settle if they could take up the land.

1699. Agriculture seems to have fallen off in some parts of this district;—how do you account for that? I think that people are afraid that they will have no market. It is only since the Gibraltar mine broke out that we have had a market.

1700. It would not pay to send to Sydney? No; we could not compete with Sydney. On one occasion there was a lot of corn stored up at Tumut, and the price rose to 3s. 6d. or 4s. a bushel in Sydney; but before they could get it away prices had fallen again.

1701. If the railway authorities imposed special rates, which would be almost as high as the rates now paid

- C. Purcell.
4 Dec., 1899.
- paid to teamsters, would the line be of any advantage to you? Yes, because it would enable us to get our stuff to market more quickly. In my opinion there are hundreds of tons of stone here which it would pay well to treat if we had proper machinery. The Challenger mine people have proved that it pays to send stuff away. Even the Gibraltar mine people, notwithstanding their good machinery, send their concentrates away. In some parts of the district mining operations are hampered very much by the presence of water after you have got down 50 or 60 feet, so that people have had to abandon their land. At Quartz Vale they have plenty of gold; but they cannot get down because of the water. In time those places will be worked, because the gold is there.
1702. But the railway would not alter that state of things? Perhaps if they had a proper crushing plant, and cheaper means of conveyance, they might be able to deal with their ore, and send it away.
1703. *Mr. Dick.*] What is the principal market to which Mr. Hides consigns his timber? He sends it to Narrandera, to Wagga, to Tumut, and to Adelong.
1704. Which is his largest market? I think the Wagga market.
1705. If the proposed railway were constructed, do you think it would pay him to send his timber by road to Adelong, and then by rail to Wagga, instead of sending it direct to Wagga? If the railway came to Adelong and to Tumut, he would do very well with his timber. Although he sends a great deal to Wagga, he also sends a good deal to Gundagai.
1706. It is cheaper for him to send his timber direct to Wagga than to consign it *via* Gundagai? I cannot say; but I have often heard him say that, if a railway were to come to Tumut, instead of having one mill he would have two or three. If people new of the quality of his timber, they would buy much more of it than they buy at the present time. I drew timber for a building in Tumut about thirty years ago, and it seems just as sound to-day as it was then. There is so much timber there, and the trees are so thick, that it is difficult to get a log out.
1707. Is that the land which you say will provide homes for so many families in the future? The country between there and where I am living. You get into that country about 14 miles from Adelong, and then you can go on about 20 miles towards Kiandra and the falls of the Tumut River.
1708. What proportion of flat lands is there on your own holding? I have about 1,000 acres that I could cultivate.
1709. About one-third of your holding? Yes.
1710. Is that a picked spot? No; it is about the usual run of the country. My place is rather more hilly than many other parts.
1711. You can only get flat land by following up the creek? Yes; but when you get well up the creek you come on to the tableland, where the country is flat, but heavily timbered.*

James Thompson Mackie, manager, Eilerslie station, near Adelong, sworn, and examined:—

- J. T. Mackie.
4 Dec., 1899.
1712. *Chairman.*] How many acres are there in the property of which you are the manager? About 30,000 acres.
1713. Is it chiefly purchased land? Purchased and conditionally-purchased land. It is all secured land.
1714. It is owned by Messrs. Petersen and Sargood, of Victoria? Yes.
1715. You have been managing it for about two years? Yes.
1716. But you have known the district for a great number of years? Yes, though not intimately.
1717. Before coming here as manager, you were managing a station in Riverina? Yes.
1718. How would you compare the two districts for grazing purposes? I consider that the Riverina country is better grazing country than this in ordinary seasons, though during the last few years it has not been. The seasons here are more reliable.
1719. What is the carrying capacity of your run? We shear from 22,000 to 24,000 sheep, but we do not stock heavily—nothing like so heavily as the majority of our neighbours.
1720. You have also a considerable number of cattle? We have 400 cattle; but we are reducing their number.
1721. Have you any other stock? Only a few horses.
1722. Your land carries about a sheep to the acre? Yes; allowing for the cattle. It would carry more if the land were all improved, but there are reserves which we have not touched.
1723. What proportion of the holding is reserved? I should say that about 4,000 acres have not been ringbarked.
1724. In its native state, I suppose the country will not carry much stock? No.
1725. The other part of the run is highly improved, is it not? Yes.
1726. Do you rely entirely upon the grass for your feed, or do you also grow crops? We do a certain amount of cultivation.
1727. Do the main flocks depend entirely upon the grass for their food? Yes.
1728. But you cultivate to a considerable extent to obtain food for your valuable stock? Yes; and also as security against very bad seasons.
1729. Would you have enough artificial food to carry the large flocks through a bad season? Yes; enough to pull them through two or three months. We grow lucerne and wheat.
1730. The crops are grown on the rich river flats? Yes.
1731. Do you find them very prolific? Yes.
1732. How many cuttings of lucerne do you get? We generally take two cuttings, and then let the animals in upon it; but we could get three cuttings, and in very good seasons, four.
1733. You go in extensively for siloing? Yes.
1734. Do you find that answer? Yes, very well.
1735. You say that the country is not utilised to its fullest extent;—what would you say would be using it to its fullest extent, if it were improved? That is a hard question to answer. It would depend very much on the manager, for one thing. One man wants to give his stock more room than another man would give. Many men would put on the place double the number of stock that we are now carrying.
1736. Do you fatten your stock? Yes.
1737. And send it away *via* Gundagai? Yes; and our wool goes by way of Gundagai.
1738. How far are you from Gundagai? Twenty-five miles.

1739.

* NOTE (on revision):—I consider that the line, as suggested by Mr. Hotson, to be brought through the town of Adelong, and thence to Tumut, and afterwards to be carried to Tumbarumba, is the most favourable route.

1739. What do you pay a ton to send to Gundagai? Fifteen shillings a ton, and the same for back loading, of which we get a considerable quantity. Salt, for instance, is a very heavy item.
1740. How far would you be from the proposed railway? I should think Adelong would be our nearest point; but if we could get through to Grahamstown, that would be the nearest point.
1741. How far are you from Grahamstown? Between 5 and 6 miles.
1742. What would it cost to get to some point on the railway about Grahamstown? I suppose about one-half of what we pay now.
1743. That would be about 7s. 6d.? Yes; probably about that.
1744. What does your clip realise in bales? Sixty tons.
1745. That would be about 420 bales? Yes; including the lambs' wool, the clip would amount to about 68 tons.
1746. *Mr. Watson.*] What weight of wool per head do you get from the sheep here? From 8 lb. up to 10 lb. The actual weight this year was 7 lb. 15½ oz., not including lambs. Lambs would average about 1½ lb.
1747. *Chairman.*] Mr. Harper has estimated the wool traffic of the proposed railway at 140 tons or about 1,000 bales;—is that an under estimate? I should say so, considering that our run alone produces 420 bales.
1748. Do you regard the proposed extension favourably, or unfavourably? I think it will do the district a lot of good.
1749. In what way would a development of the district, which would bring increased traffic to a railway, occur? Only by increased cultivation, the throwing open of reserves, and the improvement of the land.
1750. What would the reserves be suitable for, chiefly? I do not know the reserves, except our own. We are now considering an application for an exchange of land. We are willing to give up some of our good wheat land to get the land on the reserve, in order to consolidate our property.
1751. In regard to the practice of sending weak sheep here in bad seasons, would an extra 20 miles of railway make a big difference? It would make a big difference to the sheep.
1752. But do you think it would lead to the sending of a greater number of sheep here? I cannot say. If there is no feed for the sheep elsewhere, they must come here, whether there is a railway or not. Of course, if the line went to Tumut, the sheep would go further into the country. Last year we got 24,000 sheep up by rail ourselves, and we sent them back by rail. We are also getting sheep up again this year.
1753. You had to drive those sheep from Gundagai? Yes, without a bit of food.
1754. Did you lose many of them? No; because we had careful drovers, and they started before they got too poor, so that they could stand the journey.
1755. Is the district capable of carrying a very large number of sheep? Yes.
1756. That being so, why is it not stocked more heavily;—why is it that there is always food and to spare for other sheep? Because it is a summer country rather than a winter country.
1757. The country is not so good in the winter months? No. In cold weather stock want more grass, and the grass does not grow here in the winter as it does in the summer. In summer there is a rush of feed.
1758. The country is not good for continuous stocking? Not for continuous, heavy stocking. In the autumn you may get enough rain to give you feed to carry your own stock through; but not to carry through double that number.
1759. Do many of the other run-holders in the district grow produce for their flocks? I do not think so.
1760. What is the value of good grazing land here? Some of it is, I suppose, worth £10 an acre—that is, the land on the flats. The hilly land is not worth so much. The question is a very hard one to answer.
1761. What is the value of the alluvial flats, and the fringes of the hills upon which they grow crops? I cannot say; we have never sold or bought any of that land.
1762. Is there much land on Ellerslie suitable for agriculture, or is it chiefly pastoral country? It is chiefly pastoral country; but, roughly speaking, there are about 4,000 or 5,000 acres suitable for agriculture.
1763. That would be on the flats? Yes, and on some of the hills.
1764. All the crops are grown here without irrigation? Yes.
1765. And the rainfall is reliable? Yes.
1766. Of course, that land is not available for settlement? Some of it will be, if the exchange which I have mentioned comes about.
1767. The Committee have noticed small patches of cultivation on the common;—how do the holders get that land? They are residential lessees.
1768. What acreage do they hold? I am not sure whether it is 10 or 20 acres.
1769. They are people who follow other occupations, and cultivate this land in their spare time? Yes.
1770. *Mr. Shepherd.*] If you run a sufficient number of stock in the summer to keep your feed down, how do you manage to provide for your own stock in winter? There is generally enough rain in the autumn to give a fair spring for the winter.
1771. When do the stock which come here in the summer leave again? About March or April. If people allow them to stay longer they make a mistake. Last year we were running three sheep to the acre on Sharp's land until the 3rd of April, and by the end of April he had grass from 9 to 12 inches high on it, and was able to let it again after we had given it up.
1772. Is that usual? I do not think so. We generally get rains in March and April, which give a fair spring of grass in the winter.

Albert Edward Merryfull, storekeeper, Adelong, sworn, and examined:—

1773. *Mr. Watson.*] How long have you been a resident of Adelong? For twenty-six years.
1774. Do you agree with the evidence of Mr. Park in reference to the probabilities of traffic between Gundagai and Adelong? I think his estimate of the present traffic is a very fair one, but I think that a considerable quantity of goods come here to private people, for which he has not allowed.
1775. What would that amount to? It would not make a great difference.
1776. *Chairman.*] £100 a year in freight? Yes, about that, I think.
1777. That is road carriage between Gundagai and Adelong? Yes.

1778.

A. E.
Merryfull.
4 Dec., 1899.

A. E.
Merryfull.
4 Dec., 1899.

1778. *Mr. Watson.*] If a railway were made, passing Adelong about 3 miles to the east, what do you think would be the cost of conveying goods to Adelong from a station somewhere about West's Creek, or somewhere opposite the town? I think about 5s. a ton.

1779. That would have to be added to whatever charge is made for the railway carriage? Yes. Goods that now come to Tumbarumba *via* Wagga would come this way if the railway were brought near Adelong. Some years ago a survey was made up the Adelong Creek for the purpose of continuing the line on to Tumbarumba. All the Hillas Creek and Tumbarumba traffic would come here if we had a railway. A large storekeeper in Tumbarumba told me that he would prefer to get his goods this way, but they cannot be sure of getting them now. Then the people of Bago and Batlow would come here. It is Wagga that deprives this place of its rights.

1780. How is it that Wagga is able to compete with Gundagai? I do not know what the rates are now, but at one time it used to pay us to bring our goods from Wagga by team.

1781. What distance is that? Fifty-two miles.

1782. To allow this place to compete with Wagga for the Tumbarumba traffic through rates would have to be applied, because there are through rates to Wagga? Yes.

1783. Do you know anything of the country out towards Tumbarumba? Not further than Riley's Gap.

1784. How far is that? Nine or 10 miles from here.

1785. That country could be held to be within the influence of the line now projected? Yes. The proposed line would benefit the Gilmore country and places out that way. That would be the nearest point for the Batlow traffic, though, of course, if the terminus were here the traffic would come here. If the terminus were out at Godara, the traffic would go to the Gilmore.

1786. If the line were brought up the Adelong Creek, and terminated behind this town, the Tumut people would be at a disadvantage? There could be a branch line from here to Tumut. The only difficulty would be in getting through the Gap, and between here and Sydney there are many cuttings quite as big as would be required there. In my opinion, such a cutting would be the means of opening up the district, because it would open up many of the reefs that exist there.

1787. The Railway Commissioners tell us that it would be an exceedingly costly work to get through the Gap? Well, I think not. That is the route I favour. The terminus would be at the back of the town, and, subsequently, there could be an extension to Tumbarumba.

1788. Do you think that in the event of a railway being made the teamsters would reduce their rates? I am sure that they could not. They might reduce the rates for third-class goods.

1789. Do you think that teamsters could carry third-class goods for less than 17s. a ton? I am sure that they could not. Their rates for carriage depend largely upon the season. If there is a good season they can afford to cart the stuff for less, because they then have to pay less for fodder. I have seen the corn as high as 7s. 6d. a bushel, although at the present time it is only 3s. 4d. a bushel.

1790. During the spring and summer months the teamsters would rely upon the natural grasses for their working stock? Yes; but not in winter.

1791. In winter they have to buy fodder? Yes.

1792. You think that, so far as Adelong is concerned, a great deal more benefit would result from the construction of a line to Adelong, with a possible future extension to Tumbarumba, than from the construction of the proposed line? Yes. I think that if the Hillas Creek people had to go to either Adelong Crossing or Godara to reach the proposed line, they would prefer to go to Wagga, because the country that way is more level.

1793. You think that the proposed line will not draw any traffic from Hillas Creek? No. The people in that part of the district might as well go to Gundagai as to Adelong Crossing. Mr. Ryan, when he was under examination in Gundagai, stated that butter used there was obtained from Sydney, but I know personally that butter is being supplied to Gundagai from the Adelong district at the rate of 150 lb. a week. That quantity is being supplied by one person alone. Mr. O'Brien is going in for dairying on the Gilmore upon a very large scale, and soon we shall be able to stop getting butter from Sydney altogether. The only time I got butter from Sydney now is during the winter months. I do not suppose a box of butter has come into Adelong for the last two months from down the country. It is all locally supplied.

1794. *Chairman.*] Do you agree with former witnesses, that if the proposed line were constructed people would begin to use it from about Adelong Crossing? I think they would begin to use it from about Willieploma, about 6 miles out of Gundagai. They would come down from Big Ben Creek and about there, and down the marked-tree line.

1795. Six miles of road carriage would be worth saving? Yes.

1796. It is pretty well admitted on all hands that the proposed line would be a losing line to begin with;—what prospect do you see of the revenue increasing? Revenue will increase as more ground is taken up. From here to Tumbarumba, and towards Batlow and Bago, the higher the country the better the ground.

1797. That country would not be served by the proposed line to Tumut? No. If that line were constructed, the traffic from the country I speak of would still go to Wagga. There is an enormous quantity of timber out about Bago. There are three or four kinds of timber there which are largely used for coach and waggon building—urabbie and mountain ash. I think that thousands of feet of that timber would go to Sydney if the railway were taken out that way.

1798. What have you to say in regard to the starving stock traffic? Most of the sheep come to Gundagai by rail, and travel from there out towards Kiandra. If the railway were extended from Gundagai to Tumut it would benefit starving stock more than anything else.

1799. But it is only an exceptional traffic, in bad seasons; it is not a regular traffic? No; but this is chiefly a summer country. Of course, if the line were made, more ground would be taken up, and, as the district became more largely populated, the railway revenue would increase.

1800. Is the land available for population? Yes; thousands of acres.

1801. In what direction? Up Talbingo way, and out towards the caves.

1802. That is a good distance from here? I suppose it would be 60 miles.

1803. Do you think the traffic from that district would help the railway? It must help the railway.

1804. *Mr. Watson.*] Agriculturists would want a railway nearer than 60 miles? I refer to that district only with regard to its grazing possibilities. Another source of revenue would be the tourist traffic to the caves. Everything would bring grist to the mill. I am not in favour of the line as surveyed, but, if it were brought nearer to the town of Adelong, I should be in favour of it.

1805.

1805. If the line were taken along the Tumut Valley, it would be utterly useless to you? Yes. I think that when they were building the Gundagai bridge they should have made it strong enough for railway traffic, and then a great part of the difficulty would have been got over.

A. E.
Merryfull.

4 Dec., 1899.

Arthur Williamson Mollineaux, auctioneer and commission agent, Adelong, sworn, and examined:—

1806. *Chairman.*] How long have you been in the district? Nineteen years.

1807. In what respect do you think the proposed railway would benefit the district? I think it would benefit the district by making it possible for us to send our produce away more cheaply, more quickly, and with more certainty. At the present time we must depend upon the teamsters as far as Gundagai, a distance of 22 miles.

A. W.
Mollineaux.

4 Dec., 1899.

1808. Is it of any great advantage to be able to get wool away quickly? Sometimes it is, if you are consigning to any one firm of brokers, because otherwise you may miss a market. That happened, in my experience, about a fortnight ago.

1809. You are aware that the Railway Commissioners do not recommend the construction of this line, because there would be a deficiency of about £4,000 a year in the working of it? I agree that it will not pay at first, but I can hardly think that the deficiency will be so large. In my opinion, each year would make the deficiency less.

1810. I understand that most of the country here is alienated, and that the river flats are restricted in area, so that it is not easy to see how there can be any great increase in the agricultural production of the district? Although a great deal of the land is alienated, I think that if the railway were made it would be to the benefit of those who hold land to cut it up into farms, and, if they did not cultivate it themselves, to let it out to others, as has been done in other places. There is a considerable area of land suitable for agriculture along the Adelong Creeks.

1811. Did you know the district before the railway to Gundagai was built? Yes.

1812. Has that railway increased the production of the country 10 miles on this side of Gundagai? Yes; so far as Adelong is concerned there is more land under cultivation now than there was then, and each year it increases.

1813. What kind of crops are grown.—wheat? Wheat, both for grain and for hay, and oats for hay.

1814. Do they export it? Yes.

1815. Of late years has agriculture increased, or has it decreased? It has increased.

1816. Are the crops reliable year after year? Yes; I think that they are as reliable here as in any part of the Colony.

1817. Have you any idea as to the number of acres of land suitable for agricultural purposes within a few miles on each side of the proposed railway, between here and Adelong Crossing? There is a considerable area; but I could not tell you how many acres it comprises.

1818. At the present time what proportion of that land is under cultivation—one-half or one-fourth? I should say more than one-fourth.

1819. Are the people who are cultivating the land in a prosperous condition? Yes.

1820. Why is not more of the land under cultivation? Because of the difficulty and uncertainty of getting produce to market.

1821. You are aware that if special rates are imposed the railway charges will be very little lower than the present road charges? That would not refer to the charges for all kinds of traffic. It would not refer to the charges for traffic from the mines, for instance. I take it that the chief gain to the district from the construction of the railway would be in quickness and certainty of despatch.

1822. Do you think there need be any fear of the carriers reducing their rates so as to be able to compete successfully with the railway? I do not think so. I suppose if the railway were made there would be a station somewhere about Adelong Crossing, and another between here and the Crossing, and that would prevent them from competing. If there were no station between here and Gundagai it would be different.

1823. At what point on this side of Gundagai would the traffic to the railway commence? At a point about 6 miles on this side of Gundagai. The traffic from Big Ben Creek would come in there.

1824. Would it be worth the while of a person living 10 miles on this side of Gundagai to cart his stuff to a station at such a point;—would he not be rather inclined to go right into Gundagai? I think that people would cart to the nearest station, because in most cases they would use their own teams.

1825. Would the freight from the mines be increased if a railway were made? Yes. The gold here is largely mineralised, and the treatment of the pyrites ore has always been a source of difficulty. On the surface the gold is comparatively free; but, as you get deeper, the pyrites becomes heavier, and a lot of gold is lost if the stone is treated locally. Since the smelting works at Cockle Creek and Dapto were started we have sent the concentrates there for treatment.

1826. They would go by team to Gundagai, and thence by train? Yes. It is, however, becoming more the practice to send away the ore itself, perhaps only hand-dressed, and it is questionable whether in future the whole of the ore will not be sent away. The Gibraltar company have erected a very complete plant for the treatment of their ores, consisting of a battery, a chlorination plant for dealing with the concentrates, and a cyanide plant for treating the tailings. Finding, however, that they could not get all the gold by the chlorination process, they have been selling their residue to the Cockle Creek people, and they have since found it cheaper to ship the whole of their concentrates away without chlorination, notwithstanding the cost of carrying the extra weight.

1827. Do you know the rate of freight from the Gibraltar mine to Gundagai by team? No; from Adelong the general rate is 12s. 6d a ton. I suppose it would be a little less from there.

1828. What amount of tonnage do you think would be sent away? That question is a difficult one to answer; but I think that the treatment I speak of will encourage the development of mines here.

1829. Have the Gibraltar people made excavations to test their mine? I do not think they will give outsiders any particulars of their work. At the present time they are sending away between 30 and 40 tons of concentrates.

1830. What other mining developments do you expect here? The difficulty of obtaining firewood for the mines is increasing, and it is a question with the Gibraltar people whether it would not be cheaper to import fuel. I believe that they have imported some fuel at a cost very little more than what they now pay for

- A. W. Mollineux.
4 Dec., 1899.
- for firewood, and before long the price of firewood will be increased, because the wood-getters will have to go further out for it.
1831. Adelong is a very old gold-field? Yes.
1832. Why has it stagnated;—why has not the number of mines increased? So far as I can judge, the reason is that a sufficient amount of development work was not gone on with when the mines were paying. As no reserves were kept for development purposes when the rich shoots of ore were worked out they had to stop for want of capital.
1833. This is a mining field only for capitalists? At the present time it is almost solely a capitalist field. Two of our mines are over 1,000 feet in depth, while the others vary between 200 feet and 1,000 feet.
1834. *Mr. Watson.*] How are the deep mines doing now? One of them is working now at the 600-foot level, though that is not its deepest level.
1835. On tribute? Yes; at the present time the tributors are doing development work.
1836. That is rather unusual, is it not? No; of course, they do not do it if they can help it; but frequently instances have come under my notice in which the tributors are doing development work.
1837. Then we cannot look for any large increase in the mining population? Well, a few years ago there were not many men at the Gibraltar mine; but there are 250 men there now, and any of these old mines may be reopened at any time. Negotiations are now going on to my knowledge which, if successful, will probably lead to the engagement of a large number of men. The construction of a railway would, of course, reduce the rates of carriage to the mines—the rates on explosives, candles, steel, and other things required for the mines.
1838. Are you favourable to the line going as proposed, or do you think it should come round to the town of Adelong? I should like to see it come to the town of Adelong; but if you are to take Tumut into consideration, perhaps it is better where it is.
1839. It would be difficult to get to the proposed line from Adelong? Yes.
1840. That being so, do you think that the Adelong people would give the line the go-by and continue to send to Gundagai? I do not think so. I think that the proposed line would be better than no line at all, and that it would be made use of.
1841. *Mr. Shepherd.*] To what extent do you think the railway would be benefited by the traffic in pyrites? It is hard to say, because that traffic is only just commencing. It is only of comparatively recent date that they tried the experiment of sending the ore away.
1842. Cannot you form any idea as to the quantity of ore likely to be sent away? Well, I suppose 100 tons a month would be sent away, and the quantity would probably increase.
1843. The ore would go chiefly, I suppose, from the Gibraltar mine? There would be a good deal from the other mines as well. They are on the far side of the creek, and could more conveniently use the railway.
1844. How many mines are working now? About half a dozen, in addition to the Gibraltar mine. I anticipate that the ore will be sent without treatment of any kind, and that, of course, will increase the weight.
1845. Do you think that all the mines will send their ore? They must do so.
1846. *Mr. Watson.*] How much would concentrates be worth a ton? They vary from 2 ounces to 10 ounces a ton.
1847. One hundred tons of concentrates a month would only bring in about £60 a year to the proposed line, but if the crude ore were sent traffic would be much greater? Yes. The concentrates are not one-tenth the bulk of the crude ore.
1848. Estimating them at one-tenth, about £600 a year would be obtained from the ore traffic? Yes. I think it is quite possible that the traffic would amount to that.
1849. Do you think that the Gibraltar people will allow their batteries to lie idle? Well, their manager told me some time ago that their chlorination works were for sale.
1850. Do you think they would find it to their advantage to allow their batteries to lie idle, and to send away their crude ore? I think so.
1851. At Cobar, owing to the fuel difficulty, they reduce the ore to matte, and send it to Lithgow for treatment, bringing back coke;—the same arrangement might be made here if the fuel difficulty became very great? Yes; but here it is very difficult to prevent the loss of gold in treatment. The Gibraltar Company have to treat their tailings after they have been through the batteries and through the chlorination works.
1852. Do you know whether they get enough from the tailings to make that pay? I know that they can afford to buy the tailings from the other local battery, and cart them away for treatment. I think that there would be a considerable trade in timber if the proposed railway is constructed. There are large forests of timber up in the Bago district now, but at the present time it will not pay to send it away.
1853. How far will they have to cart it? They will only have to cart it to Adelong.
1854. What distance is that? Seventeen or 18 miles. A witness was asked this morning why there had been a falling off in the tobacco production of the district. The reason is, not that we cannot grow tobacco here successfully, but because the wrong kind of tobacco is being grown, and the Sydney merchants do not care to use it. They told me a little while ago that the taste for our kind of tobacco had gone out; but the growers here have not adapted themselves to the change.
1855. *Mr. Shepherd.*] I suppose the American leaf is preferred? I do not think so. The tobacco grown in the Inverell and Tamworth districts sells readily enough; but I have been told that the growers in this district have not adapted themselves to the requirements of the trade.
1856. *Mr. Watson.*] Is the land which was formerly used for tobacco now used for other crops? No; it is used for grazing. I think there would be a considerable increase in the wool traffic if there were a station near Adelong. I think that the Yabtree and Mount Adrah clips, amounting to about 500 bales, would find their way here.
1857. *Chairman.*] How far are those places from Adelong? Fifteen or 17 miles from Adelong on the direct road.
1858. They would come within the influence of the proposed railway? Yes, if there were a station at Adelong Crossing; but I do not think they would come to Adelong itself. Either place would be considerably nearer than Wagga, where they go now. Then, too, the station supplies which now go from Wagga would be brought along the proposed line.

1859. Can you give us the names of any stations which now send to Gundagai, but would send to the proposed line if it were constructed? The stations I have named are the principal ones. I am afraid I cannot give you any fuller information on that subject. I should like to report what has been said by others in regard to the fruit-growing industry. There is no doubt that we can grow very fine fruit here. All the English fruits grow well, and, at the present time, a considerable amount of fruit is exported. The export of fruit would be larger if we had better means of conveyance. Our fruit does not all go to Sydney; some of it goes to Riverina.

A. W.
Mollineux.
4 Dec., 1899.

1860. You export fruit at the present time? Yes, though, of course, we import certain fruits as well. Then, there is a large area of land suitable for potato-growing, but the heavy freights keep back that industry.

1861. The soil is peculiarly suitable for potatoes? Yes. It is volcanic soil, and is very suitable for potatoes. I have a few figures here in regard to the mining industry which might be of interest. I have obtained the information from the Mining Registrar here. Since the 1st January, 134 acres of ground have been applied for in ordinary leases, 532 acres in special leases, and 2,022 acres for authority to enter under the Mining on Private Lands Act; a total of 2,688 acres. The number of miners' rights issued is 442, so that we may take it that there are over 400 miners resident in the district.

1862. *Mr. Shepherd.*] Do you know how many there were twelve months ago? No; but I think the number was then much about the same. At the Gibraltar mine there are about 250 miners at work; but, in addition to them, a number of men are employed as mechanics and in other ways about the mine, and others in getting firewood. A railway would be a great convenience to the graziers in facilitating the transfer of fat stock. I do not know that the number of fat stock sent from the district would be increased, but they would go away in better condition.

1863. *Chairman.*] Pastoralists would sooner send their sheep away by train than drive them 20 miles? Yes. If the stock is fat they like to truck at the nearest station. Store stock they sometimes prefer to drive.

TUESDAY, 5 DECEMBER, 1899.

[The Committee met at the Court-house, Tumut, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Alfred Henry Chesterman, Staff surveyor, Department of Lands, Wagga Wagga, sworn, and examined:—

1864. *Chairman.*] How long have you been stationed at Tumut? Over nine and a half years.

1865. Are you well acquainted with the whole district? Yes.

1866. *Mr. Watson.*] Do you know the country beyond Tumut? I know the country from Tumberumba to the border. I have had fourteen years' experience in that part of the country. I also know the country north to Cootamundra, west to Wagga, and east to Kiandra. I have had nine and a half years' experience in that district.

A. H.
Chesterman.
5 Dec., 1899.

1867. Taking the land along the surveyed route of the proposed line from Gundagai to Tumut, how would you characterise it? It is mostly ridgy, forest country, but in places the line runs through flat ground. After leaving the Adelong Crossing it rises into slightly hilly country.

1868. You are speaking of the country which would be traversed by the line? Yes.

1869. Tell us about the country generally? It is flat land, or ridgy, forest country, for the most part.

1870. The flat land is acknowledged to be good? Yes; it is supposed to be particularly rich.

1871. How do you regard the higher land? The lower ridges are admirably adapted for wheat-growing, but the higher ridges consist mostly of what I would class as fairly good sheep country.

1872. So that very little of that country would be actually non-productive? From my experience of the district I think it would be all more or less productive. Of course, there would be degrees of production.

1873. Can you give us a rough estimate of the proportion of flat land to the whole area of country within 10 or 15 miles of the proposed railway? I have prepared a statement classifying the whole of the land which would be affected, in greater or less degree, by the construction of the proposed railway as pastoral and arable land, and showing the extent of the flat land.

1874. To what area of country does that statement refer? In preparing my statement I went south to a point about 10 miles north of Tumberumba, which would be less than 30 miles from the Gilmore, where the nearest point on the railway line would be. As the traffic from that district at present goes to Wagga or to Culcairn, distant respectively about 70 and 65 miles, I consider that in the event of the proposed railway being constructed it would come to the Gilmore, because the distance is shorter. On the east I have taken in the Yarrangobilly table-land, the furthest point of which is about 45 miles from Tumut, and about 60 miles from Cooma, which is the nearest railway station on the other side. North-east I have gone a distance of about 20 miles; but I have not taken in a large area included in the coloured portion of the Committee's map—the Brungle Creek country, because I consider that that country would continue to be served by the existing line. Brungle is about half-way between here and Gundagai, and it is not likely that the traffic from that part of the country would come back to Tumut to get to a railway station. I have also excluded Adjungbilly, because I think that now that a bridge has been built at Gobarralong, the traffic from that part of the country would go to Coolac. Then I have gone north-east to a point already mentioned, and from there I come back to Tumut in a south-westerly direction.

1875. That would take you to a point about 15 miles from Gundagai by the proposed railway? Yes; about half-way between Tumut and Gundagai. I have gone very little outside the coloured area shown on the Committee's map. My figures have been taken from the parish maps, and, of course, are largely approximations; but I have endeavoured to be as accurate as I can. The area I have described comprises about 960,000 acres.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

A. H. Chesterman.
5 Dec., 1893.

SUMMARY OF ESTIMATES (slightly adjusted and revised after compilation in parishes).
Total area affected, 980,000 acres—alienated, 440,000 acres; unalienated, 520,000 acres.

Alienated pastoral land	acres	310,000
Unalienated pastoral land	455,000	
Pastoral land	765,000	
Alienated arable land	130,000	
Unalienated arable land	65,000	
Arable land (includes all alluvial flats)	195,000	
Approximate area under cultivation (including Adelong Crossing area) (about) 20,000 acres.		
Alluvial flat land (mostly alienated)—	acres	
Tumut River and its tributaries	(about) 16,000	
Adelong Creek	3,000	
Hillas Creek	3,000	
Total	22,000	
Arable upland	173,000	
Tumut radius	720,000 acres (145,000 acres arable, 575,000 acres pastoral).	
Adelong radius	180,000 acres (30,000 acres arable, 150,000 acres pastoral).	
Adelong Crossing radius ...	60,000 acres (20,000 acres arable, 40,000 acres pastoral).	

Unalienated lands include all reserves, temporary commons, and leases, other than conditional leases.

Approximate Distribution of Land.

Locality.		Unalienated		Alienated.	
Parish.	Total Area.	Pastoral.	Arable.	Pastoral.	Arable.
<i>Tumut Area.</i>					
	acres	acres	acres	acres	acres
Mundongo	20,000	2,000	500	9,500	8,000
Blowering	20,000	6,000	200	6,000	7,800
Cooleman	24,000	10,000	3,000	7,000	4,000
Tomorrana	23,000	6,000	3,000	9,000	5,000*
Baloo	35,000	30,000	2,000	2,000	1,000*
Nimbo	23,000	17,000	2,000	3,000	1,000*
Garnet	22,000	19,000	3,000	40*
Part of Napier	10,000	5,000	2,000	2,000	1,000*
	(only included)				
Jibbeen	30,000	26,000	2,000	1,500	500*
Bogong	24,000	8,000	1,000	10,000	5,000
Talbingo	20,000	17,500	500	1,500	500
Jounama	20,000	19,000	1,000	120
Goobarragandra	19,000	17,000	2,000*
The Peaks	20,000	17,000	3,000*
Boraig	27,000	19,000	3,000	3,000	2,000
Yarrangobilly	23,000	16,000	3,000	2,500	1,500
Pinbeyan	20,000	17,000	2,000	500	500
Buddong	27,000	22,000	2,000	2,000	1,000
Yellowin	25,000	14,000	1,000	7,000	3,000
Bago	19,000	4,000	1,000	11,000	3,000
Selwyn (W.)	23,000	14,000	5,000	2,000	2,000
Hindmarsh	23,000	9,000	2,500	8,000	3,500
Batlow	19,000	1,500	500	13,000	4,000
Gilmore	14,000	1,000	200	8,800	4,000
Wereboldera	16,000	7,500	500	5,000	3,000
Tumut	16,000	5,500	500	6,000	4,000
Minjary	15,000	2,500	500	8,000	6,000
Gadara	11,000	1,000	1,000	4,000	5,000

* Snow lands.

A. H.
Chesterman.

5 Dec., 1899.

1876. Does the unalienated arable land consist mostly of flats, or of rising ground? Almost exclusively of rising ground.
1877. Why has it remained unalienated;—is it reserved? Some of it has been reserved, but the reason why the balance has remained unalienated is its remoteness and difficulty of access. The land you speak of is scattered all over the district. Where Crown land is near to a market and accessible, but remains unalienated, it can be safely assumed that it is very poor land; but as you get away from population, and access becomes difficult, the land remains unalienated, even where the soil is rich. In the mountain country there is good soil, a good climate, and a certain rainfall; but that country is difficult of access, and the winter is rigorous there.
1878. You have included gold-field reserves in your statement;—there is a large gold-field reserve near Adelong? Yes. I have included all gold-fields and other reserves.
1879. On the Committee's map there is an extensive area of Crown lands south-east of Tumut, coloured brown—what is the character of that land;—is any fair proportion of it suitable for agriculture? In the parishes of Baloo, Nimbo, and Jibbeen there is a lot of very rough country; but, going north into the parishes of Coleman, Garnet, Napier, and Fomorrana, there is a lot of country which is very rich and capable of cultivation. That country is suitable for anything requiring a cold climate.
1880. Do you think that the table-land would be within the influence of a railway to Tumut? Yes, I think so, for agricultural purposes.
1881. Do you know what distance that land would be from any station on the main Southern line? The nearest station on the main Southern line would be either Bowning or Binalong, which would be too far off to attract tariff. At the present time the railway station nearest to its eastern border would be probably somewhere near Queanbeyan, on the Cooma line, but if the proposed railway were made the nearest railway station would be at Tumut.
1882. Going south, there are some portions of land coloured green on our map, can you describe that country? That country is known generally as the Bago table-land. It is very good country, and, with better means of communication, would be very suitable for closer settlement. It is splendidly adapted for fruit-growing, but it is not country which should be held in large areas. At the present time it is all shut up in forest reserves. The soil is very rich, and there is a very good water supply.
1883. That land is likely to be within the influence of the railway at the Gilmore? Yes; the whole of the area to the south of Tumut which is coloured green on your map. I consider that, on the average, that land is richer than the country to the east. The eastern country is more broken.
1884. Is it suitable for anything besides fruit-growing;—would it do for potatoes? It is suitable for potatoes, oats, and wheat, though it is rather cold for wheat, and it might do for barley. I have seen exceptionally good crops of potatoes there, and good crops of wheat.
1885. With regard to the moderately high ridges beyond Tumut, do they provide fair grass for stock in summer? Going south from Tumut, you are on ridgy country between the valleys of the Gilmore and the Tumut River, and a great deal of that is poor country.
1886. You go some distance before striking the table-land of which you have spoken? Yes; you must go 15 miles before the country begins to flatten out at all on top of the hills. For the first 12 or 15 miles the country is broken. There is a steep backbone, falling away in very steep gullies, but it begins to flatten out as you get further back.
1887. Can you give the Committee a rough idea of the value of the land through which the proposed railway will pass? The alluvial flat land through which it would pass after leaving Gundagai would be worth from £12 an acre to £6 an acre, as you got further away from the town. The flat land close to South Gundagai would be worth £12 an acre.
1888. Then there is the rising country? The rising country would be worth from £3 an acre to probably 25s. an acre. I suppose the average value would be from £2 to £2 5s. an acre.
1889. Twenty-five shillings per acre would be the minimum value? Yes.
1890. Of course these values would be exclusive of improvements in the way of clearing? Yes. I have given unimproved values. Very little land would be worth £12 an acre. The railway does not go over much of the flat land at South Gundagai; it keeps more to the back, upon the ridgy country, which is not worth more than £2 or £3 an acre.
1891. Assuming your estimate, as to the area of the land which would be within the influence of the proposed railway if it were constructed, to be correct, it would seem that that land should produce a fair quantity of the traffic? I think so. In my opinion, if there were better means of communication, the Bago table-land would commence to develop. I have no doubt as to the richness of that country.
1892. Is any part of it cultivated at the present time? There are small areas round Batlow which are cultivated.
1893. Mostly for fruit? Mostly for fruit. There are some small orchards there, and some of the land is under oats, while a little wheat and potatoes is also grown.
1894. Notwithstanding the fact that they are at the present time a considerable distance from the railway? Yes.
1895. The inference is that if the railway were brought a little nearer there would be a largely increased production? I think so. They have good soil, a good climate, and a regular rainfall.
1896. What kind of timber grows on the forest reserves? The best timber there is the urabbie (*Eucalyptus Globulus*), though it is not identical with the so-called Tasmanian blue-gum. There is a great difference of opinion as to whether it is the real "globulus," but it is very similar to it. I do not consider it as good as the Tasmanian blue-gum, though it is a very good timber. It is found scattered throughout the whole area, though not in large quantities. Then there is the mountain ash, which is a somewhat similar timber. It is to be found in fair quantities, and lasts very well when it is not in the ground, but it will not last well in the ground. There is also a great quantity of peppermint, or messmate, which is similar to the Gippsland messmate, but smaller. On the lower levels there is a fair quantity of white stringybark.
1897. Do you think there would be any considerable trade in timber for that district towards the western districts? I consider the timber there valuable, though if it were in Gippsland or Tasmania I should not consider it so valuable, because there is much better timber in those places. Comparatively, it is valuable timber, and I have not the slightest doubt that a good deal of it will be sawn up and sent away.
1898. As the timber is taken away the land will be cultivated? Yes.

A. H.
Chesterman.
5 Dec., 1899.

1899. Would it be expensive land to clear? I suppose it would cost £4 an acre. It should be rung first, and cleared after the timber has been allowed to die. If dealt with in that way, it would cost about £4 an acre to clear for the plough.

1900. *Mr. Dick.*] We have it in evidence that Tumut is at the extreme end of the country to be served by the proposed railway; but I gather from your evidence that to the south of Tumut there is a large area of unalienated land which, if a railway were constructed to Tumut, would be opened up, and would provide a large amount of traffic? Yes.

1901. You divide that part of the country into two portions, that from Tumut to a distance 15 miles south, which you describe as good agricultural land? I was referring then to the alienated land. For a distance of 15 miles south there is a lot of alienated land which is very good.

1902. Within 15 miles of Tumut, to the south, you say there is a considerable area of good land, though it has been alienated? Yes. The land on the Tumut valley, on the Gilmore, and on the Windcwie is very good; but the mountains in between are very rough.

1903. Is the ridgy portion of that 15 miles of country suitable for pastoral occupation? Yes.

1904. So that we may look for a certain amount of wool traffic from the ridgy country, and a certain amount of agricultural produce from the flat country? Yes.

1905. We then come to the Bago table-land, which you say is heavily timbered, though the soil is very rich;—what sized holding would be sufficiently large to enable a man to make a decent living there, supposing there were railway communication at the Gilmore? The size of such a holding would vary from 100 to 400 acres. In the richer country 100 acres would be ample, and I know an instance in which a man is making a living from 12 acres of fruit-trees.

1906. Where is his market? He travels to Gundagai, to Wagga, and, I believe, as far as Narrandera at times, carrying the fruit round himself. So that a man need not be cramped, and to allow him room to carry on a little dairying in addition to fruit-growing, I would allow from 100 acres up to 320 acres.

1907. How many families do you think you could settle in a small way like that? On the Bago table-land you could settle from 200 to 250 families, allowing them about 400 acres each, and including a certain quantity of pastoral land with the arable land. I do not class the whole table-land as arable land, because there are large areas there which are only pastoral.

1908. *Mr. Watson.*] If you were settling families there, you would give them some of the really good land, and some of the pastoral land? Yes. I would estimate the forest reserve there as capable of carrying at least 200 families.

1909. *Mr. Dick.*] Do you think that the proposed railway would divert a serious amount of the traffic that now goes to Wagga and Culcairn? It would draw a certain amount of traffic from the northern end of the parishes of Courabyra and King, but I have not allowed for much of that traffic. The radius of influence, as shown on your map, is only a little shorter than the radius I took in making my calculations. I do not think my radius is more than 4 or 5 miles longer than yours.

1910. It was stated by a witness in Gundagai that he had been requested by a man to take up about 2,000 acres in this district for farming and grazing, but that after diligent search he could not find a suitable holding of that size;—does your experience of the district lead you to believe that such would be the case? My experience is that the man with a small holding succeeds when the large holder fails. The country is not suited for grazing; it is suited more for small holdings and close settlement. I have known a man succeed on 50 acres and fail on 3,000 or 5,000 acres.

1911. *Mr. Watson.*] What country are you referring to? To the Bago country.

1912. *Mr. Dick.*] The evidence to which I referred applied to the country between Gundagai and Tumut within easy distance of the proposed railway;—do you think that the witnesses' difficulty was due to the fact that all of that land has been alienated? It would be very difficult to get 2,000 acres of unalienated land in one block close to the proposed railway, but E.S.E. and S. there are large areas of unalienated land.

1913. I suppose you constantly come into communication with the settlers here in your travels? Yes.

1914. Have you gathered from them that the construction of the proposed railway would lead to an increase in their production? So far as I can judge, that is their opinion.

1915. Are they pretty keen upon it? The outlying settlers who suffer most from the want of railway communication are. It is not the settlers immediately round Tumut who feel the want of a railway so much.

1916. A writer in the *Gundagai Times*, calling himself "Maize Grower," referring to the large land-owners of the district, says that they "might benefit by the proposed railway, but the struggling farmer who is gripped by the octopus would only see himself ground poorer with the advance of the Juggernaut";—do you think that the poor settler referred to will be able to find opportunities for his labour in parts not now occupied? I think there will be scope for such men in country not now occupied for agricultural purposes.

1917. Is there any other large district like the Bago and Batlow country which is within the influence of the railway? There is a small part of Coleman and Micalong which might be suitable for the purpose of settlement, but there is not so large an area of good land there as on the Bago table-land. Then there is the Yarrangobilly table-land, which extends for a distance from 30 to 45 miles to the S.E. of Tumut. Talbingo is 25 miles from Tumut, and a few miles south of there the country begins to open out into a table-land. Then you get broken country, and then you get table-land again. I do not think, however, that that country will be developed to the same extent as the Bago country, because it is higher, and further away. So far as I know, there is no country similar to the Bago country in New South Wales. That country is somewhat like the Gippsland country, and has hitherto been neglected, because of its remoteness, but its resources are practically unknown. There is a large belt of mountain country there that has never had railway communication, and it has always been looked upon as very rough country, difficult to deal with, and worthless, but the soil is undeniably good, there is a good water supply, and the climate is good, so that one can safely say that with communication there would be a large amount of cultivation done there.

1918. *Mr. Shepherd.*] Do the trees that you have spoken of—the messmate, peppermint, mountain ash, and white stringybark—attain any size? Not in comparison with the Gippsland timber; but a fair size if compared with the rest of the timber in this part of New South Wales. The North Coast trees would, of course, be much bigger.

1919. Are these trees growing pretty thickly? They grow in belts or large patches. You may get a belt of stringybark, and then come upon inferior white-gum or peppermint, and then a good belt of peppermint. On the higher levels you get mountain ash.

1920. The soil is pretty rich where these trees grow? Yes.

1921.

1921. Do you know of any land that has been cleared for £3 an acre? No; that is simply an estimate.* I have known patches of land in that district to cost £10 an acre to clear; but that was fifteen or eighteen years ago, when labour was very dear. Now we consider £3 a very high price for grubbing ready for the plough, after the timber has been rung. In the lower country, and even as far as Gundagai, I have known grubbing to be done, and the roots run out for from 17s. 6d. to £1 an acre.

1922. How long do you wait after the ringing of the timber before starting to clear? Two years.

1923. Then are the trees grubbed, or is a forest devil used? I have seen them using the forest devil for road clearing on the Bago table-land; but the work is mostly done by hand. My estimate strikes an average for the whole table-land. Of course, you might get patches, where the timber was inferior, which would not cost more than £3 an acre to clear, while in other places the cost would be £5 or £6 an acre. It is a large belt of country to strike an average for.

1924. What is the capacity of the pastoral land? Taking it right through, alienated and unalienated, the unimproved land should carry a sheep to about 4 acres, and the improved land about twice that. There are large patches of alienated land which will carry a sheep to the acre, and have been carrying more; but there are also large patches of mountain country which would not carry more than a sheep to four acres even when improved.

1925. What about cattle? In our estimate we generally allow five to eight sheep for one large beast, according to the class of country. There is country which is adapted for cattle and not for sheep.

1926. You have not classified any country as useless? No.

1927. Are not some of the ridges perfectly barren and rocky at the top? I think that there are very few patches of land which are not paying a certain amount of revenue to the Crown, and if the Crown derives revenue from them they can hardly be classed as worthless, though some of them are very poor. The lowest Crown rental is for an improvement lease on Talbingo, where the country is almost exclusively poor barren hills. Speaking from memory, the rental of that country is about a halfpenny an acre. The man who has it must think he can do something with it, because he is spending money upon it.

1928. Has there been a general advance in agriculture here of late years? Mr. Gilliat prepared a return in 1891, showing roughly 9,000 acres under crop, and I believe that within the same district there are now nearly 13,000 acres under crop.

1929. There seems to have been a great falling off in the tobacco crop, which was at one time rather an important industry;—can you account for that? Not from own knowledge; but I have heard tobacco-growers say that the excise duty killed the industry, while others say that it has been killed by the operations of a tobacco-buying ring in Sydney.

1930. *Chairman.*] This is the evidence of the Secretary to the Railway Commissioners:—

Do you know whether the Commissioners or their officers have gone beyond Tumut, with the view of seeing whether there is any suitable country that would be tapped by the line? The Commissioners know, though they have not gone beyond there, that the country gets rough and mountainous. You get on the mountains in that direction.

Your evidence differs from that? That statement bears out what I have said, that that country has hitherto been looked upon as very remote and rough. On account of the poor roads people would rarely go into it, and so a misconception arose in regard to it. I have been forced to go through it, and to camp in it. During the first few years that I was in the district I had a hatred of that country, but, as I got to know it better, my opinion of it changed, and I came to hold the view that I hold now, that there is a big future before it.

1931. Are there any farms there at the present time? There are farms round Batlow, north of the parish of Courabyra, and at the head of the Tumbarumba Creek. There are one or two little holdings, too, in the parish of Cooleman; but in other places the country is almost deserted, except for grazing purposes.

1932. Is the result of such settlement as has taken place such as to lead you to believe that there will be a large increase? Judging from the success which has attended the Batlow farmers, even under the adverse circumstances brought about by want of proper means of communication, I think there will be a large production there.

1933. How many acres of land are suitable for agriculture in the hilly country beyond Tumut? I have not made any estimate regarding that part of the country especially; but on the Committee's map it is stated that there are 80,000 acres in the Bago forest reserve. Allowing 400 acres to a holding, 200 holdings could be taken up there. None of that country consists of alluvial flats; it is ridgy table-land. I did not include the whole of it in my estimate of the arable land in the district.

1934. Have you considered which would be the best route from Gundagai to Tumut, the eastern route, or one of the western routes;—which would serve the largest number of people and the largest area for agricultural and pastoral country? All things considered, I think that the proposed route *via* Adelong is the best. I think it would be productive of the greatest good to the greatest number. In my general statement of the area of arable land available, I have reduced the total area obtained by taking out the parishes separately by 10,000 acres. I have done this in order to be on the safe side.

William Daniel Patrick O'Brien, proprietor of dairy factory, Tumut, sworn, and examined:—

1935. *Mr. Shepherd.*] How long have you been a resident here? Off and on, for about thirty years.

1936. What is the extent of your holding? A little over 3,000 acres.

1937. What industry are you carrying on? At the present time, mixed farming and dairying.

1938. How many cows are you milking? About 130 at the present time; but I am making provision to 5 milk 400.

1939. I understand that you have all the latest appliances in connection with your factory? I have the necessary appliances for dealing with the milk of 200 cows; but I have also let a contract for the erection of separators, churns, butter workers, and refrigerating plant, to treat the milk of over two thousand cows. That plant is being got ready now in Sydney, and most of it is now on the ground. I intend to buy the milk from other people.

1940. Do you find your holding well adapted for dairying purposes? It is splendidly adapted for dairying purposes.

1941. What is your average return from a cow per week? Last winter I had 700 head of cattle on the land, though, of course, I did not milk as many as that. I reckon that when we get into order each cow will return me £8 a year net.

1942.

A. H.
Chesterman.
5 Dec., 1899.

W. D. P.
O'Brien.
5 Dec., 1899.

* NOTE (on revision) :—Revised estimate: £4 per acre for Bago and Batlow.

W. D. P.
O'Brien.
5 Dec., 1899.

1942. But what return do you expect to get in butter? I have only recently started, so that I cannot give you any accurate information; but we get about 1 cwt. of butter a day now, milking 120 cows. In the spring-time here everyone has cows, and it is very difficult to sell your butter. Dairying will not pay unless you have a refrigerating plant which will enable you to store your butter when prices are low.
1943. You are quite satisfied with the result of your experiment so far? Yes.
1944. And you are going into it very largely? Yes. When the refrigerating plant is up, I intend to establish creameries in different parts of the district. I shall buy milk at those places, and bring the cream to my central factory.
1945. How much land have you under cultivation? Last year about 120 acres.
1946. What were you cultivating chiefly? Wheat and maize.
1947. What is your average yield? From about 70 acres of ground I obtained 700 bags of wheat.
1948. Were they 4-bushel bags? Yes. The yield would be beyond that.
1949. How much of your land do you consider suitable for cultivation? 1,900 acres.
1950. Are you likely to bring under cultivation a larger area of land than you have under cultivation at the present time? When I have my full number of cows, I shall cultivate regularly about 200 acres for winter feed.
1951. Have you any difficulty in delivering your produce at Gundagai? Yes, great difficulty. I often get orders for maize which, if I could get it into the trucks in time to catch the market, would obtain a good price; but, by the time I have hunted about for a team, and have got to the railway-station, the market has gone down again, and I have lost the rise. If we had a railway here, we could always have our maize ready, and we could send it away directly we got an order for it.
1952. Would you be encouraged to go in for agriculture much more if you had a railway? Certainly. Whether we get a railway or not, I intend to develop my industry, and to pluck all I have in it.
1953. What is your average return from maize? I have about 50 acres under corn, but I have not weighed it yet.
1954. Can you guess at what the return would be? About 2,500 bushels.
1955. I think the Tumut maize is as a rule the highest-priced maize in the Sydney market? Hordern's manager told me that he would at any time be willing to give 3d. a bushel more for Tumut maize than for any other maize in the world.
1956. Do you know what there is in the climate here to prevent weevil from getting into the maize? It is a remarkable thing that, although you may bring the weevil here in old bags, and put your corn into those bags, the weevil will die out. Our corn seems too hard for them. There may be something in the climate or in the soil which prevents the weevil from attacking the maize here.
1957. Maize was much more largely cultivated here a few years ago than it is now? Yes.
1958. Can you account for the falling off? Yes; it is due to the fact that there is no rival market. We should have a good market in Wagga and Narrandera if there were a railway; we should not depend upon Sydney at all. The railway would not only enable us to send our produce to places where there would be a ready sale for it, but it would enable the people there to send their sheep here in dry seasons.
1959. But the people here have the same facilities now as they had in former years? In former years less maize was imported from America. Now-a-days the steamers are so large that the market is swamped by one or two importations. The people here could compete with the American producers if they had facilities for sending their produce to market, because they would then not only save a certain amount in railway carriage, but they would be able to catch the market when prices are good. Now-a-days people about here go in for things which give them less trouble, and about which they are more sure.
1960. What do you think a fair distance from a railway for agriculture? A farmer should be as near to the railway as he can get—perhaps 8 or 10 miles. By extending a railway from Gundagai to Tumut you bring it 22 miles nearer to the farming population.
1961. What extent of country is there to the south of Tumut? There is an enormous quantity of land there which is suitable for agriculture.
1962. Is it not a fact that the hills approach pretty close to Tumut? No. The hilly country will grow produce wherever you can get a plough on to it. At my own place I got 50 bushels to the acre last year right up the side of a hill.
1963. From what distance beyond Tumut do you think traffic would come to a railway? I think traffic would come to the railway from 20 miles round—from beyond Batlow to as far as Talbingo. Although the ranges come in close in places, there are valleys and ravines where thousands of acres of land would be cultivated if there were any means of getting the produce away.
1964. Are the hills good right up to the crown? Yes. On the Gilmore you can lockspit the hills right up to the top.
1965. Are there no rocky ridges there? Yes, in places.
1966. Where there are rocks the land is not of much use, even for grazing? I do not know of any land in the world which will carry more stock per acre than the Gilmore valley, land—that is, on the natural grasses.
1967. You have had experience of mining at Adelong? Yes.
1968. What is your opinion of the Adelong mines on the whole? I was eight years at Charters Towers, which, I suppose, is one of the biggest gold-fields in Australia, and when I came back I took up the Gibraltar mine. I had to get others to assist me; but I managed that mine for ten or twelve years, and during the last twelve months I was managing it I paid away £75,000 in wages, for machinery, and for railway freights. To-day between 250 and 300 men are employed there, and I suppose about £400 a week is paid away in wages. When I first came to Adelong there were one shop and a few public-houses and I would not have given £100 for the best hotel there; but now there are plenty of shops, and everyone is doing a rattling trade; so that if the farmers want ready cash they take their produce to Adelong. I am still largely interested in mining there. I am interested in the Gibraltar mine, but I am still more interested in some of the old reefs there. About thirty years ago the mines at Adelong employed, I suppose, over 1,000 men. They are idle now, but that is because, after getting through the shoot of good stone, they have got into a poor zone. The Gibraltar mine was being worked forty years ago, and was given up; but I had great faith in it. From what I had seen at Charters Towers, and other places, I believed that if they sank lower they would come on to the gold again, and it turned out to be right. All the mines in Adelong are now in the state in which the Gibraltar mine was when I went there. It only

W. D. P.
O'Brien.
5 Dec., 1899.

only requires capital to develop them. The reefs in Adelong are truer quartz channels than I have ever seen in New Zealand, Victoria—where I was reared and where I have worked in many of the mines—or at Charters Towers. The main reef in Adelong is the truest reef I have ever seen, and I am quite confident that if it were sunk upon it would last for many years. I intended to sink upon it myself. At Charters Towers the reefs pinched out at a depth of 150 and again at 700 or 800 feet; but now, at a depth of 2,000 feet, they are getting as good gold as ever. I am negotiating with some gentlemen in England to bring capital into Adelong to develop the Great Victoria mine, and I am confident that within the next two years the population of Adelong will have increased by over 2,000 people.

1969. Do you think that the construction of a railway would give any impetus to mining operations here? Certainly. The appliances they have at Dapto are so very complete, and their charges are so reasonable, that it will pay mine-owners, instead of erecting their own plants, to send their ore to Dapto for treatment. If there were a railway thousands and thousands of tons would be sent away every year.

1970. Does it not seem strange, if these mines are so rich, that those who were working them could not get sufficient capital to go on with? Yes. Adelong was under a blight for many years. While you are getting gold you ought at the same time to keep developing the mine; but the first promoters grabbed all there was in sight and left nothing. Part of what they took away should have been used in developing the mines. If that had been done, the mines would be working to-day. There is so much swindling and bad and swell management in connection with mining that is very hard to get people to invest in mines.

1971. Do you know anything in regard to the fruit-growing capabilities of the district? Yes. I had an orchard from which I used to get 2 or 3 tons of apples, but I could not get rid of the fruit, so I rooted the trees out.

1972. Would it not have paid you to have carted the fruit to market? No; you could not give it away. I brought ninety-five trees from Sydney and just put them in without giving them a drop of water, or taking any trouble with them, and now, three years after, there is not one dead. There is an enormous quantity of ground up Batlow way which would make splendid orchards. The fruit-producing capabilities of this district are unlimited. There are thousands of acres of red loam which would grow any kind of fruit for which a cool climate is suitable, and there is also a large extent of country which could be irrigated at very little expense, but at the present time there is no market for anything that is grown there.

1973. Have you any other reason for thinking that the proposed railway should be constructed? Another reason why I think it should be constructed is because of the quantity of good timber in this district. About Narrandera, and out that way, there is no timber for fencing and house building. Whether we get a railway or not most of the timber required there must go from Pilot Hill near here, where there is a large forest of splendid trees. If there were a railway we could deliver that timber in Wagga for 12s. a hundred, and employment would be given to thousands of men, because, instead of a water-wheel mill, large steam mills would be erected. But without railway communication the district will take a long time to develop, because it is so inaccessible. The timber is splendid, and would do for making fruit-boxes, butter-boxes, and other things of that kind, and the supply of it is really unlimited.

1974. How far is this forest from the nearest point on the proposed railway? I suppose 14 or 15 miles.

1975. Would it pay people to cart timber that distance? Yes.

1976. Do you think the railway would benefit largely by the timber traffic? Yes. If there were a railway here this would be one of the most prosperous districts in the Colony. I do not know any place like it in Australia for small holdings. No doubt it will go ahead whether we get a railway or not, but it would go ahead with leaps and bounds if we had a railway.

1977. Is there any other matter which you would like to bring before the Committee? There is any amount of country in this district which abounds with minerals. At Billyparoola there are any number of reefs, and thousands of acres of chrome which it would pay to work. I tested a copper lode a man found the other day, and it assayed 40 per cent. of copper, but it would not pay to work, although the lode is a big one, because there are no means of getting the copper away.

1978. *Mr. Watson.*] Where was that? Above Billyparoola. Within about 20 miles of Tumut.

1979. *Chairman.*] You have stated that if a railway were constructed to Tumut it would serve the farmers for 20 miles around;—can you explain why, with a railway to Gundagai, there is very little farming within the 20 miles between Gundagai and Tumut? The only explanation I can give you is that the people along there have not much sense. Any man who is within 10 miles of a railway should make the very most of his land. If I were there I should do it.

1980. But you say that if there were a railway to Tumut people 20 miles out would go in for farming, whereas our actual experience is that people within 20 miles of Gundagai do not farm? If the railway comes here it will give a stimulus to various industries, and the district between Gundagai and Tumut will be developed.*

1981. A former Member for the district told us that it would never go ahead until there was closer settlement, and the alienated land around Tumut was made available for settlement—he said that the agricultural land here was largely held by private owners;—is that a fact? Yes, that is so.

1982. How do you propose to get over that difficulty? If we had a railway, and a larger population—which would be bound to follow—the large holders would be induced to split up their holdings.

1983. It would pay them better to let the land out in farms than to keep it for sheep-runs? Yes. All the Adelong valley is held by Mr. Crane; but, if a railway came to Tumut, it would pay him better to cut that land up into 100-acre blocks and lease it.

1984. But as land increased in value the owners would pile on the rent? You cannot pile it on too much.

1985. We have been told that the rents have been so high as to largely drive agriculturists out of the district? Where people have their own holdings they are much more prosperous. On the Gilmore, the people are thrifty, and they have nice homes of their own, and accounts at the bank, and they are their own masters. It is the curse of Tumut that there is too much of the landlord system there. With a railway coming here, it would pay the landlords to split up their land.

1986. Have you gone in for dairying enough to be able to say which pays the better—dairying or the growing of crops? I think mixed farming pays the better.

1987. Keeping cows and growing stuff to feed them? Yes; nothing will pay better, because there is an unlimited market for the produce.

1988.

* NOTE (on revision):—The land here mentioned, I am informed, in most cases is financially locked up. The reputed owners have no say in it.

- W. D. P. O'Brien.
5 Dec., 1899.
1988. Dairy produce does not give much traffic to a railway? If the dairymen are given opportunities for sending away their produce, they must employ a large number of people. Whether the railway pays or not, the railway system of the Colony is a national asset, and if the railways pay in the aggregate, we should be satisfied with what they do in the way of placing people upon the land. Instead of ten families here we might have 1,000, and every person who comes into a district is worth £50 a year to the country.
1989. You regard not only the direct benefit, but also the indirect benefit of railway construction? Yes.
1990. Which do you think would be the better route for the proposed line—by way of Adelong or following the Tumut River? I have not gone into the matter; but I think the greater advantage would be gained by adopting the Adelong route.
1991. Do you regard Adelong as a place which should be convenienceed if possible? Eventually there will be a branch line to Tumbarumba, and I think that is the best place for it to start from.
1992. Do you think that this is a district in which a small holder can get a good living? Yes.
1993. What acreage do you think is sufficient for a man here? If there were a railway to Tumut a man could make a living on 40 acres here.
1994. By mixed farming? Yes.
1995. Is that on the rich flats, or on the ridgy land? Taking a little of each—average land.
1996. *Mr. Watson.*] The Railway Commissioners anticipate an annual loss of £1,271 on the proposed line if special rates are charged, or £6,500 if through rates are charged, and, in the latter case, they think that the teamsters will be able to compete with them, because the road is 10 miles shorter than the railway;—under those circumstances, do you think that people in the district within the influence of the railway would be willing to guarantee the Government against loss to the extent of, say, 1d. per acre per annum? I think they would. I should.
1997. A similar guarantee has been entered into in connection with other lines? By such a system you are placing a handicap upon the men who are far away from the large centres of population. If we had to pay a halfpenny per acre, for instance, we should be still worse off than we are now in competing with the people at, say, Goulburn.
1998. But do you think that the people here who would benefit by the construction of the proposed railway would be willing, in the event of there being a loss, to make it good to the maximum I have mentioned? I should be prepared to do so; but are you going to tax the landowners between Sydney and Albury for the benefits they have delivered from railway construction. I do not think the arrangement is a fair one.
1999. The difference in the position is this—the Albury line is a profitable concern, but it is anticipated that there will be a large loss on the working of the proposed line; once the loss were made up, there would be no tax? I am quite prepared to pay something extra, so far as my own holding is concerned.
2000. *Chairman.*] Mr. Harper puts down the production of maize for the districts of Adelong, Reedy Flat, Tarcutta, and Tumut as 223,411 bushels in 1896, and 146,455 bushels in 1899;—can you explain the decrease? I think it is to be accounted for by the increase of the importations from America. A large cargo comes in from America, and the price goes down at once before our maize can be sent in. If we had a railway to Tumut, we could send the maize away directly we received notice from the agents that the market was a good one.
2001. They do not store their maize here at all? No. People in a small way cannot store it very long, because they want the money for it. One year farmers were compelled to sell their maize at 9d. a bushel.
2002. *Mr. Watson.*] Why? They were poor men, tilling rented land, and they had to get rid of their maize to pay the landlord.
2003. What was the price in Sydney then? I think 1s. 2d. a bushel.

Robert Dear, Mayor of Tumut, sworn, and examined:—

- R. Dear.
5 Dec., 1899.
2004. *Mr. Levien.*] How many years have you been in this district? Thirty-three years.
2005. What is the population of the district at the present time? I think it is something like 6,000.
2006. Is the district a fairly prosperous one? I think that the district was more prosperous when I first came here than it is now, because the population was smaller then? Now, what money there is in the district is more distributed.
2007. Is the population increasing yearly? Yes; during the last three years the population of the municipality has increased by something like 200. It is only a small municipality.
2008. And is the trade of the district increasing? Judging from my own experience it is not going back. If anything, it is increasing.
2009. What is the general impression on the subject in the minds of those with whom you come into contact? The farmers complain of the depression, which they attribute to the cost of carriage to market; but I think that in other ways business is not worse now than it has been for a good many years past; in fact, I think that on the whole it has improved.
2010. What is your opinion in regard to the proposed railway? I was always under the impression, from what I heard of the original estimate, that it would not be anything like a paying line; but I think that upon the very much reduced estimate which is now being put forward it will pay within a very short time.
2011. What do you think of the evidence of the Mayor of Gundagai? My opinion is that his evidence verged so closely upon the untruthful that it is hard to distinguish it from it.
2012. He seemed to be prejudiced in favour of Gundagai? Yes, decidedly; but he was long enough in Tumut to have been able to give much straighter evidence than he gave.
2013. When he was in Tumut did you ever hear him express a strong desire to see the railway brought here? No; he was only an employee then, and I do not know that there was any very great agitation for it while he was here.
2014. You think his evidence rather warped? I think that it was very considerably warped.
2015. Do you think that if there were a railway here more land would be put under cultivation? Yes.
2016. Do you think that the construction of a railway to Tumut would be a great inducement to people to cultivate? Yes; the railway carriage would be much cheaper than the land carriage.
2017. You heard Mr. O'Brien express the opinion that it would be an advantage to have a quicker means of getting to market? Yes; and I quite agree with his evidence on that point. I know that it is often not possible to get our produce away from here in time to meet a rise.
- 2018.

2018. Mr. Harper has shown that there has been a decrease in the corn crop of this part of the Colony;—do you account for that by the opening up of land on the northern rivers? In re-settling the electorates, a considerable portion of the Tumut electorate was cut off and attached to the Gundagai electorate, and that alteration affects the returns compiled by the police. R. Dear.
5 Dec., 1899.

2019. But do you not think that the opening up of so much land on the northern rivers has affected this place a great deal, so far as maize-growing is concerned? Well, that is a subject upon which I cannot speak with authority. I think this district has been affected, not only by the opening up of the northern rivers, but also by the importation of corn from foreign parts.

2020. Have you any idea as to the quantity of wool that goes from here? No.

2021. What do you think of this as a fruit district? Well, some of the fruit I have seen grown on the higher land, and notably at Reedy Flat, was the nearest approach to English fruit that one is likely to get in this Colony.

2022. This being a colder climate, you would be able to get fruit when the fruit of other places was done with? Yes; at Batlow they grow immense crops of potatoes, though they have only the local market to send to at the present time. The possibility is that the railway will greatly increase the growth of potatoes.

2023. Which of the proposed routes do the people here favour? I think the Adelong route would serve the greatest number of people. When Mr. Melrose made the original flying survey, I drove him all over the country. Along the Gadara, at Calafat, and on the Minjary Mountains there is some of the finest land you could get, but it is not under cultivation, because there is a difficulty in getting to market from there.

2024. You have a good knowledge of both routes? Yes.

2025. You think the route *via* Adelong would serve the greatest number of people, and would open up most country for agricultural and for pastoral purposes? Certainly, for agricultural purposes. I think that a good deal of the land now used for pastoral purposes would be used for agriculture, if the proposed railway were made.

2026. Does much starving stock come into this district in times of drought? Yes; there were over 500,000 sheep last year. I do not think they all travel by the railway. A great many travel by road where they can. There are a great many sheep coming here this year. They are coming here almost daily now. The Railway Commissioners speak only from what they hear, and from the statistics which are given to them. They visited the place on one occasion, getting here at 11 o'clock in the morning, and I do not think they left the hotel till they went away again about 2 o'clock. When the House decided to refer the proposed railway to the Public Works Committee, the Commissioners sent Mr. Usher up here. I got a wire from him to say that he was coming one day, but he did not come until the next, when he came at 10 o'clock, and went away about 12. Perhaps the following particulars in regard to the Tumut municipality will be of interest to the Committee:—Tumut has been incorporated for twelve years, and its present revenue from rates is £443 10s. There is a municipal debt of £1,488 1s. 1d. on general rates, and £123 13s. 4d. on Nuisance Prevention charges. £749 16s. 9d. is the amount of the rates in arrear. £90,850 19s. 2d. is the value of improved land, and £17,672 of the unimproved land. In December, 1898, the population was 1,357, and in 1887 under 1,000.

Edward Brennan, grazier, Gocup, sworn, and examined:—

2027. *Chairman.*] How far is Gocup from Tumut? Gocup is situated about half-way between Gundagai and Tumut, upon the marked-tree line. Properly speaking, it extends from the Gilmore Creek to half-way to Gundagai. E. Brennan.
5 Dec., 1899.

2028. You are about 10 miles from Tumut? About 8 miles.

2029. Is your estate a large one? I have about 4,000 acres in all, taking both Crown land and conditional purchase land.

2030. What stock do you carry? Sheep and cattle.

2031. How many sheep? About 4,000 sheep, and 200 head of cattle.

2032. Can you carry that number all the year round? Yes, in good seasons. In bad seasons we carry about 3,000 sheep and 150 head of cattle.

2033. Do you do any farming now? Very little. I used to farm at one time.

2034. Why did you give it up? I find it easier to get my living by grazing.

2035. Have you a statement to make to the Committee? Yes. Mr. Godfrey, a practical farmer, and myself have been requested to give evidence in regard to the Gocup part of the district. Mr. Godfrey lives on his own farm, but he also cultivates land that he rents. We went round to the principal holdings, and obtained information as to the number of acres capable of cultivation, but not under crop, and the number of acres under crop. The area of Crown lands on Gocup is about 5,810 acres, and it is principally fit for sheep-grazing, though about 900 acres are fit for growing wheat, oats, or barley. The area of freehold and conditionally-purchased land in county Wynyard, parish Minjary, is 10,568 acres. There are 4,174 acres with a river frontage, most of it fit for cultivation, except where there are lagoons and swamps, which cannot be cultivated in very wet seasons; but some of that land gives very heavy yields in very dry seasons. The land is fit for growing wheat, barley, oats, maize, potatoes, pumpkins, and some of it is fit for tobacco. All sorts of fruits that have been tried grow well here. The soil and climate are fit for cotton and sugar growing. Besides the land referred to in the foregoing statement there are 2,722 acres of land fit for cultivation, but not under crop, and not including Mr. S. Gordon's land, because he has promised to give his own returns. There are also 571 acres under crop, Mr. Gordon's land not included. This land extends to the Gilmore Creek, and takes in part of the parish of Tumut.

2036. What is the area to which your statement refers? We come to the Gilmore Creek, about a mile out of town, and then we go about 10 miles along the marked-tree line towards Gundagai.

2037. And how much land do you take in on each side of the road? About 4 miles back from the river frontage. The dividing range would be our boundary.

2038. So that you speak of a district about 10 miles by 4? Yes, about that.

2039. If a railway were constructed to Tumut, *via* Adelong, where would your produce be taken? To Tumut.

2040. Do I understand that the traffic would come back 10 miles to Tumut rather than go on to Gundagai? Yes. After you get out a distance of 8 miles there is very little cultivation. The farms there are small, and

E. Brennan. and the farmers all deal with Tumut, because they sell their produce to the storekeepers here, and none of them produce enough at a time to make a truck-load. They bring their produce here, and when the storekeepers get enough to make a truck-load they send it away by waggon to Gundagai, and thence by train to Sydney; but it would be far better if they could send it by train right through.

5 Dec., 1899.

2041. The road further on toward Gundagai is very hilly and rough? Yes. There is one farmer, about 12 miles out, who cultivates about 20 acres of wheat and a little maize, and he brings all his produce to Tumut; but we have not included him, because he is nearer to Gundagai than to Tumut, and is outside the boundaries of Goemp.

2042. What do you do with your wool and stores? I get all my supplies from Tumut at the present time; but our wool goes to Gundagai direct.

2043. If there were a railway to Tumut, would you still send your wool to Gundagai? Yes.

2044. What does it cost per ton to send wool from your place to Gundagai? From 15s. to 20s. a ton.

2045. What would it cost to bring it to Tumut? They would deliver it in Tumut for about half that.

2046. The train rate for wool from Tumut to Gundagai would be about 2s. 7d. a ton? In that case I would bring my wool to Tumut, because it would be cheaper, and the distance would be less. A man could take a load of wool from my place to Tumut and get back again the same day; but it takes two days to go to Gundagai.

2047. What is your tonnage inwards and outwards—wool and goods? I could not tell you very accurately; but I daresay 20 tons would cover the inwards traffic—salt and wire chiefly—while the wool would come to 6 or 7 tons.

2048. *Mr. Watson.*] What weight of wool do you get from a sheep, on the average? It depends upon the sheep and upon the season. On the average, I reckon upon 5 lb. or 6 lb.—7 lb. would be an outside average for my sheep.

2049. *Chairman.*] Of your 4,000 acres, what area is suitable for agriculture? On the river frontage there are approximately about 900 acres, and of that area about 600 acres would be fit for cultivation. Most of it would be fit for wheat, maize, oats, or barley; but some of it would not grow maize, though it would grow wheat. Some of it is very good for growing lucerne. There would be about 300 acres suitable for wheat, oats, or barley, but not for maize. Besides that, there are little patches in the different paddocks.

2050. Would there be 1,000 acres, in round figures? Very nearly that area.

2051. *Mr. O'Brien* told us that it paid a man better to use his land for agricultural purposes than for sheep;—if that is so, why have you gone in simply for sheep? Agriculture might pay better if there were a railway; but at the present time the cost of carriage is against it. I think that all the best land would be under cultivation if we could get cheaper and quicker carriage to Sydney; but under present circumstances it is much easier to run sheep.

2052. You appear to have about 600 acres of one class of the land, and 300 or 400 acres of another class,—how many acres of each kind of land would be required to keep a man who was going in for mixed farming? A neighbour of mine who has been living there for thirty years has reared a family upon about 280 acres of land, to which there is not a river frontage. His land would be similar to the forest country I speak of. 300 or 400 acres of the land on the river frontage would be richer than any land than he has. When I was a boy, my father was a tenant on the estate which *Mr. Gordon* now owns. *Mr. Broughton* lived there then, and he had about twenty tenants, who made a living by farming the land which they rented from him. That was before the Act of 1861, after which people took up land for themselves. Produce was much dearer then than at present.

2053. Did he send his produce to Sydney? At that time they sent produce from this district to Albury, to Lambing Flat, or Young, as it is now called, to the Lachlan, and to Kiandra; but, since then, good country in those places has been taken up by farmers, who supply the local market.

2054. A witness has given it as his opinion that foreign competition has thrown back the wheat and maize growing industry in this district; is that so? *Mr. Godfrey*, who is a practical farmer, will be able to speak on that point.

2055. Would the Tumut valley route suit you better than the Adelong route? No. If the line were brought from Coolac, the nearest platform would be as far from my place if not further than Tumut. The line would be on the other side of the river from my place, and I should not be able to get to it except by crossing the Brungle bridge. There is a better road to Tumut.

2056. Which route do you think would serve the best country and the greatest number of people? I think the Adelong route. That line would tap the whole of the country on the Adelong Creek, and about Tareutta and Tumbarumba, where a great deal of maize, wheat, and barley would be grown, while the mountain country is well adapted for wool-growing.

2057. And it would also get a good deal of the Adelong traffic? Yes; it would go as near to Adelong as they can go with a railway.

2058. If a railway were brought to Tumut, would you resume agricultural operations, or would you let your 1,000 acres of arable land to tenants? I could not answer that question. I think that if a railway were made, agriculture would pay better than pastoral pursuits, because there are many crops which could be grown; but I cannot tell you which would be the most profitable way of dealing with the land.

2059. You would use it in whatever way suited your own ends best? Yes.

2060. *Mr. Watson.*] Do you think that if the proposed railway is constructed it will pay within a reasonable time? I think so.

2061. The Railway Commissioners seem to think that there will be a deficiency for a considerable length of time;—do you think that the people in your district would be willing to give a guarantee against any loss? I cannot answer that question for other people.

2062. Can you answer it for yourself? I cannot, because I do not know how much we should have to guarantee. The amount might be more than I could afford.

2063. The loss is estimated at £4,271 a year. Would you be prepared to pay your share towards making good one-half of that loss, supposing it was spread over the whole area benefited by the construction of the line? I have not the faintest idea as to what it would come to, spread over that area.

2064. Would you be prepared to pay an amount similar to what you now pay in land-tax, to make good if necessary any loss upon the proposed line? Yes.

2065. *Mr. Levien.*] You might have, on top of that, a Local Government tax? If I had to pay other taxes

taxes, my answer would be "No," because I am pretty heavily taxed as it is. I am paying a rabbit tax, a land tax, and other taxes now.

2066. *Mr. Watson.*] If the railway paid, the tax to which I referred would be discontinued? So I understand.

E. Brennan.
5 Dec., 1899.

John Hides, saw-mill proprietor, Bago Forest, sworn, and examined:—

2067. *Mr. Dick.*] How long have you been in the district? About twenty-three years.
2068. Have you been mainly engaged in the timber trade all that time? Yes.
2069. What kinds of timber do you deal with out there? Our principal timbers are mountain ash, messmate, urabbie, and a few kinds of gum.
2070. To what uses are those timbers put? The mountain ash is a very good building timber, and is largely used for building purposes. At Narrandera they have built a good many waggons of it, and one of them took the prize at the Narrandera Show three or four years ago. Mountain ash is used mostly for the body-work, not for the wheelwright's work.
2071. What do you use the messmate and the urabbie for? Some builders like urabbie for the waggon-bearers, because it is a strong heavy timber. It is also used for bridge-planking and other heavy work. Messmate is a very good timber for ground-work; it is not so strong as the urabbie, but it is more lasting in the ground.
2072. Of which of these timbers do you send most away? I send most mountain ash away. Mountain ash makes good wine-casks, and a cask which will hold about 700 gallons has been made of it. All the staves for the casks of one vineyard come from our mill, and I have sent a good many cask-staves to Albury. In some places the mountain ash is not so hard, but our mountain ash is more closely grained. In Gippsland the mountain ash is more porous than ours.
2073. Are there many people besides yourself engaged in the timber trade? There is another saw-mill about 8 miles from where I live. It cuts timber for the Upper Murray country. Those people have been there nearly twenty years.
2074. How many thousand feet do you get through in the year? In some years I put through about 250,000 feet, which is equal to about 750 tons, and 10,000 palings, which is equal to 30 tons. At the end of this year I suppose I shall have put through about 600 tons.
2075. What is your chief market at the present time? I send a great deal of timber to Hardy, at Wagga, and to the stations round about. At Tula they have been using my timber for ten or fifteen years past. It is consigned to the Whitton railway-station. I have also sent some down to a place near Hay, for gate-making and other purposes. At Yabtree and Gillingrove they always use my timber.
2076. What effect would the construction of the proposed railway have upon your market? It would make it much larger. The larger consumers are greatly against having timber brought to Wagga by team. Last year I could not get all the timber true, so that I had to abandon my orders. It costs about 12s. a thousand for every 60 miles of railway carriage; but to get to Wagga it costs me about £4 a thousand. If the proposed railway were made, I could get the timber to Wagga for 1s. or 1s. 6d. less than I pay now, and I could send it to Narrandera much more cheaply.
2077. Would you open up any new markets? I should make more use of the markets I have. I could sell a larger quantity of timber if I could get it away.
2078. If the proposed railway were constructed, would you consign all your timber from Tumut? It would be an advantage to me to do so. Instead of paying about 7s. 6d. a hundred to get to Gundagai, I should have only to pay about 5s. 6d.
2079. Are the forests out your way being thinned out, or is there still an extensive area to operate upon? This year I have cut about 200 logs, obtained within a mile of my mill, and there is a lot of timber there yet. There are places close to the mill where the axe has never been put into the timber. There are hundreds of thousands of feet on a few acres in some places.
2080. Can you form any estimate as to the quantity of timber you would be likely to cut if the railway were brought to Tumut? I could cut at my mill from 3,000 to 4,000 feet a day if I could work full-handed. In four hours we can cut about 1,500 feet.
2081. How many feet go to the ton? 1,000 feet of green timber are equal to about 3 tons, and 1,000 feet of thoroughly seasoned timber are equal to a little over 2 tons 5 cwt.
2082. So you could cut about 7 tons a day? Yes.
2083. If the railway were brought to Tumut could you find a market for 7 tons a day? Yes, because I could get all the Gundagai trade.
2084. Would you be able to get your timber to Tumut without difficulty? Yes; the dry seasons often prevent me from selling my timber, because when the road is not in good condition you cannot get teams.
2085. The construction of the proposed railway would not improve matters, so far as that is concerned? I could deliver timber at Gilmore at any time, except in the middle of winter, when the snow was on the ground; but in dry seasons it is difficult to travel. We can get very little timber through to Gundagai until after Christmas, because the travelling stock eat up all the grass on the roads.
2086. Do you think 7 tons a day is a safe estimate of the probable work of your mill? Well, a great deal depends upon the demand for timber; sometimes more is wanted and sometimes less. I have between 30 and 40 tons to go to Wagga now.
2087. *Mr. Levien.*] What is the soil like when you have taken out the timber? It is very good soil, and very deep. We have grown white beet and red beet there from 1½ to 3½ lb. in weight.
2088. What crops do you grow? We do not grow any crops; we only grow a few vegetables for our own use.
2089. If the proposed railway were constructed it would cost you about the same to send timber to Wagga by train as it costs you now to cart it there; but you would be able to send it more quickly? Yes.

J. Hides.
5 Dec., 1899.

Bartholomew Soden, grazier, Batlow, sworn, and examined:—

2090. *Mr. Shepherd.*] How long have you been residing on your present holding? For six years.
2091. What is the extent of your holding? 2,000 acres.
2092. What number of stock have you? I carry, on the average, from 1,500 to 1,800 sheep.
2093. Any cattle? Yes, a few milkers.

B. Soden.
5 Dec., 1899.

- B. Soden.
5 Dec., 1899.
2094. Have you any cultivation? Just enough for the use of the home—about 20 acres.
2095. What is your average wool return? From 5 to 6 lb. to the sheep.
2096. What distance are you from Tumut? 20 miles.
2097. In what direction? South.
2098. Is there much good land beyond you? Yes, thousands of acres.
2099. Is it similar to your own land? Yes.
2100. Are you able to carry nearly a sheep to the acre all the year round? Yes; I did it right through last year.
2101. Has your lambing been successful? Last year my lambing was 75 per cent., and the year before 86 per cent.
2102. Have you disposed of your surplus sheep, or has your flock been increasing? No; I have disposed of the surplus.
2103. Do you get a fair price for your wool? Very fair. I have not sold it yet this year.
2104. Is it considered of very good quality? It is not so good as the dry-country wool.
2105. Is any agriculture carried on near to where you are? Yes, on small areas.
2106. But nothing of any large extent? No.
2107. What success have those had who have cultivated? They have been very successful with oats and potatoes.
2108. What returns have they got per acre? As high as 80 bushels of oats to the acre; but from 50 to 60 bushels would be a very good average.
2109. Do they grow the oats chiefly for grain, or for hay? For both hay and grain.
2110. What weight do they get in hay per acre? The weight varies very greatly. A man took 3 tons of hay off an acre of land last year, while others got as little as 13 cwt.
2111. What have you got at your place? Last year I got about 30 cwt. of hay to the acre. A small patch of wheat which I put in as an experiment yielded me 25 bushels.
2112. Is any cultivation going on beyond you to the south? Yes, a little.
2113. How far from you? There is no cultivation of any extent more than 3 or 4 miles south of my place.
2114. Is any fruit-growing attempted out in that direction? Fruit-growing will be the principal industry there. I know a place where a man and his wife, with his son and daughter-in-law, and another man, earn a very handsome living off 4 acres.
2115. What kind of fruit? Principally apples and English fruits, such as raspberries, currants, and gooseberries.
2116. How is that country watered? Splendidly; it can nearly all be irrigated.
2117. There are running creeks there, I suppose? Yes; and the water could be brought by means of races from those creeks.
2118. What effect do you think the construction of a railway to Tumut would have upon that district? I think that it would induce close settlement, and encourage fruit-growing. I rent my land, and, as my lease expires in a short time, I intend to give up grazing. I have purchased about 4 acres of orchard, and I intend to go in for fruit-growing.
2119. What would be a fair area for a man to get a living upon in your immediate neighbourhood? It would depend upon the occupation he followed. If he combined farming with fruit-growing, from 100 to 150 acres would be ample. His returns from that area would be greater than his returns from a larger area. If a man intended to adopt pastoral pursuits, he could do with nothing under 2,000 acres.
2120. Do you think that that would be a sufficient area to enable a man to make a fair living? I think so.
2121. What kind of grasses have you here? We have a grass which we call summer grass, though some call it kangaroo grass. It is a tall grass, with a head very similar to oats.
2122. Is it pretty plentiful about here? Yes.
2123. Is that your principal grass? There are other grasses. There is a great quantity of wild clover.
2124. Has the district been settled for a long time? I think there were diggings at Batlow thirty years ago or more. You will find the clover on the top of some of the highest mountains about there.
2125. Do you think that the construction of the proposed railway will have the effect of bringing small holdings into occupation? Yes.
2126. Is most of the land there alienated, or is it chiefly Crown lands? It is nearly all Crown lands, though it may be held under annual lease.
2127. Do you think that if the proposed railway were made it would be largely occupied by small holders? Yes.
2128. Are there many others besides yourself? Yes; the population is fairly thick round about Batlow.
2129. Do they all seem pretty well satisfied there? They seem to be doing fairly well.
2130. Do you find it an inconvenience to be so far from a railway? Yes, a great inconvenience.
2131. What does it cost you to deliver produce in Gundagai? Thirty shillings a ton.
2132. Do you think that the proposed railway will obtain sufficient traffic to justify an annual expenditure of £8,150? That is a question I could not answer; but if the railway is made, there will be an increase of population, and therefore, I think, an increase of railway traffic. One gentleman at Batlow has planted out 25 acres of fruit-trees, and he intends to increase his area to 60 acres next year. I think that the jam-making industry will spring up there.
2133. You would still have 20 miles to go to a railway station if the proposed extension were made? If the proposed extension were made I should only have to go to the Gilmore, a distance of 15 or 16 miles.
2134. Do you not think that that would be an excessive distance? No; we could comfortably go there and back in a day.
2135. How far is it from your place to Gundagai? About 40 miles.
2136. You are in favour of the construction of the proposed railway, and you think it would be of advantage to the country? Yes; because I think it would induce population to settle in the district. We have an annual fruit show up where I live, and last year the Government Fruit Expert, who made the awards, said that the apples were the best he had seen in New South Wales.
2137. I suppose Gundagai is too far for you to deliver fruit there? Yes.
2138. *Chairman.*] What kind of country is it between Gilmore and Batlow? The Gilmore valley contains the picked land of the district. Then there is the Windowie valley land, which is also very good; and besides this there is good grazing land.
- 2139.

2139. Are the valleys wide or narrow? They spread out and come in again.
 2140. How wide is the widest—5 miles? Yes, in some places.
 2141. Is this rich land largely cultivated? Every foot of the best land in the valley is cultivated, I think. ^{B. Soden.}
 2142. What crops are grown? Wheat, oats, and maize. ^{5 Dec., 1899.}
 2143. And they grow luxuriantly? Yes.

Robert Rex Timmis, storekeeper, Batlow, sworn, and examined:—

2144. *Mr. Watson.*] How long have you been a resident of Batlow? For twenty-seven or twenty-eight years. ^{R. R. Timmis.}
 2145. Has there been any great change there during your time? It was a good place when I first came there; then it dwindled down to nothing, and now it is improving again. ^{5 Dec., 1899.}
 2146. When you first went there it was a mining centre? Yes.
 2147. But afterwards the mining fell off? Yes; and the miners took to growing potatoes, fruit, and oats. Now it is more an agricultural than a mining district.
 2148. The rejuvenation of the district is due to the capabilities of the soil and the agricultural development you speak of? Yes.
 2149. Where do the people obtain a market now? At Tumut, Gundagai, occasionally at Wagga, and a little fruit goes to Sydney.
 2150. Do they also send potatoes away? They do not send potatoes further than Gundagai.
 2151. Is the carriage too high? The carriage from our place to Gundagai is from 30s. to 35s. a ton, and, therefore, people cannot compete with the people on the railway line.
 2152. Do any of the people up there go in for dairying at all? Very little.
 2153. What is the general character of the country round there? It is all very rich basaltic soil.
 2154. Is much of it broken country? It is hilly country.
 2155. But not too much so for use? Not for fruit-growing. Some of the hills are rather too steep for ploughing, but there is a lot of good country there, and a great deal of it is still open.
 2156. What is the rainfall? About 56 inches.
 2157. Then comparatively poor land ought to be productive there? Yes; and we have plenty of water for irrigation.
 2158. Do you anticipate obtaining a larger market for your potatoes if you get railway communication? Yes, I think so, if we had a railway to Tumut.
 2159. I suppose the people in your district would send to the railway somewhere about Gilmore? Yes; that would be about 14 miles.
 2160. What would it cost you to take potatoes and other produce from Batlow to the Gilmore? About 10s. a ton.
 2161. The freight upon potatoes from Sydney to Gundagai is 23s. 5d.? Yes.
 2162. If it costs you from 30s. to 35s. a ton to send produce to Gundagai, you can be easily undersold by the people living nearer to Sydney? Yes, though we get a better price for our potatoes than they get for the Sydney potatoes.
 2163. If the proposed line were made, the charge for conveying potatoes from the Gilmore to Gundagai would be 3s. 8d. a ton, and, adding 10s. for cartage, 13s. 8d. from Batlow to Gundagai, as against 30s. at the present time;—that would be a considerable saving? Yes.
 2164. Do you think that there is room for a great improvement in the potato-growing industry? Yes, a very great improvement.
 2165. Sometimes there is a considerable glut in the potato market? Yes. Our potatoes have been allowed to rot some years.
 2166. Has there been no way of using them? Only by giving them to the pigs.
 2167. How are the people up your way getting on at the present time? They are making a living. Most of them own their own holdings.
 2168. Have they small plots of land? Yes; and I think that, generally, the smaller the plots the better they get on.
 2169. Are there any local circumstances which improve your position for competing with people in an outside market? No; except that our fruit and potatoes are better than the fruit and potatoes from other places. They are grown in a colder climate, and they are, therefore, more solid and of better quality.
 2170. Do they keep better? Yes.
 2171. Your season is much later than that of the districts nearer Sydney? Yes; we are a month or six weeks later. We are about 1,500 feet higher than Tumut.
 2172. That, perhaps, would give you an opportunity of getting into the market when it was bare of produce? Yes. We anticipate being able to keep our apples right through the year until now. We have a few that we have kept from last season, and I know that a couple of weeks ago they were quite sound. We believe that if we had railway communication we should be able to supply the Sydney market when it was bare of fruit from Tasmania and other places.
 2173. Is any large proportion of the Crown land in your district suitable for settlement of the class that there is there already? I think it all is.
 2174. For fruit-growing, combined with other industries? Yes.
 2175. That would lead the Committee to anticipate that if the proposed railway is constructed there will be a considerable increase in the population in your part of the district? I think that there will be.
 2176. Would the class of production which that district affords yield much railway traffic? I think so. Acre for acre, I think that a great deal more goes from an orchard than from any other holding.
 2177. What kind of mining is carried on there? Chiefly ground-slucing.
 2178. Were there any appearances of reefs? Yes, but they have not been very good so far.
 2179. You do not anticipate that the construction of the proposed railway will have any effect upon the mining industry there? No.
 2180. What possibility is there of an increase in population between the Gilmore and Batlow? There is a strip of 5 or 6 miles of very good land there, and then you go through about 9 miles of very poor country—grazing country.

- R. R. Timmis.
5 Dec., 1899.
2181. The strip of 5 or 6 miles, to which you refer, is already pretty well occupied? Yes; it is a narrow strip of very rich land.
2182. And, at the present time, it is cultivated to pretty well its fullest extent? Yes, I think so.
2183. Then you have 9 miles of grazing country? Yes; just where the road runs, but 2 or 3 miles from the road it is very good country again.
2184. Would the produce from the land which is off the road go towards the railway? Yes. The road from Tumbarumba runs through the land.
2185. Is it settled now? There are a few selectors on it; but it could be opened up still more.
2186. What would be the capacity of the grazing land you have referred to? I could not say, but I suppose a sheep to the acre. It is very fair grazing country.
2187. You would not expect very much development from that country? No; but the basaltic country is capable of very great development. The greatest drawback to the occupation of the district is that the land is so heavily timbered. The country has been rung, however, and is in a fit state for clearing, so that the clearing would not cost one-third of what it would have cost seven or eight years ago when the land was first selected.
2188. Has the Government land been ringbarked by the lessees? No.
2189. It is still in its natural state? Yes.
2190. And it would take some little time to get it ready for clearing at a cheap rate? Yes; but there is a great area of country already ringed.
2191. Is that country available? It is alienated land, but the produce from it would help to increase the Railway traffic. The Government land consists of a forest reserve from which timber is being drawn. That timber would be a considerable item in keeping the railway going.

George Clout, *seur.*, farmer, Upper Brungle, sworn, and examined:—

- G. Clout, *seur.*
5 Dec., 1899.
2192. *Mr. Levien.*] How long have you been living in the district? Since 1865.
2193. Then you have a thorough knowledge of the whole surrounding country? I have a perfect knowledge of the Tumut district.
2194. How many acres of land do you hold? 308 acres.
2195. Is it under cultivation? Yes. I make my living by cultivating it, and I have done so during the whole of the time that I have had it.
2196. What crops do you grow? Wheat and oats, chiefly.
2197. Have you any statement to make to the Committee? Yes. Any estimate with regard to the probabilities of a railway to Tumut being a self-paying concern cannot be relied on if based on the present output of produce. To anyone who has given consideration to the matter, it is clear that with the extension of the railway into our midst, that output will be doubled, and in some cases trebled. With regard to our staple products, viz., wheat and maize, I need not say much; the output of these commodities is steadily advancing, notwithstanding the handicap under which we labour, and it needs no great amount of discernment to perceive the impetus that would be given to their production if the extra freight cost of 3d. per bushel were saved to the farmer. The average yield per acre is higher than that of any other part of the Colony, and the quality is equal to anything that can be produced, as evidenced by the success obtained by Tumut farmers at exhibitions all over the colonies, and repeatedly at the Royal Agricultural Society's Show in Sydney, and also at the Calcutta Exhibition, the Indian and Colonial Exhibition in London, and at the World's Fair at Chicago. But for the present, I would rather deal with those commodities, which, on account of the absence of a cheap and expeditious means of transit, we are virtually debarred from producing, viz., hay, chaff, and potatoes. With regard to the former of these commodities, it is a well-known fact that the two-thirds of the chaff used in Sydney is imported from Victoria and elsewhere, because the most favoured localities in this Colony, of which Tumut is one of the principal, are prohibited by insufficient means of transit from supplying it. To make this clear, I would point out that the freight charge per road to Gundagai is 15s. per ton, and thence to Sydney, the charge is 9s. 6d.; the cost to Sydney thus being 24s. 6d. per ton. When loss of bags, cartage, and commission charges are added to this, the entire value of the article is eaten up. The result is that we have to leave the industry severely alone. Had we the railway to Tumut, our freight charge to Sydney would not be more than 10s. per ton, and in a district like this where 4 tons per acre is not at all an unusual thing, sufficient hay could be produced to not only supply local requirements, but we could send a surplus to Sydney which would go far towards crowding out the Victorian article. Again, in seasons of drought, when such a large demand is created for fodder in the drought-stricken districts, we could supply thousands of tons, but that the freight charge forbids it. An effort was made during the past dry seasons to open up trade in this direction, but the expenses attached thereto prevented it being persevered with. The same arguments apply to the cultivation of potatoes. We have a district almost equal to the famous Warrnambool for potato-growing, but have to confine ourselves to local requirements, as it is very rarely that the Sydney market will warrant the payment of the heavy cartage freight, in addition to the railway charge. As a matter of fact the Riverina country, which was our former market for this commodity, is now supplied from Sydney with Warrnambool and Circular Head potatoes more cheaply than we can supply them, as they have that direct railway communication, which up till now has been denied to us. As a consequence of this, potato-culture has become very much neglected, so much so that in some seasons local requirements are not met, and the same state of affairs will exist until a cheap and expeditious means is provided for getting rid of all surplus products. The area of land adapted for growing potatoes, and in fact roots of all kinds is practically unlimited. Turnips, mangels, beets, &c., grow to perfection. Much of the mountain country, both as regards soil and climate is admirably adapted for such, with special advantages for irrigation, on account of its bountiful water supply, a system which is much practised by landholders in that locality. The whole of the trade of these mountain districts trends to Tumut, and once the railway is an accomplished fact, Tumut as a produce emporium will hold the leading position in the south-western portion of this Colony. Poultry-farming is an industry which would flourish under altered conditions, but the expense and delay in forwarding by road to Gundagai makes it almost prohibitory at present. Dairy-farming too, which up till now has been almost entirely neglected, has great potentialities in a district which is so eminently suited for it. Immense quantities of such products as those I have mentioned could be produced in this district, did not cost of transit forbid it, but the
advent

G. Clout,
senr.

5 Dec., 1899.

advent of railway communication would give a great impetus to our agricultural industry, as it would enable our farmers to compete not only with those of the neighbouring colonies, but also to hold their own against all-comers in the markets of the world.

2198. What acreage have you under wheat? I cultivate about 50 acres altogether, and I have about 25 acres under wheat.

2199. And how much under oats? I have 12 or 15 acres under oats.

2200. What yield do you get to the acre? From 40 to 50 bushels of oats, and about 25 bushels of wheat.

2201. I suppose you sell your produce locally? Yes, mainly, but I have sent produce to Sydney at various times.

2202. If the proposed railway were constructed, how would it affect the district? I believe that the production of the district would be almost doubled if the proposed railway were constructed. If we could get rid of our surplus produce every year at a reasonable price, we could grow with much more confidence.

2203. I suppose you have a fair knowledge of other districts? I have a knowledge of the south-western districts of the Colony.

2204. Do you think that this district will be of great service in producing supplies for the drought-stricken parts of the Colony? Yes. Riverina would be our best market if we had facilities for getting there.

2205. I suppose you would be prepared to pay a little more than you now pay if you could get to market more quickly, and get there when the prices were good? Yes.

2206. That is the main point, I believe. I understand that if the people here could have got their tobacco away in time they could have sold it at a high price? That applies still more in regard to maize. At the present time people are often unable to take advantage of a favoured market because of the want of teams.

2207. *Chairman.*] You live east of the township of Brungle? I am 9 miles from Brungle proper.

2208. How far is Brungle from Gundagai? It is 13 miles from the Brungle Post-office to Gundagai.

2209. So that you would have 20 miles to get to Gundagai? Not quite, because I would not have to go to Brungle proper. I am only 18 miles from Gundagai.

2210. And how far from Tumut? Thirteen miles.

2211. If the proposed railway were constructed, would it suit you better to cart to Tumut, and to pay 33 miles of additional railway freight, than to cart to Gundagai? It suits me better to come to Tumut, because I can get here and back in a day. I cannot get to Gundagai and back in a day.

2212. Have you a better road to Tumut? The roads are about the same.

2213. I suppose that the railway charge for agricultural produce is very small? Yes, it is scarcely noticeable on a distance of 20 or 30 miles.

2214. That being so, would you avail yourself of the proposed railway? Yes.

2215. Is there much land out your way which would be suitable for agriculture? Yes; the greater part of the parish of Brungle is good agricultural land. Of course, Lower Brungle is nearer to Gundagai than to Tumut. Lower Brungle is on the valley of the Tumut River.

2216. *Mr. Levien.*] Did you read the letter signed "Maize Grower, Adelong Crossing," which appeared in the *Gundagai Times*? Yes, I read it; but I do not think the writer lives there.

2217. Do you think the statements in that letter are a slander upon the people about here? Yes. As a rule, the farmers here are as independent as any men in New South Wales.

Lewis Margules, grazier, Tomorrara, sworn, and examined:—

2218. *Chairman.*] I understand that you live at a place about 20 miles east of Tumut? Yes.

L. Margules.

2219. How large is your holding? About 1,100 acres.

5 Dec., 1899.

2220. Do you farm the land, or run sheep upon it? I use it for grazing principally. I only farm for my own use.

2221. What is the extent of the agricultural and pastoral country out your way? Taking Tomorrara as the centre, there are about 100,000 acres within a radius of 6 or 7 miles, and of this area I consider that fully 60,000 acres are suitable for agriculture. The land I speak of is table-land country, there being a fall towards Tumut and a fall towards Yass. There are about 12 miles of flat country there, and most of it is suitable for agriculture.

2222. Is the good country in patches? No; there is good rich soil throughout. There are high hills there which are too steep to be cultivated, but the country is mostly undulating.

2223. Has it been improved much? The greater part of it has been ringbarked and suckered, but it has not been cultivated. There is no way of getting produce to market from that district at any profit, and, therefore, the country is used mostly for summer grazing. There is more money to be made by renting it to Riverina pastoralists than by grazing on it yourself.

2224. When any of it has been farmed, has the farming been a success? Yes, a great success. One man who cultivated about 50 acres told me that last year his yield was 25 bushels of wheat and 30 bushels of oats to the acre, and I have had as large a yield as that myself, though I have only cultivated the land on a small scale.

2225. Is a large expenditure necessary before the land can be cultivated? In its natural state the land is heavily timbered, but where the country is ringbarked it does not require very much to get it cleared.

2226. How much? Thirty shillings an acre where it has been ringbarked for any length of time.

2227. Is this land available to settlers, or will it be available within a reasonable time? It has all been taken up, and it is returning revenue to the Government. There are a great many settlers there already.

2228. And you think that they would improve their land? Yes; they would go in for growing different kinds of produce, if they could send it away. Then, too, the large holders would give settlers every opportunity to go in for farming. It would be a good fruit-growing district, and dairying could be carried on very profitably there. At the present time the land is used solely for grazing.

2229. Will you tell the Committee what is the character of the land south of your holding which is coloured yellow on the Committee's map;—according to the Government figures there are about 50,000 acres there? Yes; but that area takes in Cooleman and other places which I have not taken in. The whole

- L. Margules,
5 Dec., 1899.
- whole of that country would be alienated if there were means for getting the produce away. More and more people go there every year. From three to four years ago most of that country was all open country, and was hardly held under lease at all, but now large portions have been selected. Of course, there are some old selections there too.
2230. Then that land has not been left because it is worthless; population is gradually creeping up to it? Yes. Of course the climate in the winter months is very severe, and, as you get south, there are heavy falls of snow there. About 40,000 acres of the 100,000 acres I have spoken of would be first-class grazing country.
2231. Would it carry a sheep to the acre? Yes, the improved land; but a lot of it is worthless until it has been improved, because there is so much timber upon it. It is surprising what a difference a little improvement makes to it.
2232. Would Tumut be the most accessible railway-station from that place? Yes.
2233. It would be more accessible than Gundagai? Yes; the traffic has to come down to a point called Kyley's Creek in order to get through the mountains, and when it is there it is only 10 miles from Tumut, whereas it is 22 miles from Gundagai. All the traffic must come to that point before it can turn either to Gundagai or to Tumut.
2234. Are the roads there very bad at the present time? Yes, they are mountain roads.
2235. Could they be made fairly good without any great expense? Yes; good grades could be got without very much expense. It is mostly side-cuttings that would be required. There would be no rock-cuttings.
2236. Does wheat-growing pay better than corn-growing now? I could not say. We are not in a corn-growing district there. We could not grow corn with certainty there.
2237. Is there any frost in the district to destroy the fruit crops? Very seldom. Last year our fruit crop was destroyed; but that happened right throughout the Colony. Apples and cherries will grow well in that part of the country, and the trees will keep on bearing. Small fruits can also be grown there.
2238. Do you know any other parts of the Colony which are better than the district that you speak of? No.
- 2239-40. You look upon your district as an exceptionally good district for cereals and other crops? Yes; I consider it the garden of the Colony for such crops.
2241. Have you a selection? Yes. There is a good deal of mineral country in the 100,000 acres to which I have referred. A lot of men are making comfortable livings there from alluvial mining and by reefing. Tin has been found in different parts, and silver has also been found. At the present time that area produces no railway traffic; but if we could get a market, about 30,000 or 40,000 acres would produce traffic for a railway. I do not think the people there are afraid of a day's work, and they will go in for whatever pays them best.
2242. I suppose that with good land and a reliable rainfall farming would be largely followed? Farming will pay best under any circumstances.

George Godfrey, senr., farmer, Gocup, sworn, and examined:—

- G. Godfrey,
senr.
5 Dec., 1899.
2243. *Mr. Dick.*] How long have you resided at Gocup? About thirty years.
2244. You have at various times acted as judge on behalf of the Government at local shows? Yes.
2245. And you have also taken a prize for model farming? Yes, on two occasions.
2246. What are the possibilities of the district immediately around Gocup? I think you can expect that double the area now under cultivation will be cultivated if the proposed railway is constructed.
2247. What prevents the people from doubling their area now? We have no market except the Sydney market now, and prices are very low, so that those who can do well at other occupations do not bother about farming.
2248. Would the construction of the proposed railway enable you to compete successfully in the Sydney market? Yes, because we could get our stuff away so much more quickly and cheaply.
2249. What obstacles stand in your way now? Well, on the far side of my place the roads are very heavy.
2250. *Mr. Watson.*] Do you mean towards Gundagai? Yes; and I have to pay nearly as much for carriage from there as from Tumut.
2251. *Mr. Dick.*] How far are you from Gundagai by road? Thirteen miles.
2252. And from Tumut? Eight miles.
2253. Are the grades against you, going to Gundagai? Yes; it requires a strong team to take a load from my place to Gundagai.
2254. Even if the proposed railway were constructed you would have 8 miles of road carriage? Yes; but I could do my carting then with a small team.
2255. It would be a decided advantage to you to have the railway extended to Tumut? Yes; I could do my own carting then instead of hiring a team.
2256. Mr. Brennan has given us certain figures concerning the land within the parish of Minjary, county of Wynyard; but he told us that there were about 5,810 acres, which he was not sure were suitable for agriculture. He stated that you would be able to tell us how much of his holding would be fit for agriculture? About 1,000 acres.
2257. Is the land all of one quality? No; some of it is forest land, but a great deal is river frontage.
2258. He told us that in the parish of Minjary there were about 10,568 acres of freehold and conditionally-purchased land, of which a certain area was river-frontage land, and suitable for agriculture;—how much of that land is suitable for agriculture? About half of it. A lot of it is low country, and under water at times, but it is all good land. Some of the good soil reaches up on to the high land, but not much.
2259. Is much of it being cultivated now? Not of late years.
2260. Can you tell us why that land went out of cultivation? I think it pays them better to graze at the present time. The price of produce is low, while carriage rates are high.
2261. Do you think that the construction of the proposed railway will materially alter the present state of things? In years to come, all of that land will be under cultivation. It is all good land.
2262. What is the size of your holding? 230 acres.

2263. How much of it do you cultivate? Seventy acres, and there are 70 more which I could cultivate. G. Godfrey, ^{senr.}
2264. What do you grow chiefly? Wheat, oats, and maize, and I have grown tobacco.
2265. What is the average yield that you obtain? From forest land, taking one year with another, I have obtained from 15 to 20 bushels of wheat. I got as much as 25 bushels to the acre when I first broke the land up, and as much as 35 bushels from the river land. 5 Dec., 1899.
2266. How much of your 280 acres is river flat? I have no river flat myself, but I have rented river-flat land at Gocup.
2267. The general tenor of your evidence is that at the present time road carriage is so high that it is better to use the land for sheep-grazing than for agriculture? Yes; with the exception of the very rich land.
2268. And you say that, if the railway were extended to Tumut, land which has been under cultivation in years past would again be put under the plough? Yes; and I think, too, that a great deal of new land would be cultivated.
2269. *Chairman.*] Does your land extend as far as the Gilmore Creek? No.
2270. Is it exceptionally good land? No, it is only middling forest land. There are some little flats in it which were formerly covered with ti-tree, and they are very good. The low land is all good land for maize-growing, especially in dry seasons; but in wet seasons the forest land is generally the best for wheat.
2271. Do they crop their land continuously or do they occasionally rest it? I crop my land continuously, but I change the crops. I do not put in the same crop every year.
2272. How many flour-mills are there in the Tumut district? Two.
2273. One a water mill and the other a steam mill? Yes.
2274. Have there ever been more? Yes; there used to be another mill on the Gilmore.
2275. Why was it discontinued? I could not tell you. In olden times they used to send a great deal of flour out of Tumut, but this has all been cut off now.
2276. Have you been here very long? I have been thirty years where I am living now.
2277. Notwithstanding the difficulties attending farming in this district, as a rule have the farmers been successful? Well, in my own case, I have just about made a living for myself and my family.
2278. I suppose you have always sold your produce locally? At one time I used to sell horse-feed a good deal by the road-side. That was when the teams used to travel to Goulburn, but now I cannot do that, and therefore I do not grow so much hay. I generally sell my produce in Tumut now, though I sell some of it in Gundagai.
2279. Is your acreage sufficient for a man to make a living upon? I have made a living upon it by following agriculture and by running a few cattle and sheep.
2280. Is yours rented land? No; it is conditionally-purchased land.
2281. Do you think the fact that the land round Tumut is largely owned by private owners is likely to prevent it from being extensively cultivated? I do not think so. I think that if people could get a market for their produce they would be willing to rent land, though the rents are pretty high.
2282. A man could get more by leasing his land for agricultural purposes than by running sheep upon it? I think he could get more for rich flat land.
2283. Could a farmer afford to pay £1 an acre for rented land? Well, they do pay as much as that in some cases.
2284. Is it not rather a heavy rent? I should think so if I had to pay it.
2285. Especially when, in addition, there are cartage charges to pay? Yes. There is 4d. a bushel for cartage and the price of the bags, so that when you have paid your rent there is not much left.
2286. In some of the large agricultural districts near Sydney they pay much higher rentals than £1 an acre for flat land? Yes; but there they are close to market.
2287. *Mr. Watson.*] What have you to pay to send your wheat and other produce from Gocup to Tumut? I always bring it in myself.
2288. And do you convey your own produce to Gundagai? No; I pay 1s. a bag to have it taken to Gundagai. It requires a strong team to take produce to Gundagai, and if you are sending produce away by train you must send it by the truck-load in order to get the cheap freight.
2289. If the proposed railway were constructed it would cost 3s. 6d. a ton to convey wheat by train from Tumut to Gundagai;—that being so, would you bring your wheat to Tumut? Yes; because I could not send it to Gundagai for as little as 3s. 6d. a ton.

Patrick Halloran, farmer, Blowering, sworn, and examined:—

2290. *Chairman.*] Blowering is 9 miles from Tumut, in a southerly direction? Yes.
2291. I understand that you have a statement to make to the Committee? Yes. My statement refers to an area of land extending for 5 or 6 miles along the river frontage, and running back for a distance of 4 or 5 miles. In that area there are about seven settlers, and the area of land suitable for cultivation but not now used for that purpose would amount to: Corn land, 105 acres; and land suitable for wheat and oats or oats alone, about 800 acres. The approximate yield of grain and other produce per acre on land cultivated during the last few years has been: Wheat, 26 bushels; and corn, 47 bushels. Some farmers have grown crop after crop on the same land for thirty-five years, and the land has yielded 50 bushels of corn to the acre, two crops yielding as much as 50 and 70 bushels to the acre, by ploughing 8 or 9 inches deep. If all land were cultivated properly, the average yield would be 70 or 75 bushels to the acre. The area of land suitable only for pastoral pursuits is 2,601 acres, and it is capable of carrying one head of cattle to 4 acres. The timber in the district comprises gum, box, stringy-bark, and mountain ash, close in; and a little further back, there are thousands of acres covered with mountain ash, messmate, stringy-bark, and white gum, the mountain ash running 60 and 70 feet without a branch. This belt extends from Micalong right through Gobragandra, Blowering, and Yarrangobilly, to within 8 or 9 miles of Kiandra. Strawberries, gooseberries, raspberries, mulberries, blackberries, cherries, plums, apricots, peaches, nectarines, almonds, walnuts, apples, melons—water, pie, and rock—passion-fruit, pears, quinces, oranges, lemons, loquats, pomegranates, and grapes, will thrive in the district, and 329 acres of land are likely to be planted with fruit-trees if the railway is constructed. Hundreds of tons of pie-melons grow wild, and are allowed to rot in the paddocks because we have no railway. Our fruit lasts all the year round, and when the Batlow and Tumut apples are gone we have oranges, lemons, and early cherries. Copper and other minerals. P. Halloran, 5 Dec., 1899.

P. Halloran. minerals are known to exist in the district, but they have never been worked. Pumpkins grow well through corn. If the railway were constructed, about 1,470 pigs would be reared. Hops grow well on the flats when they were tried some years ago, but the district is too far away from the railway to make the industry profitable. Vegetables such as potatoes, onions, peas, beans, carrots, turnips, parsnips, pumpkins, vegetable marrows, cauliflowers and cabbages do well. A great quantity of chaff would be sent away if there were a railway, but, owing to the long distance to the station, the cartage takes away one-third of the profit. At present there is no encouragement offered to the farmers to break up more ground. Sugar-beet was planted here some years ago, and it did remarkably well. If we had a railway here, we could get our reapers and binders to work, and save the straw which is now destroyed. About 18 cwt. of straw could be saved on every acre of wheat-land. There are three or four firms in Tumut who buy grain, and then they hire all the available teams to carry it to Gundagai, so that if the farmers did not sell to them they would have to wait three or four months before they could have their produce carried to the railway station.

2292. If the railway came nearer you could do your own carting? Yes. At the present time you can only take two truck-loads a week from Blowering to Gundagai.

2293. If there were a railway, how many people would settle upon the area that you speak of? I suppose that there is room for half a dozen farmers there, supposing they went in for wheat-growing. I do not know how many acres of orchard are necessary to keep a man; but fruit-trees will yield as well in that district as in any part of the Colony.

2294. Do you think that 50 acres would keep a man? I think so. Fifty acres of wheat-land would keep a man, though he would not make a rich living on that area. Until lately none of the high ground has been broken up, because it was considered unsuitable for farming; but, of recent years, they have found that wheat grows better there than on the river flats, and is less likely to be affected with rust.

2295. How is the country occupied now? It is used for grazing.

2296. Would it be available for farming if the proposed railway were made? Yes. It belongs to various owners.

2297. Have your neighbours stated that with better access to market they would go in for farming in preference to other occupations? Yes; and they have been very cautious in the statements they have made, because they are afraid of having their land tax increased. They have not made things appear better than they really are.

WEDNESDAY, 6 DECEMBER, 1899.

[The Committee met at the Court-house, Tumut, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEU, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

Samuel Gordon, farmer, grazier, and dairyman, Gocup, sworn, and examined:—

- S. Gordon. 2298. *Chairman.*] How many miles do you live from Tumut? Six miles out, on the marked tree line.
6 Dec., 1899. 2299. How much land do you hold? 2,500 acres.
2300. How many sheep do you run? I have no sheep.
2301. How many cattle have you? 360 head.
2302. And how many horses? Sixty head.
2303. How much land do you cultivate? I cultivate 290 acres myself, and on the halves system, and I rent 800 acres.
2304. What is the character of your land? It is alluvial flat land.
2305. What crops do you get? I get from 35 to 40 bushels of corn to the acre, and about 25 bushels of wheat to the acre for 250 acres. I have also 15 acres under oats.
2306. Where is your market? I sell my produce locally, but it ultimately goes to Sydney. It is taken to Gundagai by team, along the marked tree line.
2307. What do you pay for carriage? About £1 a ton.
2308. That is for the 16 miles from your place to Gundagai? Yes.
2309. That is pretty high? They will not take it for less.
2310. Is that because the road is so hilly? Yes; it is a heavy road.
2311. If the proposed railway were made, I suppose you would send your produce back to Tumut, and consign it from there? I intend to go into dairying altogether.
2312. But would it not suit you better to grow crops upon your rich land? No; dairying would be better. I would use that land for grass.
2313. I suppose you could feed a large number of cattle upon those paddocks? On the rich land you could run a beast to 2 acres. There are 1,300 acres of alluvial land, and 800 acres of ordinary forest country. I have more forest country on the other side of the road.
2314. Do many other people intend to convert their cultivated land into paddocks? No, I do not think so.
2315. If the district is going to be used chiefly for dairying, it will very much diminish the railway traffic? Well, I speak only for myself, I cannot speak for anyone else.
2316. What do you get for the land you lease? Thirty-shillings an acre.
2317. That is for the rich land? Yes.
2318. Can a farmer make a living when he has to pay so high a rental as that? Yes, he can do so easily.
2319. What is the area of each farm? I have leased out 290 acres. The size of the farms runs from 35 to 40, 50, and 60 acres.
2320. Are all your tenants making a living by the cultivation of the land? Yes, by growing maize and tobacco. They are Chinese.
2321. All of them? Yes; though I am working some of my ground upon the halves system with European labour.

2322. I understand that the tobacco crop has not been satisfactory lately ;—is that because the tobacco grown is not of a kind that is cared for? Yes. S. Gordon.
6 Dec., 1899.
2323. Then we may regard the tobacco-growing industry as one that is likely to collapse? Yes, unless they grow a better quality of tobacco.
2324. The production of corn has gone down ;—is not that rather strange, seeing that the Tumut corn has such a good reputation? I believe that it fetches 1d. a bushel more than other corn; but the cost of carriage prevents our farmers from competing satisfactorily with the farmers in other places.
2325. If the proposed railway were made, would the farmers in your locality bring their produce to Tumut and consign it from there, instead of sending it to Gundagai? I think so.
2326. It would not cost anything like £1 a ton to do that? No.
2327. Is there a large area of agricultural land available for small holders? Well, I have moved very little about the district.
2328. Some of those who are opposed to the construction of the proposed railway say that the land round about Tumut is all held by large landed proprietors, who let to the farmers ;—is that a fact? I do not think so. I have been in the district fifteen years, and I let my first leases for periods of ten years, but, during the last five years, I have given only annual leases, because I intend to resume the land, and to put it under grass.
2329. Dairying is rather a new industry here? I have been engaged in it for ten years.
2330. Where have you sent your produce? To Tumut, Adelong, and Gundagai, and now I send to Sydney as well.
2331. Do you make a fair profit by sending to Sydney despite all the charges you have to pay? Yes, a fair profit.
2332. Are there many others who send milk and butter to Sydney? I do not know.

Hamlyn Lavicount Harris, land-owner, Tumut Plains, sworn, and examined:—

2333. *Mr. Dick.*] What is the acreage of your holding? The original acreage of the property was 25,000 acres. H. L. Harris.
6 Dec., 1899.
2334. Will you tell us how much of that land is alluvial land, how much is forest land capable of cultivation, and how much is grazing land? There are about 3,000 acres of alluvial land, about 10,000 acres of forest land capable of cultivation, and about 8,000 acres of grazing land.
2335. At the present time, how much land have you under cultivation? I have tenants in occupation of a little over 1,100 acres.
2336. Then the whole of your alluvial land is not under cultivation? No.
2337. Can you tell us what rent you receive, and how your tenants get on? I receive from £1 to 3s. an acre for the alluvial land.
2338. What is the average size of the holdings? About 40 acres.
2339. Is that enough for a man to make a living upon? Yes. Some of them have only 20 acres, while others have as much as 60 and 70 acres.
2340. What is the main crop? Maize and wheat.
2341. And tobacco? Yes. In past years a great deal of tobacco was grown, but there has not been so much grown during the last two or three years.
2342. Where is the produce disposed of? Most of it locally; but the maize and the wheat go to Sydney.
2343. If the proposed railway were constructed, would you lease out the remainder of your alluvial land, or place it under cultivation yourself? Yes; the greater part of it.
2344. Do you think that you are handicapped now by the cost of cartage from your place to Gundagai? Yes.
2345. Have you been gradually extending the area under crop, or have you continued to cultivate the same area for a long time? I have cultivated the same area for some time, though during the last two or three years I have let small extra areas.
2346. Is any of your land let on the halves system? No.
2347. What land do you cultivate yourself? I only grow a few acres of hay for my own use.
2348. What stock do you run on your estate? I have about 1,200 head of cattle, and about 100 horses.
2349. Any sheep? No.
2350. Do you think that the development of your holding has manifestly been retarded by the want of railway communication to Tumut? I am sure it has.
2351. Is the 10,000 acres of forest land such that it could be easily cleared? Pretty easily. The timber is not very heavy.
2352. Has any of it been rung? Yes; about 5,000 acres of it.
2353. If the proposed railway were made, could that land profitably be put under cultivation? Yes; it is all wheat-growing land.
2354. How many acres of forest land would be required to give a man a decent living for his family? I think about 100 acres.
2355. What would it cost to clear that land in its present state? £1 an acre.
2356. On how little alluvial land could a man make a living—on 50 acres? A man could make a living upon a smaller area than that. Fifty acres would make rather a large farm. The oldest tenant on my place has 50 acres of land, for which he has paid £1 an acre during thirty-seven years. He has reared a family of sixteen children upon it, and he has obtained as much as 3,500 bushels of corn and 12 tons of potatoes a year from it. Not only has he reared a family, and brought up his children to be useful citizens, but he has also purchased a freehold of 536 acres between Tumut and Gundagai.
2357. On your statements, the alluvial and forest land would provide accommodation for 160 families? Yes.
2358. Do you think that the only thing that prevents an increase of settlement is the long road carriage to Gundagai? Yes.
2359. Is your land supposed to be rich land? I think that it is; but the land on the Gilmore is also very rich.
2360. Do you know of many other patches of land of a fair size of equal richness? Yes, a good many.

- H. L. Harris. 2361. At the present time is it under cultivation or out of cultivation? A good deal of it is under cultivation. Up the river for 20 miles from Tumut there is similar land, and a good deal of it is under cultivation.
- 6 Dec., 1899. 2362. What is the average width of the alluvial flats up the river? I think about a mile.
2363. And in each case is there rising forest land before you come to the hilly country? Yes.
2364. Land fit for agriculture? Yes, undulating ridges.
2365. What would that make the total average width of arable land up the river? About 3 miles.
2366. Is there any other information which you can supply to the Committee? The district is very suitable for fruit-growing.
2367. Is the alluvial land, the forest land, or the high land most suitable for fruit-growing? I think the high ridges are the best.
2368. Do the fruit-trees frequently suffer from frosts? Not frequently.
2369. Has the frost during the present year been exceptional? I do not remember such a frost having occurred before, and I have been here thirty-seven years.
2370. Which route do you think would serve the district best? I think the route *via* Adelong. Adelong is an important mining centre, and I think the population along that route is larger than on the other route.
2371. Is there a larger area of land to be served there? I think so.

Rowland Mansfield Shelley, grazier, Tumut Plains, sworn, and examined:—

- R. M. Shelley. 2372. *Mr. Watson.*] Have you been long in the district? I was born in the district, within half a mile of where I am now living.
- 6 Dec., 1899. 2373. It has been suggested that a line from Coolac, coming along the Tumut Valley, would give a better connection with Tumut than the proposed extension from Gundagai;—what do you think of the proposal? That line would suit a great many better than the proposed line, but if we are to consider the whole population to be benefited, I would say, "Take the railway *via* Adelong," and I have already voted for that proposal.
2374. You think that that is the line which is most likely to give a return for the money invested? I do, looking at other facts which will back it up in the future.
2375. Do you think that the construction of the proposed line will lead to the cultivation of a much larger area of land than is now being cultivated? Yes, a considerably larger area. The population will increase considerably, and more land will be cultivated.
2376. In what portion of the district do you think the increase of population will be most noticeable? Well, to the south there are large areas of country which are now leased by the Government as snow leases; but if the railway came to Tumut, and sheep could be brought more quickly to that land, its value would be considerably enhanced, and it would be cut up, and would support a large population. Then all over the eastern and southern hills adjacent to Tumut the population would increase, because the soil is suitable for growing anything.
2377. Would the land now let out in snow leases be suitable for agriculture? It would be suitable for dairying and for the growing of hay.
2378. Will they be able to grow enough hay there to support cattle during the winter months? Yes, quite sufficient.
2379. You are aware that the bringing of sheep by rail into the district to obtain summer pasture was quite a new experience last year? No; the railway to Gundagai was used for that purpose before last year.
2380. Mr. Harper told us that last year was the first in which any number of starving sheep worth speaking of were carried by the railways? Yes; it was the first year that any large number was brought.
2381. The probability is that in ordinary seasons stock coming from the lower levels to the mountainous country would be travelled along the stock routes? If the railway were extended to Tumut, a larger number of stock would come here, because their lives could be preserved with more certainty. At the present time the sheep come here in November or December, but instead of being able to stay up in the mountains until the first fall of snow takes place, they have to rush away before their time is really up.
2382. But would it pay to send sheep by railway if there were grass on the stock routes? The grass on the stock routes is eaten down by the first few flocks.
2383. The evidence of the Railway Commissioners points to the fact that owners prefer to use the stock routes? That was before they had experience of the railway.
2384. The experience is that sheep-owners prefer to travel store and breeding sheep along the stock routes rather than send them by train;—why should things be different in this district? The squatters down Riverina, anticipating the fall of rain, wait until their sheep get very weak before sending them away. Grass will grow in Riverina in twenty-four hours, if there is a fall of rain; and therefore the squatters there keep their sheep back till the last minute, and by that time they have become too weak to travel, and must use the railway.
2385. Would you regard Humula as within the influence of the proposed railway? The upper portion. Up towards Bago the country would be within the influence of the proposed railway. The traffic from a large part of that country which now goes towards Germanton would come to the proposed railway at Adelong Crossing.
2386. Have you any information to give us with regard to the mining operations of the district? No, I have not had much experience of mining, though in this district we live in the midst of an immense number of mines, and, as population increases, men of experience will come here who will know the worth of them. I would point out that the Tumut district is never known to suffer from drought; we are always able to obtain enough water. Our rivers and our main back creeks are never known to be dry, and we have always had sufficient quantity of grass for our stock. If in a dry season one crop has not matured, other crops have made up for it, because we do not confine ourselves to one crop, and we can grow anything here. There is no better place in the Colony for fruit-growing. All round Batlow, the further you go up the hills the better the soil is for fruit-growing. All English fruits will grow in the district. This district is a sanitarium, and if it were brought within quick access of Sydney it would be a boon to the Colony generally.

2387. There is mountainous country nearer to Sydney than the Tumut district? Well, there can be no doubt that we are heavily handicapped in regard to the carriage of our produce. We have to pay exactly what the carriers charge us—from 4d. to 7d. a bushel for maize. About twelve years ago I had as fine a dairy as any man could have; but I discontinued it after three years, because I found that my produce would have to be taken to Gundagai at night, or the cheese would run all over the place in grease in hot weather.

R. M. Shelley.
6 Dec., 1899.

2388. You pay 16s. 8d. a ton to send your maize to Gundagai? Yes; but when the market is up in Sydney we cannot compete, because we cannot obtain a sufficient number of carriers to get our stuff away in time. The high prices only last for about a month, and in that time not more than a fourth or an eighth of our produce can be sent away, and then we have to hold the remainder until next year, or take a lower price. Any number of people round here would go in for pig-rearing if the proposed railway were made, because it would be possible to send away a few animals at a time. So with calves. I would often send calves away if I could get my neighbours to join me in making-up a truck-load; but it is not practicable when we have to send to Gundagai.

2389. Do you intend to store your maize here so as to be able to take advantage of any rise in the market, or will you allow it to take its chance? We would be ready to chance the market, because a railway would make a saving of 3d. or 4d. a bushel in the cost of carriage straight away.

2390. With regard to goods coming here, there would be no reduction upon the present rates;—under those circumstances do you think the carriers will compete with the railway? No; I am sure that they would not try to do so.

2391. The carriers get £1 a ton now, and the railway rates would be 19s. 3d. a ton;—why would not the carriers compete under those circumstances? A great many of the carriers are farmers, and they would farm more of their land if the proposed railway were made.

2392. And consequently would not have so much time for carrying? No.

2393. Is there not a period of the year when the farmers have no other occupation for their horses? A certain number of them would perhaps discontinue carrying altogether. Of course, they would have a certain amount of employment in bringing produce to the railway at Tumut. Round about Patlow, potatoes as good as those grown at Warrnambool can be grown, and they would be brought to the railway. Then, too, there would be a large timber trade.

2394. The Commissioners anticipate a loss of £1,271 a year upon the working of the proposed line;—do you think that the people here would be prepared to guarantee a portion of that loss? I do not think so.

2395. Would it not be worth their while to do so? I do not think there would be any loss.

2396. In that case it would be a safe thing to give the guarantee? I think the Works Committee have said that they hardly expect any line to pay at first.

2397. The question is, when the loss is a large one, will the people in the district be prepared to guarantee a portion of it? I would not undertake to answer your question until a public meeting had been held to consider the subject. If those present at such a meeting agreed to give a guarantee, probably I should do so.

2398. Mr. Harper estimates that 1,000 bales of wool would be carried on the proposed railway;—do you think that that is an under-estimate? Yes, it is considerably under the mark. People have not been going in for many sheep here until recently; but now they see that sheep will pay well, and they are going in more for sheep than formerly.

2399. *Mr. Levien.*] If you were within a short distance of the railway you could send away calves and pigs without loss or deterioration? Yes; and we should save three days' travelling.

2400. *Mr. Watson.*] What proportion of the country between Gundagai and Adelong is fit for agriculture? There is a large area of country between Adelong Creek and Mount Horeb which is fit for agriculture. A lot of the land through which the railway would pass is undulating country, and would be suitable for wheat. People are beginning to see now that the flat land is too strong for wheat, and that it grows better on the undulating land, and now they are clearing their higher land and are using their flat lands for crops other than wheat.

2401. Is much of the land you speak of more in the direction of Gundagai? All through the Mount Horeb country and the Gadara country there is good land.

2402. Where does that country commence? It extends from the Adelong Crossing-place right through to the Gilmore.

2403. A lot of the forest land you speak of is within 8 or 10 miles of the existing railway;—why, then, has it not been put under wheat? It makes a wonderful difference to a man if the railway runs right through his property instead of being 5 miles distant.

2404. But we have been led to understand that if the railway were brought to Tumut the land between 15 and 20 miles of Tumut would be cultivated, and yet we find the land within a few miles of Gundagai uncultivated? I think that is due to want of energy.

2405. If the country beyond Tumut is allowed to remain in the same state as the country between Gundagai and Tumut, we cannot hope for much increase in the railway traffic? The people about Tumut are more pushing than the people about Gundagai. Gundagai has always borne the name of Sleepy Hollow, and when the people there were trying to obtain the railway they referred to the existence of the rich valley of the Tumut in support of their application. I consider that in ten years the population here will be three times as much as it is now.

2406. *Mr. Levien.*] In that case a great deal of merchandise will be brought here? Yes.

2407. *Mr. Watson.*] Do you think that the fact that the rainfall south of Tumut is much greater than immediately south of Gundagai would give more encouragement to the prosecution of agriculture there? Yes.

2408. The rainfall increases rapidly as you go south? Yes; of course the rainfall south of Gundagai is very good. The rainfall throughout all this part of the country is good. Ten miles from here you get another 6 or 7 inches however.

2409. Of course, with a greater rainfall there would be greater production? Yes; if the proposed railway were made, part of the money now spent on existing roads could be spent in giving access to the fruit-growing country on the high lands. There is plenty of good land to the east of Tumut, although the country there is mountainous. In the valleys there is plenty of land which is fit for growing anything.

Arthur Bannerman-Graves, miner, Micalong, sworn, and examined:—

A.
Bannerman-
Graves.
6 Dec., 1899.

2410. *Mr. Shepherd.*] How far are you from Tumut? About 22 miles east-north-east.

2411. I understand that you have a statement to make to the Committee? Yes. The areas of land in this district suitable for cultivation are too vast to admit of accurate estimate, but 20,000 acres would be somewhat near the mark. From that land the production of 20 bushels of wheat and 25 bushels of oats per acre might be looked for. There are thousands of acres of land which, if properly cultivated, would yield magnificent crops of almost every variety of English grasses—lucerne, clover, rye grasses, rib grass, trefoil, &c., or wheat, oats, barley, rye, and cereals generally. Potatoes, turnips, peas, beans, khol-rabi, rape, carrots, mangel-wurzel, &c., would also do well. All this ground is now unused for want of suitable means of transit to market. The soil, in a great measure, is of volcanic origin. There are also some 80,000 acres of grazing land, 2 of which will carry a sheep and 10 will carry a bullock. During the late drought the capabilities of the Alpin Ranges and slopes underwent a very severe test; with most gratifying results. Vast belts of valuable timber exist at Nottingham Forest, parish of Napier, on the Micalong Ranges, Cooleman, and for many miles south of the Micalong, abounding with splendid timber—mountain ash, messmate, and stringybark, most of which grows on excellent soil of volcanic origin. Fruit-trees grow luxuriantly in the district; apples, pears, plums, cherries, grapes, gooseberries, black and red currants, peaches, &c., all doing well. The fruit grown in the mountain regions is much superior to that grown on low lands—the latter is of too spongy a nature for transit, is easily bruised, and will not keep. Fruit of every description grown in the mountain ranges, or adjoining thereto, is much more solid, not so readily bruised, and will therefore bear more knocking about on transit. In fact, fruit grown in these regions bear a remarkable resemblance to English fruit. I know of no district so admirably suited for growing high-class fruit. Want of communication is the chief drawback. We have splendid soil for the purpose, and plenty of room. Minerals are abundant in the district, but are undeveloped, there being no suitable outlet; Gundagai, the nearest railway station, being too far away. I was extensively engaged in chrome-mining, but I could not make it pay because of the heavy cartage—14s. to 16s. a ton. Both hematite and magnetic iron are abundant, and gold, copper, lead, silver, and tin exist in large quantities, but the deposit has not been developed. The unalienated land in the district has been estimated at 100,000 acres.

2412. What experience have you had in fruit-growing? I have had a great deal of experience from time to time.

2413. In this locality? I have not grown much fruit in this locality, though I have seen it growing here.

2414. How is it that to-day, in Tumut, one cannot buy a pound of locally-grown fruit? I cannot say.

2415. Is the district of which you speak so superior to Tumut that fruit can be grown there when it cannot be grown here? It is in every sense equally good country, and for apple-growing probably superior country; but the fruit industry has not been developed there for want of an outlet.

2416. Tumut has been settled for a very long time, so that they must have had time to test the capabilities of the soil? In the neighbourhood of Tumut fruit is grown to a considerable extent.

2417. Is there any cultivation at all at Micalong? Yes.

2418. Is there much alienated land there? Not very much.

2419. What area of land is under cultivation at Micalong? There is not much land under cultivation there at the present time. What is cultivated is in small patches. There may be 300 or 400 acres under cultivation.

2420. Chiefly under wheat, I suppose? Yes.

2421. What area of land would be under fruit? Very little. At the present time the only orchards there are small orchards to provide fruit for home consumption.

2422. What area of land is there under cultivation at Bondo? There is very little land under fruit there. I have spoken of the capabilities of the country, not of its production. The orchards there are simply for home use, because at the present time it is useless to grow fruit for market there.

2423. Where have you had experience in fruit-growing? In the old country, and in the neighbourhood of Parramatta.

2424. And you have come to the conclusion that the districts you speak of are suitable for fruit-growing? Most decidedly.

2425. Do you feel satisfied that there is valuable mineral land in the area you have spoken of? Yes.

2426. Has any work been done there? Yes; I sent some chrome to the old country, and it was of the highest grade ever introduced there.

2427. Can you tell us what industry is likely to develop sufficiently to furnish traffic to the railway within two or three years of its opening? The construction of the railway would induce closer settlement, and the whole of the Argalong country is so suitable for agriculture that I think it would be taken up in small holdings, and people there would grow more produce. Then, too, the mineral production would be very much increased, even in the first year. I myself would endeavour to do something in that direction.

2428. Is there plenty of water there for mining purposes? A never failing supply.

2429. And plenty of timber? Yes, and every requisite. There is an immense quantity of valuable timber there, and it would be brought to market if there were a railway. The taking out of the timber would clear the land, and it would then come under cultivation.

2430. *Chairman.*] How far is Micalong from the Gundagai railway station at the present time? About 40 miles.

2431. Would the traffic from that district come to Tumut if the proposed railway were made? Yes, the whole of it.

2432. Because of the bad roads on the other route? Yes.

2433. *Mr. Watson.*] Is this the season for the kind of fruit that grows in the district you have mentioned? Yes; the fruit is just coming forward.

2434. Would it be on the market at the present time, or a little later? A little later. Cherries come in about Christmas time, gooseberries about the same time, and plums very much later.

2435. I suppose that is why the market is bare of local fruit at the present time? Yes; it is too early for fruit here now.

Daniel Lane Herlihy, miner and grazier, Argalong, sworn, and examined:—

2436. *Mr. Levien.*] How long have you been living in this district? All my life.
2437. Where is your holding? Fourteen miles due east of Tumut.
2438. How many acres have you there? I am working in conjunction with my brother, and we have some 15,000 acres altogether, including leased land.
2439. That is including annually leased land? Annual leases, C.L.'s, and C.P.'s.
2440. What stock do you run? During the last few years we have been leasing our land, and we have been running only about twenty-five head of horses and a hundred head of cattle.
2441. Have you any sheep of your own? Not now. We have been leasing our country to Riverina people.
2442. Does that pay you better? Not now, but when wool was very low it did.
2443. If you had known of a rise of the price of wool you would have been running sheep of your own? Yes; we are intending to stock this year.
2444. What do you get for your land when you lease it? From £75 to £100 for every 1,000 sheep carried; that is what we get for the frontage country.
2445. And what do you get for the back country? From £35 to £40 a thousand sheep.
2446. Did the Railway Commissioners or any other officials come to you for information when they were compiling their estimate of the probable traffic? I understand that the Railway Commissioners came here, but they made a very short visit. They did not go into details, because, if they had done so, they would have altogether a different tale to tell. They saw nothing of the district, except the country they passed through.
2447. Did you hear of any inquiries being made amongst your neighbours? No.
2448. An inquiry such as the Committee are now making would have been more conducive to the obtaining of proper information? Yes. I think that is what we are entitled to.
2449. You think that if the Commissioners had made proper inquiries their estimate of traffic would have been much larger, and the deficiency that they speak of would have been much less? I consider that if they had gone into the matter thoroughly they would have known that their estimate was quite an absurd one. They did not give any credit at all to the natural resources of the district.
2450. How many sheep to the acre does your frontage land carry? The improved frontage land would carry just a fraction over a sheep to the acre.
2451. And the back land? A sheep to 3 or 4 acres.
2452. What is your opinion as to the capabilities of the district? I think that this is one of the finest districts in New South Wales, as regards climate, and agricultural, pastoral, and mineral resources.
2453. Have you any land under cultivation? Only a small area.
2454. How much? Only for our own use. We have a very bad road, so that we cannot even get to Tumut very easily.
2455. I suppose you only grow enough to feed your own stock? We do not send away a pound of produce.
2456. Have you done anything in mining at your place? A good deal of gold and tin mining is being done in the immediate vicinity.
2457. Is there much tin there? Not a very great quantity.
2458. Are there many tin-mines open there? There has never been any prospecting to speak of there, except what is now going on. There is a good deal of tin associated with the alluvial gold on all the creeks.
2459. But not in payable quantities? Yes; payable from a miner's point of view.
2460. What about the gold? A number of reefs were sunk upon during the boom time, thirty-seven years ago, but the influx of water was so great that the miners were forced to withdraw. Of course, at that time it was more difficult than it is now to get proper pumping machinery.
2461. Are there any alluvial workings there? Yes.
2462. How do they pan out? The men have done very well, but the alluvial workings now are pretty well worked out, and require heavy pumping machinery. There is one firm which is negotiating for a dredge to work some of the alluvial ground immediately below the reefs, and a couple of companies intend to work the reefs down to a greater depth, and are obtaining machinery to enable them to contend with the difficulties that they will have to meet.
2463. Where does the stock that is placed upon your land come from? From Riverina.
2464. Does it come by train, or travel by road? About half the stock came by road, and the other half by train to Gundagai.
2465. Was the stock in bad condition when it came? Yes; we had a difficulty to get it on to the run, but the sheep went away very much better than they came. I got a very good reference from Mr. F. R. Clayton, who was thoroughly satisfied with the condition of his sheep, and considered that our country was equal to any of the hill country.
2466. What is the rainfall at your place? I think we have between 36 and 40 inches at this end, but, further back, at the top end of Argalong, there is a rainfall of about 56 inches.
2467. Have you ever been short of feed? Only through overstocking.
2468. Do you know anything about the capacity of that country for fruit-growing? We have a small orchard, and the trees there do very well. Our country seems to be admirably adapted for fruit, and those who have orchards there can grow fruit which is equal to, if not superior to, the fruit grown in any part of the Tumut district, or, in fact, in any part of New South Wales.
2469. What kind of timber is there? Mountain ash, stringybark, and messmate.
2470. Is it all good timber? Excellent timber.
2471. Is much of it used? There is one saw-mill at work there, but it is too far from market. In 1894 £12,336 worth of chrome was taken from the Gundagai district. Chrome is worth about £3 2s. a ton, so that it can only be worked within a certain radius of a railway station; but the same matrix of chrome exists right through to the Tumut River, Robb's Hole, and out that way. If the railway were extended to Tumut the chrome industry would be a very important one. Chrome is known to exist along the Little River in very large quantities.
2472. And what is the quality of it? The quality is pretty good. Our iron resources are also very important. On the table-land country near Yarrangobilly there is an enormous deposit of iron, and on the Cooleman Plain there are about 30 square miles of limestone country, and large ferruginous masses

D. L. Herlihy.
6 Dec., 1899.

D. L. Herlihy. all over that country. At one place I estimated that there were half a million tons available, practically within sight, while gold, silver, lead, and copper are to be found almost in the same vicinity.
 6 Dec., 1899. 2473. How far away is that district? It is equi-distant from Queanbeyan, Cooma, and Gundagai. The following statement gives the result of several assays which I have had made:—

No.	Assays of Ores.		
		oz. dwt. grs.	
1. Galena,	65 per cent. lead ; silver,	27	4 10
2. Carb. and silica,	10 „ ; „	9 16	5 ; trace of copper ; gold trace, under 2 dwt.
3. Silver lead	19½ „ ; „	5	8 20
4. „	20 „ ; „	10 19	19 ; slight trace of copper.
5. „	24 „ ; „	4	7 3
6. „	20 „ ; „	4	7 13
7. „	65 „ ; „	10	17 17
8. Sample taken from 9-ft. (wide) reef, 36½ per cent. lead ; silver, 11 oz. 19 dwt. 13 grs. ; strong trace of copper ; trace of gold.			
9A. Mudstone (not reef).			
9B. Silica and copper in it, taken from reef 35 ft. wide, 11 oz. 19 dwt. 13 grs. of silver.			
10. Sulphate of lime, indication of lead ; silver, 1 oz. 1 dwt. 9 grs.			
11. Iron gossan, slight indication of silver.			
12. Iron gossan, slight indication of silver.			

STEPHEN J. VALE.

The above is a true copy of Mr. Vale's assay.—D. L. HERLIHY.

No. 1 is good galena ; No. 2, carbonate of lead and gangue (silver) ; No. 3, carbonate of lead and gangue (silver).

I have also received the following information from the Department of Mines in regard to another sample:—

Sir, Department of Mines and Agriculture, Geological Survey Branch, Sydney, 21 August, 1896.
 I have the honor to inform you that the sample submitted by you, and stated to come from Cooleman, Tumut (D. Herlihy, junior), has been assayed with the following result:—3649—Crystallised galena with a very little siliceous gangue, yielding : silver, 21 oz. 15 dwt. 13 grs. per ton ; no gold ; metallic lead, 80·00 per cent.

I have, &c.,

D. C. McLACHLAN,

Under Secretary for Mines and Agriculture

(per E. F. PITTMAN).

T. Jones, Esq., M.P., Sydney.

2474. You send to Gundagai for your goods and get them *via* Tumut? Yes.
 2475. The draftsman of the Stock Branch speaks of the area of country likely to be affected by the proposed railway as bounded on the east by the range dividing the waters of the Tumut and the Baloo Arm;—you are considerably to the east of that country? Yes.
 2476. Do you think that this official has limited the area to be served by the railway too narrowly? I do not know how he could lay down such lines. Any goods that we get from Gundagai have to come within three-quarters of a mile of Tumut.
 2477. How far from the east of Tumut would it suit people to come to Tumut instead of to Cooma? Forty miles east from here—as far as Coodradigbee.
 2478. Is there much stock between the Peak River and that place? Yes; it is nearly all pastoral country.
 2479. Do they send their wool now by way of Tumut and Gundagai? Yes; though a portion of that wool goes through to Yass and a portion to Queanbeyan. Some of the settlers when they want to shear rent a place in the vicinity of the railway station at Yass or Queanbeyan, and take their sheep there to shear them.
 2480. Which do you think would be the best route for the proposed railway? Having regard to the number of people to be served, I favour the staked line. With regard to the opening up of the country for all future time, I would, perhaps, be inclined to favour the other route.
 2481. Has starving stock ever been sent to this district before last year? No.
 2482. How long have you been here? All my life—twenty-five years.
 2483. You admit that any revenue you would derive from the carriage of starving stock must be only occasional? Yes; if there were a railway to Tumut, however, that traffic would increase, because the road between Gundagai and Tumut is very droughty, and the lanes are narrow. That prevents people from sending stock here, though, if there were a railway, they would probably send it here by train. When you get here you are beyond the droughty country.
 2484. How many acres of your land are fit for cultivation? Somewhere about 7,000 acres would be fit for cultivation if the land were improved.
 2485. What would it cost per acre to take off the timber? From £1 to £5 per acre, according to the class of timber.
 2486. What crops would the land be suitable for? Wheat, oats, barley, rye, lucerne, and various fruits.
 2487. Is there much land which would be suitable for lucerne? Yes; lucerne seems to thrive splendidly there, and so do all kinds of English grasses. Some of the upland country beyond our place—the Yarrangobilly and the limestone country—seems to be magnificently adapted for growing grain. The greater part of the land is deep volcanic soil—more than 20 feet deep in some places.

MINUTES OF EVIDENCE—RAILWAY FROM GUNDAGAI TO TUMUT.

Joseph Lambert, grazier, East Blowering, sworn, and examined:—

2488. *Chairman.*] I understand that your holding is about 12 miles to the south-east of Tumut? Yes.
 2489. Have you a statement to make? Yes. The following tabulated statement supplies information in regard to the character and extent of the land in my district, and the manner in which it is held:—

J. Lambert.
 6 Dec., 1899.

PARTICULARS for submission to the Public Works Committee in justification of the extension of a line of Railway from Gundagai to Tumut, *via* Adelong.

Owner.	Crown lands.	Area of land at present cultivated.			Area suited for cultivation.			Area suited for grazing.			Total area.	Production, and carrying capacity per acre.		
	acres.	ar.	r.	p.	a. c.	r.	p.	ac.	r.	p.	ac.		r.	p.
Joseph Lambert .	13,000	250	0	0	2,500	0	0	4,500	0	0	20,000	0	0	Average production—maize, per acre, 50 bushels; wheat, per acre, 25 bushels; oats, per acre, 40 bushels; potatoes, per acre, 7 tons. The carrying capacity of the 13,000 acres of Crown lands for the year I estimate at 2½ acres per sheep, say 6,000, or 8 acres to each head of large stock. Regarding the fruits and vegetables that grow in abundance here are the following: Fruits—apples, pears, plums, peaches, grapes, walnuts, cherries, nectarines, mulberries, quinces, apricots, and gooseberries. Vegetables—cabbages, pumpkins, potatoes, tomatoes, cauliflower, flowers, peas, beans, radishes, turnips, squashes; in fact, all garden vegetables grow splendidly.
John E. Bridle	40	0	0	80	0	0	141	0	0	221	0	0	Average returns per acre—wheat, 20 bushels; maize, 60 bushels; oats, 40 bushels; potatoes, 8 tons (have had 16 tons). Carrying capacity, similar to above. Fruit, vegetables, &c., similar to above.
John Morris	16	0	0	40	0	0	130	0	0	170	0	0	Average returns per acre—wheat, 25 bushels; corn, 50 bushels. Carries 20 head horses, 40 cattle, or about 300 sheep all the year round.
Thomas Morris	40	0	0	150	0	0	350	0	0	500	0	0	Average returns per acre—wheat, 20 bushels; maize, 50 bushels. Carries about 150 head cattle all the year round, or about 1,000 sheep, 20 horses, and 20 pigs.
John Ryan.....	60	0	0	60	0	0	110	0	0	170	0	0	Average returns per acre—wheat, 20 bushels; maize, 35 bushels. Carries 15 horses, 15 cattle, and 3 pigs all the year round.

NOTE.—Any or all of the above holdings are eminently suited for the purposes of dairying or experimental farms, or the establishment of piggeries on a large scale. Timber.—Speaking of timber, our forests of gum, stringybark, and mountain ash cannot be excelled in quality, and will form a considerable item as a commodity for exportation. With reference to my own holding or that part of the conditional purchase improved land, it is capable of carrying from 1 to 1½ sheep to the acre all the year round, and 4 sheep per acre for six months.

2490. Is your land exceptionally good land? No; it is a fair sample of the land in the district.

2491. For a considerable distance round? Yes.

2492. For what area of country? For an area of country extending in some directions 18 miles, and in other directions 12 and 7 miles.

2493. I suppose your grazing land is highly improved? It is.

2494. Is it expensive land to clear? Yes, parts of it.

2495. Would it cost £3 an acre? Some of it would cost as much as £10 an acre. 16,000 sheep are there now for agistment.

2496. Is your holding at the present time stocked to its fullest extent? No.

2497. But it would not carry so much stock all the year round? I have had 2,800 cattle upon it all the year round.

2498. And any sheep? No; only cattle and horses.

2499. The sheep are there just for the summer? Yes, until the 1st of May; they go away then.

2500. Do those sheep come *via* Gundagai? No, they came *via* Wagga Wagga. Last year there were nearly 15,000, and they came *via* Gundagai; but this year the grass is a little better.

2501. This year they brought the sheep into the district before they were dead beat? Yes.

2502. Do any of the people to whom you have referred work on the halves system? No; but I have other tenants who work on that system.

2503. Is the system a satisfactory one to landlord and tenant? Yes. Some of my tenants have been with me for fifteen years.

2504. The evidence we had in Sydney was that the tenant farmers were an unsatisfactory class, and did not farm their land as well as the other farmers? That has not been my experience. They have done very well with me, as a rule.

2505. You seem to be located pretty close to a large tract of land held under occupation license, or untenanted;—what is the character of that land? Some of it is very good, but some of it is very rough. It is good land for grazing, and about one-third of it would be good for farming.

2506. As an old resident of the district, what is your opinion as to its future development;—is there much scope for agriculture here, or is the available land very limited in extent? The available land is very extensive.

2507. Does that remark apply to the land beyond Tumut, or to the land between Gundagai and Tumut? From Gundagai to Tumut, and then out towards Adelong and Wagga Wagga.

- J. Lambert. 2508. How is it that more farming has not been done between Gundagai and Tumut, seeing that that country is within a reasonable distance of a railway? Some of the land there is not of the best quality, and then, too, it is held by large land-holders.
- 6 Dec., 1899. 2509. Who hold it for pastoral purposes? Yes.
2510. When you get beyond Tumut are the conditions more favourable for settlement? Yes.
2511. There are not so many large land-holders? No; and there are more selectors and farmers.
2512. More people who have small holdings and who would increase their production if they had a ready market? That is my opinion.
2513. Is most of your arable land under cultivation at the present time? No only 300 acres are under cultivation at the present time.
2514. Why do you not put more land under cultivation? Because of the cattle I run. I do not farm any land myself.
2515. If there were a ready market, would it pay you better to let out your land in farms? Yes; if there were better transit to market.
2516. At the present time which pays you better—to lease your land for farming or to run sheep and cattle upon it? It pays better to lease the land.
2517. What rent do you get? In some instances I go halves, and in some cases I have got as much as £2 5s. an acre rent.
2518. Would that be flat land? It would not all be flat land.
2519. Have the men who are paying that rental been with you for any considerable length of time, and are they making comfortable livings? Yes. I am getting £1,150 for the land upon which the 16,000 sheep are running at the present time. That rent is for a period of six months.
2520. But that is an exceptional rent? I have received it frequently during the last eighteen years. I have received as much £1,260 for some of the paddocks.
2521. How many times have you leased your land for the use of starving sheep? Seven times.
2522. Are not the sheep generally driven into the district instead of being brought by rail? No; in many cases they come by rail to Gundagai. Last year nearly 15,000 sheep came to Gundagai by train, and stayed at my place for six months.
2523. That was an exceptional year? Yes. This year 16,000 sheep have come up. They came by rail to Wagga Wagga, and as they were only the third flock, and there was plenty grass on the roads, they were driven up from Wagga Wagga to my place.
2524. How many starving sheep have come to your place during the last eighteen years, and have been conveyed by rail to the nearest station to your run? Sheep have been brought twice to Gundagai, and once to Wagga Wagga. Of course, sheep used to come on to my run before the railway to Gundagai was made.
2525. If the railway were completed to Tumut would it convey a large number of starving stock? I think so.
2526. How do you get your stock to market? By way of Gundagai.
2527. Where do you get your goods from? I get them in Tumut. I support the local storekeeper.
2528. Which route do you favour—that by way of Adelong, or that from Coolac by way of the Tumut River? The Adelong route.
2529. Do you think that that route would benefit most people? Yes.
2530. Do you think the dairying industry is likely to increase here? Yes; the district generally is suitable for dairying. If I do not sell my cattle on the place, I send away from 200 to 500 head every year.
2531. They go to Gundagai? Yes.
2532. If the proposed railway were made, would you continue to drive them to Gundagai? No; I would truck them at Tumut, if they were not sold on the station.
2533. *Mr. Watson.*] You would not have to pay very much more to send stock from Tumut than from Gundagai—only £1 a truck,—so that it would pay you to truck at Tumut? Yes; if the railway were made to Tumut.
2534. *Chairman.*] We have been told that the people here “cannot extend the area under cultivation very much, and the area available for stock is not a very large one”? That is not in accordance with my knowledge of the district.
2535. The witness goes on to say,—“You may judge what kind of country it is from the fact that under normal conditions it produces 140 tons of wool; that is equal to 1,000 bales”? I think that is too small an estimate. Before I had cattle I used to send away 140 bales myself.
2536. *Mr. Levien.*] Did any of the Railway Commissioners or their officials interview you with reference to the capabilities of the district? No; and they made no inquiries that I heard of.
2537. How often do you truck stock to Sydney? I send away from 300 to 500 head of cattle every year.
2538. Do you know what steps the Railway Commissioners took to make themselves acquainted with the district? No.
2539. Was no notification given to anyone here that they were making an inquiry? No. I did not hear anything about them until they had gone.
2540. Did the Commissioners move about the district at all? No.

Arnold Hamilton Peter Watts, manager, West Blowering station, sworn, and examined:—

2541. *Mr. Dick.*] How far are you from Tumut? About 10 miles south of Tumut.

2542. What is the acreage of your holding? Between 15,000 and 16,000 acres.

2543. Have you prepared a statement for the information of the Committee? Yes. The following statement shows the area held by the owners of the run and the selectors upon it, and its capabilities for various kinds of production:—

A. H. P.
Watts.

6 Dec., 1890.

Owner.	Total area.	Cultivation.	Grazing.	Land available for cultivation.	Wheat.	Maize.	Hay.	Tobacco.	Potatoes.	Orchards.	Carrying capacity.

2544. Is any land rented from you for farming purposes? Yes.

2545. How much of that land is cultivated? The area cultivated is included in the 550 acres mentioned in my return.

2546. That includes your own cultivation and the cultivation of the rented land? Yes. I cultivate some land myself, growing wheat chiefly.

2547. Can you tell us what number of acres of land there are not now cultivated and not selected? At least 650 acres of land on the holding would be suitable for cultivation, but are not cultivated now.

2548. If the proposed railway were constructed what would you do with that land? There is a lot of it which I would be prepared to open up.

2549. What rental do you get for your land? From 32s. to 37s. 6d. an acre.

2550. Do the tenants do well on it? Yes, very well.

2551. What is your average clip? About 6 lb. of wool to the sheep.

2552. How many bales do you get on the average? About 100. Last year I rented my country, and the year before I sold the sheep in the wool. Last winter I could only half stock, so that this year I only got forty-eight bales of wool.

2553. Then calculations as to the yield of wool made on the production of last year would not be reliable as showing the actual amount that the district could produce? Well, I could have produced from 100 to 130 bales.

2554. Did others beside yourself sell their sheep with the wool on? I could not tell you.

Charles Gilbert Long, farmer and grazier, Laemalac, sworn, and examined:—

2555. *Mr. Watson.*] You live $7\frac{1}{2}$ miles to the east of Tumut? Yes.

2556. And I understand that your holding comprises 1,180 acres? Yes.

2557. Is it mostly agricultural or mostly pastoral land? I could put about 200 acres under cultivation.

2558. Is the land that is under cultivation mostly flat land or is it rising ground? It is forest land.

2559. What have you been getting from the cultivated portion of your land? Last year I got fully 25 bushels of wheat to the acre. I have not grown any corn during the last few years.

2560. There has not been the same market for it lately? No; I am growing corn again now, however. I spill some of my land sometimes.

2561. What can your grazing land carry? I am running 1,110 sheep now, and about eighty head of cattle.

2562. Do you usually carry that number of stock? Yes. When I have fewer sheep I have more cattle.

2563. Is your land pretty good? It is pretty good land. The scourer here offered to give me 1s. 2d. a pound for my wool in the grease.

2564. Is it merino or cross-bred wool? Merino.

2565. Does your land include any of the high ridges. Yes, that is where I run my sheep.

2566. For how long does that kind of country furnish grass? I can run my sheep well all the winter.

2567. Can the sheep find feed on the higher hills in the winter time? I generally find them on the highest ground I have. They camp there at night.

2568. I understand that further south from here the higher ground can be used only as summer country, but round your way the higher ridges will carry sheep in the winter time? Yes, splendidly. My country adjoins the country about which Mr. Graves was giving evidence, only I am on the frontage.

2569. Is there any considerable area of country near to where you are that is suitable for agriculture? Well, I am on the place highest up the Little River. There are small flats above me of 8 or 10 acres in extent, upon which a little hay or wheat could be grown.

2570. The greater part of your land is pastoral land? Yes, and it is good land.

2571. Is the pastoral land extensive? Yes, it is all selected land.

2572. If the proposed railway were made, could the land which is now devoted to sheep be turned to better account? The high ground could not be turned to better account, but the low ground could be. I consider that there are 1,000 acres of splendid forest land there which could be cultivated.

2573. Do you think that the proposed route is the best that could be obtained in the interests of the district? By far the best. Of course, a line coming through Brungle would run through finer properties, but the proposed line would serve more people.

2574.

C. G. Long.

6 Dec., 1890.

- C. G. Long. 2574. Have you anything to add to the evidence which you have heard already? I have heard it said that Tumut has gone back in regard to wheat growing, but that is because we have lost the market which we once used to have. Thirty-seven years ago I used to cart flour to Hay, but we do not do it now, and I even had to send to Granville for flour. We used to cart our maize to Bowning, but we have lost most of our old markets. Tumut, however, has gone ahead during the last few years. I might mention that there is any quantity of chrome in the country I speak of. Mr. Kelly, the manager at Coolac, told me that if I sank 6 feet more, and the deposit became bigger, he would put in a wire rope arrangement for drawing it out, but it did not become bigger, and the percentage is not high enough to make the cartage profitable.
2575. Do you think that there would be a large output if the railway came nearer? Yes; the lode runs right from Coolac.
2576. And what is the percentage of chrome? About 50 per cent. If the carriage were less, 40 per cent. would pay.
2577. Are there any other minerals up your way that you think would be developed if the railway were made? There is gold there in patches, though the deposit is not extensive. They talk of bringing a dredge there.

Harry Wharton Mason, medical practitioner, Tumut, sworn, and examined:—

- H. W. Mason. 2578. *Mr. Levien.*] How long have you resided in this district? Nearly sixteen years.
2579. I suppose you have a thorough knowledge of the district? Yes; I think I know the district for 40 miles round.
2580. Have you any land under cultivation here? Yes; I have 170 or 180 acres under maize this year.
2581. Have you any land under wheat or oats? Only a small area.
2582. How long have you had this land under cultivation? About 50 acres of it have only been put under cultivation this year; but some of the land has been under cultivation for ten or twelve years.
2583. What is your average yield per acre? This year I shall get about 4,000 bushels of maize from about 100 acres of ground.
2584. What do you do with your maize? It goes to Sydney.
2585. What do you pay a ton to have it conveyed to Gundagai? One year I paid the teamsters £80 odd; but of late years I have generally sent it away by my own teams.
2586. How many tons do you send away at one time? The usual load is about sixty bags, which is equal to about 6 tons.
2587. How many acres do you hold altogether? I do not suppose that I have more than 600 or 700 acres. The rest of the land is used chiefly for dairying.
2588. If the railway were brought to Tumut, you would put more land under cultivation? Yes.
2589. What is your general impression of the district, so far as its agricultural and pastoral capabilities are concerned? I do not think you can beat it for agricultural and pastoral pursuits. A drought never affects this district to any great extent. During the sixteen years I have been here people have always been able to grow maize; but they have not always been able to grow it at Gundagai. My explanation of that is that, although the Gundagai flats are quite as rich as ours, the Murrumbidgee being a much deeper stream in dry weather drains the soil more thoroughly than does the Gilmore or the Tumut, the Murrumbidgee being about 30 or 40 feet deep, and our river only 4 or 5 feet.
2590. What proportion of your 700 or 800 acres is suitable for cultivation? That depends upon whether you want to cultivate maize or wheat. My land is used chiefly for maize growing. I suppose we could grow 300 or 400 acres of maize.
2591. Is there much land suitable for cultivation about here? Yes; there is a great deal of country about here which will grow wheat, though you would hardly think it was wheat country; and there is a great deal of country that you could use for maize-growing which has not yet been touched. During the last fifteen years several estates along the river have been broken up, and the land is being used for maize-growing; but there is still a certain limited area of ground that could be used for that purpose. Much of the hilly country could be put under crop, though it would not grow maize. It is timbered now, and is not being used as it would be used if there were a railway to Tumut. The soil is basaltic.
2592. You have heard it stated that this hilly ground was at one time not thought to be very good, but that it is now looked upon as good wheat-growing country? Yes, the soil is suitable for wheat growing. There are acres of such ground at Bago and Batlow. The soil is very good, but the land is heavily timbered.
2593. Suppose the railway were to be brought to Tumut? In that case, I think a great deal of the country I am speaking of would be improved and brought under cultivation.
2594. The country would be opened up, and population would increase? Yes. There are a great number of small holders in this district, and, as the families grow up, they will want places to go to, and the country I speak of is all suitable for settlement.
2595. Have you ever heard any of the tenant farmers complain that they are oppressed, or speak about the heavy rents they have to pay? No. You will find men prepared to give high rents for good ground. Of course, during the bank troubles the farmers could not get on well here, any more than anywhere else, and they all complained; but during the last two or three years those of them who are renting good ground are doing fairly well, and are quite contented.
2596. I suppose you would know if there were any complaints from them about being oppressed by the land-sharks? I do not think anyone is better able to judge, because when I talk with a farmer I talk as a farmer, and I know pretty well how matters are going.
2597. In your opinion, they seem to be satisfied with the rentals charged, and are fairly prosperous? If they were not satisfied they would not pay the rentals that they now have to pay. I think that they are fairly well off.
2598. We have been told that Messrs. Harper and Usher came here to make inquiries on behalf of the Railway Commissioners as to the probability of the proposed railway paying;—did you know of either of these gentlemen being in town? No; I did not hear anything about their visit.
2599. Were you not interviewed by either of them? No. All I know about Mr. Harper is what I read in the newspapers, and I understand that his opinion is unfavourable to the railway.
2600. I suppose you have not heard of Mr. Usher at all? No.
2601. Do you know anything of the mineral resources of the district? The mineral resources of this district are undeveloped, and from the opinions which I have heard expressed by mining experts who have travelled

travelled through the district it is a surprise to me that they have not been developed. To my own knowledge there are reefs which you can trace for 20 miles, but they are not worked, though it is not because the stone is not good enough. We have sent stone away from a place 30 miles from Adelong to Adelong, Granville, and other places, and from just over 50 tons we obtained 100 oz. of gold, or 2 oz. to the ton. I could take you to several places where there are reefs which will go from 1 oz. to 1½ oz. and 2 oz. to the ton. Mr. Howell saw some of the stone, and he was of the opinion that no appliances except those that they were then erecting at Dapto could treat it. He said that it was stone which required roasting and other treatment. That stone will give us 1½ oz. to the ton at Adelong or Granville; but, if the proposed railway were constructed, we could send the concentrates to Dapto, and have them properly treated. Tumut never has been a mining town, and the people here have taken very little interest in mining, but the district is pretty well surrounded with gold. The town is right in the centre of a gold-bearing district. Many of the miners know of reefs of payable stone, but they are too far away to be worked.

H. W. Mason.
6 Dec., 1899.

2602. *Mr. Watson.*] What would be the width of the reefs that went 1½ oz. to the ton? One of them is from 3 to 4 feet wide. The Government Inspector who was up here about three years ago said that it was a compact reef, and that others of the kind had been proved to go down thousands of feet.

2603. Has not that land been taken up? It has been taken up, but it has not been worked.

2604. *Mr. Levien.*] Why has it not been worked? I believe that more mining will be done later on. I am quite confident about the mineral wealth of these mountains.

2605. Which route do you approve of for the proposed railway—the Adelong route or the Brungle route? I have no hesitation in recording my opinion in favour of the Adelong route. There is a fair population all along that route, and a railway taken that way would benefit more people than a railway taken along the Brungle route. In the second place, I believe that the whole of the land on the Adelong Creek will grow maize, because the creek has the same source as the Gilmore Creek, the soil along which is very good, since the creek rises in the basaltic hills about Bago and Batlow. All along the Gilmore Creek there are about 4 feet of good soil, and you can grow excellent maize for a distance of 20 miles up. The original black soil on the Gilmore does not retain moisture so well as the red soil which has been deposited upon it, but on the red soil you can grow excellent crops. The intervening country, too, would grow very good wheat.

2606. *Chairman.*] How far is the land you speak of on the Adelong Creek from the Gundagai railway station? About 17 miles. From below the Gibraltar Mine downwards the flat land would grow maize.

2607. Why have they not grown maize there already, seeing that they are so close to a railway station. Why do not the big holders break up their estates? Very little agricultural settlement has taken place between Cootamundra and Gundagai, although the railway runs through that land; but I think it is because the land is in the hands of three or four men. I believe, however, that the tendency now is for large holders to break up their runs, and I think that if they do so they will have plenty of tenants.

2608. Will the railway make them do that? Civilization advances wherever a railway goes, and I think that the people will make progress in that as in other matters.

2609. Do you think that is why there has not been so much cultivation between Gundagai and Tumut? That is one reason. They have not the farming community that we have here. If the same soil had been in this district, a certain amount of it would have been cultivated.

2610. Mr. Harper has stated that if the proposed railway was made that teamsters could successfully compete against it. What do you think of that opinion? I think that if the railway was managed properly there would be no competition on the part of the teamsters. I have heard that 7s. 6d. a ton would be the freight charged upon the railway, but the teamsters have told me over and over again that they could not carry grain for less than 3d. a bushel.

2611. Is Adelong a distributing centre for goods? There is a fair amount of trade done with Adelong.

2612. The Commissioners seem to think that Adelong will remain a distributing centre, and that goods will be sent from there to Tumut, Adelong Crossing, and other places? I should not think so. I should like to add that the Tumut district is a good dairying district. Some years ago I sent some butter and cheese from this district to England, and I believe that that consignment of butter paid. At any rate, such an enterprise could be made to pay if there were proper facilities for getting the butter away from here. I do not think you will find a finer dairying district in the Colony than this. All along the flats you can grow the very best rye-grass. Cattle do well here, and the returns are good. I have a herd of about seventy cows, and they average about 6 lb. of butter per cow per week, although a great number of them are heifers with their first calves. I am positive that there is a great future for anyone who goes in for dairying here, but there is no market for small people at the present time, except the Tumut and Adelong market. If facilities were given for sending away produce, this would be a very large dairying district. Farmers have told me that if there were a railway they would produce great quantities of chaff to send away, but they cannot afford to cart it to Gundagai. Then, too, men have complained to me that, whereas if there were a railway to Tumut they could often send away a truck load of fat sheep, it does not pay them to send so small a number to Gundagai. The hilly country is as good as the flat country for sheep. At Red Hill they carry a sheep to the acre all the year round, and the clip is a good one, and generally tops the market for price. There is no reason why sheep should not be kept here during the whole twelve months, and, if the hilly country were improved, a great many more could be carried. Out of 70,000 sheep which Mr. McCaughey sent here last year, he only lost 5,200, and many of them had to be carried away from the railway trucks. If the sheep do so well in the summer time, and they can be carried right through the winter, it shows that this is a good sheep district.

2613. *Mr. Shepherd.*] Are your cattle fed on natural or upon artificial grasses? Upon natural grasses at the present time; but in the winter time you must give dairy cattle artificial feed—pumpkins, chaff, ensilage, &c.

2614. Mr. Peterson expressed the opinion that dairying was likely to pay better than grain growing here? So far as I can see, the area of land in this district which will grow maize is limited; but I think that on the ground which will grow maize, maize-growing will pay better than dairying.

2615. Why is it that the production of corn in this district has gone down since 1896;—is that accounted for by the substitution of other crops? Maize came down about 1s. a bushel, and the farmers went in for wheat. That was a good thing for the land, because it was sick of the maize, and the wheat improved it. Many acres of old maize land was put under wheat, and good returns were obtained; but after the

second

H. W. Mason. second year the wheat crop deteriorated. Many crops this year have had to be cut for hay, partly because of the quantity of oats in them, and partly because the ground has got sick of wheat, and there fore the tendency is to go back to maize.

6 Dec., 1899.

2616. You say that there is no reason why the district should not become a big sheep raising district; is there only a small number of sheep here now? Yes, in proportion to the area of ground upon which sheep can be run. Last year large tracts of country were leased out to people who brought sheep from other places. I believe that the district is uniformly reliable for sheep-farming, dairying, and agriculture, if people go about their business in a proper way.

2617. During your long residence here have the farmers kept on at their work, or have they got tired of it and gone away? The farmers who were here fifteen years ago, or their descendants, are here to-day.

2618. They stick to the district because it is a good one? Yes, and the same class continues to go in for farming. This is not a shifting population by any means, because the same families continue to live in the district year after year.

Alexander Davis, farmer, Upper Gilmore, sworn, and examined:—

A. Davis.

2619. *Mr. Shepherd.*] How far is the Upper Gilmore from Gundagai? My place is 32½ miles from Gundagai.

6 Dec., 1899.

2620. What is the extent of your holding? 622 acres.

2621. Have you a statement to make to the Committee? Yes. This statement embraces an area of 5 miles along the valley of the Gilmore Creek, starting about 1½ miles north of the parish of Batlow, and running south. In that area there are sixteen holders cultivating this year 1,372 acres. On the sixteen holdings there are 1,205 acres of land suitable for cultivation, but not at present cultivated. Those holdings depasture 1,017 large stock and 5,250 sheep. The hills on each side of the valley are suitable for sheep, the western bank specially. One of my neighbours is at present depasturing 3,000 sheep on 2,000 acres of this land. The cultivated land in the valley is suited to grow anything which does not require a tropical climate. Although last season was one of the driest on record, I harvested 42 bushels 51lb. of good sound wheat to the acre. A bag of this wheat took first prize at the last Show in Sydney as best milling wheat, and an analysis made of the wheat by the Department's chemist gave 96 per cent. As to maize growing, I may tell you that I competed for the prize offered by the Department of Agriculture in 1892, or 1893, for the best cultivated maize in the Colony, the judge being Mr. Jas. Stevenson, secretary to the Board of Export, and the result I obtained was 112 bushels to the acre. This prize was competed for by twenty-nine farmers in all parts of the Colony, Mr. G. K. Green, of Tumut Plains, being third. With a railway, this valley would produce large quantities of hay, chaff, straw, melons, pumpkins, &c., which we cannot send at present. I have about 25 tons of hay in my shed now for which there is no demand. If I could have delivered it at, say, Tumut, or at a siding at Gilmore, it would have been sold long ere this. There is also a large marble quarry situated in this area which supplies this district with lime. Sugar beets grown here, when analysed, have been shown to contain 12½ per cent. I may add that I called upon all the holders I have referred to, and asked them how much land they had under cultivation at the present time, and how much of their land was suitable for cultivation, though not cultivated. I produce samples of maize, oats, and wheat.

2622. Was the grain from which these samples were taken grown upon your own land? Yes. A sample of the wheat was shown in Sydney, and took first prize for the best bag milling.

2623. Are the 622 acres you speak of fit for cultivation? No; only about 150 acres are suitable for cultivation.

2624. And the remainder of the land is suitable for grazing? Yes; they run sheep on the hills.

2625. So that you have nearly 500 acres of grazing land? Yes.

2626. How many sheep do you run on that land? Generally about 250 sheep on the hills. The hills on the other side of the valley are very much better grassed. On my land there are a number of stony ridges.

2627. I suppose you deliver your produce to Gundagai? I usually sell it locally, but it goes to Gundagai all the same.

2628. What is the cost of carriage per ton from the Upper Gilmore to Gundagai? From my place they charge from 5d. to 5½d. a bushel.

2629. That is 16s. 8d. a ton? About that.

2630. One of the witnesses this morning stated that it cost about 20s. a ton to send produce a distance of 16 miles? His road may be a bad one.

2631. Is there much Government land in your neighbourhood? Not until you get up to Batlow. Round here the land is pretty well all alienated.

2632. Are the holdings large? No, they are small.

2633. What do they generally average? My holding is 622 acres. Of the other holdings to which I have referred—No. 2 contains 420 acres; No. 3, 360 acres; No. 4, 420 acres; No. 5, 540 acres; No. 6, 320 acres; No. 7, 100 acres; No. 8, 1,010 acres; No. 9, 620 acres; No. 10, 515 acres; No. 11, 760 acres; No. 12, 320 acres; No. 13, 2,200 acres; No. 14, 200 acres; No. 15, 200 acres; and No. 16, 360 acres.

2634. Are those farmers all cultivating wheat or maize? They are cultivating both.

2635. What proportion of those holdings do you consider fit for cultivation? About half of them. Some of the farmers could extend their cultivation, but, as they combine stock-raising with farming, I suppose they find it necessary to keep their land to run stock upon.

2636. Do you consider farming more profitable than grazing? I do not think I could live on my farm by grazing alone.

2637. In the event of the proposed railway being constructed, what distance would you be from the nearest railway station? Five and a half miles.

2638. So that the construction of the line would be of tremendous advantage to you? Yes, of very great advantage.

2639. Do you think that its construction would induce many people to go in for more cultivation? I think so. It would induce me to extend my cultivation. There are many things which I could grow but which I do not grow now, because of the uncertainty of the market. I have a shed about half full of hay now, and I would certainly send it away if I could have sent it away quickly; but at the present time it is very difficult to obtain teams when you require them, particularly for bulky loading, such as chaff and hay.

2640.

2640. Would the freight on hay be about the same as the freight on maize, or would it be more? I fancy that it would be more. A. Davis.
2641. Would not 16s. 8d. a ton be rather too much to pay on hay? I think not. It is a market that we want. I could run down to a platform at the Gilmore and fill two trucks in a day. 6 Dec., 1899.
2642. Would you be willing to enter into a guarantee to pay half the loss upon the proposed line for a certain number of years, supposing there were a loss? I have not heard the question mooted before; but I can hardly see how there could be a loss.
2643. According to the Commissioners, the yearly cost of the line would be £8,150, and the return on special rates £3,900, or on through rates £1,700;—do you think that the additional production of the district would be likely to get rid of that loss within any reasonable time? I think so. There can be no doubt as to the extent of the increase which would take place in my district if a railway were constructed. We have energetic men here who will endeavour to increase their holdings and make the most of them.
2644. Do you think that the people through whose land the railway would run would give that land to the Government? I think that a great many of them would. The argument used against many lines is that they would pass through so much Crown land. Yesterday Mr. Chesterman was asked upon how small a holding could a man make a living. I know the Bago country pretty well, because I was there when quite a young man; and at one time I had the idea of settling there, because the land is really good; but my capital was too limited to enable me to take up land and to stock it. The railway was then at Goulburn. However, I rented a farm of 2½ acres, including a vineyard and orchard, for £60 a year, and I saved £100 a year upon it—sufficient in the long run to purchase my present holding. Four acres of that land were planted with fruit-trees, and at that time fruit was a fair price, and there were no pests.
2645. Do I understand that the margin of profit in your case is destroyed by the cost of carriage to a railway station? I contend that if the railway were constructed my profits would be increased, and I would therefore increase my cultivation.
2646. Do you approve of the proposed route? Yes, and I know both routes very well. I am a resident of forty-five years standing, and I know the district thoroughly. A line *via* Adelong would serve the greatest number of people.
2647. *Mr. Levien.*] I suppose you have come into contact with a great many of the tenants here? Yes.
2648. Have you heard many of them complain about being oppressed by their landlords? No; we have very few landlords in the district.
2649. The tenants are satisfied with the rents they pay? They seem to be.
2650. And they are fairly prosperous? Where a man is willing to work and is energetic he does very well. Some of them, of course, put their earnings down their throats.
2651. Do you know of any enquiries having been made by the Railway Commissioners of any of the farmers here as to the number of acres under cultivation in the district? No enquiry of the kind has been made. All I know of the visit of the Railway Commissioners was that I heard that they had passed through the district.

John O'Sullivan, farmer and grazier, Lower Gilmore, sworn, and examined:—

2652. *Chairman.*] I understand that you are prepared with statistics concerning the Parish of Gilmore, which commences about 3 miles from Tumut, and extends up the Gilmore Creek for a distance of about 12 miles? Yes. J. O'Sullivan.
2653. What is the average width of that valley? About a mile, a little more or a little less. The following statement gives particulars in respect of 31 holdings, comprising an area of 9,900 acres:— 6 Dec., 1899.

PARISH of Gilmore Returns for 1898-99.

Name of holder.	Area of holding.	Area suitable for cultivation.	Area of wheat.	Area of corn.	Bushels of wheat.	Bushels of corn.	Tons of hay.	Cattle and horses.	Sheep.	Probable increase of cultivation.
	acres.	acres.	acres.	acres.						acres.

The

- J. O'Sullivan. The previous witness and myself went round from house to house to make absolutely sure that the figures were correct.
- 6 Dec., 1899. 2654. Why is it that the area under cultivation is not increased? Because of the want of a market and the cost of transit at the present time. It costs us 5d. a bushel to send wheat or maize to Gundagai. That is equal to about 15s. 7d. a ton of wheat and about 16s. 8d. a ton for maize. From Gundagai to Sydney, however, a distance of 286 miles, the freight is only 12s. or 13s. a ton.
2655. Then the teamsters' rates are pretty well prohibitive? Yes.
2656. What do you do with your produce? We sell it locally. Of course the wheat goes away to Gundagai and on to Sydney.
2657. What do you get for your wheat? We got 2s. 2d. a bushel at the sheds for our last lot of wheat, and the purchaser had to take it away.
2658. That is about the minimum price? It is a very low price. There is very little in wheat-growing at that price. Last year we had a good crop, and, in fact, the year was a phenomenal one. On the Gilmore some of the farmers got as much as 40 and 50 bushels to the acre.
2659. Is the district a reliable one for crops? Undoubtedly.
2660. So that there would be every inducement for a man to enlarge his operations if there were better means of transit? Yes. Speaking for myself and my brothers, we could increase our cultivation area by 220 acres. We only grow 100 acres of wheat now, but we could put 200 acres under wheat.
2661. Do you think that farming pays better than dairying? I think so.
2662. Mr. Peterson indicated that dairying might be taken up very largely here because it would be more remunerative than farming? Well, I know so little about dairying that it would not be safe for me to speak about it.
2663. Dairying is a new enterprise in this district. Yes.
2664. Are all the holders mentioned in your statement fairly prosperous? Yes.
2665. Are they mostly tenant farmers, or are they owners? They are all owners. The largest holding is 3,200 acres, and one man holds as little as 40 acres.
2666. *Mr. Shepherd.*] Have you seen any weevil in the maize of this district? Yes.
2667. Can you account for the fact that the maize here is usually free from weevil? I attribute it to the fact that our maize is very hard. I have often noticed weevils in sacks that we have got up from Sydney, but they do not increase because the corn seems too hard for them.
2668. Have you reason to believe that 600 acres more would be brought under cultivation if the proposed railway were constructed? I have every reason to believe it. The proposed railway will come so close to the people I have named that every facility will be given to them. They would deliver their wheat or maize at the platform at the Gilmore. At the present time hundreds of tons of straw go to waste, although it is always a saleable commodity, but the cost of sending it to Gundagai would leave no profit.
2669. There are many acres of good ground close to the present railway that are not brought under cultivation;—why do you suppose that the particular area to which you have referred would be brought under cultivation? Because I think it would pay the farmers to bring it under cultivation. I am certain that it would pay me to put 200 acres instead of 100 acres under crop.
2670. Have you consulted with most of the people mentioned in your statement? Yes; and I have put questions to them upon the subject. I know one man who could put in about 1,600 acres, and he assured me that if the railway came to Tumut he would certainly put that area under crop. At the present time he uses the land for grazing,

Henry Francis Hayes, manager for Sanderson and Taylor, millers and grain merchants, Tumut and Gilmore, sworn, and examined:—

- H. F. Hayes. 2671. *Mr. Dick.*] Does your firm buy as well as mill all sorts of grain? Yes.
- 6 Dec., 1899. 2672. What amount of business do you do each year? This year we bought about 120,000 bushels of wheat, of which we ground 50,000 bushels, sending the balance away by team.
2673. Was that grain ground for local consumption? For local consumption here and at Gundagai; but some of it went to Sydney.
2674. How would you describe the quality of the grain which comes to your mill? We buy for a number of mills down the country, and in Sydney as well, and they tell us that our wheat is one of the best that they handle. It is fine mellow wheat, and makes good strong flour of a very good colour. On the average it takes 52 bushels of Riverina wheat to make a ton of flour, whereas it takes only 48½ bushels of Tumut wheat.
2675. Is that due to the absence of moisture in Riverina? No; but the local wheat has a fine deep plump grain with very little bran and pollard in it. Nevertheless we have had to cancel orders wholesale, for the simple reason that we cannot get produce away in time.
2676. In spite of the fact that you have practically a monopoly of the carrying trade? Yes. As for the carriers competing with a railway, it is all nonsense. I understand that the railway freight would be about 3s. 6d. a ton, whereas it costs the carriers at least 7s a ton for horse feed, shoeing, and the expense of living on the road.
2677. It is anticipated that the carriers would successfully compete for back loading, the local train rate for which would be 19s. 3d.? Even then they could not compete, unless they had loading down to Gundagai as well as the loading back.
2678. Could they do it for 11s. each way and make anything out of it? I think that at the end of 12 months they would be in debt.
2679. Then you do not anticipate any serious competition from the carriers? I anticipate no competition whatever.
2680. Do you think that the construction of a line to Tumut would by developing country south of Tumut give a new field for the operations of the carriers? Yes; that is where they will go.
2681. Are many of the carriers farmers? Yes.
2682. Would it pay them better to give up carrying and go in for farming entirely, supposing there were a railway? Yes. Now they only go carrying in order to fill up time. If they could get more ground, it would pay them to increase their cultivation.
2683. Even if they cultivated more ground, would they not still have an idle period in which they could go carrying? They would be pretty well occupied in carting their stuff to a railway at Tumut; they would not want to go carrying for anyone else.
- 2684.

2684. Could you offer any opinion to the Committee as to the reasons for the decrease in the maize yield of the district during the last two years? During the last couple of years we had had a bit of a drought, and they were getting 8s. 6d. and 4s. a bushel for wheat, so that a good many grew wheat instead of maize. Now, however, a good deal of ground has gone under maize again. One gentleman who is present here to-day has only 3,000 bushels of maize this year; but next year, with a good season, he will have from 12,000 to 15,000 bushels, and other farmers will be in a similar position. The crop this year will amount to about 200,000 bushels, but last year it was nothing like so much, so that things are improving again. The wheat crop was 250,000 bushels last year; I have not got the returns for the present year yet.
2685. Do you confirm the evidence of previous witnesses concerning the Bago and Batlow country? Yes. I think that the country is suitable for the Manitoba wheat, which is the best wheat grown in N.S.W., because the climate is similar to the climate in which the wheat was originally grown. The flour from Manitoba wheat brings £3 a ton more than other flour. A gentleman living up on the Yarrangobilly country expects to get about 30 bushels to the acre there.
2686. You speak of this country from personal knowledge? Yes.
2687. Which do you think is the best for the proposed railway? The Adelong route. It has been said that there is no cultivation along that route, but they have lately gone in for growing corn in the Adelong Valley. The other day one of the farmers there wanted to sell me 1,200 bushels; and I know that there are three or four who are trying to rent ground there to grow maize upon. For the last three years our production of grain has been increasing by leaps and bounds. About four years ago the production of wheat was only about 40,000 bushels; then it increased to 80,000 bushels; and then to 250,000 bushels; and next year the crop will be still larger.
2688. *Mr. Watson.*] The increase in the production of wheat may account for the decrease in the production of maize? It may a little; but they are clearing more land for wheat-growing.
2689. How many teams are there in Tumut and Adelong? About fifty in summer-time; but, on the average, right through the year, only about twenty. Our firm has kept as many as thirty-three or thirty-four teams going in a week. I am sure that the proposed railway would pay within five years, and that the Commissioners would then be able to reduce the rates.
2690. Have you seen the Commissioners' figures? Yes; but I do not think that there will be a deficiency. Gundagai is credited with a lot of the traffic that comes from Tumut. For instance, I never make out my consignment notes from Tumut; I make them out from Gundagai. Last year there was a great failure of the crops in Gundagai.
2691. Do you think that the Tumut trade has been keeping the Gundagai extension going? I am sure of it. Four years ago no wheat at all went away from Tumut, but this year between 4,000 and 5,000 tons will go away.
2692. *Mr. Levien.*] Do you know Mr. Usher? No.
2693. He did not call upon you? No.
2694. Did Mr. Harper call upon you? No. I think Mr. Shepherd wanted to know why the Tumut corn never gets weevily. There is an outer skin on it which the weevil cannot get its nose into. The frost puts this skin on the corn. I had a lot of maize stocked some time ago, and one of the bottom bags got very wet, so that the weevil got into the corn; but the bags that were higher up were not touched by the weevil.

William Henry Bridle, auctioneer, Tumut, sworn, and examined:—

2695. *Mr. Watson.*] Have you resided long in the district? About forty-eight years. I was born here, and I know the district thoroughly.
2696. Can you give the Committee a general statement as to the character of the country, and as to its agricultural possibilities? I could do so, but having been through the electorate as a valuer in connection with the Land Tax assessments, I have compiled tabulated statements respecting the parishes of Wyangle, Mondongo, and Blowering, showing the owners of the various holdings, the area of land now under cultivation, the area of land suitable for cultivation, but not yet cultivated, the area of pastoral land, and the total area of each holding.
2697. You leave out of account in your statements the Gilmore part of the district? Yes.
2698. Your statements deal only with the immediate country north-east, east, and south of Tumut? Yes. The following are the particulars which I have collected:—

PARISH OF WYANGLE.

Owner's name.	Present cultivated.			Land capable of cultivation.			Pastoral land.			Total area.

672 acres more land might be brought under cultivation.

- 20 bushels per acre, average yield of wheat.
- 65 " " " " " maize.
- 40 " " " " " oats.
- 2 tons per acre " " " hay.
- 8 " " " " " potatoes.
- 15 cwt. " " " " " tobacco.

The grazing capability of the pastoral land, as a whole, I would average as follows:—

Cattle.—One beast to every 4 acres, all the year.

Sheep.—Two and a half to every acre, all the year.

Fruits of all kinds (not purely tropical) flourish in abundance. Apples, pears, peaches, plums, nectarines, walnuts, oranges, lemons, apricots, grapes, currants, gooseberries, strawberries, &c. These fruits could be placed on the Sydney market to advantage, if we had cheap and easy means of transit, but, as at present situated, this opportunity cannot be availed of. There would be undoubtedly a big future for this district, if the country were opened up by railway communication, in the way of establishing jam factories and the conservation of fruit.

It has been argued that the bulk of our produce reaches Gundagai as matters stand at present, but this is entirely wrong; and were it true, our producers frequently meet a slump in the market through inability to get their stuff down in time. This latter is undoubtedly a big consideration.

Thousands of extra acres could and would be cultivated here to advantage if facilities of transport were granted. Tourists from every quarter would avail themselves of the salubrity of our mountain country, where the scenery is surpassingly wild and romantic. We have the far-famed Yarrangobilly Caves, unrivalled as yet in the Colony; and Kosciusko (the nearest point to heaven in New South Wales) rears its snow-capped summit to the sky. To the tourist in search of information, scenery sublime and enchanting, health so dear to all, climate unparalleled in the Colony—where can you find its equal? and this in the immediate background to our hitherto neglected town. Had we speedy means of access, thousands would avail themselves of the opportunity to recuperate from the sun-scorched plains of the west, to revel in our sylvan solitudes, and find life and energy invigorated by a dip in the hot spring at "Glory Hole."

Mining.—Tunut undoubtedly offers a large field for the enterprising miner, a fact till lately unknown, by reason of our isolation; still, reference to the books in our Warden's office will show as large a revenue, from August last, as that of any district in the Colony. We have gold, tin, silver, lead, iron, copper, chromes, in abundance, only awaiting future development, and the railway to this place is everywhere regarded as a prime factor in bringing about the same.

Dairies.—With a railway to our door, you will, on inspection of our country, say there is not a better field for the dairying industry in the Colony—a field where the land is extremely fertile, droughts unknown, rainfall average 35 inches per year, and any amount of pasture summer or winter; but, oh! the freight and the delay.

Timber.—With the advent of a railway our back country will be opened up, and our forests of mountain ash on Micalong, Gooharragandra, and Batlow will prove a source of supply to the builders below, to say nothing of our forests of gum and hardwood, so necessary for house and bridge building purposes.

Starving Stock.—For several years past our mountain country has fed about 500,000 sheep, to say nothing of cattle and horses; and a railway from Gundagai thither would greatly minimise the great loss yearly entailed in weak sheep untrucked at Gundagai, for, if landed here, they would be on grass straight away.

The Government Statistician's report (though every care is taken in the compilation of it) cannot in any sense be considered accurate. Tenant owners (and there are many here) are averse to giving their full returns, and for business purposes the information is withheld, though with a view to better prospects ahead.

Some of my friends have handed to me some returns, which I think I can vouch for as being accurate. The first return was furnished to me by Mr. John Wilkinson, of Werreboldera, and the next by Mr. S. F. Wilkinson:—

Wilkinson Bros.	25,000	450	24,550	6,000	1,300	7,500	40	5	15	1 sheep to the acre ; 5 acres to one head large stock.

Remarks.—The timber on the above holding is as follows :—Mountain ash, stringybark, blue gum, red gum, white gum, and peppermint, all of which grow in large quantities, and with the aid of a railway, timber-cutting would become a great industry, for the stringybark and mountain ash is almost inexhaustible.

All kinds of fruit grow luxuriantly, and large areas could be cultivated with every success.

Payable gold is found along the valley of Tumut River.

It has been said that the agricultural land in this district only extends for a distance of a few miles south of Tumut; but the following replies to certain questions sent out to various people throughout the district by the Secretary for our Railway Committee will show that the agricultural country is much more extensive than that. The information was furnished by Mr. H. F. Lampe, of Talbingo :—

1. The amount of land suitable for cultivation, not now used for that purpose,—1,000 acres.
2. The approximate yield of grain and other produce per acre, on land cultivated for the past few years,—hay, 2 tons per acre; potatoes, 12 tons; wheat, 30 bushels.
3. 50,000 acres suitable for pastoral pursuits; and when ringbarked and properly killed will carry 1 sheep per acre, or 1 beast for 6 acres.
4. Mountain ash, stringybark, blue gum, urabbie, peppermint, and other kinds of timber grow in great quantities; and with the aid of a railway timber-cutting would become a great industry.
5. All kinds of fruit grow luxuriantly, and large areas could be cultivated with every success.
6. Quantities of gold exist along the Tumut River.

2699. *Mr. Levien.*] The statements which you have handed in are the statements of reliable men and could be supported upon oath? Yes. So many Riverina sheep have come into this district that our own people have found it more advantageous to lease their land than to run their own sheep upon it.

2700. *Mr. Watson.*] So that a large proportion of the wool grown here is not shorn here? That is so. The wool output from this district is, therefore, comparatively small.

2701. From the statements which you have read it would appear that there is a fair area of agricultural land in the district which the construction of the proposed railway might bring under cultivation;—do you think that if the line were constructed that land would be brought under cultivation? I feel satisfied of it. I have been engaged in farming for the greater part of my life, and I know that the farmers here only want a slight incentive to increase their production. At the present time we are handicapped. This was a prosperous district before the line was brought to Cootamundra. At the present time we pay about 4d. a bushel for cartage, so that the tenant farmer here pays about 6s. 8d. an acre more than a man in Gundagai would pay.

2702. But the man in Gundagai would probably pay a higher rental? I think that the rents are about the same in each place.

2703. At Gundagai they have a lighter rainfall than you have here? Well, I can endorse what Dr. Mason said in regard to the flat land in the two places. The original soil on the flat land is black soil, and under it is sand, and under the sand gravel, and where the flats are deeply drained, as they are by the Murrumbidgee, there is much less moisture left for the crops than in places like this where the river channel is not so deep. The people here have gone into figures, and have tried to properly estimate the probably traffic on a railway; but we cannot reconcile the statements of the Railway Commissioners with our ideas upon the subject. At the present time the Government have to keep in repair the roads between Tumut and Gundagai *via* Brungle, between Tumut and Gundagai by the marked tree line, and between Tumut and Gundagai *via* Adelong, in all a distance of about 80 miles, representing an expenditure of about £50 a mile, or a total expenditure of about £4,000 a year. To look after these roads two maintenance men are required, and about £240 a year could be put down for them.

2704. The roads would still be required even if there were a railway? I think there would be some saving. It would not cost anything like so much to maintain the roads if we had a railway.

2705. The Under Secretary has repeatedly said that the construction of a railway means the increasing of the road expenditure of a district? Well, that shows that railways open up the country. In an easterly direction from here there are thousands of acres of Crown lands which could be worked to advantage if we had facilities for transport.

2706. *Mr. Shepherd.*] Are mountain ash, peppermint, and stringybark considered good timbers? Yes; very good timbers. Mountain ash is a light timber.

2707. There are two ashes, one with a bark very similar to ironbark, and smooth at the top, and the other with a bark more like box, but darker in colour; which is the tree you have here? Our mountain ash is more like peppermint, but at the top it is like white gum.

2708. Smooth? Yes.

2709. Does it attain any size? On the table-land I have seen trees 150 feet in height.

2710. Does the peppermint attain to a great size here? Yes; it is almost as large as the mountain ash.

2711. Is it used for sawing, or for splitting? For both. It is not as good a timber for sawing purposes as is the ash. You will not find the ash at a lower altitude than 3,000 feet.

2712. You have the white stringybark here? Yes.

2713. What it is used for? For fencing, building purposes, and that sort of thing.

2714. Do you use it for posts? In 1896 I saw some posts which had been in the ground ever since I was about 3 years old, and many of them are sound at the present day. Stringybark is largely used for boards and battens, and also for rails.

2715. I suppose blue gum is a most valuable timber? Yes.

2716. There is no ironbark here? There is a bastard ironbark, but it is not used.
2717. *Chairman.*] What do you consider the value per acre of the best land that the proposed route runs through? Its improved value?
2718. Yes? I should say it would be worth from £7 to £8 an acre.
2719. That would be about the dearest of the land? Yes.
2720. The land in the hilly country at Gundagai would not be nearly so valuable? No. There is some very poor land on parts of the line.

W. H. Bridle.
6 Dec., 1899.

William Bridle, farmer and fruit-grower, Tumut, sworn, and examined:—

2721. *Mr. Shepherd.*] What area of ground do you occupy? About 230 acres. I was one of the first settlers in Tumut.
2722. You have heard most of the evidence that has been given? Yes, and so much has been said upon the subject upon which I was prepared to speak that the wind has been taken out of my sails altogether.
2723. Will you give the Committee any information you have at your command upon any point which you think may not have been sufficiently explained? Yes. When Mr. Graves was giving evidence he was asked why it is, if this district is so suitable for fruit-growing, that no fruit is obtainable here now, and he replied that the season is too early for fruit, whereas, as a matter of fact, the cherry season is about over now, and this year we had a very severe frost which destroyed a great deal of the fruit. Mr. Priza, of Young, estimated that he lost about £500 by reason of the late frosts, and, although I have been here for fifty years, I do not remember a frost which was so destructive. I have lost the whole of my cherries, peaches, grapes, figs, walnuts, and fruit of all kinds. The frost came two or three nights, and extended all over the district, even as far as Albury and Corowa, and even to Camden. Then, last winter, we had a snowstorm, a thing which we have not had before for forty-six years. There is not a district in the Colony to be compared with the Tumut district for fruit-growing, both in respect of the quality and the quantity of the fruit raised, and I can speak with some authority upon the subject, because I have been growing fruit ever since I was a boy. I had the honor to represent Tumut at the Fruit Conference of 1890 and 1891, and I took a sample of fruit from this district, and I was proud to find that our fruit was the best exhibited there. We have land here 900 feet above the sea-level, which in good seasons will grow apples and pears up to 3 lb. in weight. At Batlow the climate is a cool one, and the cooler the climate the firmer the fruit, and the longer it will keep. The ripening season there is two months later than the Tumut season, although the district is only 20 miles away, and consequently we can have fruit right through the year. Mr. Timmis up there kept his apples right through from last season. It has been said that no hay is grown in the Tumut district. The hay will grow, but the cost of taking it to Gundagai would take away all the profit of growing it, though, so far as our capabilities are concerned, we could grow enough hay here to supply the whole of Riverina in droughty seasons, supposing that we were in a better position to compete against the Sydney market. The fertility of the soil of the Tumut district is inexhaustible. However heavily cropped the alluvial lands may be, one overflowing of the muddy water of the river renovates them, and restores them almost to their original richness. There are places on my farm where maize has been growing continuously for twenty-five years without any apparent diminution in the yield.
2724. Do the inundations you speak of occur periodically? We have not had an overflow for five years, but, ordinarily, we have one or two every year, or every other year.
2725. Do the floods ever destroy the crops? No. The water may take a little of the fencing away sometimes, but the improvement to the soil more than compensates for that.
2726. Is there any particular season of the year in which these inundations occur most frequently? Generally, if heavy rain comes when there is snow on the Alps, the water spreads all over the alluvial plains here.
2727. That would usually be in the spring? Yes. The highest flood that we ever had was on the 18th August, 1853. It was caused by a heavy fall of rain following a great fall of snow.
2728. Did the frost destroy the whole of your fruit-crop? It did not destroy the apples, but it destroyed a great number of the pears; they did not seem to stand it so well. I never knew frost to destroy the fruit before as it has done this year. A severe frost coming when the bloom is on will nip even the wheat.
2729. You attribute the failure of the fruit-crops entirely to the frost? Yes.
2730. When did the heavy fall of snow that you have referred to occur? A month or two before the frost.
2731. Are you of opinion that the fruit industry would largely increase there if the proposed railway were constructed? Yes; but the codlin moth is troublesome in this district, and until legislation compels every one who has fruit-trees to prevent it from spreading, it will do a great deal of harm.
2732. Is it long since it made its appearance here? Eight or ten years. The pest could be destroyed if everyone took to bandaging his trees and killing the grubs.
2733. Have you treated your trees in that way? Yes, I have bandaged them every year. Spraying was tried here, but it did not seem to answer, and I have heard that it has not answered in Tasmania.

W. Bridle.
6 Dec., 1899.

Charles Silvester Byrne, auctioneer, Tumut, sworn, and examined:—

2734. *Chairman.*] I understand that you have been here for the last fourteen years? Yes.
2735. Can you tell us the names of the principal sheep stations in the district? I have compiled an estimate of the wool grown within an average distance of 15 miles of the proposed railway, with a list of the owners of the various stations, the names of the holdings, and the number of bales of wool that they send away.
2736. What area of country does your return embrace? I commence at the Adelong Crossing, and from there, commencing at Adelong Crossing, thence to Mundarlo, thence *via* Hillas Creek, Mount Adrah, to Nacka Nacka Creek, 4 miles from Adelong. Thence I go *via* Ellerslie to Middle Adelong, south-east, to a point 6 or 7 miles from Adelong, and then on to the Gilmore, a distance of about 4 miles. From there

C. S. Byrne.
6 Dec., 1899.

C. S. Byrne. there I go to a point south of Tumut; then up the Tumut River to Talbingo, 22 miles from here; then to the Gobragandra, to a point 10 miles east of Tumut; then to the head of the Bombowlee Creek, about 8 miles north-east of Tumut, and back to the Adelong Crossing. The following is my return:—

* This holding on the map shows to be much nearer Gundagai than Tumut; but the road to Gundagai direct is not practicable. The wool has to be carted 8 miles on the Tumut-road—as a matter of fact within 12 miles of Tumut—before turning off to Gundagai via road down Brungle Creek. I am assured by the manager of the Bank of New South Wales here (who are in reality owners of the station) that the whole of the wool would come to Tumut if railway constructed.

2737. What weight of wool is there in a bale? I allow about 400 lbs. to the bale. The Commissioners made a very hurried visit here six or seven years ago. It was raining heavily at the time, and they just drove down the street and over the bridge and went away again. There are one or two large estates here which it is intended to open up shortly, though I am not at liberty to give you the names of them. The land is good frontage land, and will be either sold or let. When that is done there will be still more room for population.

2738. Will that pay better than running sheep? Yes, if the land sells well.

2739. Supposing they lease it? Yes, the frontage land will. They have rented some of it; but they have not made any improvements on it.

2740. Do you think that the district is capable of great expansion in the way of agriculture? Yes. South of Tumut there is a lot of country suitable for agriculture to be opened up.

2741. We have heard that there is ridgy land in the neighbourhood of Batlow which is very suitable for agriculture; do you think that that land is suitable? Yes. There is good red land there which, if cleared, will return good crops of potatoes and of fruit, and it will also grow oats and wheat, though I have not heard of corn being grown there. I think that the Bondo country, which is east of Tumut, is the best country for oats and wheat.

Sivyer John Rootes, senior sergeant of police, Tumut, sworn, and examined:—

S. J. Rootes. 2742. *Chairman.* How long have you been living here? I came to the district twenty-one years ago last month. I was then stationed at Adelong for seven years.

6 Dec., 1899.

2743. Have you the usual statistical information collected by the police for the Tumut district? Yes; and I have, in addition to the returns collected by the Tumut police, the returns collected by the Batlow and Adelong police. There has been an alteration in the boundaries of the districts of Adelong and Tumut during the last two or three years, and therefore the area of alienated land appearing in the returns for the Tumut district for the year 1899 is not so large as it was for the year 1897. My returns are as follows:—

AGRICULTURAL Statistics collected by Tumut Police in January, 1897, 1898, 1899.

Year.	No. of holdings.	Alienated land.	Crown lands.	Area under cultivation.	Area under wheat.	Yield wheat.	Population.
1897	485	186,710	223,942	9,630	3,167	54,373	3,996
1898	512	185,726	271,375	11,384	4,649	82,527	4,057
1899	505	177,739	286,245	12,890	6,627	140,509	4,081

TUMUT

TUMUT Agricultural Statistics collected January, 1899.

S. J. Rootes.

6 Dec., 1899.

County.	No. of holdings.	Alienated land.	Crown lands.	Area under cultivation.	Area under wheat.	Yield of wheat.	Population.
		acres.	acres.	acres.	acres.	bushels.	
Wynyard ...	106	40,396	16,654	4,741	2,575	56,231	Europeans— Town..... 1,346 Country 2,569

Totals.....	505	177,739	286,245	12,890	6,627	140,509	4,081

RETURN of Agricultural Statistics for the Police District of Batlow for year ending 31st December, 1898.

Alienated land.		Crown lands.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat.
Freehold.	Rented.				
acres.	acres.	acres.	acres.	acres.	bushels.
156,685	30,337	15,677½	1,370½	540	11,715

POPULATION for year 1898—Europeans, 825; Chinese, 12; Aliens, 15.

ADELONG Agricultural Statistics collected January, 1899.

Alienated land.	Crown lands.	Area cultivated.	Area under wheat.	Yield.	Population.
acres.	acres.	acres.	acres.	bushels.	
56,544	53,240	2,658	1,314	22,112	2,842

These returns are all collected in January, but that is too early for this district, because by that time the crops have not been gathered, and sometimes I have been told that the actual crop was a little more than was anticipated.

2744. What is the total population that would be served by the construction of the proposed railway? I have not got those figures. Of course, the traffic from Brungle Creek and other places beyond Killinickat would go to Gundagai.

2745. Then the whole of the district to which you refer would not be served by the proposed railway? No, but on the other hand, there are people living outside the Adelong district who would be served by it.

2746. Mr. Hall has estimated that 8000 people would be served by the construction of the proposed line? According to my figures there are 7,775 people in the district. I may have omitted a few, but not many. I can corroborate the evidence of Mr. Byrne, because I assisted him to make up his list. We allowed for 70 fleeces to each bale; but if the sheep were heavy you could not put in so many fleeces.

2747. You do not consider Mr. Byrne's estimate an exaggerated one? No; if anything, it is otherwise than exaggerated. All the people mentioned in his statement would be benefited by the proposed railway.

2748. Do you consider the district a progressive one? Undoubtedly.

2749. In what direction do you consider it bound to go ahead? I think that it will improve in every way. I do not say that there will be a great increase in the production of maize, but there is a great deal of forest land which is now almost in its natural state, and which is suitable for growing wheat and oats.

2750. Why do you not think that the production of maize will increase? Because the greater part of the maize land is already under cultivation. There is land which might be placed under corn, but it is not of any extent. The area of land under corn has increased gradually each year.

2751. Has wheat growing gone on more or less during the whole of the time that you have been in the district? It has increased gradually until this year. A number of people put their maize land under wheat when the price of wheat became high. Country which, when I came here eight years ago, was wild forest is now ringbarked and is carrying stock.

2752. Has farming, according to your observation, been a marked success in this district? Yes.

2753. Are there regular seasons, a good rainfall, good soil, and all natural advantages? Yes. No district that I know of can equal it. We are favoured with a good rainfall, and a climate under which we can grow first class crops. I could show you oats going 50 bushels to the acre growing on apparently poor land. Similar land would produce two and a half tons of hay and from 18 to 20 bushels of wheat to the acre. Dairying is an industry which could be largely developed here. It has increased to some extent during the last two years, and there are thousands of acres well adapted for it.

2754. What do you think about the river-flat land; is it good for dairying? I think it pays better to grow maize upon that land. I consider this district well adapted for mixed farming, the cultivation of crops, dairying, and the running of a few sheep. You can produce almost anything here.

2755. What is your explanation of the fact that very little farming has been done between Adelong and Gundagai? They have not had an outlet for their produce, though they can grow it right enough.

2756. How is it that more land has not been put under crop between Gundagai and Adelong? I think that the farmers down that way are fairly comfortable, and when a man has enough he does not produce any more.

2757.

- S. J. Rootes. 2757. But if it pays the large land owners better to crop their land or to lease it out in farms, it is strange that they do not do so. Mr. Crain, for instance, has a fair quantity of good land? Yes, but I understand that last year he grew a certain quantity of maize. No doubt his land is well adapted for cultivation, and he has a good deal of forest country which would be suitable for wheat.
- 6 Dec., 1899. 2758. We were told in Sydney that the agricultural land here is held by large owners, so that farmers have no chance of getting it, except by paying extravagant rentals. Apart from that land, is there a large area of farming land available? Yes, for mixed farming.
2759. We have heard that the alluvial flats here are very narrow; do you look to that land to support a large agricultural population, or to the land on the hills? There is land on the hills which, although it would not grow maize, would grow oats, wheat, and fruit well.
2760. Have you ever talked to the settlers in the district in which Mr. O'Sullivan lives in regard to the proposed railway? Yes. His statements were quite correct. At his own residence I have seen tons of straw thrown out to rot.
2761. Do you think that the want of better communication is a great check upon the production of the district? Yes. I think that with a railway many things would be produced which it will not now pay to produce. We never suffered from drought here, and we are never flooded out. We have a regular rainfall, and get a fair crop every year, though, of course, the seasons vary somewhat. They had a far better yield last year than the year before.
2762. Mr. Shepherd.] A great many witnesses have spoken of land 20 miles from Tumut which they say would be brought into cultivation if the proposed railway were made. What should induce them to cultivate their land, when the farmers round Tumut are not cultivating as much as they might do? That is a very hard thing to explain; but there are farmers up the river who are increasing their cultivation every year.
2763. Mr. Dick.] Are they more than 20 miles from Gundagai? Some of them are 40 miles from Gundagai. The district is capable of carrying a much larger population, and, as the population increases, more land will be cultivated.
2764. Chairman.] Is the population increasing or decreasing? It is increasing at the rate of about sixty or seventy a year.

THURSDAY, 7 DECEMBER, 1899.

[The Committee met at the "Commercial" Hotel, Tumut, at 8 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a Line of Railway from Gundagai to Tumut.

Charles Richards, farmer, Windowie, sworn, and examined:—

- C. Richards. 2765. Chairman.] How far are you from Tumut? Eight and a half miles.
- 7 Dec., 1899. 2766. In what direction? South-west from here. My father and I have a farm there between us. I have been there ever since I was born.
2767. What kind of crops do you grow? Wheat, tobacco, maize, and other crops.
2768. Are there many farmers out there? There are nine, going down our creek for a distance of about 4 miles. The following are the particulars about their holdings:—

Name.	Acres.	Fit for cultivation.	Fit for wheat.	Fit for corn.
— Richards	700	240	160	80
Mrs. Kleino	424	130	110	20
J. Bawn.....	270	15	8	7
G. Williams	120	35	24	11
C. Crouch	100	42	22	20
— Beatie	200	108	90	18
— Quilty	250	170	130	40
W. Purcell	1,100	300	260	40
S. Williams	250	207	190	17
	3,414			

2769. How many acres have you under crop this year? One hundred and thirty.
2770. How many acres has Mrs. Kleino under crop? Forty acres under wheat and 12 acres under corn.
2771. Mr. Bawn? His is all pastoral land.
2772. Mr. Williams? He has nearly the whole of his arable land planted.
2773. Has Mr. Crouch the whole of his 42 acres of arable land under cultivation? No; there are 4 acres not planted.
2774. How much land does Mr. Beatie cultivate? He has 50 acres under wheat and 15 under corn.
2775. Mr. Quilty? He has the biggest part of his 170 acres of arable land under cultivation, but I could not tell you exactly how much.
2776. Mr. Purcell? He has about half of his arable land under cultivation.
2777. Mr. S. Williams? He has about 60 acres under cultivation.
2778. How do you send your wool and produce to market now? By team to Gundagai or to Tumut.
2779. What does it cost you to send it to Gundagai? Fivepence a bushel for grain.
2780. How much a ton? We pay about £1 from our place.
2781. Mr. Levien.] What is the yield per acre this year? Last year we had 90 acres under wheat, and our return was 615 bags. 2782.

2782. *Chairman.*] Is there anything else you can tell us in regard to your own locality, or the district generally? There is some good country out at Califat, about which, I understand, the Committee have had no evidence. That is all good country—level country, whereas the country where we are is confined between hills. C. Richards.
7 Dec., 1899.
2783. Is the land suitable for cultivation? It is suitable for wheat. The soil is pretty well the same as ours.
2784. What is the extent of that country? About 6,000 or 7,000 acres. The area I speak of is this side of Mr. Crain's, Mr. Downie's, and Mr. Barrett's. Mr. Barrett told me yesterday that he had about 130 acres under cultivation. He has a splendid crop of wheat this year.
2785. *Mr. Shepherd.*] How is the country which you have been speaking of supplied with water? There is plenty of water all through it.
2786. Are any of the farmers you have mentioned growing fruit? They have their own orchards, and the trees do very well. We have about an acre of fruit trees.
2787. What kind of fruit do the people there grow chiefly? Apples, pears, peaches, plums, cherries, and fruit of that kind.
2788. Do gooseberries and raspberries grow well there? Fairly well; but not so well as they grow at Batlow, where they grow splendidly. I lived there for a couple of years, and I know that it is very good fruit country.
2789. *Chairman.*] What crops is the Batlow country suited for? Potatoes and oats chiefly.
2790. Is there any large area suitable for those crops? Yes; but the land requires a lot of clearing. There is a great deal of timber upon it.
2791. What does it cost per acre to clear? About £5.
2792. How do farmers like tackling that sort of country? It is not suitable for large farmers; but it is suitable for men who take up only 20 or 40 acres, and go in for growing potatoes and fruit. They can get water on to their land there.
2793. Do you think a large number of farmers are likely to settle there? Yes; small farmers and fruit-growers.
2794. What do they do with their fruit? A jam factory started up there; but I do not know how they will get on.
2795. Is the land up there Crown land? Most of the land round the township is taken up; but there is a large forest reserve there.
2796. If a farmer took up 30 acres of land there he would have to spend £200 in clearing it? Yes, if he wanted to have it all cleared at once.
2797. What timbers are there there? Messmate, white-gum, and mountain ash.
2798. Are they saleable timbers? Yes.
2799. So that something could be made out of the timber on the land? Yes. Towards Bago there is any quantity of good country.
2800. How far beyond Tumut would that be? About 32 miles, I suppose.
2801. That would be rather a long distance for a man to bring his produce? It would be rather far; but, if the proposed railway were made, the people there would be better off than they are now.
2802. *Mr. Shepherd.*] Is £5 an acre the price of clearing live timber? That is the price for ringing and then clearing the timber off the land.
2803. It would cost more than that to clear live timber? I suppose it would.
2804. *Chairman.*] I suppose that land is not as good as the land about Tumut? Not for maize. It is too cold there for maize; but it is splendid land for other crops.

John Weedon, storekeeper, Tumut, sworn, and examined:—

2805. *Chairman.*] How long have you been in Tumut? Forty years. I am trading as Mandelson & Co. J. Weedon.
7 Dec., 1899.
2806. I suppose you get all your goods from Sydney by way of Gundagai? Yes.
2807. What amount of freight do you pay from Gundagai to Tumut? 20s. a ton for third-class goods, 15s. a ton for second-class goods, and 10s. a ton for first-class goods—heavy material, such as sugar, salt, or iron.
2808. What amount of tonnage is conveyed for your firm from Tumut to Gundagai, per annum? During the year 1898 we despatched to Gundagai about 1,000 tons.
2809. How many general storekeepers are there in Tumut besides yourself? Four others.
2810. Do you think they would import as much as you? Mr. Newman might do so, but I should not think the others would import anything like as much.
2811. The others are in a smaller way? Yes.
2812. Is your store a general store—do you sell groceries, drapery, wines and spirits, and so on? Yes—ironmongery and everything else.
2813. Besides the goods that come from Gundagai to Tumut to the business firms here, does any large quantity of goods come to Tumut from Gundagai? A certain amount goes to the different stations without going through the local stores—special lines, such as wire. I have known of several instances in which people have got up wire netting for themselves in 5-ton or 6-ton lots.
2814. With regard to goods coming up by train, do you charter a truck for yourself, or do you combine with the other storekeepers? The sugar comes by the truck rate, and so does iron and kerosene; but I have never chartered a truck solely on my own account. My goods come through Wright, Heaton, & Co.
2815. If the railway came to Tumut would you bring your goods to Tumut by train? Certainly.
2816. A Government official has stated that if the line were constructed Gundagai would still remain the place of consignment for store goods? So far as I am concerned it would not, because such an arrangement would mean delay and loss. It would be absurd for me to think of it.
2817. It would pay you better to use the railway than to bring goods from Gundagai by team? Yes; because, other things being equal, the handling and loss of time in bringing goods by team would put that means of transit out of the question.
2818. Do you send anything from Tumut to Gundagai? Yes, grain.

- J. Weedon. 2819. You are a buyer of grain, and you send it to Gundagai? Yes.
- 7 Dec., 1899. 2820. What freight do you pay? Fourpence a bushel, at the present time.
2821. How much would that be a ton? Over 10s. a ton.
2822. That rate would be charged if there were back loading? It was charged independently of back loading. Last year I sent away a lot of maize at 10s. a ton. This year we are paying 4d. a bushel.
2823. If the proposed railway were constructed, you would use it for the conveyance of grain, because the rates of produce are so low? Most decidedly. It would be foolish for me to do anything else.
2824. Are you able to give us an opinion as to the probable development of the district, supposing a railway were made? I think that if the railway were extended to Tumut agriculture would develop, and other industries would spring up. There is no better place in the colony for market gardening than this is, and cauliflowers, turnips, and other vegetables would be largely grown if people could get a market for them. At the present time they do not attempt anything new in the way of production, because of the want of a market.
2825. Some of the witnesses have told us that there is very little additional land in the district which could be cropped. Do you think that the fertile valleys here are at the present time cultivated to their fullest extent, or are you of opinion that there is still a considerable area of land suitable for cultivation? I think that many portions of the upland would be cultivated if the people had easier access to market.
2826. Are the lowlands fully cultivated? I do not think they are. I think that, with a railway, cultivation such as we have now would be wiped out, and that people would go in for closer settlement, and a different class of cultivation, so that the face of the district would be altogether changed, and there would be more produce to send to market.
2827. Is the wheat and flour which is sent to market from this district of good character? Yes; I have never had any trouble with it.
2828. It always fetches a fair price? Yes. Of course the wheat market has been very low for the last year or two.
2829. Between Adelong and Gundagai there has not been as much agricultural development as one might reasonably look for, seeing that that district is within reasonable distance of a railway? I cannot account for that at all.
2830. *Mr. Levien.*] I understand that the wheat and other produce sent from this district and elsewhere by train is booked from Gundagai? Yes, because Gundagai is the railway station from which it is sent.
2831. Then the railway authorities have no means of knowing whether it comes from Tumut or from Gundagai? Our weigh-bills are made out with the heading, "Gundagai, from L. Mandelson and Co., Tumut, to So-and-so," so that the Railway people would have an opportunity of knowing where the produce came from. No doubt Gundagai is credited with all the produce and goods that go through the Railway books.
2832. You do not think you get sufficient credit for the produce that is sent on to Tumut? I do not think we do.
2833. When you spoke about the lowlands being used for other purposes, I suppose you were thinking of market gardening? Yes, and fruit-growing.
2834. The land is well adapted for cauliflowers, cabbages, and other vegetables? They could be grown here to perfection.
2835. And if there were a railway they could be sent to market within a few hours? Yes.
2836. Do you think you could produce potatoes equal to those which are grown in Warrnambool? Yes.
2837. Which route do you favour for the proposed railway? I think the line *via* Adelong is the only line likely to be adopted.
2838. Would that route serve a greater number of people than either of the other routes? Yes, and it would serve two towns; the other routes would only serve one town.
2839. We have heard that some of the tenant-farmers here have paid as much as 37s. 6d. an acre rent; have you ever heard any of them complain that their rental was too high? Some of them grumble about the rents. The tobacco-growing industry boomed up the rents here; but when the farmers began to grow wheat and maize on the land it was found that rents were too high.
2840. But the farmers still keep on paying them? Some of them do; but in many cases the rents have been reduced.
2841. What is the financial condition of the farmers as a whole? Taking them right through, I think they are as good as any men in New South Wales.
2842. You look upon them as stable men whom you could thoroughly trust? Yes.
2843. They are energetic and industrious? Yes, and they are all solvent, too. I do not think there are three or four men on the Gilmore who are in any way hard up.
2844. As a large merchant, you think that if the proposed railway were constructed things would be better here than they are now? Yes, probably.
2845. But the railway will give the farmers a chance of getting their produce to market independently of the storekeepers? Yes.
2846. So that you are not speaking from selfish motives? No, I am not speaking from personal motives.
2847. If you were considering yourself personally you would say let things remain as they are? I do not know that I would say that; but, at any rate, I have no axe to grind in this matter. If the railway came to Tumut I think the district would advance considerably. Dozens of my friends in Sydney would be only too glad to come up here in the summer time; but they will not come while they know that there are 20 miles to be travelled by coach. I think, too, that the proposed railway would open up traffic from Victoria by way of the Yarrangobilly Caves. The Government now run all the traffic to the caves down through Cooma; but, if the railway came to Tumut, this would be the shortest road, and I think there would be a considerable amount of traffic in the summer time.
2848. If the train were brought to Tumut, tourists would have a shorter road journey to Yarrangobilly than they have now from Cooma, and a good road? Yes.
2849. From Tumut to Yarrangobilly is a distance of 44 miles, and from Cooma to Yarrangobilly a distance of 72 or 73 miles? Yes; and I have been told that the road is a very difficult one.
2850. *Mr. Shepherd.*] Do you send your goods direct to Sydney, or do you employ an agent at Gundagai? Wright, Heaton, & Co. are our agents at Gundagai for traffic coming from Sydney, but all the grain goes direct.

2851. Mr. Harper told us that for the general merchandise for which the teamsters get £1 a ton, the railway would charge 19s. 6d. per ton, and we have heard that it would pay people to continue to employ the teamsters;—do you think that the teamsters could reduce their rates so low as to induce you to bring your goods from Gundagai by road instead of by the train? I do not think they could; at any rate, they could not carry grain at the rates for which the railway would carry it.
2852. Then you think that they could not carry on their business profitably if they only got loading one way? I do.
2853. We were told by a practical man yesterday they would find themselves going backwards, financially speaking? Yes; they could not live by doing it.

J. Weedon.
7 Dec., 1899.

Robert Albert Newman, storekeeper, Tumut, sworn, and examined:—

2854. *Chairman.*] How long have you been carrying on business in Tumut? Thirty years.
2855. You are one of the principal storekeepers of Tumut? Yes.
2856. And there are four others besides yourself? Yes.
2857. What freight do you pay upon goods between Gundagai and Tumut? £1 a ton.
2858. And what is the annual amount of freight paid by you?—*
2859. Do you buy produce? Yes.
2860. And you consign it to Gundagai? Yes.
2861. I suppose you pay about the same rate as the last witness—10s. a ton? More than that. Fourpence a bushel is about 14s. 8d. a ton.
2862. And for goods brought from Gundagai to Tumut you pay 10s. a ton for first-class goods, 15s. a ton for second-class goods, and £1 a ton for third-class goods? Yes.
2863. Would you not be better off if you could consign your third-class goods right through from Sydney to Tumut by train, even if it cost you as much as it now costs you to consign them to Gundagai and to bring them from there by road? Yes, because of the saving in time and handling. Every business man will tell you that he would rather pay more to get his goods brought direct to him by train.
2864. The railway freight upon third-class goods from Gundagai to Tumut would be very close upon £1 a ton; would it suit you to pay that? Yes. Nowadays we frequently have goods lying at Gundagai for nine or ten days, because we cannot get teams to bring them on here.
2865. Wheat or grain of any kind would be conveyed from Tumut to Gundagai at lower rates than you pay to the teamsters? Yes. I estimate that the freight upon grain would be about 1d. a bushel, and we should be able to get it away much more quickly than we can now. Under present conditions, if I were to get an order for 20,000 bushels of maize, and I was asked when I could deliver it, I should have to reply, "I cannot bind myself to make delivery within a given time. All I can do is to guarantee that it will go as soon as possible." The carriage of 20,000 bushels would necessitate the employment of eighty teams, and it would take three months to get the produce away. Before we could complete the order, therefore, a cargo might come in from America—that happened only last week—and the market would go down. At the present time we have to buy two or three months in advance, and the undertaking is altogether speculative, but if we had a railway to Tumut we should know what the prices were and when we could deliver. It would suit us to pay the present rates if we could get our produce taken away more quickly. At the present time the business people of Tumut practically monopolise the teams, because we can say to the teamsters, "We will give you back-loading," whereas the growers cannot do that, and they are therefore worse off than we are.
2866. If the growers had not so far to get to a railway station they could cart their wheat and maize there themselves? Yes, and no doubt they would do that.
2867. I suppose Tumut is a big distributing centre? Yes.
2868. Are most of the goods used by the residents of the district obtained from the local storekeepers? Yes.
2869. The people do not import much on their own account? No.
2870. I suppose some of the large runs do? We have no very large runs here.
2871. I suppose the large landholders would import their own fencing wire, iron, salt, and things of that kind? Yes.
2872. Have you any general statement to make? I have listened to most of the evidence which the Committee have taken during the last three days, and I have come to the conclusion that you are convinced that there are quite 30,000 acres of land in this district which could be placed under cultivation.
2873. Do you mean within a distance likely to be affected by the construction of the proposed railway? Yes. If 30,000 acres were put under cultivation, 10,000 acres being put under maize, 10,000 under wheat, 5,000 under hay, and 5,000 under potatoes, and the produce upon that land sent by rail, the total freight at 1d. a bushel for the wheat and maize and 3s. a ton for the hay and potatoes would amount to £9,000.
2874. Do you mean through to Sydney? No, from Tumut to Gundagai. That freight would be quite apart from the freight upon tobacco, wool, live stock, fruit, and passenger fares, and the back freight from Gundagai to Tumut, which would considerably increase with the natural increase in population. If we are getting so many tons of goods up now for a population of 6,000 people, and the population increased to three times the present number, we should want three times as much goods as we require now. I am under the impression that this would be one of the best paying lines in the Colony, because the facilities for production in this district are so great. The mining population is increasing here, and a great deal more gold was obtained during the last twelve months than during many previous years. If the railway were brought to Tumut, you would, within a short time, find the country 15 miles south from here studded with furnished cottages, to which people would come to spend two or three of the hot months of the year. Of course, these people would want supplies, and it would all bring traffic to the railway. Then, too, we should be given some credit for the trainage from Gundagai to Sydney. If the freight from Tumut to Gundagai amounted to £9,000 at 1d. a bushel, at 4d. a bushel to Sydney it would amount to £36,000.

2875.

* NOTE (on revision):—Mr. S. Groves has collected from the business people in Tumut the amount of trainage paid annually by them, and has sent particulars—[*Vide Appendix*]

R. A.
Newman.
7 Dec., 1899.

- R. A. Newman.
7 Dec., 1899.
2875. Of course your figures are somewhat extreme, but if only one half were realised the traffic would be considerable? Yes; though I do not think my figures are extreme.
2876. How is it that there is not more cultivation between Gundagai and Tumut at the present time? Because many of the holders there are large holders, and they are doing remarkably well out of the land as it is, so that they do not care to bother with tenants. Mr. Gordon has a few Chinese growing maize, but the others have done very well with their land without leasing it. It is acknowledged that that land is not so good for agricultural purposes as is the land south and east of Tumut. There is a lot of land out towards the east of Tumut which is still open for selection, and which would be taken up if the railway were brought here—splendid wheat-growing land. Bombowice is a large property quite near to Tumut which is about to be cut up into farms, and that will bring a large population to the district.
2877. Then you endorse the statement that has been made to us over and over again by the farmers in the Gilmore Valley, and in the other places, to the effect that if they had a better and more reliable means of communication they would till every acre of their arable land? Yes. If they were sure of their market they would put more land under cultivation, but their difficulties are now so many that they do not trouble about it. This place has always been kept back for the want of a market. All those who purchase grain here have to do so in the dark at the present time, because we do not know what we shall get for it. If wheat were to take a jump from 2s. 8d. to 3s. 6d. a bushel to-morrow, we could not get our wheat away in time to take advantage of the rise. I believe that when federation is an accomplished fact, and a duty of 1s. a bushel is placed upon maize and Californian flour, and upon New Zealand oats and flour, farming will pay very well in New South Wales.

James Daniel Walker, C.P.S., Mining Warden and Crown Lands Agent, Tumut, sworn, and examined—

- J. D. Walker, C.P.S.
7 Dec., 1899.
2878. *Chairman.*] I understand that you have prepared some statistics for the information of the Committee? I have here a return showing the area of the gold leases applied for in the district, and the amount of the deposits and survey fees paid. The area of gold leases applied for from the 1st January to the 30th November of the present year was 1241 acres, and the amount of the deposits and survey fees paid £1340 8s. These figures do not include the Adelong district. The mining revenue last year amounted to £84 10s., and the increase is to be accounted for by the large number of dredging leases applied for this year. The total revenue of the office during 1898 from land, mining, and other sources was £13,418 10s. A large number of applications have been lodged under the 28th section of the Act, but, instead of being lodged with the warden, they are sent to the Department of Mines. The Red Hill reserve, in the parish of Wyangle, has been pegged out for miles.
2879. Is land sought after in this district for selection purposes? Yes, and a lot of selections have been taken up this year by people who in other years would not have looked at the land because of the dry seasons.
2880. Are these selections taken up by practical men, who will go to work to improve their properties? I should say so. In my opinion this is one of the soundest districts in the colony. Very few people here have availed themselves of the provisions of the Conditional Purchasers Relief Act—I think not more than twenty; and very few conditional purchasers—I should say not more than about forty—are in arrears. I do not think that any district in the colony has greater mineral resources than this district possesses; but it needs capital to develop them.

Spencer Groves, proprietor, *Tumut and Adelong Times*, sworn, and examined:—

- S. Groves.
7 Dec., 1899.
2881. *Chairman.*] How long have you been in this district? Twenty-eight years.
2882. I understand that you have been the proprietor of the *Tumut and Adelong Times* for twenty-six years? Yes.
2883. You are also secretary to the District Improvement League? Yes.
2884. You have heard the greater part of the evidence which has been taken by the Committee? I think that I have heard the whole of it.
2885. Do you agree generally with the purport of that evidence and the facts and figures which have been given? Yes. A part of the district from which we have got no witnesses is the Yarrangobilly Caves. I have ascertained from the caretaker there that the average number of people visiting those caves during the last few years is 800. There are three routes to the Caves—from Gundagai, a distance of 65 miles; from Cooma, a distance of 75 miles; and from Wagga, *via* Tumbarumba, about 85 miles. If the railway were brought to Tumut it would come within 45 miles of the Caves. At the present time, there is a constant agitation for the keeping of each of these roads in order; but if a railway were brought to Tumut it would settle all contention as to which road should be kept in order, as the road to the Caves, in favour of the Tumut-road, and the other roads would then require much less attention. Thousands of pounds have been spent upon the road from Tumut to the Caves, for the purpose of opening up the Caves district, and those who have travelled over both the Cooma and the Tumut roads say that the Tumut-road is undoubtedly the better, and that this district contains better scenery. The question has been asked, why is it that more cultivation has not taken place in toward Gundagai. I think that may be explained in this way:—For the first 7 or 8 miles from Gundagai most of the land through which the railway passes is comprised within the South Gundagai Common and ridgy country until you get to Big Ben Creek and the Adelong Crossing. There is cultivation there, and that land was cultivated even before the train came to Gundagai, and the area of cultivation has been kept up very fairly. Leaving Adelong Crossing, you get into the large estates held by Mr. Crain, Mr. Broughton, and Mr. Bardwell. Those people own pretty well the whole of that country. Then you get on to the Tumut Common. So far as I can learn, Mr. Crain has received no inducement to give up the pastoral industry, and to lease out his land in small farms, up to the present time; but if the railway came through the country, it would be opened up, and there would be no difficulty in getting tenants. The country is all first-class wheat country, and I think it would be taken up very readily by the farming population. It has been mentioned that in the Young electorate farmers can afford to grow grain 80 miles from a railway, while we, who are only

only 20 miles from a railway, grumble about the distance; but I should think 30 miles would be the extreme outside limit in the Young electorate, whereas in our district the outside limit would be 50 miles; most of our good country being within 15 or 20 miles of Tumut. The roads over which the people in this district have to travel are hilly roads, so that the teams cannot take more than 5 or 6 tons at a time, but in flatter country, I dare say they would take 10 tons. There are three roads from Gundagai to Tumut, aggregating 80 miles in length, and all these roads have now to be kept in repair, at a cost of £50 a mile; but, of course, when the railway is constructed, the heavy traffic will be taken off them, and the expenditure for maintenance will be very much decreased. I do not think there is any other part of the country in which, by the construction of a railway, expenditure could be saved upon three main roads.

S. Groves.
7 Dec., 1899.

2886. But would not the people require cross-roads to enable them to get to the railway? I do not think more would have to be spent upon the cross-roads than is spent at the present time. Money is voted each year for expenditure on these roads, and that money would, I think, suffice to keep them in order, because, with the construction of a railway, the farmers would use lighter teams. I understand that the annual expenses of a railway to Tumut have been estimated at about £8,000; but I should like to point out that the same rolling-stock that is now used between Cootamundra and Gundagai could be used for the whole length from Cootamundra to Tumut, and nearly the same staff. Perhaps a shunter or two would be required at Gundagai to help with the station work there; but I suppose the staff of the train would come on to Tumut. The demand for residences in this town is, at the present time, greater than the supply. I know of three families who are now living at boarding-houses because they are unable to get houses of their own; and, no doubt, many other people would come here if better inducements were given them. There is a lot of vacant land in the town, and if the railway came here it would be utilised, because building materials are as cheap here as in any other part of the Colony. At the present time contracts for buildings are let up to the value of over £6,000.

2887. Have you considered the question as to what will have to be paid for compensation for land? I think that in many cases the people through whose land the railway would pass would agree to give their land to the Government. In some cases the railway comes close to the road, and it is possible that part of the road might be taken for railway purposes. That would make the strip of private land to be resumed much narrower, and therefore less costly.

2888. Are the sheep which are brought into this district for agistment paid for by the thousand, or are the paddocks into which they go rented? I think that the sheep are paid for by the thousand.

2889. Do you know what is paid for them? No. A question was asked as to what guarantee there is that land 20 miles from here can be brought under cultivation if the proposed railway is made, seeing that land within 20 miles of Gundagai had not been cultivated. At the present time, people here cultivate such land as will produce 20 bushels to the acre; because, unless they have as high yields as that, they cannot afford to pay the cartage to Gundagai; but, if the railway were brought to Tumut, they would cultivate land yielding only 15 bushels an acre. The Batlow district, which is capable of producing even better yields than we get here, would be on the same footing, as far as railway communication is concerned, as Tumut. Mr. Weeden was asked if he could account for the decrease in the maize-production of the district. I think it can be accounted for by the substitution of wheat for maize; but, if the railway were brought to Tumut, a great deal of the land now being used for wheat would be used for maize, and the wheat-growing would extend to the hilly country. On the Bombowlee estate there are large areas of land under wheat which could produce splendid crops of maize, and I think that if the railway came here they would grow maize upon that land, and wheat upon the higher country.

FRIDAY, 8 DECEMBER, 1899.

[The Committee met at Brungle, at 1 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of railway from Gundagai to Tumut.

Alexander McGruer, grazier, Brungle, sworn, and examined:—

2890. *Chairman.*] How many years have you lived here? Thirty-nine years and nine months.

A. McGruer.

2891. Are you well acquainted with the country from Gundagai to Tumut, and the district generally? Yes.

8 Dec., 1899.

2892. Are there any townships between Tumut and Gundagai, on the Brungle route? No, none whatever.

2893. Brungle is a village in name only? Yes.

2894. Between Brungle and Gundagai what towns are there? None.

2895. Between Brungle and Coolac is there any concentration of population? No; there are only a few farms there.

2896. As an old resident of the district have you formed an opinion as to which of the three proposed routes would be the best for a line to take? I have formed a very strong opinion upon the subject, and I think the railway should be taken along the Tumut Valley, because by going that way it would serve 20 miles of good country on the Tumut River, in addition to the country round about Tumut itself, and further out. The produce grown upon the Adelong route amounts to very little until you get to the Gilmore Creek; though, of course, there is more population upon that route. The population of Adelong, however, is a mining population, and is supplied with produce chiefly from Tumut, aided by a little locally-grown produce.

2897.

- A. McGruer. 2897. Between Gundagai and Tumut *via* the Tumut River what extent of cultivation is there? It is all cultivation. Just opposite this house, on the river flat, there are 400 or 500 acres under maize. The Tarrabandra traffic would come in to the line you speak of at the Brungle bridge. A railway going *via* Adelong would lose the traffic from the Tumut valley district until you get beyond Killimicat Hill.
- 8 Dec., 1899. 2898. I suppose you are aware that if a railway were brought along the Tumut Valley it would have to start from Coolac? Yes.
2899. That is looked upon by the Department as a very serious objection to the route? There is some force in the objection; but, to my mind, the proper route to adopt would be one crossing the river near Coolac. A few years ago I showed Mr. Burge a place where the Murrumbidgee could be crossed by a bridge not a quarter as long as any bridge that would be required at Gundagai.
2900. Where do the people on the Tumut valley send their produce to now? There is not such a great lot of produce grown on this side of the Tumut valley now, though it has been grown, and it will be grown again. There is a big plain between here and Gundagai, and I have seen every acre of it ploughed. I might also mention that one season I owned one of four threshing machines, which were employed on the Brungle Creek; and, though my machine was the smallest there, it put through 10,000 bushels. I threshed for Mr. Clout that season.
2901. Then are we to understand that agriculture has fallen off very much here? Yes.
2902. Why is that? There are eleven or twelve fewer families on the creek now than there were then. Mr. P. Kiley holds land which used to belong to four, five, or six men; Henry French has land which other people used to be in possession of; and Messrs. Robert and William French have land which was at one time owned by others.
2903. That indicates retrogression rather than progression in respect to agriculture? Yes; but I think that what has to be studied in regard to a railway proposal is rather the capabilities of the soil than the manner in which the land is held. In years to come the land will be put to its proper use again.
2904. Between Gundagai and Tumut, *via* the Tumut valley, how many acres are there on the flats suitable for agricultural purposes? I could not give you any direct reply, because I have not gone into the matter.
2905. Is it not the general experience that when land gets into the hands of the large holder he uses it for pastoral rather than for agricultural purposes? Yes; but when families increase it has to be divided again amongst them.
2906. Do you go in for farming at all? Very little.
2907. You used to do so? Yes.
2908. I suppose you find it easier and more pleasant to let the cattle and sheep earn your living for you? Yes.
2909. On the other route the people have the local market and all the advantages which arise from close settlement, and which you have not got. Do you not think, therefore, that the future of that district as a farming district will be realised more rapidly than the future of this district, supposing the railway is brought this way? My opinion is that once you get past the Gilmore on the other route you will get traffic to the railway; but between Gundagai and Gilmore the prospects of traffic are very poor.
2910. It is said that agriculture is not largely engaged in in that part of the country, because large holders keep the land for other purposes? I do not think that the land is there. You can see the extent of good land from the road.
2911. On the Gilmore, and round about Tumut for a distance of five or six miles, is there not a large extent of country suitable for agriculture? Undoubtedly; and therefore I say that Tumut should get a railway. I think that the producers should be helped, because they have to work very hard.
2912. Your contention is that the country between Tumut and Gundagai on the Tumut Valley, will support a larger population than the country on the Adelong route? It would give more traffic to a railway.
2913. Traffic in agricultural produce? Yes, and perhaps in copper and chrome ore. It does not matter to me which way the line goes, because I am pretty handy to the railway now. I am only about 12 miles from Gundagai.
2914. Have you a fairly good road? Yes. If the railway were being promoted by a private company I would rather take shares in a line going along the Tumut Valley than in a line going along the Adelong Creek Valley. I should like to see the line start from Coolac. The country down there is wonderful.
2915. But are not the people down there fairly well served at the present time? Yes, fairly well.
2916. Do the people on the eastern route take much interest in this matter? I do not think so. Even in Tumut they do not seem to trouble much about it. I was there at one meeting, and only one farmer spoke.
2917. If the railway were brought along the Tumut Valley would you use it? Yes, if there were a station close at hand, unless I wanted to take anything into Gundagai.
2918. How far would you be from such a line? If it came on this side of the river it would go through my land.
2919. We have it in evidence that if the line were taken *via* Adelong Crossing the people out almost as far as the Crossing would still continue to cart their produce into Gundagai? I do not think they would cart produce that they intended to send through to Sydney, or any long distance, into Gundagai.
2920. Is the land on the Tumut Valley as fertile as the land on the Gilmore? Yes. There is a piece of land in front of my door from which I have received 35 or 36 bushels of wheat to the acre. Last year I only got 25 bushels from it; but the wheat was quite pinched, and by its colour I think that it will be pinched this year. The land here and on the Brungle Creek is splendid wheat-growing land, though a lot of it is lying idle.
2921. There is no Government land here? No, I think not, unless in the travelling stock reserves.
2922. Do you know what that land is worth an acre? I do not know what it would be worth all through.
2923. Is it any of it leased to farmers? Yes.
2924. What do they pay for it? I do not know.
2925. Mr. Shepherd.] Have you ever tried fruit-growing here? Yes, on a small scale.
2926. What kind of fruits have you grown? Grapes, apples, pears, and apricots.
2927. Do they all do well? Fairly well.
2928. How much land have you under cultivation? About 7 acres this year.

2929. Is that land chiefly under wheat? Yes.

2930. What kind of wheat do you grow? At one time my fancy was for White Lamb wheat; but now I do not care what I grow, as I use it merely for hay.

2931. I suppose the grazing country about here is not considered very good? It is not too bad.

2932. What is the average carrying capacity of the hilly country? A sheep to the acre, or a little more. In conjunction with my brother, I hold not quite 5,000 acres, and this year I shored over 5,000 sheep. In addition to those sheep we fatten from 150 to 200 head of cattle.

2933. Do you think that the construction of a railway through this district would induce people to go in for agriculture more? I think so.

2934. I suppose that between here and Gundagai the people are well served already? Yes.

2935. Are you acquainted with the country south of Tumut? Not very well, though I have been through it all. It is good country. Tumut is the spring-head from which the present traffic on the Gundagai line comes. Gundagai would be nowhere if it were not for Tumut.

A. McGruer.
8 Dec., 1898.

WEDNESDAY, 10 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

William John Hanna, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and further examined:—

2936. *Chairman.*] Since you were last before the Committee you have prepared a statement, showing the expenditure upon the roads in the Tumut district during a certain period? I have particulars of the expenditure for the past four years. The return is perhaps fuller than the Committee actually require. It contains some roads which are not directly affected by the railway. It is as follows:—

RETURN of Expenditure on Roads likely to be affected by construction of proposed Railway from Gundagai to Tumut.

Schedule No. 93-9.	Name of Road.	1895-96.	1896-97.	1897-98.	1898-99.	Total.
		£	£	£	£	£
1,323	Tumut to Gundagai.....	1,388	1,093	915	657	4,053
1,324	Tumut, <i>via</i> Brungle, to Gundagai	1,453	498	598	423	2,977
1,325	Tumut to Lacomalac.....	244	278	150	85	757
1,326	Tumut to Kiandra	906	598	805	978	3,287
1,327	Tumut to Adelong	464	253	231	289	1,237
1,328	Tumut, <i>via</i> The Plains, to Jones' Bridge	167	124	150	141	582
1,329	Tumut to Tomorrana.....	223	314	93	175	805
1,330	Tumut, <i>via</i> Piper's, up Bombowiee Creek.....	152	58	75	56	341
1,331	Adelong Crossing to Bago	601	448	331	505	1,885
1,332	Adelong to Hillas Creek	225	127	205	229	786
1,335	Gilmore to Reilly's Crossing	133	104	126	118	481
1,338	Jones' Bridge to West Blowring	153	144	156	133	636
1,339	Reilly's Crossing, <i>via</i> Batlow, to Bago	148	94	159	191	592
1,340	Tarrabandra to Gocup	68	56	63	191
1,341	Windowie School, up West Bank, Gilmore Creek	39	52	77	34	202
1,342	Windowie, up East Bank, Gilmore Creek	126	84	118	84	412
		£ 6,495	4,269	4,244	4,221	19,229
—	Main Southern Road (S. Gundagai to Tarcutta Creek)	536	326	327	507	1,696
		£ 7,031	4,595	4,571	4,728	20,925

2937. Will you mention the main roads, and state what amount has been expended upon them? There are only three roads which would be much affected, and only one of those three to a large extent, and that would be the main road from Gundagai to Tumut *via* Minjary. Upon that road during the past four years we have expended £4,053. The next road is that from Gundagai to Adelong, which embraces two roads—part of the Great Southern Road, and the scheduled road from Adelong Crossing to Adelong. Upon the Tumut to Adelong portion the expenditure has been £1,237 during the last four years. Upon the portion lying between Adelong Crossing and Adelong, on the road from Adelong Crossing to Bago, the approximate expenditure has been £1,300 during the same period. Upon the main southern road the expenditure has been £1,690; the other roads are feeders; I do not think they will be affected. We cannot count upon any appreciable reduction in the cost of maintenance.

2938. The cost of maintaining them will go on whether there is a railway or not? Yes; it would be increased rather than reduced. There will be a considerable saving effected upon the direct road from Gundagai to Tumut, but that saving will be all required to open up fresh roads as feeders to the railway. Taking the additions and reductions, I think the expenditure will remain about the same as at present.

2939. That is owing to the hilly and difficult character of the country? And the necessity for opening up fresh roads owing to the opening of the railway; even with the present settlement fresh outlets will be wanted.

2940.

- W. J. Hanna. 2940. *Dr. Garran.*] Is there plenty of good road-metal in that district? It is a very good district for metal.
- 10 Jan., 1900. 2941. There is no trouble whatever in making good roads? No.
2942. The road from Gundagai to Adelong is a good road? Yes. It is in good order and is metalled throughout, excepting about half a mile.
2943. It meets all the requirements of the Adelong mining population? So far as I know.
2944. There is no difficulty in carting machinery along the road? I should not think so.
2945. You have not had any complaints? Not that I am aware of.
2946. You have not heard of mining being kept in abeyance through the want of a good road to Gundagai? I do not recollect any complaint of the kind.
2947. Is that road as good on to Tumut as it is to Adelong? I think the direct road is, perhaps, rather better. I do not think there is much difference; they are both good roads for traffic.
2948. Have the farmers of Tumut as good an outlet for their produce as have the mining people at Adelong? I should think so.
2949. They do not complain of the badness of the road? There has been no serious complaint.
2950. Carriage is as cheap there as it is anywhere? I should think it would be. The direct road from Gundagai to Tumut is all metalled, excepting about $3\frac{1}{2}$ miles.
2951. Is the unmetalled part a good natural road? Fairly good.
2952. In dry weather, certainly? Yes.
2953. Does it get soft in wet weather? Yes; but not to a serious extent.
2954. I suppose that year by year you will gradually metal it? Yes, we are continuing to improve it.
2955. Is the whole district fairly well served by main roads? Yes.
2956. Are the branch roads off to the farms in fairly good condition? The branch roads are, many of them, bad in wet weather, especially in some places. They are attended to from time to time, as the funds at our disposal admit.
2957. *Mr. Watson.*] Although the road between Tumut and Gundagai is well made, it has a very heavy grade has it not? Yes, there are some hills.
2958. It is more hilly than the road between Adelong and Gundagai? Yes.
2959. *Mr. Dick.*] You mentioned the road from Adelong to Bago; is that a direct road from Bago? Yes.
2960. That road would not be much affected by the railway? Not beyond Adelong.
2961. *Mr. McFarlane.*] What is the length of the direct road from Gundagai to Tumut? Speaking from memory, about 23 miles.
2962. It is metalled all the way, with the exception of $3\frac{1}{2}$ miles? Yes.
2963. Have you any idea of the rate of carriage? No.

FRIDAY, 12 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |

JOHN CHRISTIAN WATSON, Esq.

WILLIAM THOMAS DICK, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

William John Allen, Fruit Expert, Department of Mines and Agriculture, sworn, and examined:—

- W. J. Allen. 2964. *Chairman.*] You are a fruit expert in the Department of Mines and Agriculture? Yes.
- 12 Jan., 1900. 2965. *Mr. McFarlane.*] What is the nature of your duties? My duties are principally in connection with the fruit industry. I have charge of the orchards belonging to the Department of Agriculture, and I also travel round the country giving instruction when requested to do so.
2966. I suppose you have a good general knowledge of the fruit-growing districts of the Colony? I have a fairly good insight into them.
2967. Do you know the Tumut district? I have driven through the district to Batlow from Gundagai.
2968. How long ago? Last April or May.
2969. What is your opinion of the district? Judging from the fruit I saw at the show at Batlow, and from the orchards I saw there, I consider that there is in the district some of the best fruit-growing land for cold climate fruits I have seen. It is specially adapted to the growth of apples, pears, currants, and different kinds of berries, also to the growth of vegetables. I saw some exceptionally fine potatoes and onions there—as good as I have seen at any show, and I have attended some of the best shows in the Colony.
2970. It is also a great maize-growing district? I believe maize is grown there; but I did not see much in the part I visited. I was mostly looking through orchards.
2971. What part of the district did you visit? In going to Batlow I went *via* Adelong and back by Tumut. I was driven from Batlow to Tumut, and I was shown some very good country; but I saw no country better than that which I saw round Batlow for fruit-growing purposes.
2972. Is there a large area of that fruit-growing country? There are some good-sized patches. I will not say that the whole of the land is good; but the red soil is at places deep, and it is better for fruit-growing purposes than is some of the clayey soil. In some cases you come to the clay at a depth of a foot or 15 inches. Although that land will grow good fruit, it will not grow as good fruit as will the red soil.
2973. Apart from the flats along the river, the bulk of the country is hilly? Yes.
2974. What is the area of land there which you consider well adapted for the growth of fruit? There is a great deal of good land suited to the growth of fruit in the hilly country, where it is not too steep. I could not give you the area; but some of the best land I saw was on the hillside between Tumut and Batlow.
- 2975.

2975. Is it similar country to that in the immediate vicinity of Tumut;—is it similar to the hilly country there? I apprehend so. I could not see much difference in the soil. W. J. Allen.
2976. Is there a large production of fruit in the district at the present time? At the present time it is not particularly large; but I think there is a good future for the industry if the country is opened up so that the fruit may be easily got to market. It is rather expensive to get the fruit down from Batlow to Tumut, especially summer fruit; vegetables are also difficult to get down. 12 Jan., 1900.
2977. At present there is not a very large area of land under fruit? Ten acres would be a good orchard there at the present time. I did not see any very large orchards.
2978. You think, as an expert in fruit, that if the people in the district had better facilities for getting their produce to market, their fruit-growing operations would be largely increased? I think so. It is as good country as any I have seen in New South Wales for cold-climate fruit.
2979. Would the proposed railway offer the necessary facilities for a large fruit-growing industry? I think it would greatly help the fruit-growing. I do not think that so far as fruit-growing is concerned the proposed line goes quite far enough. There is a lot of good country at the back of Tumut which would not be touched by the railway.
2980. In what direction? Round the hills at Batlow.
2981. I suppose you have had some experience of the results derived from the carriage of fruit? Yes.
2982. Where fruit is conveyed by teams it gets knocked about a good deal? Yes; a great proportion of the producers have not proper conveyances. Fruit requires to be conveyed by spring waggons, and most of the producers have only drays, which cannot take any very great quantity at a time.
2983. With their present facilities the producers are not likely to extend their operations of fruit-growing? They could not do so very well.
2984. *Mr. Shepherd.*] Have you ever resided in the district between Tumut and Adelong? No; I have made only one trip to that district; I was there only three or four days.
2985. So that you have only a superficial knowledge of that part of the country? While I was there I had a look at some of the orchards and the land generally. I went there to learn as much as I could and I gained considerable information while I was there.
2986. I suppose the main reason why fruit-growing has not been more largely carried on lies in the difficulty of getting fruit to market? Quite so. Fruit is greatly bruised in being sent to the railway station. I am told that although the fruit is good when it is sent away, when it reaches Sydney it is greatly bruised and would not be of any use for export.
2987. You said, I think, that apples, and pears, and cherries were the principal fruits grown? Apples, cherries and pears, and the different berries and currants.
2988. Do you know whether the seasons are sometimes so severe as to destroy the fruit? I have not heard it.
2989. When the Committee were there some time ago it was impossible to get fruit of any kind locally grown, and we were informed that the snow and frosts had completely destroyed the crops? This year has been an exceptional year all over the Colony. Last year I was shown in this district as fine fruit as I have seen grown anywhere in the Colony.
2990. This season, then, is quite exceptional? It has been in most parts of New South Wales.
2991. Did you have much conversation with the fruit-growers of the district? I conversed with those I met.
2992. Do you think there is a general desire among the residents to enter largely into the fruit-growing industry? I do not think there is at the present time. We now import a great quantity of apples and pears, but if it can be shown that fruit-growing can be made to pay in the district—as no doubt it can—the industry will soon thrive, and in place of our being importers of fruit we might easily become exporters.
2993. What was the real object of your visit to the district? I was judging at the Batlow Show.
2994. You did not make any inquiry to ascertain what traffic would be likely to result to a railway from fruit-growing? No; I did not think about the railway at that time, but the fruit-growers told me that their fruit got damaged a great deal in travelling to Gundagai, and I can quite understand that that would be the case.
2995. What is your opinion of the land generally in the district for fruit-growing purposes? The best of the land for fruit-growing is on the hill-side.
2996. Would it be nearer Tumut or Gundagai? Beyond Tumut, towards Batlow.
2997. The area suitable for cultivation there, I suppose, is rather limited? I should say that a very big area of country suitable for fruit-growing could be opened up. It is certainly rough country, but from what I could see, some of it is as good for fruit-growing purposes as you could get anywhere.
2998. The hills, as a rule, would be too steep for fruit-growing? Round about the hills where the ground is not very steep, some of the best fruit-growing land exists.
2999. What portion of the district do you consider most suitable for fruit-growing? Most of the land I saw was around Batlow. I could not say whether the land at Tumut was better or worse than the Batlow land. I saw the land round about Batlow for a radius of a few miles, and it struck me as being exceptionally good fruit-growing country.
3000. What is the character of the country between Tumut and Batlow? It is rather rough country. It is similar to the country round about Batlow. It is a little more open than the country at Batlow.
3001. I suppose there are patches suitable for fruit-growing? Yes.
3002. And it is your opinion that fruit-growing would be largely gone into there if there were railway facilities? I think it would be an industry which could be very profitably opened up there.
3003. Did you take any notice of the agriculture in the district? No; but I noticed that particularly good onions and potatoes were grown.
3004. Have you seen much of the Tumut fruit in Sydney? Yes.
3005. Do you know the variety of apples which are chiefly grown there? I believe the five-crown pippin is the variety chiefly grown.
3006. They grow chiefly the better-keeping varieties, I suppose? Yes; and that is where they would be able to make their money.
3007. *Mr. Dick.*] How would you describe the soil in the Batlow and Bago districts? It is a changeable soil. Some of it is a nice loamy soil, with an open subsoil, while some is very shallow, with a white, clayey subsoil.

- W. J. Allen. 3008. Although the land out there is fairly rough, by far the greater part of it is suitable for orchards? I should say about half of it would be.
- 12 Jan., 1900. 3009. Is water plentiful there? The water is certainly plentiful at Batlow; it is a mining place, where they can get water at any time.
3010. In what way do they get the water? I saw it running in small channels.
3011. It is brought down in races from the tops of the hills? Yes.
3012. Did you see any instances of irrigation at Batlow? I saw some crude methods of irrigation, but they have not taken it up extensively. They use the water when it is necessary, but I do not know how they apply it to the land.
3013. Taking the district altogether with its climate, rainfall, and soil, do you think it offers exceptional advantages for fruit culture? Yes; not only that, but for farming. I was raised on a farm in Canada, and I know something of it. I think there is very good land in the district for farming purposes.
3014. I suppose the construction of a line to Tumut would be of great advantage to the people at Batlow? I suppose it would make a difference of 20 miles in their carriage. It would certainly be a great advantage to the people of Tumut.
3015. Do you know where their principal market is at the present time? I should say in the western districts.
3016. What sized allotment would be sufficient to enable a man to earn a decent living? I should say about 20 acres.
3017. The Committee were informed that one man there kept himself and his own family, and his son and son's wife, on 4 acres? I should not have thought that. If a man got on to the best land there he would do very well, but I could not say that he would get a good living off 4 acres. He might make £200 perhaps, at the most.
3018. Is there anything exceptional in the character of the fruit grown there? From what I could see it is very good. It is a good keeping quality of fruit, and it attains a good marketable size.
3019. Did you see much country fit for the growth of potatoes and onions? Any of the land fit for orchard cultivation would grow splendid potatoes and onions. The potatoes grown there would be, I should think, a good keeping quality.
3020. Do you know of any other form of agriculture besides those you have mentioned for which the district is suited? A large proportion of the land would be well adapted to general agriculture.
3021. As a rule it is fairly expensive to clear? Yes. Some of the heavily timbered country would be very expensive. There are some very large trees, and if you tried to clear the land right away it would be very expensive to get the stumps out.
3022. The clearing of a small area sufficient in that district to enable a man to earn a living would not be so serious an item as the clearing of an area sufficient to enable him to make a living in any other district? That is a very strong advantage; a small area would be enough to keep a man and his family.
3023. You did not go over the country to an extent sufficient to give you a rough idea of the cultivable land? No.
3024. *Chairman.*] Did you make any observations of the country between Tumut and Gundagai? I cannot say that I did.
3025. You cannot say whether it will be suitable for fruit-growing? I could not say. I do not remember that part of the country. I just drove through it.
3026. Would the fruit grown at Batlow be for selling in its natural state or for preserves? The apples and pears would be sold as they are, but I think a large trade could be opened up in raspberry pulp and black currants.
3027. Which do you consider the best climate for fruit-growing—a dry climate, such as that of the western district, or a climate such as that of the Tumut, where there is a regular rainfall? It would depend upon the description of fruit you grew. If you were growing apples you would go to Tumut and Orange, but if you wished to grow citrus fruits you would go to drier and warmer country.
3028. The Tumut district is particularly suitable for what you have described as cold-climate fruits? Yes.
3029. Would it be very expensive to clear the land which you observed at Batlow as being so suitable for fruit culture? Some of it would be expensive in clearing.
3030. How much per acre would it cost? I should say some of it would cost £5 per acre, if you wished to clear it right away.
3031. You think there is a market in Sydney, and the Colony generally, for the class of fruit which could be grown in this district? Yes; and I think that in the future there will be a good export market for that fruit.
3032. What quantity of fruit is imported into the Colony of a character similar to that which could be grown in the Batlow district? I could not give you the exact figures, but in the season from 10,000 to 15,000 cases of apples and pears come into the Colony weekly from Tasmania and Victoria. We are importing apples and pears from Tasmania as long as they can keep them.
3033. Has that been the case for a number of years, or is it attributable at all to the disease which we are informed has affected our apples and pears? We have never yet grown enough for the local market.
3034. At the present time Batlow is from 40 to 45 miles from the railway? Yes.
3035. Do you think that is a prohibitive distance for the cartage of fruit in its natural state? I think that if people there were thoroughly alive to the requirements of the trade they could make it pay to cart that distance, but of course the people would do much better if they could get within a few miles of the railway.
3036. If they had the proper conveyances? The men who made a business of fruit-growing would get the best appliances for conveying the fruit to market.
3037. He would pack properly and have proper vehicles? Yes; but even then 40 miles is a great distance to cart fruit.
3038. Could you say whether the class of soil in that district would grow fruit by natural moisture, or would it be necessary to irrigate? It would not be necessary to irrigate with thorough cultivation. I think you could always conserve enough moisture in the soil to grow the best fruits there.
3039. Could you procure for us figures showing the annual importations of cold-climate fruits into the Colony? 506,078 cases of fruit were imported into Sydney by steamers in 1899.

THURSDAY, 1 FEBRUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LUNDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVLEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- 3040. *Chairman.*] Since you were last under examination the Committee have visited Gundagai, Adelong, Tumut, and the district generally which would be affected by the construction of the proposed railway, and they there took a great deal of evidence; but, as the estimates of traffic given by the local witnesses largely exceed the Departmental estimates, we have thought it well to recall you to hear what you have to say further on the subject; in the first place, the local witnesses appeared to think that your estimate of the receipts from goods, stock, and wool—£2,489—was too low; that estimate, I suppose, includes the receipts from the carriage of wheat and other produce? Yes. J. Harper.
1 Feb., 1900.
- 3041. In making your calculations, what did you take as the area of land likely to be put under cultivation to give traffic to the railway? Allowance was made for the traffic produced by 17,000 acres.
- 3042. *Dr. Garran.*] 17,000 acres is the total drainage area you allowed? Yes.
- 3043. *Chairman.*] Have you read the local evidence upon the point? I have not; but I may say that the police statistics give the area now under cultivation as only 12,890 acres.
- 3044. A summary of the evidence given at Tumut by Mr. Chesterman, the local Staff Surveyor; Mr. E. Brennan, of Gocup; Mr. Margules, of Tomorroma; Mr. P. Halloran, of Blowering; Mr. H. L. Harris, of Tumut Plains; Mr. A. B. Graves, of Micalong; Mr. J. Lambert, of East Blowering; Mr. Watts, of West Blowering; Mr. O'Sullivan, of Lower Gilmore; and Mr. W. H. Bridle, of Tumut, in regard to the district lying within 20 miles north-east of Tumut, and within 10 or 15 miles on either side of the proposed railway line, shows the area under cultivation to be 10,984 acres, while they put down the area suitable for cultivation as 131,000 acres; would you be prepared to call that an exaggerated estimate? The matter is one upon which I should not like to express an opinion. As the Committee are aware, the proposal to extend the railway to Tumut was very exhaustively examined a few years ago by Mr. Gilliat, who was then examiner of public works proposals, and he put down the total cultivatable area in the district at 17,000 acres. The amount of traffic actually brought from the district has been ascertained by an examination of our books at Wagga and at Gundagai to be only 5,000 tons; but in my estimate of the probable traffic of the proposed railway I have allowed for 7,000 tons. I may add that the total tonnage, inwards and outwards, of general traffic on the whole length of line from Gundagai to Cootamundra is only 18,000 tons, and of that I have credited 10,706 tons to the proposed extension. Those are absolutely ascertained figures, gathered over a period of three years.
- 3045. They indicate that the bulk of the present traffic on the line really comes from the Tumut district? No; that is not so. The actual ascertained figures for Tumut are only 5,000 tons of outward produce, but in my estimate I have increased them to 7,000 tons. I only quoted the above figures to show the capacity of the whole district.
- 3046. Is not the best cultivated portion of the district that in and around Tumut? That is so.
- 3047. Between Gundagai and Tumut there does not appear to be very much cultivation? Not so much relatively as at Tumut; but, between Gundagai and Cootamundra, the railway deals with ore, wool, and other traffic, in addition to produce.
- 3048. Do you think that the land between Gundagai and Tumut is as suitable for agriculture as the land in and around Tumut? No. I think that the best land in the district is the land on the Tumut River and its tributaries.
- 3049. Therefore, with better railway communication, we might reasonably look for an extension of the agricultural output of the country around Tumut? Yes; and in my estimate of the traffic I have allowed for 5,000 acres of additional cultivation.
- 3050. Do you think, then, that we should pay no attention to the local evidence, which is strongly to the effect that the increase of cultivation would be much larger? Of course, I am not going to characterise the people of Tumut as untruthful; but my experience in these matters, which extends over thirty years, leads me to very largely discount such evidence. Promises have been made all through the Colony under circumstances like these, and they have never been redeemed.
- 3051. In making up your estimate of the wheat traffic, did you allow a certain return per acre? Yes; I allowed a ton to 3 acres. That would be equal to about 12 bushels an acre.
- 3052. We have been told that the tendency is to grow wheat rather than corn in the district, because wheat is the more reliable crop? Yes. Maize would give more than 36 bushels to the acre, but the information I have obtained is to the effect that the tendency is to grow wheat rather than maize, and it seems to be only a matter of time when the cultivation of maize will be abandoned in favour of the cultivation of wheat.
- 3053. In estimating the probable wool traffic, do you think you stretched the figures as far as they would go? I have allowed for every bale of wool that would come from the district. My estimate is that 140 tons of wool would be delivered at Adelong, and 166 tons at Tumut, or, approximately, 1,800 bales in all. That accounts for every bale of wool grown in the district, and those figures are very easily obtained.
- 3054. Mr. Byrne, when giving evidence at Tumut, furnished a tabulated statement, showing the names of the holdings which he thought would send wool to the proposed railway, and the number of bales each would contribute;—do you think that that information is accurate? I could not tell you off-hand; but there is no doubt about the accuracy of my information in regard to the wool coming from the district, because four or five days were spent in exhaustively taking out the details given in the Gundagai railway books for the last three years. The total number of bales of wool carried on the Gundagai line, from Gundagai and Coolac, last year was only 6,194, and there is a good deal of sheep country between Gundagai and Cootamundra. However, I will have Mr. Byrne's return checked with the actual figures in the possession of the Department, and will submit the result to the Committee. 3055.

- J. Harper. 3055. *Dr. Garran.*] How far would the wool be drawn from each side of the railway line? I suppose wool would be drawn to the Gundagai line from a distance of 15 or 16 miles on each side.
- 1 Feb., 1900. 3056. *Chairman.*] But if the railway were continued to Tumut, would it not draw more wool than we get now? I do not know where it would be drawn from. The whole of the wool grown in the district now comes to Gundagai, or to some point on the line between Gundagai and Cootamundra. The Tumberumba wool would not come to the proposed railway. It would continue to go either to Wagga, and, from the southern part of the district, to Melbourne, as it does now.
3057. The extension of the railway to Tumut would not draw any of that wool? No.
3058. An important feature of the evidence given at Tumut was what was said in regard to the probable effect of the proposed extension to Tumut in leading to the cultivation of a large area of hilly country in the direction of Batlow for fruit-growing;—have you made any estimate of that traffic? I have allowed a liberal margin for traffic of that kind. Of course, it would require a very large output for the fruit traffic to make any great difference.
3059. But you took the subject into consideration? Yes; it is allowed for amongst the general items of traffic. I should think about 400 tons have been allowed for.
3060. That would be over a ton per day,—is that a liberal allowance? Yes, an exceedingly liberal allowance. There is not much profit to be obtained from the conveyance of fruit. We should only get about 4d. a ton for it.
3061. What have you allowed for the inward tonnage to Tumut? I have allowed 3,400 tons for the inward tonnage to Tumut and Adelong, which is considerably in excess of the tonnage now sent through Gundagai.
3062. What would be the freight on that from Gundagai to Tumut? £687 10s. on local rates. Total tonnage of produce of all kinds allowed for is 7,000 tons.
3063. Is that exclusive of wool, hides, and tallow? It is exclusive of wool.
3064. Are your figures based upon information obtained from local storekeepers and others? No; upon the figures obtained from the railway books. Our books show the tonnage to be 5,000 tons, and my estimate allows for 7,000 tons. A considerable margin for development is also given in the estimate of the inward tonnage. The figures I have given are in excess of the quantity actually passing through our hands, though, during the years upon which they are based, a considerable quantity of timber and mining machinery was being brought into the district.
3065. A letter received by the Committee from the Secretary to the District Improvement League says that "One merchant here can prove that he pays to the Government in trainage and taxes £4,000 a year"? He would get his goods through from Sydney. I do not know what taxes he pays.
3066. On consignments, the railway charges for which from Sydney to Gundagai amounted to £4,000 a year, what would be the freight from Gundagai to Tumut? It is pretty hard to know how many tons would go to make up such a consignment. With high-class traffic it would not require very many tons. The Committee may rest assured that the figures which I have given have been very carefully extracted from the books. No less than fourteen different lines were taken out by the officer who obtained the information.
3067. *Mr. Watson.*] The proposed extension to Tumut is estimated to cost £4,686 per mile, inclusive of the bridge;—if the Cootamundra to Gundagai line had been constructed at the same rates, the saving in interest charges, at 3½ per cent., would amount to £4,410 per annum, and the returns for 1898 would have shown a slight profit? Yes; but it must be borne in mind that a light line, such as the proposed extension would be, costs a good deal more to maintain than a line like the Cootamundra to Gundagai line would cost.
3068. So that the saving would be, to some extent, rather apparent than real? Yes.
3069. The cost of the Gundagai line was £9,800 per mile? I take it that that includes compensation for land resumed. The other figures are exclusive of compensation.
3070. When we were at Tumut we were informed that traffic from Tumorrroma and the surrounding district would, if the proposed extension were made, come into Tumut instead of to Gundagai, because the country between there and Gundagai was very hilly? Tumut has been credited with all the traffic coming to Gundagai through Tumut; but I should imagine that if local rates were charged on the proposed extension the trend of the traffic you speak of would be to Gundagai.
3071. We were informed that the country north-east of Tumut, about Tumorrroma and Goobarragandra, was, at the present time, undeveloped, because of its distance from a railway, but that if it were brought within 20 miles of a railway it would be developed? I know the local people generally make those statements; but, in my opinion, the traffic from that part of the country would continue to go to Gundagai after the railway was extended to Tumut.
3072. Have you or any of your officers ever been over any part of that country? No. I understand that at the present time that country is not being used.
3073. Going south from Tumut, in the direction of Batlow and Bago, there is some very good basaltic country, a fair quantity of which seems suitable for settlement;—have you made any inquiries as to the probable agricultural development of that district? No. We have to deal with hard solid facts, not with the theories of local people. My estimates are based upon the actual traffic returns, a liberal allowance being made for development. That is all I can give the Committee in the way of reliable information.
3074. It has been urged by local witnesses that a railway to Tumut would be advantageous to the country in bringing the Yarrangobilly Caves and the surrounding tourist district nearer to the centres of population;—would that traffic amount to much from a railway point of view? Well, when I was at the Jenolan Caves, two or three months ago, I ascertained that only 2,000 people from all parts of the world had visited the place within the preceding twelve months, and it must be remembered that those caves are within 100 miles of Sydney. I leave you to guess, therefore, the number of people who would visit the Yarrangobilly Caves, which would be much more difficult of access.
3075. *Mr. Leitch.*] I suppose you merely went from Gundagai to Tumut;—you did not go round the district? No.
3076. Nor did the Commissioners? No.
3077. Did Mr. Usher? He spent two or three hours driving round; but you could not say that he made an inspection of the district.

3078. How can an officer of your Department report on the district after only a casual visit like that? The Railway Commissioners and their officers only undertake to furnish the Committee with an estimate of the probable traffic upon any proposed line, that estimate being based upon what is known of the existing traffic. J. Harper.
Feb., 1900.

3079. They know nothing of the district beyond what they see in driving along the main roads? And beyond the returns which they obtain.

3080. At Tumut the Committee examined a most intelligent body of witnesses, who furnished them with a large number of statistics;—do you not think that their information is to be relied upon? I would rather rely upon the actual returns shown in the railway books.

3081. Do you not think that the people of the district would have a larger knowledge of the capabilities of the land than either yourself, or Mr. Usher, or the Railway Commissioners? Decidedly they have. All we can go upon is what we know of the actual production.

3082. You are not prepared to deny what they say as to the area of land capable of cultivation? No; I am not in a position to do so. It is for the Committee to judge of the value of that evidence.

3083. Mr. Byrne must have taken a great deal of trouble in preparing his statement of the wool production of the district;—do you undertake to say that his figures are wrong? I have promised to have them checked; when that has been done I can tell you whether they are wrong. I can trace every bale of wool that comes from the district.

3084. It is not stated that all this wool is sent to the railway? Then I do not know how it is disposed of.

3085. Does not a large quantity of wool come to Morpeth from the northern districts by road? Yes; but we know every bale that comes. We know every bale that is carted on every road in New South Wales, whether it goes to Victoria, to Morpeth, to Grafton, or elsewhere.

3086. How can you do that? We have agents who give us the information.

3087. How many bales of wool come from the northern districts by road? I could not tell you off-hand, but I should think about 3,000 bales.

3088. What places do they come from? Some of the wool comes from as far north as Quirindi, and it has come by road from Tamworth.

3089. It comes by road because of the high railway charges? No; I think it is sent by road in the interests of the storekeepers. In a great many cases the same freight is paid to the carriers as would be charged by the Railway Commissioners.

3090. Can you name any storekeepers up north who are interested in teams? Yes; Mr. Campbell, of Muswellbrook, is one. I know that many teamsters do the work under an arrangement with the storekeepers that they shall be paid the railway rates. Wool has been carried by road from Narrabri, but not this year.

3091. *Mr. Watson.*] What objects have the storekeepers in making such an arrangement? They get back loading up, and they make a profit out of the teamsters, because in many cases the teamsters take out the freight in kind.

3092. *Mr. Levien.*] I suppose that is a mere surmise of yours? No; the facts have been admitted to me by some of the storekeepers.

3093. Is it the storekeepers or the graziers who send the wool down? Sometimes the storekeepers and sometimes the graziers.

3094. How many storekeepers in Tamworth send wool down in that way? I do not know; but I know at least one who does so.

3095. How much does he send? I cannot tell you off-hand.

3096. The people mentioned in Mr. Byrne's return have, I take it, no interest in stores? I may say that not a single bale of wool has been brought from the Gundagai district to Sydney by team, or indeed from any southern district, since the railway was built.

3097. Did you get any report from Mr. Usher upon his visit to the district? He furnished the figures which I have already given to the Committee.

3098. I suppose you know that the land about Tumut is of very great value. They get tremendous rentals for land which will carry starving stock—in some cases from £75 to £100 for every 1,000 sheep? They got nearly as much as that in the Wellington and Dubbo districts this year. Graziers will pay anything for good country in a bad season.

3099. *Mr. Shepherd.*] When you are obtaining information upon which to make your estimates, is any evidence taken? It is usual to meet the local people and to hear what they have to say upon the subject, and to gather such information as they may tender; but we are not in a position to obtain sworn evidence, and the statements which are made have to be largely discounted.

3100. The Commissioners invite information from the local residents? Yes; and the information which is tendered is checked with the actual returns given in the station books, and with such statistical information as can be obtained from the police and other local authorities.

3101. Has the Department found that its estimates are generally pretty correct? That has been our experience, though there have been instances, as in the case of the Cobar line, when the estimate of the Department has been largely exceeded.

3102. I suppose you always allow for a probable increase? Yes, a margin is always allowed for such development as an ordinary business man might foresee; but, of course, not for all possible developments.

3103. I suppose that it is impossible to determine exactly how much of the railway traffic comes from Tumut? No; the average traffic during the last three years has been 5,000 tons.

3104. Does it not often occur that people living at a distance have agents at Gundagai? Yes; and when we cannot get what information we require in any other way learn what we want to know from these agents.

3105. The local opinion seems to be that there will be an enormous increase in the production of wheat in the district, if the railway is extended to Tumut;—has the Department formed that opinion? We cannot do more than allow a fair margin in a case like this. Our experience is that similar predictions have not been fulfilled in other parts of the country.

3106. You have found the local witnesses liable to give too favourable an opinion of the possibilities of a district? Yes; that has been my experience, and it is only natural that they should do so. If I were a local witness I should be inclined to do the same thing myself.

- J. Harper. 3107. *Mr. McFarlane.*] What is the general system adopted in arriving at an estimate as to the area of land available for cultivation in a district? We are absolutely dependent upon the local officer of the Lands Department for that information, because, of course, the officers of the Railway Department are not experts on the subject. We obtain figures showing the absolute traffic of the district, and we leave it to the Committee to ascertain its possibilities of development.
- 1 Feb., 1900. 3108. The Railway Commissioners have no personal knowledge of the agricultural capabilities of any particular district? No; they only know its actual productiveness.
3109. You have stated that a margin is allowed to cover any increase, but what that increase is likely to be must depend very much upon the fertility of the district;—it would not do to apply a general rule to each district? That is so; but in this case a very exhaustive report has been made upon the capabilities of the district, and its productive agricultural area has been stated at about 17,000 acres, or about 5,000 acres more than the area actually under cultivation to-day.
3110. Would not a very large additional area be put under cultivation if the railway were extended to Tumut? 5,000 acres has been allowed as the probable increase of the cultivated land, but I am not in a position to speak as to the correctness of that estimate.
3111. The maize grown in the district is grown chiefly on the rich flats near the river? Yes.
3112. There has been a decrease in the maize production of the district of late years? Yes.
3113. Have you any idea as to the cause of that decrease? I imagine that wheat has been found to pay better than maize, because of the competition of the maize-growing districts on the coast.
3114. If the proposed railway were made, and they could get their grain to market at a cheap rate, would not the people in the district put their land under maize again? They might, but I do not know that it would affect my estimate very much if they did.
3115. Have you a personal knowledge of the district? I have been into the district twice, but not for the purpose of inquiring into the proposal before the Committee.
3116. A fruit expert informed the Committee that there was a very large area of land in the district admirably adapted to the cultivation of fruit-trees? Yes; I have seen some of the best apples in that district that I have ever seen in the Colony.
3117. Do you think that the area suitable for the cultivation of fruit-trees is very large? I cannot speak as to that.
3118. It is not likely that much fruit will be produced unless the railway is extended, because of the difficulties of transit? No; but there are a great many districts in the Colony which are almost if not quite as well suited to fruit-growing already served by the railway, and yet fruit is not grown there. However, as I have already said, the rates for fruit are very low, so that the fruit production of the district would not materially increase the revenue of the line.
3119. But if settlement were encouraged there, the fruit-growers would indirectly do a great deal to increase the traffic of the railway? Quite so.
3120. *Dr. Garran.*] You say that local witnesses are apt to be very sanguine as to railway prospects—are you able to compare the local estimates with the actual results obtained in any case? I could not make any comparison offhand.
3121. Your general experience leads you to take a very large discount from the local estimates? Yes.
3122. You say that in the Tumut district there is a general tendency to grow maize rather than wheat;—would the growing of wheat instead of maize increase the railway traffic? No; we should get more tonnage per acre from maize land than from wheat land.
3123. The Tumut district is pretty well occupied at the present time, so that if its output is to be increased that must be done by stimulating its productiveness; in what way do you think the extension of the railway to Tumut will stimulate the productiveness of the district? I am at a loss to know, unless it be in the direction indicated by Mr. McFarlane; but it is impossible for me to say to what extent the growing of fruit would develop.
3124. Would the fruit grown in the district be sent all the way to Sydney to compete with the water-borne fruit which comes to this market? It will have to come to Sydney, because there is no intermediate market. Goulburn, the chief centre of population on the line, is itself situated in a fruit-producing district.
3125. Is the carriage of fruit as profitable to the Railway Department as the carriage of wheat? It is a little more profitable than the carriage of wheat.
3126. But it will not go very far in producing revenue? No.
3127. If the line, instead of being extended to Tumut, were to stop at the nearest point which would give access to Adelong, that would decrease the capital expenditure, and would draw trade from both Adelong and Tumut? It would draw part of the Adelong traffic.
3128. But even on a reduced capital expenditure you do not think the line would pay interest? No.

Edward Johnston Sievers, Government Land Valuer, Department of Public Works, sworn, and examined:—

- E. J. Sievers. 3129. *Mr. Shepherd.*] I understand that you have recently paid a visit to the Tumut district? I was asked to do so, but, as I have recently broken my ankle, I sent up my assistant, and I have since gone through the plans with him, and made myself thoroughly acquainted with the particulars of every property affected by the proposal which is under the consideration of the Committee.
- 1 Feb., 1900. 3130. You are prepared to give us information as to the value of the land through which the proposed line would pass? Yes; and as to the compensation which would have to be paid for the damage caused by severance. The first part of the line goes through a number of township allotments situated in South Gundagai, and onward from there most of the land affected is second-class agricultural land. I have put down the probable total cost of the South Gundagai land at £3,000, and of the agricultural land—about 338 acres—at about £5,000. These figures include compensation for severance. Under the 24th section of the Act we are entitled to apply the betterment principle to land situated as this land will be situated, and I think, therefore, that these figures may be materially reduced if the land has to be resumed. I might mention that in the case of the Culcairn to Corowa extension, and of the Tamworth to Manilla extension, the land required for railway purposes was obtained practically for nothing, through the application of the betterment principle. The total cost of the resumptions in this case I have estimated at £8,000, and I think that that may be reduced when the line comes to be resumed.

John James Miller, manager, Farmers and Settlers' Co-operative Association, sworn, and further examined :—

3131. *Chairman.*] Is there anything you wish to add to your former evidence? I should like to point out that there is a very strong probability that the Federal capital will be built somewhere on the Southern line between Sydney and Melbourne, and that in that case the Tumut district will find there a market for its vegetables, fruit, and other produce. That traffic will go to increase the present estimated traffic on the proposed line. J. J. Miller.
1 Feb., 1900.

3132. *Mr. Watson.*] When the Committee were at Tumut, they were informed that if the proposed railway were constructed, the district would be considerably developed to the eastward, in the direction of Bondo and Goobarragandra, and to the southwards towards Batlow and Bago? Yes; I know all that country. The Batlow country is especially good, but there is similar rich volcanic soil out towards Nottingham Forest, Micalong, and Goobarragandra. That country is heavily timbered, with an undergrowth of wild hop-bush.

3133. For what purposes would that country be most suitable? It would be more suitable for dairying than for anything else. The climate is too moist for cereals, and in some parts of the year snow falls there. The land would do very well for dairying, pig-raising, and the growing of English fruits. I have seen grown there some of the best potatoes I have ever seen. I have had sheep there on several occasions, and the men camping with them could grow potatoes anywhere.

3134. How far does the basaltic country in the direction of Bago extend;—it commences at a point about 16 or 17 miles from Tumut? It extends to within 10 miles of Tumbarumba, on a tableland, and then you get rough hilly country down to Tumbarumba.

3135. What distance would it extend? I suppose 30 miles.

3136. And is all that country similar to the country about Batlow? It is much the same. You get here and there a stony hill; but, generally, there is rich volcanic soil throughout.

3137. How soon do you reach the good country towards the Goobarragandra? At a point about 12 miles from Tumut.

3138. And how far does it extend? Right on to Brindabella, in towards Queanbeyan—a distance of 25 or 30 miles.

3139. Are the two tablelands connected at all? No; they are separated by the valley of the Tumut.

3140. I understand that on both tablelands there is a considerable area of Crown land? It is pretty well all Crown land. Here and there you meet with a selector.

3141. Do you think that that land could be occupied in small areas, supposing the railway were brought to Tumut? I think that it could. I know several people who have made a living upon very small areas at Batlow. Cootamundra has for many years been largely supplied with fruit from Batlow. The fruit-growers go down there regularly with their vans.

3142. Where do the supplies of potatoes and similar produce used in the south-western districts come from? The Crookwell and Goulburn districts have for years been supplying the south-western districts with potatoes.

3143. Do you think that the Crookwell and Goulburn districts can produce the same classes of fruit as can be grown at Batlow? Yes; the country about Crookwell is very similar to that about Batlow.

3144. Is the elevation about the same? I do not know what the difference in elevation is.

3145. We were informed by the people of Batlow that the climate there is more suitable for English fruits than for any other fruits? Yes; raspberries, gooseberries, and English fruits do splendidly there.

3146. From what you have said, it would seem that we have a right to expect that if the proposed railway is made, that land, which is now very sparsely settled, will be brought into profitable use? Well, the people there are too far away to do much at the present time. The farmers who are able to take their own produce to market can do pretty well; but they cannot afford to employ teamsters.

3147. Will it be practicable to extend the line beyond Tumut? No, except towards Yarrangobilly.

3148. Would that be practicable? I think you could get up the river, though there would be some engineering difficulties. At one time it was said that you could not get up Talbingo with vehicles, but now there is a good road there, and you can trot all the way up.

3149. *Dr. Garra.*] Can good fruit be grown at Gundagai? Yes; though, of course, the climate there is much drier than on the tablelands.

3150. Is any large quantity of fruit grown there? No.

3151. There is no market for it? No.

3152. Would the fruit grown on the tableland command a market in virtue of its superiority? Fruit could be grown on the tableland without irrigation. The climate and soil make it easier to grow fruit there.

3153. What is the elevation of the tableland above Gundagai? I should think about 1,500 or 1,800 feet.

3154. Is it reasonable to expect a great development of the fruit industry on this tableland if the railway is brought to Tumut, when there is no market for the fruitgrowers of Gundagai? I think that if the railway is brought to Tumut there will be a lot of small settlement in the district as well as large settlement, and the higher land will be worked in conjunction with holdings in the drier districts.

3155. The tableland you speak of is at some distance from Tumut? Yes, from 12 to 30 miles.

3156. Is not that a longer distance than it would pay to cart fruit? So long as orchardists can get to the station and back on the same day, they can afford to cart their fruit.

3157. Could they do 30 miles and back in one day? That would be rather far; but they could go to Tumut and back, in a day from Batlow and Nottingham Forest.

3158. What is the elevation of the tableland above Tumut? In some places 1,000 feet.

3159. That would be rather uphill going back? Yes; but they go back empty.

3160. *Chairman.*] I suppose you have not made an estimate as to the quantity of fruit which would be taken by the railway, supposing this district were opened? I had not gone into details; but it would come in from all directions. Then, too, the railway would be useful in taking stock to the summer pastures, and especially in bringing back the ewes. Sheep-owners are bound to keep their stock away at least four months, and they like to keep them on the highlands until the end of the summer. When the sheep are sent out to the district the rams and ewes are allowed to run together, and consequently the ewes come back with lamb, and it is better that they should be returned to their home pastures in a day than have to knock about on the roads for a month or five weeks. I would also impress upon the Committee

the

J. J. Miller. the importance of the timber industry in the district. There is very fine timber in the mountains there and if the railway were extended into Tumut a large quantity of palings, and all kinds of sawn and split timber, would be sent away.
 1 Feb., 1900. 3161. *Mr. McFarlane.*] What kind of timber is grown in the district? Stringybark, black-butt, and the usual mountain timbers.

FRIDAY, 2 FEBRUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, J.L.D.
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Gundagai to Tumut.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

J. Harper. 3162. *Chairman.*] You promised yesterday to look through the schedule handed in by Mr. Byrne, when under examination at Tumut, and to check the statements therein contained; have you done so? I have looked into the statement made by Mr. C. S. Byrne, on page 110 of the Minutes of Evidence in connection with the above proposal, and find that there is an error in addition of 300 bales of wool. His total should read 3,485 instead of 3,785 bales. In the next place I find that this gentleman has claimed the following clips which I consider are more likely to still truck at Gundagai, and in this opinion I am supported by the sworn evidence of Mr. Yeo, of the Stock Department, whose estimate, based on a three years' return, is 280 to 300 tons of wool per annum (*see page 43*), whilst my estimate is 303 tons:—

Name of owner.	Name of holding.	No. of bales.	Remarks.
Whittaker	Jellingrove	170	*125 claimed. 50 allowed according to Stock Returns.
W. Bootes	Mundarloo and Bangus.....	200	
Horsley	Yaltree	250	
A. W. Crain	Mount Horeb	130	
Crain Bros.	Mount Adrah	130	
Roach and Arragon	Condongblouga	75*	
Keefe and Geary	Wyangle	180	
Kiley	Red Hill	400	
	Error in addition previously referred to	300	
	Total	1,835	

After deducting 1,835 bales from Mr. Byrne's figures it leaves a total of 1,950 bales, which would represent about 325 tons. As previously stated, my estimate is 303 tons, and that of the Stock Branch is 280 to 300 tons. Even if we allowed credit for the whole of the wool claimed by Mr. Byrne the estimate would only be increased by £19 17s., as shown below:—

100 tons more at 2s. 6d.	£ s. d.
147 tons more at 1s.	12 10 0
	7 7 0
247 tons	£19 17 0

I produce a map which indicates approximately the positions of the clips named.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Gundagai to Tumut.

APPENDIX.

A.

[To Evidence of Henry Deane, Engineer-in-Chief for Railway Construction]

SURVEYORS' REPORTS ON RAILWAY EXTENSION TO TUMUT.

Minute Paper.—Subject: Proposed Extension, Coolac to Tumut.

Department of Public Works, Railway Construction Branch,

Sydney, 22 November, 1889.

I HAVE had this proposed route investigated by Mr. Burge, one of the engineers of this Branch, and have the honor to append his report.

At the point where the alternative routes examined by Mr. Burge cross the Murrumbidgee, that river is confined to a much narrower channel than exists at Gundagai, on the staked line, and would cost considerably less to bridge.

An examination of the estimate of the Gundagai to Tumut extension shows that the bridge over the Murrumbidgee at Gundagai has been put down at £113,148. I consider this amount excessive; in fact, by adopting an economical method of construction, I am of opinion that it need not cost more than £64,000, and a saving would thus be effected of £49,148, which would reduce the estimate of the whole line, which now stands at £387,300, to £338,152.

The bridging of the river near Coolac would probably cost £29,000, or £35,000 less than the Gundagai bridge.

In deciding between the advantages of the staked line and one or other of the alternative routes up the Tumut River, the question of the differential rates, adverted to by Mr. Burge, may well be put on one side, as they do not properly form part of the engineering question, nor are they necessarily permanently established facts.

I find that the arguments in favour of the routes may be summed up as follows:—

Coolac to Tumut.—Saving in cost of bridge to the extent of £35,000, the interest on which, at 3½ per cent., would amount to £1,225 per annum.

Gundagai to Tumut.—Serves Adelong, and has the advantage of being a continuation of the present line, and offering no inconvenience in working the traffic.

The annual cost of working the short section from Coolac to Gundagai would probably amount to as much as the interest on the saving in the cost of the bridge.

I am, therefore, of opinion that the present staked route is preferable.

I have left the earthworks on the competing routes out of consideration, although Mr. Burge's report asserts the probability of their being heavier on the Coolac to Tumut line; and, if this is so, it is a further argument against the adoption of this route.

H. DEANE.

Memorandum to the Engineer-in-Chief, Railway Department.—Coolac to Tumut, Adelong and Tumbarumba Extension.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,

Sydney, 8 November, 1889.

IN accordance with instructions, I have examined the country in reference to above, having specially in view the question of a cheaper crossing of the Murrumbidgee River than that necessary on the present survey of the Gundagai and Tumut railway.

I have found two crossings having this advantage in a large degree, and they are the only two from which there is any practicable "get away" for the connection of the present Gundagai branch and Tumut.

One of these being above, and the other below, the junction of the Tumut River with the river Murrumbidgee, there are involved two alternative lines to Tumut on east and west side of the former river, respectively.

There are two matters in connection with the proposal now being investigated which must influence the decision between these two routes, more, perhaps, than their relative cost, viz:—

1st. Any junction on the existing Gundagai railway will convert the portion between such junction and Gundagai into a minor branch line from the then main branch from Cootamundra to Tumut, &c.

Either, therefore, a separate train, with its staff of driver, fireman, and guard, will have to be maintained for the minor branch, a few miles long, with certainly not more than one short train daily each way, and possibly less, thus causing a very heavy train mileage expenditure; or, the main branch passenger trains will have to be run, as is done sometimes in these cases, down the small branch and back again, which, of course, involves so many miles of non-paid-for work, and so much delay to the main branch traffic.

2nd. The other matter is also in reference to the traffic. It appears that, owing to the system of differential rates, the goods rates from Wagga to Sydney (Wagga being about 60 to 70 miles from the district served by any Tumut extension) are 13s. 6d. less per ton (wool) than those from Gundagai to Sydney. It is evident, therefore, that as long as this system prevails, the greater part of the traffic from the west side of any such extension would still, as it largely does now, go to Wagga, and the main and branch lines would be, to some extent, competing ones.

Of the two lines investigated, that on the eastern side of Tumut River would leave the Gundagai line at about 277 miles, beyond Coolac Station—see tracing accompanying this report—and rising by a sharp grade to the lowest saddle of ridge at 1 mile 60 chains, descend by another sharp grade to the Murrumbidgee. This descent will have to be carefully laid out and lengthened as much as the width of the valley will allow, in order to get down. The river crossing is highly favourable, 15 chains in length, with one or two flood-openings only being necessary, I believe, the present plans showing over 41 chains at Gundagai. There are also indications of a rocky bed.

From the river the line would follow, generally, the Tumut River valley, with, however, a sharp and short rise over a spur at 10 miles, having generally, however, easy grades. The tributary creeks—Adjungbilly, Brungle, Killimeat, and Bombowlee would have to be bridged, and finally the Tumut River itself, at Tumut; but of course if the Adelong and Tumbarumba extension were to be deferred, the latter bridge might be dispensed with for the present. This would amount, roughly, including the Tumut, to about 330 lineal feet of creek-bridging, exclusive of the Murrumbidgee.

There is an alternative line on a portion of this route, shown in broken line, over the Killimicat Range; but it would involve two tunnels, and the river valley line is, in my opinion, the best, both as to gradients and work. Generally, the works are not heavy, being scarping along sides of hills; but I should say, as far as one can judge by a mere inspection, that mile for mile, with the important exception of the Murrumbidgee crossing, the line under consideration would be rather heavier than the permanently-staked one it is proposed to replace. The length of the former to the junction with the surveyed line at Tumut is 32½ miles.

This line would have the advantage of tapping the rich valley drained by the creeks above mentioned, and is better situated than the western route, as regards the differential rate question, but is inferior to it as leaving the Gundagai branch longer and incurring more unnecessary traffic mileage should the trains be worked in and out from that place. This latter branch, as it would certainly be worked from the existing Coolac station, would be practically 10 miles long, or 20 miles to run over with the through working.

There being a high ridge between Coolac village and the confluence of the Tumut and Murrumbidgee Rivers, no more southern junction can be obtained for the eastern route.

The western route starts from 28½ miles, reducing the Gundagai branch to about 4½ miles, and would cross the Murrumbidgee just below the junction of the Tumut River. The bridge would be about the same length as that on the other route, and here also are indications of a rocky bed. A sharp grade would then be encountered to get over a spur, when the line would follow the river valley, on west side, to Tumut. The line would be generally of the same character as that on the other side, and, similarly, two alternative lines present themselves opposite those on the other side. The surmounting of the range here would involve some heavy work, including a tunnel and grading, and I would suggest that a river-bank line be tried as well. This latter, as shown by broken lines, is less closely to be followed than the others on the tracing, as I only saw the ground on the other side of the river—having followed, on the western route, only the mountain line, or hard line, throughout;—but it is possible that a line, following generally the dotted line, might be an improvement on the heavy grade of the mountain route. The scarping would appear, however, to be very heavy.

The only creek of any size on this western route would be the Gilmore, say, 220 feet of creek bridging. The length of the western route would be about 30½ miles to Tumut.

Generally, the earthwork on this line would be heavier and the bridging lighter. It would have the advantage of a better junction as regards the non-paying branch to Gundagai; but, as regards local traffic, that from the eastern side, which, as pointed out in reference to the differential rate question, is chiefly to be relied on, could only reach this line at one point, viz., Brungle Bridge, which is the only crossing-place over the river below Tumut.

In both lines short lengths of steep grade cannot be avoided. The country passed through by each is generally good and well populated, the alluvial flats of the river and creeks being exceptionally rich.

Beyond Tumut the surveyed route to the neighbourhood of Adelong is the best one; but the difficulty of approaching the town, or of connecting with the projected extension therefrom to Tambarumba, is considerable. Mr. Hotson's report regarding the latter, which has been placed in my hands, and is returned herewith (85-1,416), regards, of course, the extension as necessary from the existing surveyed line from Gundagai, and his junction at 303 miles would be unsuitable as an extension of the project under report, as it would involve an unjustifiable detour in the general route. His alternative junction, shown by a blue dotted line on his map, which would obviate this, appears to me, if it is correctly shown thereon, to be altogether impracticable. It passes under one of the high peaks of the range on east of Adelong Creek, and drops suddenly down to the valley in which the township is placed.

In my opinion this would involve a tunnel and viaduct of most gigantic dimensions, and is practically impossible.

A detour, at least as long as is shown on my tracing, is necessary to get down to the Adelong River valley, up which Mr. Hotson's line follows towards Tambarumba, and if even, as his is here an ascending line, the junction of mine with his were prolonged southward as far as possible, there would still be heavy works and grading to be encountered, while the difficulty in getting down would necessitate the line being kept round on the side of the range at a considerable distance from the township, and gradient difficulties in the construction of a station would be unavoidable.

The present survey—Gundagai to opposite Adelong—is 20 miles long.

The western Tumut River line, near Coolac to Tumut, is 30½ miles long. The eastern line is 32½ miles to Tumut; while the surveyed line from opposite Adelong to Tumut, which is common to the three, is 10½ miles long. But, if Tumut alone is sought to be reached (Adelong being of much less importance), the mileage of construction would be in favour of the new project on the west of the Tumut River, to a slight extent.

There would be heavy grades on both of the Tumut River lines, but they are short, whereas there is a long length of them on the existing survey and on the new line, if extended beyond Tumut to Adelong.

I think there can be no doubt on account of the latter, and what has already been said that the extension of the Tumut River line to Adelong ought not to be adopted, unless it is intended to go on to Tambarumba.

There is an aspect of the general question of the extension to Tumut which might possibly be worth consideration, having in view that the great objection to the present surveyed line is the great expense of the Murrumbidgee bridge.

The present road bridge at Gundagai consists of three 80-foot (about) spans of pin-connected iron girders, and a long timber approach over flooding. I am informed that the latter part will require renewal before very few years, and at present costs a large annual amount for maintenance. When it is renewed, I do not see myself why it should not be made available for road and railway, where there is only one mixed train a day, as is not uncommon in India, and, I believe, elsewhere. The iron part might be strengthened, if necessary, and the road traffic might easily be protected by interlocking-signals and gates, being also close to the existing station. The present permanent survey, which could easily be made to suit this idea as regards alignment, would thus be carried out, and the Railway Department should only be debited with the cost of making the bridge available for railway traffic and a proportion of the maintenance.

This proposal would continue Gundagai on the main branch, and the objectionable working of its small traffic on a small branch would disappear.

This is a matter involving the consideration of a considerable departure from ordinary usage in this Colony, and is therefore merely mentioned as a suggestion.

As I had seventeen working days, nearly all fine, and a generally clear country, I had a good chance of locating the lines shown on the map, consisting of about 86 miles; and, with the small exception already referred to, they may be followed in any trial survey—subject, of course, to minor improvements in detail.

C. O. BURGE,
District Engineer.

Minute Paper.—Gundagai to Tumut.

Department of Public Works, Railway Construction Branch, Sydney, 23 December, 1892.

I HAVE the honor to forward herewith Mr. Burge's report on the above line.

It is quite evident, as indeed has already been pointed out, that a reduction of distance to anything like 19 or 20 miles with easy works is quite impracticable.

The Tumut valley route, even with the winding suggested to reduce earthworks, would probably be more costly than the present surveyed route.

The present surveyed route is capable of revision, and the estimated cost may be much reduced by using sharper curves, adhering in parts more closely to the surface of the ground, by reconsideration of the Gundagai bridge and waterways generally, and also in the item of station accommodation.

I am not an advocate for a combined railway and road traffic bridge at Gundagai. I believe there are in this particular case exceptionally great objections; but a great saving can otherwise be effected by cheapening the construction over the flat.

I recommend that this survey and estimate be revised in the same way as the Minister has lately given his approval in the case of other lines.

H. DEANE,
Engineer-in-Chief.

Memorandum to the Engineer-in-Chief.—Gundagai to Tumut.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,
Sydney, 13 December, 1892.

I BEG to report that, as instructed, I have inspected the suggested Tarrahandra connection between South Gundagai and Tumut, more especially with reference to the portion between the latter township and 14½ miles on the western Tumut River valley line, on which I reported in 1889 (89-3,481, page 5). (See map accompanying that report attached.)

This is the connection alluded to in my minute, 15/12/92, on paper 92-6,642.

I also took the opportunity of riding round and examining the alternative route on the latter line, from 14½ miles to 20½ miles, to avoid the tunnel at 17½ miles, adverted to as "the river bank line," in page 6 of my report as above.

Returning from Tumut to Gundagai *via* Adelong, I thoroughly examined, as far as an exploration can do it, the permanent survey on that route, with the view to its improvement as regards cost.

In these investigations I was well assisted throughout by guides recommended by the Tumut people.

As regards the first: The country enclosed between the Tumut River valley and the Adelong Creek is very high, and a spur from this extends northward to the confluence of the Tumut and the Murrumbidgee Rivers. This spur has to be crossed by the connection now in question at a conveniently low point, which is marked X on the map before referred to, on which I have added the line explaining this report.

To go straight through this spur, which would be necessary for the only line which would even approximate within 3 or 4 miles of the 19 miles expected in Mr. Gilliat's report, would, according to aneroid heights, which are corroborated by Mr. Melrose's previous ones, involve a tunnel of from $\frac{3}{4}$ to 1 mile long, costing alone probably as much as one-third of the whole permanently surveyed line *via* Adelong, excluding the Murrumbidgee bridge.

This being clearly out of the question, a line was investigated approaching the summit by skirting the amphitheatre of hills indicated by the dotted red line on the map, as amended by this inspection to the dotted purple line. This would probably give the distance necessary to rise over the range without a tunnel; but it would be over exceedingly rough ground, the gullies running in deeply and the spurs being too sharp to be contoured by practicable curves. To some extent this character would be maintained right back to South Gundagai, and, moreover, the start at the latter place could not connect with any Murrumbidgee bridge as a continuation of the existing railway, unless by curving into the hill behind South Gundagai with another formidable tunnel, as shown by the dotted purple line now added to the map.

The descent from the spur X towards Tumut would be hardly less rough and circuitous than the ascent, and is shown in the same way. A grade of 1 in 40 is assumed in this description.

The river bank deviation next examined, between $14\frac{1}{2}$ miles and $20\frac{1}{2}$ miles, on the western bank, Tumut River line, would be comparatively easy for about half its length. Beyond this the ground is very steep laterally, about 10 feet to 15 feet per chain, dipping in sharp spurs straight into the flooded flats of the Tumut River. The line here would have to keep on the toe of the slope as far as its curves would allow, and, for about half a mile, entirely in the siding, as, for that distance, the main channel of the river washes closely the hill side. Except for grades, therefore, the improvement on the line over the hill, explored before, is not very conspicuous, though it is probable that it would, on trial, turn out to be the cheaper.

The mileage of the line by this route from Gundagai station to Tumut would be, approximately, 29 miles, the excess of this over the crow's flight line from point to point, being chiefly accounted for by the climbing to get round and over hills, a necessity apparently overlooked by Mr. Gilliat in his report.

This further acquaintance with the Tumut valley route more than confirms me in the opinion that, mile for mile, it would be more expensive than the permanently surveyed line, excluding, of course, the bridge; and also that the trial of the Tumut River valley line, east or west, is only justifiable on the grounds of the cheaper bridge over the Murrumbidgee, which was included in the former project, but which sole advantage, in an engineering point of view, disappears in the proposal now under investigation.

As regards the permanent survey *via* Adelong, and taking it from Tumut towards Gundagai, the leading feature of this line is the rise over the neck which connects the high country before mentioned (page 2) with the lofty ranges south of Tumut. After surmounting this, from the Tumut side, the line falls to the bottom of the Adelong Creek valley, which it follows to Gundagai.

This neck appears not to have been crossed at its lowest point, and with the view of taking the lowest crossing, and thus saving unnecessary lift in the traffic working, a deviation extending from near Tumut to the Adelong valley occurred to me as possibly an improvement, crossing the neck more to the eastward at about 100 feet lower level. This is approximately shown by the purple dotted line on the map. On the Tumut side the improvement is very marked, as the approach to the saddle is along a gentle side slope, the total grade from Gilmore Creek being about 1 in 80, divisible into almost any gradations according to the ground selected, and the works much easier than on the present line. Descending to Adelong Creek the works and maximum grade would probably be no better than on the present line, and the advantage would be only in the reduction of the height surmounted. The length would be about the same. Before any regular survey of this is undertaken, it would be necessary to run a flying traverse over it, as, with regard to the descent just referred to, an exploration is not sufficient to determine whether the superiority in the ascent, and in the reduction of the summit level, might not be counterbalanced by heavier works in the descent. This diversion would increase the distance of the line from Adelong from 3 miles to 4 miles; but when at Adelong, the local Progress Committee called on me, and, while expressing much indifference to any railway at all, said that, if not constructed right through the township, which is practically a physical impossibility, they would rather have no line at all than one at such a distance, with a steep approach thereto, and leading possibly to the formation of a rival township at the station. The same views were expressed to Mr. Gilliat. (See his report paragraph 40.)

Under these circumstances it would seem that the site of the station on the summit is a matter of indifference to the existing township, the probability being that, taking road grades into consideration, their practically most accessible point in the line would be where the line joins the Adelong valley, to which there is an easy road.

Taking the permanent survey as it stands, I find that, except through South Gundagai township, the minimum radius of curves is 15 chains, and this is used only three times, 20-chain curves being more generally used in the several rougher places. The tunnel at 290 miles may be either avoided or considerably shortened by this means, though a double ground. A considerable reduction in earthwork and culverts, &c., might be made by the free use of 10-chain curves in crossing of the main road, and a considerable lengthening of the line would be a set-off. A diversion of the line to avoid a double crossing of the main road near Tumut is also advisable.

To estimate the amount of saving in these matters, an extension of the present cross-levels and additions to them would be necessary.

Reduction might also be made by freer use of the ruling grade.

In reference to the matter alluded to in my former report—89/3,481—of utilising the present road bridge over the Murrumbidgee as a joint road and railway bridge, I find that the main spans have pin-connected diagonals, with top boom and struts built, and bottom boom and ties of links. The strengthening could, therefore, be best carried out by substituting longer pins, and adding to the above numbers. The cross-girders would be more difficult to deal with, but no doubt they can be dealt with.

The question of a low-level bridge, such as has been, I believe, used with success in Queensland, might be considered. The flooded flats would be crossed on the level, and merely the main channel bridged, the whole in high flood being submerged, and traffic suspended temporarily. In the present case, on account of the high ground on the south side traversed by the present centre line, the lowering of the bridge level would entail unduly heavy cutting on that side, and to bring the crossing lower down west of the road bridge, so as to be opposite lower ground, the main channel would have to be crossed where it is 2 chains wider than at the present crossing. At the north side of the river the present line terminates close to, and at a considerable height above, the level of the river flats; hence, even with a grade of 1 in 40, with a suitable vertical curve intervening from station yard, 14 chains of the flat would have to be crossed before their level would be reached. This portion would have to be bridged. The amount of the saving by adopting a low-level bridge could not be accurately estimated without resurvey, additional borings, &c., but the circumstances described above show that it would not be so large as might be otherwise expected.

I may be allowed to call attention to the fact that, since my previous report was written, the Cootamundra and Temora line has been authorised and begun. Should the Tumut line therefore be made, there would exist the means of a local train service from Temora, across the main line and connecting therewith to Tumut, of over 100 miles, which would probably have an effect on the running expenses, as compared with those of the present short branch to Gundagai alone. This consideration can hardly be left out in coming to a decision as to whether the probability of this line being ultimately sanctioned justifies the surveying operations necessary to enable the estimate to be revised.

C. O. BURGE.

TOBACCO CULTIVATION AT ADELONG, TARCUTTA, AND TUMUT.

Sir,

Government Statistician's Office, Sydney, 10 November, 1899.

I have the honor, in compliance with the verbal request of the Chairman of the Parliamentary Standing Committee on Public Works, to forward herewith a statement showing the area under cultivation for tobacco, and the yield therefrom, for the years 1896 to 1899, within the Adelong, Tarcutta, and Tumut districts, that will be served by the construction of the proposed line from Gundagai to Tumut.

I have, &c.,

J. R. MARTIN,

Assistant Statistician.

The Secretary, Parliamentary Standing Committee on Public Works.

Proposed Railway, Gundagai to Tumut.

AREA under cultivation for Tobacco, and yield therefrom, for years ended 31st March, 1896-9.

District.	Year ended 31st March—	Area under cultivation.	Yield.

D.

[To Evidence of Spencer Groves.]

TRADE STATISTICS OF TUMUT DISTRICT.

Dear Sir,

Tumut, New South Wales, 18 December, 1899.

I have taken all pains possible in compiling accurate figures for the guidance of the Works Committee as to the tonnage of goods despatched and received by principal business people of the district, and am quite content, from investigations made, that the particulars now furnished should be added to my sworn statement given before the Works Committee when on their visit to Tumut lately.

The tonnage of goods received by the firms approached by me, in the town of Tumut only, was 1,050 (one thousand and eighty) tons; and the output in produce alone was 7,460 (seven thousand four hundred and sixty) tons; this is exclusive of wool, hides, tallow, &c., sent away, but includes the tonnage of Sanderson and Taylor, as given in evidence here by H. T. Hayes.

These figures, excepting as regards 250 tons, taken as an annual average output of tobacco, taking same for several years past, refer to the year 1890.

By comparisons made with particulars furnished by the different trading firms, I can candidly affirm it as my opinion that large errors, in the way of under-estimates, have been made in the figures supplied.

One merchant here can prove that he pays to the Government, in trainage and taxes, £4,000 a year.

Previous to last year very large consignments of fruit were annually despatched by rail.

Yours, &c.,

S. GROVES,

Secretary,

District Improvement League.

The Secretary, Public Works Committee.

Grafton to Casino Railway.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM GRAFTON TO CASINO.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred, for consideration and report, the expediency of constructing a line of Railway from Grafton to Casino, have, after due inquiry, resolved that it is expedient the proposed railway be constructed, provided that the cost of construction does not exceed £4,000 per mile, and that an adequate portion of the revenue from unalienated lands benefited shall be conveyed to the Railway Commissioners towards covering any loss; and, in accordance with the provisions of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

PREVIOUS REFERENCES.

1. The present is the third occasion on which the proposed railway has been under the consideration of the Public Works Committee, and on this as on previous occasions it is submitted as a section of the North Coast Railway. When first referred, in 1889–1890, it was included in a proposal for the construction of a line from Grafton to the Tweed, which the Committee recommended should be modified to the extent of constructing a section from Lismore to the Tweed, a work that has since been carried out. The second reference was in 1892, when the proposal submitted was a line from Grafton to Lismore, and on that occasion the Committee recommended, subject to certain specified conditions, the construction of the section between Lismore and Casino. The present proposal is the third section of the scheme referred to the Committee in 1889–1890.

DESCRIPTION OF THE PROPOSED RAILWAY.

2. The proposed railway, 64 miles 20 chains in length, would begin at the west side of Turf-street, between Irene and Pound Streets, Grafton, and, following the north bank of the Clarence River for about 6 miles, bear away north to the Richmond Range which would be crossed at 29 miles from Grafton. The direction would then be more westerly, following the eastern side of the main road from Grafton to Casino, up to 42 miles, where the road would be crossed, and thence it would be maintained to the junction of Mongogarie and Shannon Brook or Deep Creek, where the latter would be crossed. From that point the route would be more or less direct to the crossing of the Richmond River, at about 63½ miles, and thence it would continue north-easterly and east to the northern side of the Township of Casino, where it would end on the western side of West-street.

The

The country through which the route runs is largely of an undulating character; several moderate sized creeks, beside the Richmond River, would have to be bridged; and about 7 miles of the route is through country liable to flood in motion. Provision is made for extensive terminal accommodation at Grafton.

ESTIMATED COST.

3. The estimated total cost of the line was, at £5 5s. per ton for rails, £485,700 or £7,559 10s. per mile, but with rails at £7 10s., the present maker's price, per ton the cost would be £501,375 or £7,803 10s. per mile, exclusive of land and compensation, which is £200 per mile less than the estimate put before the Committee when the line was last under consideration. Included in this amount are £91,419 for earthworks; £80,462 for culverts and timber bridges; £25,833 for large bridges; £21,601 for level crossings, cattle stops, fencing, and road diversions; £40,015 for permanent-way material, calculating the rails at £5 5s. per ton, and £55,690 at £7 10s. per ton; £63,419 for platelaying, ballasting, and sleepers; and £70,000 for the Grafton station, including all works, buildings, and wharfs. Engineering and contingencies, calculated at nearly 15 per cent., are estimated at £63,352.

RAILWAY COMMISSIONERS' REPORT.

4. The Railway Commissioners state in their report upon the proposal that there is no present prospect of the line paying working expenses, nor any reason for assuming that, if constructed, it will materially increase the traffic. Except in passenger traffic, which is on the decrease, there is, they say, practically no interchange between the Clarence and the Richmond, and the country between Grafton and Casino is generally of such a poor nature that it will not carry a large population, and does not, in their opinion, justify the construction of the railway. The annual cost they estimate at £21,429, which comprises interest on capital cost at 3 per cent., £15,041, and cost of maintenance and traffic and locomotive expenses, £6,388; and the annual revenue at £4,844, made up of £2,824 for the carrying of live-stock and merchandise, and £2,020 representing passengers, parcels, mails, &c.

THE COMMITTEE'S INQUIRY.

5. Having examined the Under Secretary for Public Works and the Engineer-in-Chief for Railway Construction, in Sydney, a Sectional Committee visited the district through which the proposed line would go, and, in addition to inspecting the route of the line, took evidence at Grafton, Myrtle Creek, Casino, and Lismore. On their return, further official evidence was taken in Sydney, which included information from the Engineer-in-Chief for Public Works as to the present navigable condition of the Clarence River, and the results expected from the works in progress at the river entrance.

SECTIONAL COMMITTEE'S REPORT.

6. In their report the Sectional Committee state that, in their opinion, the best route for the railway has been selected, including a deviation at the Casino end, adopted originally as providing a better junction for a Tenterfield-Casino line, and since retained as an improvement upon the first survey. The land along and on either side of the route they found to be not nearly so good as that on and near the river banks and surrounding Grafton and Casino, which is of exceptionally good quality. It has upon it only a small amount of settlement, and that of a scattered nature, and dairying is practically the only industry that would have to be depended upon for railway revenue. Large areas of the land inspected were carrying a heavy crop of grass, which would be materially improved by ringbarking the timber, and the carrying capacity of the country would be still further increased by introducing artificial grasses, a practice now generally followed on the richer lands of the North Coast. In its natural state the land, it is stated, would carry about one beast to 10 or 12 acres, and, when improved, probably a beast to 5 or 6 acres, 640 acres being sufficient to support a family. The Sectional Committee found that there is very little passenger or goods traffic between Grafton and Casino, and to them it appeared difficult to see how there could be any considerable interchange of products between the two towns. The evidence of some of the witnesses examined, however,

however, pointed to a substantial revenue being obtainable from the carriage of timber, a very large quantity of which, of a marketable character, was said to be within a reasonable distance of the line.

TRAFFIC PROSPECTS.

7. The traffic prospects in connection with the railway are encouraging, as there is every reason to believe that the construction of the line would be followed by a considerable increase of settlement and expansion of the dairying industry. Though the land which would be served is not as rich as that on the river flats, it is undoubtedly well suited for dairy purposes, and the extent to which the dairying industry has already developed in the Clarence and Richmond districts goes far to show that, with the facilities which the railway would afford, the industry would be largely followed in the district between Grafton and Casino.

The Chief Railway Traffic Manager, in his report upon the traffic prospects, does not speak very favourably; but he admits that there is, at intervals along the route, a good area of land suitable for dairying, and says that dairying on a limited scale has been carried on during the last three years by a few old settlers at Myrtle Creek. This, he states, is, as far as he could ascertain, the only new feature of development worth recording along the route. As far as intermediate traffic is concerned the line presents to him a complete blank, and as there is no exchange of products between the Richmond and Clarence Rivers there can be, he says, no through goods or stock traffic. Under these circumstances he finds it very difficult to estimate, with any degree of accuracy, what the earnings of the proposed line would be, especially as the country to be served is not, in his opinion, likely to be sought after until the large areas of excellent land on the Upper Richmond and around Lismore have been brought into profitable use. Allowing for trade that, he believes, would continue to pass through the Clarence and Richmond River ports, he considers that the railway could not rely upon carrying any goods or stock traffic a further distance than 40 miles, midway between Grafton and Lismore, and upon that basis he gives the following estimate:—

Goods...	£2,566
Passengers, &c.	776
Mails	744

Total £4,086, which amount has been increased by the Railway Commissioners in their report to £4,844.

In contrast with this report, however, there may be placed the evidence given before the Sectional Committee, by the District Surveyor at Grafton. He states that the progress of the district in settlement and production, to an extent highly satisfactory from a railway traffic point of view, is assured if the line be constructed. Hitherto land taken up along the route has been devoted to cattle-breeding, as, from want of facilities to encourage any other industry, that has been the only pursuit possible. In view of the success which has attended dairying in other localities, the occupiers of the land are now becoming dairymen; they are changing from cattle-raisers to dairy-farmers. In his opinion the unalienated land along the route is well suited for dairy purposes, and with the railway running through it would be taken up readily. Lands on the Clarence River, which, in the past, have been used for the cultivation of sugar-cane and maize are now devoted to dairy purposes, and the fact that the river flats are now fully stocked with dairy cattle is an indication that the time has arrived when, for the extension of the industry, resort must be had to other classes of land. Leaving out small areas along the route, and treating the whole of the land as dairy country, the District Surveyor estimates that a block of 500 to 640 acres would be sufficient for a family, and that, when ringbarked, the grazing capacity of the land, under dairy conditions, would be 5 acres to a cow. This, with the dairy system of small paddocks and winter-fodder crops growing, would enable a man to keep 100 cows on 500 acres, his earnings from the cows being added to by what he could obtain from the sale of calves and pigs. With families settled upon blocks of 500 acres, the railway traffic, he explains, would come chiefly from the carriage of cream and passengers,
and

and of goods and stores in return. He admits that there would be little or no interchange of commodities between Grafton and Casino, but the railway, he points out, would open up the country for settlement, and be a feeder to the rivers.

The Chief Traffic Manager anticipates that there would be some timber traffic, but not much, as a great deal of the timber along the line would, he states, go down the Richmond River. There is at present, he explains, a cheap and easy means of transit by water to Coraki—as many as 150 large logs having been rafted down the river at one time.

The District Surveyor and the Conditional Purchase Inspector, at Grafton, both anticipate a considerable revenue to the State from the timber in the neighbourhood of the railway. In the forest reserves, the timber is said to be very valuable, and when land is thrown open for settlement, will be so dealt with that the Government will receive a large amount of royalty from it.

TIMBER ALONG THE ROUTE.

8. With regard to the timber question, the Conditional Purchase Inspector and Forester at Grafton is of opinion that timber, for about 8 miles east of the railway, would be drawn to the line; and to the west, it is anticipated, he states, that the railway would carry timber cut on the Richmond Range over a length of 60 miles of that range, by a width of 4 miles. The forest on the Richmond Range he describes as one of the finest and densest on the North Coast, consisting of spotted gum, ironbark, blackbutt, tallowwood, red mahogany, grey gum, stringy bark, and bloodwood. There are also patches along the range of pine, beech, teak, black bean, silky oak, and a little cedar, of marketable sizes. He estimates the possible yield in royalty to the State from the marketable timber within the area that would furnish traffic to the railway at £76,800; and the production after the present marketable timber has been removed as equal to an annual royalty, if a demand on the area to its full capacity were made, of £25,600. Other forest reserves of a temporary character would also, he says, provide traffic for the railway.

THE LAND ALONG THE ROUTE.

9. Within an area of 20 miles on each side of the railway, and within 20 miles of Grafton as a centre at one end of the route, there are, according to evidence given by the Chief Draftsman of the Department of Lands, 624,500 acres of alienated land, 515,200 acres of reserves, and 742,500 acres of Crown lands, exclusive of reserves. Of the Crown lands, 545,700 acres are held under occupation license, and 196,800 acres are untenanted. The alienated land is chiefly along the course of the two rivers, and if excluded from the traffic area of the line (which it may very fairly be, it being admitted that the railway would draw little or no traffic from the country south of Grafton, and north of Casino the traffic question will be affected by a line from Casino to Lismore) would leave only Crown lands as a source of traffic. Some of the reserves are forest reserves.

POPULATION AND PRODUCTION.

10. The estimated population within the area likely to be affected by the railway, including that of Casino, but excluding that of Grafton, is given by an officer from the Government Statistician's Department as 6,700. Cultivation, apart from that at either end of the line, is very limited, and production small, nearly all the land, in the absence of railway facilities, being devoted to pastoral pursuits.

EFFORTS TO CHEAPEN THE RAILWAY.

11. It appeared to the Sectional Committee that, as for a considerable time there was no likelihood of other than light traffic resulting from the construction of the railway, it might be possible to regard the line from a standpoint different from that of one to be connected with the general railway system of the Colony, and make it a light line pure and simple, which, of course, should materially reduce its cost. The Full Committee were also, during the course of the inquiry, impressed with the conviction that the line might be cheapened, and the Engineer-in-Chief was asked to look into the matter and see what could be done. This he did, and though strongly

strongly opposing any cheapening of construction, he explained that a certain reduction in cost could be effected by steepening the grade—making the line in that respect more like a tramway—sharpening the curves, lessening the estimate in relation to station and wharfage requirements at Grafton, and in some other respects altering the original plans. By steepening the grades, sharpening the curves, cutting out a portion of the ballast, reducing the station accommodation to what is necessary for first requirements, lessening the cost of sleepers, and cutting off a portion of the allowance for contingencies, the cost could be reduced from £7,803 per mile, the present estimate, to £4,800 per mile.

The station accommodation at Grafton was originally estimated to cost £70,000, but the Engineer-in-Chief admits this can be brought down to £6,000. This original estimate appears to the Committee to be most excessive, and it brings under notice the practice, apparent in all proposals of this nature, of making the station arrangements much more elaborate than is necessary. The Committee are of opinion that a considerable saving might be effected, in all cases relating to proposed railways, if the station accommodation provided were not more than is absolutely requisite for immediate requirements.

An officer of the Railway Construction Department was sent to Grafton and Casino to see what arrangements could be made in respect to the land required for the railway, but, though a report from him on his visit appears in the evidence, information indicating what the claims for land and compensation are likely to be was not available up to the time the inquiry closed.

THE COMMITTEE'S RECOMMENDATION.

12. The Committee recommend the construction of the line, provided the cost can be reduced to £4,000 per mile, and an adequate portion of the revenue from unalienated Crown lands along the route benefited by the railway be conveyed to the Railway Commissioners towards covering any loss.

The difficulties in the way of an unconditional approval of the railway are the excessive cost of construction, and the period that must elapse before the traffic returns are satisfactory. The line must be worked at a loss for a time; but there is every indication that within a reasonable period it will pay, if the increment in the value of the Crown land affected is, as recommended in the Committee's resolution, credited to the railway. It is important to notice that the line between Lismore and the Tweed is improving in its return of revenue, and the fact must not be overlooked, as mentioned by the Chief Railway Traffic Manager, that this railway was the means of developing the dairying industry in the Tweed and Lismore districts, and inducing companies to open up factories at Casino and elsewhere for the treatment of cream. The possibilities in connection with the dairying industry, which were not apparent when the line from Grafton to Casino was previously under inquiry, are a new and important feature in connection with the present proposal, for if the proposed railway should have an effect similar to what has resulted from the Lismore-Tweed line—and there is good reason to believe it would—the large area of Crown lands between Grafton and Casino now unoccupied would be taken up by settlers in blocks of 600 or 700 acres, and be the means of providing a livelihood for many families as well as considerable railway traffic. Then it is clear to the Committee that the construction of the railway should be carried out on a much cheaper scale than that submitted. They have been able to elicit the information that the cost can be reduced at once to £4,800 per mile, though the Engineer-in-Chief does not recommend it; and they are of opinion that it is possible to still further reduce it. They think the line could be constructed, in the first instance, for £4,000 per mile, and if this were done, the capital cost would thereby be reduced from £501,325 to £257,000, and the interest on the cost of construction from £15,041 to £7,710. This would bring down the annual cost, including maintenance and traffic and locomotive expenses, to £14,098, instead of £21,429, the estimate based on the original figures, and the estimated loss to £9,254, instead of £16,545. The further provision in the Committee's recommendation should materially reduce this smaller loss if it should not quickly cause it to disappear. The average value per acre of the Crown lands within the traffic area of the line is estimated at 15s., and it is thought that the

the railway would increase this to 25s. If the Railway Commissioners receive a fair proportion of the amount realised from the sale of these lands at their increased value, it should prove a satisfactory set-off against present loss, and it would be in accordance with a recommendation made by them in 1889, in their report upon the proposal, then under consideration by the Public Works Committee, for the construction of a railway from Grafton to the Tweed, which included the section from Grafton to Casino.

THE COMMITTEE'S RESOLUTION.

13. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings :—

Mr. Shepherd moved,—“That, in the opinion of the Committee, it is expedient the proposed Railway from Grafton to Casino, as referred to the Committee by the Legislative Assembly, be carried out, provided that the cost of construction does not exceed £4,000 per mile; provided also that some satisfactory arrangement be made whereby the district benefited shall contribute to the Railway Commissioners a sum sufficient, together with the earnings, to cover working expenses and interest on capital expenditure at the rate of 1½ per cent. per annum.”

Dr. Garran moved,—“That the motion be amended by the insertion of the word ‘not’ before the word ‘expedient.’”

The amendment was negatived on the following division upon the question,—“That the word proposed to be inserted be so inserted” :—

Ayes, 1.
Dr. Garran.

Noes, 6.
Mr. Dick,
Mr. Shepherd,
Mr. Hyam,
Mr. Watson,
Mr. Levien,
Mr. McFarlane.

Mr. Levien moved,—“That the motion be amended by the omission of the words ‘provided also.’”

The amendment was passed on the following division, upon the question,—“That the words proposed to be omitted stand part of the motion” :—

Ayes, 3.
Mr. Shepherd,
Dr. Garran,
Mr. Watson.

Noes, 4.
Mr. Dick,
Mr. Hyam,
Mr. Levien,
Mr. McFarlane.

Mr. Levien moved,—“That the motion be further amended by the omission of all the words after the words ‘£4,000 per mile.’”

The amendment was agreed to.

Mr. Watson moved,—“That the motion be further amended by the addition of the following words—‘and that an adequate portion of the revenue from unalienated lands benefited shall be conveyed to the Railway Commissioners towards covering any loss.’”

The amendment was agreed to, and the motion, as amended, was passed.

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 17 September, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM GRAFTON TO CASINO.

THURSDAY, 22 FEBRUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD,
THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.
JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Grafton to Casino.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you prepared a statement giving some particulars of the proposed railway? Yes.
2. Will you read the statement? It reads as follows:—

R. R. P.
Hickson.

22 Feb., 1900.

GRAFTON TO CASINO RAILWAY.

THE proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration, on 22nd December, 1899, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Grafton to Casino."

The present is the third occasion on which Parliament has seen fit to refer this railway line to the Public Works Committee, and on this, as on previous occasions, the proposal is submitted as a section of a great North Coast Railway.

Its first reference was made in 1889-1890, when the proposal to construct a line from Grafton to the Tweed was, after an exhaustive inquiry, cut down by the Committee to the construction of the section from Lismore to the Tweed, a length of 63 miles 57 chains. This sectional line was constructed in due course, and has been in operation for the last five years. It still remains, however, in the category of non-paying lines.

In 1892 the remaining portion of the original proposal was again submitted to the Public Works Committee, who, after a second lengthy inquiry, recommended the construction of the section between Lismore and Casino, a distance of 18 miles 8 chains, provided that the cost did not exceed £6,000 per mile, and that the "betterment" principle could be applied to the land to be served by the proposed line.

No steps have as yet been taken to carry out the Committee's recommendation.

With regard to the proposal under review, namely, the construction of a line of railway from Grafton to Casino, a distance of 64 miles 20 chains, being the third and final section of the scheme as originally referred to the Committee in 1889, there is nothing to be brought forward that may be called new. It may, however, be pointed out that during the interval since that date, in the Richmond and Clarence River districts, and more particularly in the areas served by the Lismore to Tweed railway, there has been a striking development and increase in the dairying industry, and, consequently, the population is steadily growing in numbers.

The proposed line of railway has been so fully considered and reported on by the Committee on the two previous occasions above referred to, that I can add nothing to the information already given in the Committee's reports of 1890 and 1892.

The following is the report of the Railway Commissioners upon the proposed railway from Grafton to Casino, together with a memorandum regarding the district between Lismore and Casino:—

Office of the Railway Commissioners of New South Wales, Sydney, 19 December, 1899.

Proposed Line of Railway from Grafton to Casino—64 miles 20 chains.

In accordance with the provisions of the Public Works Act of 1888, we beg to report as follows:—

<i>Cost of Construction—</i>	
Engineer-in-Chief's estimate (exclusive of land and compensation)	£501,375
<i>Annual Cost—</i>	
Interest on capital cost at 3 per cent.	£15,941
Estimated cost of maintenance, and for traffic and locomotive expenses	6,388
Total annual cost	£21,420
<i>Revenue Estimate—</i>	
Life stock and merchandise	£2,824
Passengers, parcels, mails, &c.	2,020
Total estimated revenue	£4,844

The estimated annual cost is based upon a tri-weekly train service.

In our report of the 7th December, 1897, we stated that there was no present prospect of the line paying working expenses, nor was there any reason for assuming that the railway, if constructed, would materially increase the traffic. We are still of this opinion.

Except in passenger traffic, which is on the decrease, there is practically no interchange of traffic between the Clarence and the Richmond: and the country between Grafton and Casino is generally of such a poor character that it will not carry a large population, and does not, in our opinion, justify the construction of a railway.

B. E. P.
Hickson.

The Railway Commissioners' memorandum respecting the Lismore to Casino line is as follows:—

22 Feb., 1900.

PROPOSED RAILWAY FROM GRAFTON TO LISMORE.

With reference to the report asked for in connection with a proposal to construct a line of railway from "Grafton to Lismore," the Commissioners now note, as intimated on the 12th instant, that the Minister only wishes a report from "Grafton to Casino," and we have confined our remarks in the report submitted under the terms of the Public Works Act to that section.

We had, however, gone over the district between Lismore to Casino, and as it may assist the Minister, take the opportunity of expressing our views on the section in question.

The country in the district of Casino, and between Casino and Lismore, is of a rich character, and during the last few years has been, and is still being, so extensively developed by agricultural and dairy farming that we consider the construction of a line between those points deserving of favourable consideration, particularly if it can be carried out at a reasonable cost.

The following is a description of the line now submitted to the Committee:—

Length, 64 miles 20 chains; estimated cost £501,375, or £7,804 per mile, exclusive of land and compensation.

This line begins at the west side of Turf-street, between Irene and Pound streets, in the City of Grafton, and follows the north bank of the Clarence River for about 6 miles, from whence the bearing is generally north to the Richmond Range, which is crossed on the 29th mile. The direction then becomes more westerly, following the eastern side of the main road, Grafton to Casino, crossing it about 42 miles, the same direction being maintained close to the junction of Mongogarie and Shannon Brook or Deep Creek, where the latter is crossed. From here the line is more or less direct to the crossing of the Richmond River at about 63½ miles; thence north-easterly and east to the northern side of the township of Casino, where it ends at the western side of West-street at 64 miles 20 chains from Grafton.

This railway is largely through undulating country, the Richmond Range being crossed; there are also, besides the Richmond River, several moderate sized creeks to be bridged, and about 7 miles of the line is through country liable to flood in motion. Extensive terminal accommodation at Grafton is provided.

The steepest gradient is 1 in 50. The amount of land alienated is not large.

I beg leave to submit the two reports made by the Public Works Committee, on 15th April, 1890, and 28th September, 1892, as portion of, and supplementary to, this present statement.

3. Is there anything which you could add to the statement? I do not think there is anything I could say which would be of any value. The proposed railway keeps pretty close to the road nearly all the way until you get near to Casino, when it goes to the west of the main road.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

H. Deane.

22 Feb., 1900.

4. *Chairman.*] Mr. Hickson, the Under Secretary, has read a statement which is really a description of the route of the proposed line;—the Committee desire to be furnished with a more detailed description of the character of the line, of the country through which it passes, and as to whether there are many bridges and viaducts to be made? I can hand in an estimate of the cost of the line and a section of the line.

5. Have you been over the surveyed line? Yes; but not lately. I have not been over the surveyed line since the previous inquiry. I know the country fairly well, as well as one can see it without going very far to the right and the left of the line. The first part of the line for about 3 miles passes through the town of Grafton, and the outside allotments, and at about 3½ miles it rises slightly on to a ridge near the Clarence River. From there for some miles the works are fairly easy, though not of the same easy character as those on the lines which have lately been considered. The cuttings vary, say, from 5 feet to 19 feet in depth. The line altogether is of a rougher and costlier character than anything that has been considered for some time by the Committee. The country is somewhat undulating, and you have to rise and fall when passing over the low ridges. The ruling grade is 1 in 60 going south, and 1 in 50 going north. The line with which it connects—Casino to Lismore—has a ruling grade of 1 in 50, and on the line from Lismore to the Tweed the ruling grade is 1 in 50. There is nothing particular to remark about the first part of the line until you get to the Richmond Range. It will be seen on the plan that when you get to mileage 21, the line begins to wind about a good deal. That is done with the object of getting across the range with as little earthwork as possible. The deepest cutting on that section is about 35 feet, and there are a good number of cuttings varying from 15 feet to 20 feet, or a little more.

6. From the 21-mile peg till you get over the range, is it a continuous cutting? No, it is a series of cuttings and banks. The line begins at Grafton at a level of about 25 feet above high-water; the highest point on the line is near 24 miles 30 chains, and that is 344 feet above high-water at spring tide.

7. *Dr. Garran.*] Will there be a good deal of rock-cutting in that range? Yes; from what I remember it is sandstone and hard shale. At about 32 miles 15 chains you cross Myall Creek. There is a creek called Two-mile Creek at about 42 miles 20 chains, but it is not important. Myrtle Creek is the next most important creek, and it is crossed at about 44 miles 60 chains.

8. *Chairman.*] From the Richmond Range to Myrtle Creek is it all comparatively level country? It is all pretty level. There are some rises in the ground to go over—low spurs, but nothing difficult at all.

9. Easy grades? Yes. At 47½ miles there is a cutting 27 feet deep; but, generally speaking, the country is not very hilly. Just beyond 57-mile peg we cross Deep Creek, and after that there is nothing to speak of till we get to the Richmond River, which is crossed near Casino. On this map, which is a compilation of parish maps, there are two lines shown.

10. In the general description of the line there is a paragraph which says that "about 7 miles of the line is through country liable to flood";—is that a continuous stretch of 7 miles? No, that is a summation of the bridges over different creeks and swamps which we have to cross.

11. Where does that occur chiefly? There is a good deal at the Casino end, and especially at the crossing of the creeks like Myrtle Creek and Deep Creek. The flooded country will have to be crossed on timber viaducts.

12. Is it proposed to construct the line above ordinary flood-level? Yes; above the highest flood-level which we have information about. I have included that in that estimate.

13. How high is it—a couple of feet? It varies very much. On the banks of a creek there may be depression other than the main channel to pass over, as at Deep Creek, which is nearly equal to the depth of the creek itself. There is a flood-channel at Deep Creek, which is 16 feet, the main channel being 20 feet. Then beyond that point on the Casino side there is a swampy place where the line will be 7 feet above the surface. I think that gives as good an idea of the kind of country to be crossed as I can furnish.

14. You were about to explain, when I interrupted you, that near Sandy Creek there is an alternative route? From about 48 miles two lines have been laid out. The blue or eastern line is the original survey which crossed the Richmond River to the east of the town of Casino. When I was up there some years ago, I examined the line very carefully, and I came to the conclusion that an adequate station ground could not be made on the northern side of the river. When that line was laid out it was proposed to bring the Tenterfield-Casino line, as shown in green on this plan, following the Richmond River on the south side, and connecting with this blue line, also on the south side of the line, and then following to a common station on the north side of the river. But when the line came to be permanently staked, and the question of the proper location of the Tenterfield-Casino line was being fixed, it was suggested that a more westerly route would be more suitable, on account of its shortening the distance of the line from Tenterfield, making no material difference in the length of the line from Grafton to Casino, and giving a better station ground in Casino itself. The crossing of the river involved by the adoption of that more westerly line is not so favourable as the crossing to the east of Casino, where the rock is almost at the surface of the river-bed. For other reasons, however, that westerly line seems to be the best, and has been adopted. It was adopted at first on account of its giving a better junction for the Tenterfield-Casino line, and it is still adopted, although that particular reason no longer holds good, because the newer survey of the Tenterfield-Casino line comes in at a more northerly point, as shown on this plan. On the whole, the location of the line seems to be better and more suitable on that western route, and it has, of course, the one great advantage of giving a very good station ground on the northern side of the town of Casino. In my evidence at the last inquiry that point is referred to. On page 5 of the report on the Grafton-Lismore railway, the Committee will see that I gave the following evidence on the 14th June, 1892:—

H. Denne.
22 Feb., 1900.

27. What are you reasons for this deviation at the 50-mile peg from Grafton? The original line at this part is shown as a dotted red line, and it crossed the Richmond River below Casino; that is, what is sometimes called the South Arm.

28. That crossed the Richmond to the east of Casino? Yes, and the survey made to Tenterfield junctioned with that line on the southern side of the river, and went almost in a due westerly direction. When we were prosecuting the revision of the survey between Tenterfield and Casino, I found that it was a very awkward line, with severe grades, and I instructed the surveyors to examine another line. Mr. Lloyd is the surveyor who found this line, and we got a crossing on the Richmond Range (running west for some distance, and then running north, dividing the catchment basins of the Richmond and the Clarence) at a lower elevation, and with very much better grades. Seeing that we were coming in the direction shown by the green line on the plan into Casino, it struck me that it would be better to junction there, as otherwise we should have a duplication of 12 miles out of Casino, which is unnecessary. As it did not lengthen this line very much, I thought it was a better one to adopt.

29. If there were to be no connection with Tenterfield, would you take the more direct course shown by the dotted line? Yes; supposing it was decided for all time that there should be no connection with Tenterfield, I think that would be the case. At the same time, I must say that there is good country at the proposed junction. There is a butter-factory and more settlement there, which the new line serves better than the dotted line. Even on its own merits I think, on reconsideration, the red line is a better one than the dotted line.

30. Will it serve more population? There is not much population on either line, but it is better country, and there are better grades.

31. If the Tenterfield line were out of the question, would you still recommend this deviation? Yes; I should in any case recommend this as the best line to adopt, for this reason: Even supposing the original survey to Tenterfield were adopted, that would be the proper point of departure—that is, west of Casino.

I see no reason to alter my opinion upon that point. The length of the eastern line is 16½ miles, and the length of the western line is 19 miles. The cost of the eastern line is about £117,716, and the cost of the western line is £124,716. The difference in cost, £7,000, is not represented by the difference in distance, as the westerly line seems to be the cheaper line per mile.

15. From that you indicate that the westerly line is the easier line? Yes.

16. I think you have some figures to give to the Committee? Yes; I have an estimate which was made in December, 1899, and which was marked "Grafton to Lismore, Part 1." It was not quite certain then whether the whole line would have to be submitted from Grafton to Lismore, and so I separated the two, Grafton to Casino being part 1, and Casino to Lismore part 2. I will now read the estimate for the first part:—

GRAFTON TO CASINO.

REVISED estimated cost of a single line of railway 64 miles 20 chains in length, with 60-lb. rails. Ruling grades, 1 in 60 going south, and 1 in 50 going north. Sharpest curve, 12 chains radius.

Description of Work.	Estimated Cost.			Average per mile.
	£	s.	d.	
Earthworks	91,419	7	6	1,423
Culverts and timber bridges	89,462	17	6	1,252
Large bridges	25,333	15	0	402
Overbridges	580	0	0	14
Level crossings, cattle stops, fencing, and road diversions	21,601	0	0	336
Permanent-way material (rails taken at £5 5s. per ton)	40,015	2	6	623
Freight	6,783	0	0	106
Platelaying at 1s. 2d. = £6,596 6s. 8d.	63,419	0	8	957
Ballasting at 5s. 6d. = £31,097				
Sleepers at 3s. 3d. = £25,723 14s.

Add for extra cost of rails at £7 10s. per ton	£15,675	0	0
Total cost	£501,375	0	0	7,803

- H. Deane.
22 Feb., 1900.
17. In the statement which the Under Secretary read the estimated cost is put down at £501,375? That estimate takes the cost of the rails at £5 5s. a ton, which is a convenient price for a standard, but the price of rails now is very much higher than it was. A rise or a fall of 5s. a ton in the price of rails makes a difference of £30 per mile. Taking the price of rails at £7 10s. per ton, the extra cost would make the total £501,375, or £7,803 10s. per mile.
18. *Mr. Watson.*] In the case of that contract which was let the other day for a little over £7 10s. per ton, were the rails of a heavier class? No; they were also 60-lb. rails. I think the price of rails was about £7 8s. per ton, and the freight is very high at this time—16s.
19. *Dr. Garran.*] At what do you estimate the average cost per mile in this calculation? £7,803 10s.
20. If you add to the standard price of iron it will come to a little more? I think it will.
21. Do you recollect what you estimated the cost of this section at in 1890—at the first inquiry? I do not think it was my estimate at all; but it was a very rough estimate made before the surveys were complete. I stated that, I remember, in my evidence.
22. In answer to Question No. 68, by Mr. Trickett, it is stated that there is an estimate of £12,256 per mile, but whether that was for the whole of the line or for this portion only I do not quite see;—this will be a little cheaper than some of the other parts of the line, will it not? This is really the cheapest part of the whole line between Grafton and the Tweed.
23. Therefore, to take the average of the whole line will be to put too high a price on this section? Yes.
24. So that there is a great reduction on the estimate of 1890;—what was your estimate in 1892? The estimate was £8,000.
25. And you brought it down about £200 per mile? Yes.
26. In what way has it principally been cheapened? Everything has undergone revision since then. I have cheapened the waterway designs very much since then. Stations also have undergone revision. Then prices, although they are going up again now, are lower than they were then.
27. When you say that you have cheapened the waterways you do not mean that you have diminished the area of the waterways? No; I have cheapened the design of the bridges and the culverts.
28. A cheaper style? Yes.
29. Have you left them sufficiently good and durable? They are quite as good; many of them are very much better than they used to be.
30. You have not increased the gradients? No; the gradients are the same. I have improved the gradients where possible. I have now grades of 1 in 60 where we previously had grades of 1 in 50.
31. Then, substantially, during the course of these years which have passed the general route of the line remains much as it was? Very much the same.
32. And the general construction very much the same? Yes. Even in 1890 I anticipated that we should have to pass over a great deal of flood-country.
33. What is the latest date at which any competent engineer has been over the line to reinspect it? I think Mr. Burge's inspection was the last.
34. When was that made? It was a good many years ago. It must have been before the last inquiry.
35. There has been no thorough inspection since then? No, except at that part where the deviation is made.
36. What engineer has suggested that deviation? I think that was suggested in my office when I was discussing the matter with the surveyors. As I explained, Mr. Lloyd suggested a new and better route between Tenterfield and Casino—a more southerly route; and then I thought it was better to deviate the whole line so as to meet it.
37. I understand from you that you are going to keep above flood-level in all the floodable parts of the line? Yes.
38. So that when the floods are up the traffic will not be interrupted on this line? Yes.
39. As the object of this line is to connect the Richmond River with the Grafton River, and, as if this line is made, and the line to Tenterfield is made also, the section between Lismore and Casino will have to be made;—do you know enough of the country to say whether a straighter line from Lismore to Casino might be made—more to the east on that plan submitted? From my own knowledge, I could not say. I think probably a straighter line could be made. I do not suppose, there are, any impediments as regards ranges. You would have more water to cross, but a straighter line could be made, though it would leave out Casino. One of the points it was desired to accommodate in all these proposals was Casino.
40. But if there is a line from Casino to Tenterfield, I suppose Casino will be accommodated then? Yes.
41. I only wanted to know whether we could get a straighter and a cheaper connection between Lismore and Grafton than this one? I do not think it would make any difference. I should think that a line from Grafton to Lismore would cost about the same as a line from Grafton to Casino, and you would still have to complete the Casino-Lismore line ultimately.
42. I suppose all the ranges you cross dip towards the Clarence River? Yes.
43. That Richmond Range, for instance? It runs out easterly.
44. You would cross it at a low level? I should not like to say whether it does not rise again, but it eventually runs out to the east.
45. Suppose the connection is only meant to be between the two rivers, could you drop this line down on Lawrence, and save anything in the cost of going to Grafton? So as to start from Lawrence?
46. As soon as you cross the Richmond Range, could you not hit Lawrence very much more cheaply than you could hit Grafton? Yes.
47. And the line from Lawrence to Grafton would follow the bank of the river pretty well? Yes.
48. And fairly level country? There will be a good deal of flooded country.
49. Unless you get back from the river? Yes. And then you would not be very far from the present line for a good portion of the way. I do not think you would gain anything. I do not think you would get a very nice line.
50. So far as you know, there has been no regular survey made between Lismore and Lawrence? I do not think there has. We never had instructions to do it.
51. Therefore, no one is in a position to say anything about it? No. This line has been looked upon as part of the North Coast line, and of course Grafton has been looked upon as the proper place to meet the line from the south and the line from the north.

H. Deane.

22 Feb., 1900.

52. It is the capital of the district at present? Yes.
53. Will the station at Grafton be well above flood-level? Yes. Where the line starts there is a strip of country, which is above the level of the highest flood known. The floods have gone over most of the town of Grafton, but there is a strip where the railway starts which is above the floods.
54. Supposing there is a railway made from the south to come up to Grafton, where will the bridge cross to connect the railway systems? I think the bridge ought to cross a few miles above Grafton.
55. Where dotted blue line is shown on the wall map? That is the idea.
56. That will hit it at about 6 miles above Grafton, I suppose? On the other plan it is shown at about $5\frac{1}{2}$ miles.
57. Will that have to be a bridge with an opening to let vessels go through? Not there.
58. How far over Grafton is the river navigable for coasting steamers? I do not think that steamers of any size go above Grafton.
59. It is practically the head of navigation? It is.
60. And there will be no objection to blocking the river with a bridge there? A bridge would have to be built high enough so as to admit of droghers and small craft going under.
61. The people in the district have never made any objection to a railway bridge going over there? I do not think it has been seriously proposed. I have never seen any objection which has been made.
62. Suppose we ever have a railway made from Armidale or the Mother-of-Ducks down through the Don Dorrigo country:—when we get opposite to Grafton we will have to make this detour round and go back 6 miles into Grafton station? I should say that passengers coming from the south or from Guyra would be taken across the river by ferry. The trains could be run round if necessary, or it could be arranged to run the railway carriages on to a punt and punt them across, but that would be better.
63. *Mr. Watson.*] What is the difficulty about building a bridge right across? It would be a very expensive bridge, as the river is very wide, and it would block navigation.
64. *Mr. McFarlane.*] The ocean steamers never go above the proposed railway terminus at Grafton? I do not see why passengers coming from the south, or Glen Innes, or Guyra should not be satisfied with a nice ferry steamer to get on at once and go right across.
65. *Mr. Watson.*] The block to navigation would not be sufficient to prevent a bridge being put up if the vessels did not go above Grafton to any extent? A fairly high bridge would be a very expensive thing. It would also mean that the main line could not be joined for some considerable distance back, because, being up at such a height, some distance would be necessary to get down again.
66. Would a swing be too expensive? No; but it is a most objectionable thing for a railway, and for what would eventually become a main line of railway.
67. *Dr. Garran.*] Would a bascule bridge be suitable? It would do, but still it is open, more or less, to the same objection.
68. Is it really necessary for surveyors to have gone as far above Grafton as that before they cross the river if there is no traffic above Grafton? That is the most suitable point.
69. Is that due to low land? No, to high land. The land begins to rise there.
70. Why not go nearer to Grafton? Because the land is so low.
71. Low land on the east side or the west side? Low land on both sides.
72. Very bad for a bridge? The dotted blue line on the wall map and the black line on the plan get away from the river in order to avoid the flooded country.
73. You go over the first good sound ground you get? Yes.
74. You cannot do it in less than $5\frac{1}{2}$ miles? No.
75. You were going to give us a little information on a point which seemed to strike the Committee a good deal. The estimate of £70,000 for the Grafton railway station looks rather large; I suppose it includes all the terminal expenses of water supply, turn-tables, sheds, and so on? Sheds, railway offices, workshops, and wharfs. The requirements of Grafton have not been worked out. That a considerable sum of money is necessary I think there is very little doubt, but what the amount would be is still indeterminate. I think the item of wharfs should really not be charged to the railway, because the wharfs, to a certain extent, are revenue-producing works and the Railway Commissioners get no benefit from them. There are charges for wharfage.
76. *Mr. Dick.*] They collect revenues from all the wharfs along which a railway runs? I know of a lot of wharfage dues which goes into the Treasury, and the railways are not credited with the money.
77. *Dr. Garran.*] With regard to this wharf, has the railway a water-frontage of its own to make a special railway wharf? No. The terminus of the line is on the top of the bank—on the high ground above flood-level.
78. How much above the usual wharf-level? It is considerable.
79. How much is this station-level above the level of the steamer's wharf? I think it is about 20 feet.
80. Are you going to have a little railway down to the bank? I have not worked out anything, but that is what would be necessary, and that is why I kept the station well back. The first proposal which was made was to bring the rails considerably further east into Grafton, but I kept them back there so as to admit of the rails descending along the river-bank at some suitable spot to the wharfs.
81. Why do you want to make a wharf—will not the other wharfs do which are in existence? I think very much more commodious wharfs than the present ones are required; they might do for a start.
82. Do you anticipate any very great increase in the water-side traffic? I have not gone into the traffic question at all.
83. Generally, in providing wharfs, you look at the probable traffic? Yes.
84. You have made no estimate of that? No.
85. You get your estimate of that from other Departments? Yes; but I am not aware of any estimate having been made at all; so that this sum which is put down, and which includes the cost of wharfs, is not intended to approach accuracy.
86. How much of this item of £70,000 do you think will go for a wharf? I think about half of it.
87. You could build us a new wharf 600 feet long in Woolloomooloo Bay for £24,000? I was desirous of including enough for the purpose; that is all I can say about it.
88. You have gone on the safe side? Yes. I would very much rather that that item were deducted, because I think wharfs should be constructed independent of the railway.
89. *Mr. Watson.*] In the evidence taken at the inquiry in 1892, an item of £44,000 was put forward for wharfage? My predecessor, Mr. Whitton, put down £44,000.

- H. Deans. 22 Feb, 1900. 90. I see, on referring to page 7, that the statement was made by yourself; Mr. Collins asked, "Does this estimate include all the railway station buildings?" and your reply was, "Yes; it also includes the sum put down by Mr. Whitton in the original estimate for wharfs and various works at Grafton—namely, £44,000?" I do not remember any detail ever having been worked out to make up that item of £44,000. It did not include the station yard at Grafton, I believe, but was intended to include wharfs, workshops, branch administration offices, and traffic offices.
91. *Dr. Garran.*] Of course, if this line is made, and Grafton is not connected with the other part of the railway system, you will want some place for repairing engines? Yes.
92. I suppose that will be at Grafton? Yes.
93. Will there be room for that in your station yard? Yes; but repairing shops need not necessarily be right at the terminus; they might be placed further back on higher ground.
94. You could have a little local Eveleigh? Yes.
95. You have not taken land for that purpose? No; the question of resumption of land has not been dealt with.
96. If you leave out the wharf, could you do all your other station requirements for £35,000? Yes; I should think that the Grafton station works and workshops, and so on, would run to between £30,000 and £40,000; but that will cover the necessary expenditure for a considerable time to come.
97. That would cover a repairing shed and a locomotive shed? Yes, for the North Coast system.
98. If there was a new wharf built, I suppose that would be a township wharf generally;—it would not be confined to the railway? I do not think it would.
99. Would it be quite fair to the Railway Commissioners to charge the whole cost of that wharf to the railway capital? No; I think it would be right to deduct it.
100. We might leave the wharf alone until we can prove that it is wanted? Yes; I fancy something will have to be done straight away. Perhaps it might only be a small expense of a few thousand pounds; but the lines would have to be taken down to the river, and cranes and so on would have to be provided, and sheds to suit the railway traffic specially.
101. Would the contractor want to get access to the water to load and unload material and other things for making the line? Yes, he would be very glad to have it; he would have to make some provision himself.
102. Supposing the line were made by day labour, would the Government have to make such a line down to the wharf? Yes; it would be better to do so.
103. It would save you a great deal of expense in dragging up the stuff? Yes, if the trucks could be run right down to the water and the goods taken up without double handling.
104. If this line were made, could we begin at both ends conveniently and work along? Yes; there would be the gap between Casino and Lismore, but I believe the Government intend to introduce a Bill to authorise the construction of that section.
105. To act upon the decision of the last Committee? Yes; and on the latest report of the Railway Commissioners.
106. But the recommendation of the last Committee was conditioned by a betterment proposal? Yes.
107. There is no recommendation from the Committee to make a railway apart from that betterment scheme? I have no doubt the Government will be guided by the Committee's conditions.
108. The Commissioners in this last report do not positively recommend the Lismore-Casino line; they speak favourably of the district; they say "We consider the construction of a line between those points (Casino and Grafton) deserving of favourable consideration";—do you think that line could be made for less than £6,000 a mile? I do not think it could.
109. Because that was one of the conditions which the Committee put down, too? Yes; at the present price of rails the estimate comes out at £6,800 per mile.
110. What did the Murwillumbah-Lismore line cost per mile? Between £12,000 and £14,000 per mile—a very expensive line. None of this district is easy country for making railways, on account of the sharp ridges which occur at intervals, causing the expensive cuttings. As it is mostly hard ground—sandstone, schist, hard shale, or even basalt—you cannot make a line cheaply.
111. It is impossible to make one of your cheap lines here? Quite impossible.
112. If ever there is a line made from Tenterfield or Glen Innes, this will become a quasi-trunk line? Yes.
113. So that it would not do to have it flimsy? No; I have estimated for a full amount of ballast on this line.
114. You have a pretty heavy rainfall in this district, and you cannot have the ballast soft? No; it would not do to leave out ballast.
115. You must have the permanent-way well drained? Yes.
116. All that means expense, and that puts a cheap line out of the question? Quite. The contour of the country is against cheapness. On this line from Grafton to Casino the culverts and timber bridges, not to speak of the large bridges, come to £1,252 per mile. In some of the cheap lines the culverts and openings for water have come to little more than a tenth of that sum.
117. *Chairman.*] What did the bridge across the Richmond River cost? Over £20,000.
118. *Mr. Shepherd.*] Do you know what sort of timber there is on the line between these two points? Not very far from the line there is iron-bark, blue-gum, and turpentine. All the good timbers of the coast are represented in that district.
119. It would not have to be taken any very great distance? No.
120. Does not 3s. 3d. each seem a very high figure for sleepers when the timber is so easily got? I do not think so. In places there will be a good deal of carriage, and I have estimated for a stronger and better sleeper than we have on the light lines.
121. I think the great expense of these sleepers is due to the cost of squaring them;—all the sleepers have to be squared according to the present regulations, would it not be possible to have only one surface squared? You must have them even in width; three sides must be squared, even if the top be left, but I do not think it would be desirable to leave the top round as is done in the west. As broad a surface as possible is required for the rail to sit upon. All the white, soft, outside sap-wood must be got rid of, and the rail allowed to rest on the hardwood proper; and when that is insisted on, and when it is remembered that, although good patches of country are passed, near or through, there would still be a good deal of carriage on the average, and I do not think 3s. 3d. each is too high a price to reckon to have to pay for sleepers laid on the road. That price includes adzing.

H. Dónne.
22 Feb., 1900.

122. In America, some of the lines are constructed at a very cheap rate;—what kind of sleepers have they, as a rule? They have ordinary soft pine sleepers. In California, they use redwood to a very large extent, and in dry country it is a very durable timber; further east they largely use white oak. With the soft pine sleepers, some preservative process is often made use of, which very much lengthens their life.

123. Are you aware of the cost of sleepers there? Yes; on the whole they are very much cheaper than ours. I suppose they run from 1s. 6d. to 2s.; but then the American forests are worked in quite a different way from that in which we work ours. They work them in the face, and they put a saw-mill and saw up everything as they come to it. When ironbark sleepers are required, the trees, which are scattered through the bush and do not grow close together, have to be picked out; a face cannot be worked.

124. The American timber is very much softer and very much more easily worked? Yes.

125. Have you ever tried to see if it is possible to reduce the cost of sleepers at all? Yes. I have been in office nearly eleven years, and during that time I have been trying to reduce the cost of sleepers and every other item. I think I have been fairly successful; but there is a limit below which you cannot go.

126. I thought where you had timber contiguous to a line the cost of the sleepers would be reduced;—I have noticed that where they had to cart sleepers a very long distance they seemed to do it for about the same price as you pay where you get them close to the line? I do not think you get any timber which is quite suitable actually close to the line, or at least you pass through very little of it. On this Richmond Range, where the line goes through, there are some large trees, but there are not many of them, and it is very likely that we may have to cart the sleepers some little distance—certainly you would over some parts of the line where there is no suitable timber at all.

127. You said that the deepest cutting is 35 feet; I suppose that occurs in crossing the Richmond Range? Yes.

128. I suppose you have endeavoured to get the line as level as it is possible to be got under the circumstances? Yes.

129. I have always been a great advocate of making a line almost level? If you want to make the line quite level you will have to tunnel.

130. Do you not think that where a railway line is being constructed for all time, it will pay to go to great expense in the first instance to get the road comparatively level? Yes; but if you went too far in that direction, the cost might be too prohibitive.

131. Much smaller trains can only be taken where the gradient is great, and the wear and tear on rolling stock is much greater on a steep gradient than on a level? I think that in a line of this character, and in country partially undeveloped, it is as well to provide for a line that will not cost too much, so as to avoid having too large an amount to pay for interest; but afterwards if the country became thickly populated, and the traffic grew to be very large, it would then pay to reconstruct the line in parts.

132. *Mr. Dick.*] Has the Grafton end of the line been set out entirely on its own, or with a view to a possible connection either with Glen Innes or with the North Coast railway? It was worked out originally as a section of the North Coast railway.

133. And no alteration has been made in the original surveys for that purpose at the Grafton end? Yes, there have been. I remember seeing the first survey which was made, and that went right through the middle of the town.

134. That was with a view to a southern extension? Yes; with a view to crossing the river at Grafton and going south.

135. What led to the alteration of the position of the present proposed terminus? The object of the alteration has been to reduce the cost, and to get on high ground, which is not subject to floods.

136. Do you know whether the suburban allotments which the present proposed terminus occupy are of a valuable nature, or is it comparatively cheap land? Not where we go through. All the land about Grafton is good. The Grafton area is a very large one, and the population at present is comparatively small, so that there is a very small proportion of the town really occupied.

137. It would not cost much, then, for the resumption of the suburban allotments? I should not think the cost of the resumptions would be much, because the supply of land for business purposes is very much greater than the demand for town allotments.

138. I suppose at Lismore they have repairing sheds? The traffic at present is so very small that there is very little repairing to do. What repairing has to be done is done there.

139. At about what distance are repairing sheds usually placed on our lines? Judging by the existing system—there are shops at Goulburn, Bathurst, Newcastle, and, I think, Junee; that would make the distance at about 150 miles.

140. *Chairman.*] Having regard to the character of the country through which this line is proposed to be carried, do you think an average cost of £7,504 per mile is the lowest price at which it could be constructed, consistent with safety? I think this line, when it comes to be constructed, will cost probably less than that. This estimate is intended to cover all contingencies.

141. Seeing that the amount is so large that the line apparently is not going to be a profitable one, is there any means by which we could make a cheaper railway? I do not think there is. I do not see how you can make it of a much cheaper class than that estimated for. My estimate may possibly be high in some directions, and it may be low in others, but I am quite sure that the class of line for which I have made the estimate is the right one, and that it would not be desirable to cut out anything. I have proposed to make it as cheaply as circumstances will permit. Unfortunately the undulations in the country, and the amount of flood country that one has to pass through, and the crossings of the creeks and the Richmond River do not permit of a cheap line being made.

142. All these features prevent possibility of its being a cheap line or a surface line? Yes. It might be objected that the line proper should not include workshops, traffic offices, and wharfs, and that these things should either be found somewhere else or should be spread over the whole northern system. If you take out these items, and leave merely the Grafton station proper, I think you would cut out about £60,000, or say £55,000. Then again I put down an item for engineering and contingencies, and I hope that when we construct the line we shall not have to draw upon the contingencies. Engineering design and supervision must be paid for.

143. Then there is a possibility that the item of £63,352 put down for engineering and contingencies may not be absorbed? It may not be absorbed.

144. It may possibly be considerably reduced? Yes.

- H. Deane. 22 Feb., 1900. 145. You may not want more than £40,000? I have always found it very unsafe to assume that the sum put down for contingencies will not be drawn upon, because we nearly always have to do it. You lay out a line with the best of intentions, and after the most careful thought, and study of the traffic requirements, assisted by the Railway Commissioners' officers, decide what is to be provided for; but no sooner do you begin to start the line than you find that something more is required. I think it is far better, therefore, to allow such items in the estimate to stand. That remark also applies to contingencies.
146. I suppose in a country such as that to be traversed here it is rather likely to occur than otherwise? I think it would.
147. Would this be a line of railway on which a train could be run at full speed? Yes.
148. No limitation to the rate of speed? No. I have put down 60lb. rails, and, with the close sleepers and the ballast, I think one will be able to run safely at that speed all locomotives but the heaviest. If I had to provide for the heaviest locomotives, I should say, put down a heavier class of rail. If we had a standard rail now of 70 lb. per yard. I should put in 70 lb. rails; but 70 lb. rails have not been used for some time, and our only standards at present are 60 lb. and 80 lb. rails.
149. The statement which the Under Secretary read, says that a large portion of the country to be traversed is alienated land. Can you state the distance of alienated land to be traversed? The length of alienated land traversed is 18 miles 55 chains; the length of roads traversed is 1 mile 10 chains, and the length of unalienated land traversed is 43 miles 10 chains. I have provided for good fences all the way along, because it is a cattle country and wire fences are not suitable.
150. The statement which the Under Secretary read refers to the work being carried out on the betterment principle. Seeing that such a large length of the line goes through Crown land, would not that very much reduce any return in that direction? I do not know that it would, because there is a very large amount of alienated land contiguous to the line. We go through a lot of reserves which are surrounded by private lands.
151. I suppose the land that is not alienated could be treated as a railway reserve, and be sold on special terms? If the selling would reduce the capital cost, that would be a very good thing.
152. Mr. Watson.] The last Committee that inquired into a proposal of which this line was a part drew attention to the fact that Mr. Lloyd, District Railway Surveyor in the Railway Construction Branch, had at first estimated the cost of the Grafton-Lismore line at £6,000, and then thought that it could be reduced to £5,000, although he admitted that that was exclusive of bridges.
153. Did you, after he gave that evidence, get Mr. Lloyd to give you any details of his estimate? I had some conversation with Mr. Lloyd about that. If he had been engineer-in-chief he would not have made that estimate; he did not know all the circumstances. You see, a field officer judges things partially only; he does not know all the items that have to be included. It is very probable that he would under-estimate a line, and he might be a very intelligent man and know something of the matter. You can do a good deal for £5,000. You can make a good line for £5,000, excluding bridges, stations, and a number of other things; but we have to include bridges and stations. I have to include all office and survey expenses; you must not forget those things. The man who volunteers the opinion that the line should be made for a certain sum forgets to include them.
154. Mr. Lloyd admitted in his examination that he had left out the bridges, and he seemed to take as a criterion the cost of a line between Cootamundra and Gundagai;—that would be no proper guide, I suppose, as to the cost of a line on the North Coast? No.
155. Notwithstanding your conversations with Mr. Lloyd on the subject and any information which he may have been able to afford you, you have no reason to think that it could be done for anything like what he said? No.*

FRIDAY, 23 FEBRUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
	JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 23 Feb., 1900. 156. Chairman.] I think you have one or two items to supply to the Committee? The price of steel rails, according to the recent tender, came out at about £7 10s. a ton, delivered in the stores at Eveleigh, so that that makes my estimate right. The extra length of deviation on these two lines—the blue and the red—at the Casino end is 2¼ miles, and the extra cost is £7,000.
157. Mr. McFarlane.] In your evidence yesterday you stated that the traffic would be considerably more by adopting the original scheme—that is, the westerly line? There is more settlement on the westerly line.
158. Do you think it will be more desirable, in the interests of the country, to carry out that scheme, notwithstanding the slightly-increased cost owing to the increased settlement and possible traffic on the line? Yes.
159. Has the estimate which has been made in connection with the construction of this line been based on actual survey? Yes.
160. When did this actual survey take place? Before the last inquiry—about 1891. A few small deviations have been proposed which would not materially alter the cost of the line. There is no necessity for a further revision of the survey, except, probably, with regard to these deviations.
161. In estimating the cost, the survey which you had to guide you was a survey which had been made nine or ten years ago? Yes. 162.

* NOTE (on revision):—If to Mr. Lloyd's estimate of £5,000 per mile be added the cost of bridging, station works, and supervision, an amount exceeding my estimate will be arrived at, viz., £8,636 per mile.

162. From your knowledge of the Department, do you think that the information which was supplied in that old survey was accurate enough to submit in figures the probable cost of the line now proposed? Yes; of course the prices and the requirements have been revised very recently. H. Deane:
23 Feb., 1900.
163. What do you mean by revision? I mean that the grading of the line has been looked into—the question of waterways and prices to be placed in the estimate for all classes of work has been looked into.
164. Have all these prices been reconsidered? They have all been reconsidered since that date.
165. A number of years ago there was a proposal made to construct a railway from Glen Innes to Grafton, and the expenditure in connection with that proposal was estimated to be about £2,000,000, but on recent surveys that estimate has been reduced to less than £500,000;—what I want to know is whether, in view of the survey which was made on that particular line nine or ten years ago, if an additional survey was to be made that amount could not to an equal extent be reduced? No. I will tell you the circumstances connected with the Glen Innes to Grafton railway. The first estimate was made in 1884.
166. I am speaking of the time when the first trial survey was made of a line between Grafton and Glen Innes, which from my personal knowledge was fully twenty-five years ago. I remember the time distinctly when it was submitted to Parliament, but I am speaking of the time when the first trial survey was made? The time when that estimate of £2,000,000 was submitted to Parliament was in 1884, the year in which a vote was taken for the Glen Innes-Grafton railway, and Mr. Whitten stated, if I remember aright, at the time that it was an estimate which was made without a complete survey—without sufficient data—and that he could not guarantee it. He therefore in no way backed up the estimate. After that data the survey which was called the permanent staking of the line was completed. Other surveys have been made, and that estimate, which was placed roughly at £2,000,000, was brought down to, I think, about £1,250,000.* That was for a line of ordinary construction. Now, some time ago there was a suggestion made by Mr. Thomas Kennedy, of my branch, to adopt another route, to run out near the Gibraltar Range to a point over the Manning River, to run down the declivity to the Manning River by means of some special arrangement, such as a rack railway, then to cross the river, and get into Grafton. He went over that line, and his report shows that he estimated that the line would cost under £500,000. That line is not a line of ordinary construction; it involves a portion of several miles of rack railway.
167. Will you explain what a rack railway is? A central rack is laid between the rails with teeth, and there is a special locomotive used, with a spur wheel underneath, which fits into this rack, and so, by the adhesion which is gained by means of this rack, pulls the train up the steep incline, whatever it may be, of 1 in 10, or 1 in 15. It is used for going up inclines and making use of the full power of the engine, without depending on the mere adhesion to the rails.
168. This rack minimises the cost of construction? Steeper grades are possible in certain places. That, you see, introduces a principle which has not been used in this Colony hitherto; it, of course, is perfectly practicable, but it makes a break in the railway system.
169. Has this rack principle been tried in any other extension in this Colony;—will this proposal of Mr. Kennedy's be an experiment of this rack principle? No, it would not be an experiment, because there are plenty of examples of the same system in different parts of the world. As regards this Colony it would be new.
170. Would not that be an experiment? No. I should not call it an experiment, because I am quite satisfied that it could be successfully carried out.
171. If it has not been carried out before in this Colony, would it not be practically an experiment here if tried? No; I do not agree with you. It would be a novelty; it is a practicable design.
172. Are you, as Engineer for Railway Construction, satisfied that in steep grades, on light lines, where there is not a very large amount of traffic, this system could be carried out successfully? Do you mean with a view to reducing the cost?
173. Yes? I believe it could in some circumstances, but the circumstances would have to be particularly fitted for it.
174. As far as Mr. Kennedy's report is concerned, would you agree to that suggestion? I believe it is quite applicable to that particular line.
175. In view of that, and of the estimate he made, this enormous estimate of about £2,000,000, which was made years ago, has been reduced to considerably under £500,000? Yes; but you are not estimating for the same thing. You are estimating for a substitute for the original proposal.
176. If that substitute will answer the requirements, would it not be taken for granted that that should be acceptable? Yes, it should; but, of course, that has still to be inquired into. First of all a survey has to be made.
177. I understand that a survey had been made? A survey has been made in part; but the plans are not ready, and then the advisability or not of adopting such a system has to be considered.
178. *Mr. Watson.*] How would the cost of the work compare;—it would not be increased by the central rail? Yes.
179. They have one in New Zealand, and the cost of working it is very expensive? Yes; the cost of working is very much greater.
180. *Mr. McFarlane.*] You have stated already that the Department have approved of the rack system being applicable to such lines of railway as are now surveyed between Glen Innes and Grafton;—you admit that it is suitable for that line? If the physical features are suitable.
181. You are well acquainted with the physical features? Yes.
182. With your knowledge of the physical features between Glen Innes and Grafton, do you think the rack system would be applicable to that part? I believe it would.
183. It would be a cheaper line to construct? Yes.
184. Would it make any material difference in the cost of construction? Yes; it would make a lot of difference.
185. About how much per mile? I do not think you could reckon it at per mile, as it shortens the line very considerably. On the whole estimate it might save about three-quarters of a million. 186.

* NOTE (on revision):—This amount was stated from memory, but the real amount of the estimate is, I find on looking it up, £1,600,000.

- H. Deane.
23 Feb., 1900.
186. On a railway, say 100 miles long, between Glen Innes and Grafton, you would save £750,000 in construction? Yes.
187. Could you give any idea of what it would save annually? No, I have not gone into the matter.
188. I should like to know very much the amount of the increased annual cost of maintaining a railway 100 miles long in such country as we have between those two points;—could you not give us roughly an estimate of the increased cost? No. At the present moment I could not give you any information which would be of any service. But a system of that kind is utterly inapplicable to the Grafton-Casino line.
189. I was just going to ask whether you do not think it possible, according to the physical conditions, that such another scheme would be possible? No.
190. For what reason? Because you have not the same circumstances to deal with.
191. In what way? What you have in the Glen Innes-Grafton line is a great drop in altitude. There is a great difference of level between Glen Innes and Grafton. If you drop down with suitable grades to work ordinary locomotives, you have to work round spurs, and down river and steep valleys all the way. That involves tunnels and bridges, and heavy cuttings, which are very costly, between Glen Innes and Grafton. But, if you can find any system like this rack railway by which you can drop down a slope—a comparatively even slope—rapidly, you may be able to save a lot of money. You may be able to run it at a high level along the top of a ridge which is part of the table-land at very little cost. It does not cost much, you understand, to run along the top of the table-land, but when you begin to descend, and work round the contours to come down into the valleys, you then introduce questions of serious cost. With this line of Mr. Kennedy's you run out on the top of this spur of the table-land at a comparatively low cost, and then you drop down and you put a large portion of your descent or ascent, as the case may be, into that short length of line, about 5 or 6 miles. You have a costly bit of line for 5 or 6 miles on the valley below, and then you go along the valley instead of contouring round as you do to get an ordinary locomotive over the country. Where the end points are very different in latitude you run out on the level on the top for a distance, and you have another piece a comparative level at the bottom, and you put a steep piece of expensive line in the middle which has to be worked by special appliances. That is the difference. In the Grafton-Casino line you have nothing of the sort.
192. Have you a good knowledge of the country between Grafton and Glen Innes? Yes; I have been over it.
193. Do you think that this rack system can be advantageously worked there? Yes.
194. You believe that this estimate which has been made by Mr. Kennedy is practicable, and that the line could be carried for something over this estimate? No; I will not go so far as to say that. I undertake no responsibility whatever for Mr. Kennedy's estimate. As soon as the quantities have been worked out—and we have the required levels in the office now; I think it is all complete—and as soon as I have an opportunity of going into the estimate myself, then I shall take the responsibility of it, but not until then.
195. You would not care at the present time to form an opinion? I can form an opinion. I am quite sure that there must necessarily be a very large saving, but I will not say how much.
196. You will not say, for instance, that Mr. Kennedy's estimate is either excessive or not sufficient? I am quite sure it is not excessive.
197. He is a very old officer in the Department, and from the position you occupy, would you not place some very large regard on any estimate which he made in this connection? Yes; but I do not consider him infallible. I appreciate Mr. Kennedy's services. I think he is an able officer, but, at the same time, I do not think I am called upon to in any way take the responsibility of his estimates.
198. You could not endorse his estimate without the actual details being given, and gone over in the usual official way, making a calculation of what each mile must cost? I must have all the details.
199. The first estimate did not purport to be an actual estimate;—although he confined himself to two or three different mile sections it was not an actual survey? No; he only looked at the country, and said he thought that a line might be made for a certain sum.
200. Would not that apply equally to the proposed line between Grafton and Casino? No, because you have no point where you have a considerable difference of elevation to treat.
201. That is all the better for the report? Not at all. The gain made by introducing the rack system is one due to the class of country you go through, to the difference of levels.
202. In the present estimate the grade is 1 in 50 going north, and 1 in 60 going south; that is not a steep grade? It is not very bad.
203. It is not considered a bad grade? It might be worse.
204. Could not the line be constructed at a much less cost than the proposed estimate? No.
205. Could not the proposed expenditure of £70,000 or £80,000 on wharfs and station at Grafton be dispensed with? In my evidence I explained what I thought about that.
206. The reduction of the estimate by that amount would mean that the line would cost about £1,000 less per mile for the whole distance between the two points? Yes.
207. That would be a considerable saving? Yes; only that it would have to be done at some other time. The expenditure would have to be incurred, but would not be charged to the particular line.
208. Some other time might come along when perhaps the railway would be more profitably worked? Yes; I have nothing to object to that.
209. In view of the small amount of revenue which the Railway Commissioners say will be taken in the event of that line being carried out, do you not think that that item is very greatly excessive? I think that sum might be left out of this estimate at present.
210. In view of the fact that it is so long since an actual survey has been made, and also in view of the fact that railways are being constructed now for much less than the cost estimated seven or eight years ago, would not that apply to this particular line? No.
211. Without wishing in any way to depreciate your estimate, has it not invariably resulted that estimates which have been made even five years before, have been very greatly minimised when tenders have been called, and that the work has been carried out at a much less cost? I do not think so. In some cases the estimates have been slightly exceeded; in other cases, where a saving has been made, it has not been a very large one—not sufficiently large to show that the estimates were wrong.
212. I am not wishing to show that at all; where an estimate has been made ten or fifteen years ago, and no fresh survey has been made in the interval, and tenders have been called for ten or fifteen years after the survey was made, and the estimate given, has it not been invariably the rule that the work has been carried

carried out at a much less cost than the actual survey? Not by the survey. The original estimate may have been excessive, but I have pointed out that I have revised the whole question of estimates.

H. Deane.
23 Feb., 1900.

213. When did that revision take place, for we see that the report was dated in December last? That was when it was finished.

214. In arriving at that estimate, was it based on the survey which took place ten years previously? Yes, under my direction; so that I perfectly understand what was done.

215. Ten years ago there was not the same amount of knowledge of the country between even Grafton and Casino as there is now? I do not think there is any increase in knowledge of that part of the country.

216. Considering that in ten years there has been such a material difference between the surveyors who have explored the line from Glen Innes to Grafton that we found this substantial decrease in the proposed expenditure, would not that also exist in the case of the line between Grafton and Casino? No; the cases are not parallel—the conditions are entirely different. I know of nothing that has occurred within the last eight years to show that the latter survey is not a right one; in fact, the ground has been gone over two or three times, and there is not the slightest doubt that in the main the survey is the right one. It may be possible here and there for a few chains, or for half a mile, to make a deviation which will save a little, or be better in other respects; but I am quite sure that no survey that could be made at present would so materially alter that line as to bring down the estimate, or alter the class of line, to make it much cheaper than what has been proposed.

217. Do you not think the circumstances generally have altered during that period; I am speaking now, not with regard to the difficulties of the country as to construction, but more particularly with regard to the class of country; in that period, as in every new country, when settlement takes place the people are the best judges of the quality of the land, and they only take up from the Government the best portions of land in the locality;—do you not think there will be a very material difference, looking at it from that aspect now and ten years ago? I do not think there has been such a large amount of settlement in that district. There has been a large amount of settlement between the Richmond and the Tweed, but I do not think there has been much settlement along the Grafton-Casino line.

218. Do you not think there has been a large amount of settlement about Myrtle Creek? There may have been, but as you see from the map there was a considerable amount of settlement there when the survey was made.

219. I am speaking of country which I know perfectly well; with regard to Myrtle Creek, are you acquainted with that particular locality? I passed through Myrtle Creek.

220. To any extent? I have driven through there.

221. Yes; but that is along the main road; there is a large area of rich agricultural land on that creek? I know there is dairying done.

222. There is also rich land along Sandy Creek? Yes.

223. And on Deep Creek and a number of other creeks? Yes.

224. All these localities are capable of carrying a large population? Yes.

225. Ten years ago these localities were only sparsely populated; as the dairy industry grew the country was being developed, and what was a sparsely populated district ten years ago, is, you might say, a densely populated one now? Yes; I think that is very likely in certain portions.

226. Would not that interfere to a very large extent with the estimate which the Railway Commissioners have made of the traffic on this proposed line? I do not know anything about the traffic estimates.

227. But would not that be probable? No doubt it would. That would bring increased traffic to the railway.

228. It appears that the Railway Commissioners have really not considered the amount of revenue to be derived from the district, but have only considered the estimate which was made a considerable time ago; that estimate, I think, would be materially altered in view of the developments which have taken place since then? I may point out that the Committee will have an opportunity of examining the Railway Commissioners' officers—Mr. Harper, for instance.

229. If it were merely a matter of connecting the most important part of the Clarence River district with the most important part of the Richmond River district, from your knowledge of the districts would you adopt the proposed scheme? Yes; I think it is the best practicable line.

230. I wish you distinctly to understand that I am not speaking of the line as a section of the North Coast railway, I am speaking now as if it was a proposal to connect the most important part of the Richmond River district with the most important part of the Clarence district, and if it was, would the proposed line be the one which you would suggest? Yes; I think the line would have to go round by the way which has been laid out.

231. Would not that be more expensive than any other proposal? I do not think so. I know of no other proposal which would be cheaper.

232. For instance, a line from Casino to Lawrence could be carried out at a much less cost than a line from Casino to Grafton? Yes, it could; but it would leave Grafton out.

233. I am speaking now of a line to connect the two districts, and not the two important centres;—a Casino-Lawrence line would be cheaper than a Casino-Grafton line? I think it would be, by a very large amount, cheaper.

234. Would not also the cost of a line from Woodburn to Chatsworth be even much less? Yes, probably there will be a difference of about 14 miles in starting from Lawrence instead of Grafton.

235. There will be a saving of 14 miles, and it is over comparatively speaking level country between Lawrence and Casino? It is slightly undulating country.

236. Equally as good as we leave between Casino and Grafton, and you would escape the flooded area near Grafton; but this line before the Committee is to be considered only as a part of a North Coast railway? Yes.

237. And I presume that this survey has been made between Grafton and Casino with a view to the line extending southward in the event of the North Coast railway being approved of? It has never been suggested that Grafton should be left out in any case.

238. Not in any case, and I am not suggesting that it should be left out in any case; I am looking to the fact that this portion between Casino and Grafton is to be a non-paying portion, according to the estimate which has been submitted here; even if it will not be a paying portion of this section, in view of future extension as part of the North Coast line, would it not be justifiable in the interests of the Colony to carry out a portion of the North Coast line? I think so; I think it would be a pity to go to Lawrence and make that the terminus when, at some future date, you must carry it on to Grafton. 239.

- H. Deane.
23 Feb., 1900.
239. That is exactly what I look upon as the crucial point; if it were merely a matter of connecting the two districts, another route might be adopted at a less cost, and perhaps in a more profitable way; but in view of its being a section of the North Coast railway, this, in your opinion, is the most practicable route and the best route in the interests of the Colony to adopt? Yes.
240. Supposing a line of railway were proposed between Lismore and Maclean or Lawrence, that might be more profitable and less expensive as regards the two districts;—but would it answer the purpose of being a portion of the North Coast line? I think you would find that it would be much more expensive. You would have a lot of water trouble to deal with.
241. Where? Between Lismore and Lawrence.
242. No, very little? I have not been through that district; but I have been talking to Mr. Hickson, who knows. You have all these rivers and creeks to deal with further east, where the country is flat and the water spreads out.
243. As regards Lawrence you will have high land, and it comes abruptly into the town? Yes; but Lawrence is not everything.
244. I do not wish to imply that; if it was only a question of connecting the two districts, you think that a better route might be adopted; but that, in view of a North Coast extension, the Grafton to Casino route would be the better route to adopt? I am sure that, in view of the North Coast extension, it is the best route.
245. There might be other parts of the Clarence River district and the Richmond River district which it might be desirable to connect, that is if we were only considering the local requirements of the two districts; but when we come to consider the line from a national standpoint, as a portion of the North Coast railway, this would not answer that purpose, and the proposed route from Grafton to Casino is the best available for a North Coast railway? I have no doubt on that score—that the Grafton-Casino line is the best line.
246. With regard to crossing the river at Grafton, it is proposed to have a railway station at Turf-street, in Grafton, almost on the bank of the river? Yes.
247. In view of the small traffic which the Railway Commissioners estimate to get between Grafton and Casino, will it be desirable to carry out this large expenditure of £70,000 or £80,000 on wharfs and a railway station at Grafton;—could not these works be postponed for a number of years to come, when the traffic will warrant the expenditure? I could not say how much would be necessary at the present time.
248. But is this amount necessary? At the present time I do not think it is.
249. Could it not well be postponed for four or five years, until the traffic warrants the carrying out of the work? I think the proper way would be to settle the question of the railway, leaving these items of expenditure out for the present.
250. I quite fall in with your views; but at the same time the Committee are in the unfortunate position that they are not able to decide that question? I think the Committee could recommend the leaving out of certain expenditure.
251. For wharf purposes? I consider that out of about £70,000 put down in the estimate, £15,000 may be considered as absolutely necessary, and the rest left out for a future date. I would recommend that, say, £55,000 be left out.
252. That saving of £55,000 would be almost £1,000 per mile? Nearly.
253. A question was asked you, yesterday, by Mr. Shepherd, with regard to railway sleepers; I happen to have some knowledge of this subject;—do you not think that in the locality where ironbark timber is plentiful railway sleepers could be got for less than the rate paid by the Commissioners,—3s. 3d. or 3s. 4d. per sleeper? We give the timber-getters and others every opportunity to tender.
254. But what are the conditions;—Mr. Shepherd broached the subject yesterday without going fully into it;—you stated yesterday that there is a large quantity of ironbark in this locality, which is a fact; I suppose it is about the best ironbark district in the Colony, and it is well adapted for getting railway sleepers at a cheap rate;—do you not think the conditions which the Commissioners have in regard to getting sleepers somewhat out of date—for they invariably insist on getting hewn timber? I do not think the Commissioners themselves impose any conditions as regards my work.
255. In regard to contracts let for railway sleepers, either for renewals or for originals, is it not sawn timber as a rule which has to be supplied? Ironbark is invariably hewn.
256. Why should it be invariably hewn? Well, the men prefer to do it.
257. That is another question. I maintain, as one having a perfect knowledge of that question, that the Commissioners could get this ironbark timber at a much less rate and in larger quantities, and at more profit to the timber-getters if they made another condition—that instead of having hewn timber all straight-grained trees would be allowed to be sawn? I think there is a little misunderstanding about this. For new lines it is I who have to determine the kind of material, and in my specifications I always say “sawn or hewn.” I have no objection to a sawn ironbark sleeper, but I never get it.
258. There is a great misunderstanding in that respect? Oh, but the timber-getters never do it.
259. The timber-getters and the saw-mill owners are quite separate people, and the saw-mill owners would have been glad to supply timber at a much less rate if they had known that sawn sleepers would be accepted by the Commissioners? I will take sawn ironbark if it is straight in the grain.
260. And the saw-mill owners could supply it at a cheaper rate? If you want to saw timber at a saw-mill you have to bring in the whole log, whereas the sleeper-getter cuts out what he wants and the carting is confined to that particular portion which is useful.
261. To that particular sleeper? He gets a lot of sleepers out of a good log.
262. Would not the saw-mill owner get far more? He might, but I suppose it has been thought out. I give every opportunity to saw-mill owners.
263. I am in communication with a number of the largest saw-mill owners in the Colony, and they are quite ignorant of the fact that the Railway Commissioners will accept sawn sleepers? I will accept them.
264. And I think it would be wise on the part of the Commissioners if they only accepted sound sleepers out of straight-grained trees? I am very much surprised to hear that the saw-mill proprietors would be willing to supply sawn sleepers. I know that they do not care about sawing iron-bark because it is very hard. The different timbers that you get in the mill are blue-gum, grey-gum, mahogany, black-butt, and tallow-wood. These timbers are very much easier to saw than iron-bark. My experience shows that the ironbark is used solely for piles and girders, which have not to be sawn—the timber is simply hewn, shaped in the bush and brought in—or if sleepers, split out of the log.

265. You will find that if the Commissioners invite tenders for railway sleepers out of straight-grained trees sawn they will get them at a much less rate than they get hewn sleepers, and they will be just as good? Well, I will take them. H. Deane.
23 Feb., 1900.
266. In view of the large amount of ironbark in the locality where it is proposed to build this railway—and I think you have a sufficient knowledge of the amount of ironbark there, and of its easy accessibility to the railway—I venture to say that these sleepers could be got at a very much less rate than the estimate made by the Commissioners? This is my estimate. I will take care to let them know. I am doubtful now as to whether they can be obtained any cheaper. I know that when we pay for sawn timber we pay a higher price per cubic foot than we do for sleepers.
267. With regard to crossing the river at Grafton, you stated yesterday that it would not interfere with navigation. Susan Island is the nearest point to the railway terminus at Turf-street? Yes.
268. Do you think it would be possible to construct a railway across there? Yes; but you could not start from the station ground in Grafton; you would have to start from a long way back in order to get sufficient height above the river to admit any small craft passing underneath.
269. On what side of the river would you have to start from a long way back? From the northern side.
270. But it is high land to the water's edge at Turf-street? Yes; it is high land—it is about 25 feet above high water.
271. It is above flood level;—would it not do to start the railway bridge from that level? I do not think it would.
272. Would you have to go considerably above that? I think you would.
273. For what reason? I do not know much about the navigation of the river above Grafton, but if there are any small craft at all, I suppose they would want a headway of 30 or 35 feet.
274. But all the small craft could go under that;—are you not aware of this fact, that lower down the river, where the existing bridge is, the people have been agitating for a number of years to have a high-level bridge there? I do not know what they have done.
275. They would be perfectly satisfied if they could get what they have been agitating for for years, a bridge to connect South Grafton and North Grafton, at flood level? Then it would want to have an opening.
276. There is no navigation above that point except by droghers and small launches? You would have to provide for that.
277. They could go under the bridge? I do not think so.
278. A drogher only has a funnel, and it is the largest steamer which goes above that point? I think you would have to give a headway of 30 or 35 feet. You would have to provide not merely for high water without floods, but also for the time when freshes are coming down.
279. There is no traffic when there is a flood in the river? No; but when a fresh is coming down.
280. A rise of 3 or 4 feet in Grafton means up the river at Copmanhurst a rise of 25 feet, so that there is no travelling done in that case? In a flood, there is a difference in level of 20 feet at Grafton.
281. When there is a rise of 80 feet or 90 feet at Copmanhurst, there is only a rise of 20 feet at Grafton? Yes.
282. You think that, notwithstanding the different surveys which have taken place and the various estimates which have been made of the cost of constructing this line, and notwithstanding the deviation which has been mentioned, the original survey marked on the map is the best practicable route and the best one to adopt in the interests of the country in view of its being a portion of the North Coast railway? I look upon this line as a section of the North Coast railway, and I believe the location of the line to be right in accordance with that view.
283. As a portion of a North Coast line, you think it is the best available route which has been submitted yet? I do.
284. *Dr. Garraun.*] Could you not fit in a Lismore-Lawrence line to a North Coast railway? I think you would have a great deal of trouble with water if you tried to cross the flooded country from Lismore.
285. That is a local difficulty;—I asked whether it would not fit in with a North Coast line? You could fit it in, but I do not think it would be as good a line.
286. *Chairman.*] Would not that make a difficulty between Lawrence and Grafton? This map shows Lawrence, and all this country is flooded. If you get into Lawrence, I think you would find some difficulty in getting out again without a lot of expense to keep clear of floods.
287. *Mr. Shepherd.*] Can you give us an idea of the difference in cost between a slow line—that is, a line on which the trains run at 10 miles an hour—and the ordinary line? I would not make any difference between a slow-going line and this line. It is a question really of climate and proper foundations. If this line were out in the west, where there is so little rain, I might cut out a good deal, but a substantial line must be built in a climate like this. Apart from that, whether you have slow-going trains or whether you have quick-going trains, you must have proper grades, and those grades, even 1 in 50 and 1 in 60, involve a great deal of cutting.
288. On very level country, such as we have in the west generally, the line could be cheapened a good deal? Yes; I have carried out a good number of very cheap lines in the west. That is very largely because the country is suitable and level. There is a good deal of difference in the estimates of the different lines on the western side of the “divide.” Some of them have only cost about £2,000 a mile. The Parkes-Condobolin line cost barely £2,000 a mile. There are others which have cost £2,500 a mile and over on account of the country not being quite so favourable; but the same attention has been devoted to economical laying out, the same care has been devoted to the subject as where I have been able to make the lines cheaply.
289. *Mr. Watson.*] Is the country on the Tweed-Lismore line supplied with ironbark? There is a good deal of ironbark. There are some ironbark patches, I believe, down the river, not very far from Lismore, and there is ironbark near Mullumbimby, not very far from the Brunswick.
290. Did you follow your usual practice of advertising locally for sleepers for that line? No, we did not advertise for sleepers separately, they were included in the railway contract.
291. What was the estimate in the railway contract, or do you know what the contractors got them for? I will tell you presently when I get the contract schedule.
292. If the timber was fairly abundant there, it ought to be a guide as to what you can get sleepers for here? I do not think we have ever paid much less than 3s. 6d. or 3s. 8d.

- H. Deane.
28 Feb., 1900.
293. I think you have paid less than that inland for squared sleepers? I do not think we have, but I will see presently. We have paid less than that rate for the round topped sleepers.
294. *Dr. Garran.*] On this Grafton-Casino line, what proportion of the line is 1 in 50 grade, and what proportion 1 in 60 grade? I can tell you what lengths there are; there are not long stretches as a rule. There is a quarter of a mile of 1 in 60 grade at 9¼ miles; there is another of about the same length—about 25 chains—at 10½ miles; then there is a stretch of about three-quarters of a mile of 1 in 60 grade at 13 miles, that is going north. The longest stretch of 1 in 60 grade going north is nearly 2 miles; but still 1 in 50 going north is the ruling grade, so that it does not so much matter. In the other direction it is about half a mile,—just over the range.
295. The stiff grades are comparatively short as compared with the length of the line? Yes; and there are not very many of them.
296. Are they compensating grades to any extent as to curvature and so on? Yes.
297. *Mr. Watson.*] I take it that your answers to Mr. McFarlane's question about the propriety of using a rack rail on the Glen Innes-Grafton line would not apply to the Grafton-Casino line? No.
298. If you did apply the rack rail to the Grafton-Casino line,—that is, avoiding, perhaps, the necessity for the Richmond Range of curve,—would it make any material difference in the cost of construction? I do not suppose it would in this case, and it would be very awkward to run the traffic with it.
299. As a matter of fact, in other parts of the world the rack rail is only used in extremely difficult country? Yes.
300. Is it not also a fact that the cost of working that system is very excessive as compared with the ordinary system? Yes, it must be. I have not any particulars here, but before these lines go before the Committee, as I imagine they will go sooner or later, I intend, if possible, to get all information, so that the Committee can judge.
301. There is a rack railway, I understand, in Queensland and another in New Zealand? There is one in New Zealand, one in Queensland, and there is also one in Tasmania, on the west coast.
302. As a rule, railway companies and Governments in charge of railways prefer to spend a larger sum, and avoid what is necessarily, to some degree, a break? It is true that you would have the same gauge as the other parts of the line, and you would be able to get your trucks and carriages over it, but still it is a break in the sense that you have to change your locomotives, and you have to break up your trains so as to alter the loads.
303. *Mr. McFarlane.*] Could not a railway between Casino and Grafton be constructed at a much less rate than that which is now proposed? No.
304. Would not a light line answer the requirements of the Clarence district and the Richmond district? No, you could not make a lighter line with safety than the one I am proposing.
305. Are you aware that in Queensland they make light lines of narrow-gauge railway over difficult country? You would not save anything by doing so here.
306. I mean in construction and working expenses;—could not these districts be connected by rail at a much less rate than that now proposed, were it not for the fact that this line is considered to be a portion of the North Coast line? No, I do not agree with that at all.
307. Would not a narrow-gauge line suit here? You could use it.
308. Would not that be done at less cost? I do not think it would. I would sooner make a standard line with stiffer grades or sharper curves.
309. But as a matter of policy? No; the only advantage which the 3 feet 6 inch gauge line in Queensland has over ours is in being able to negotiate sharper curves. If we introduced that system we should have to get a lot of special rolling stock. Our rolling stock can go round these sharp curves with the exception of the locomotives.
310. Now, as a means of connecting these two districts, could not the narrow-gauge system be found to work suitably, and could not the line be built at a much less cost than that now proposed? I do not think so. You must remember that you have a piece of standard gauge from Lismore to The Tweed.
311. Apart from the construction of this line as part of the North Coast railway, if it were merely a matter of connecting these two districts, could not a cheaper and more profitable system of railway connection be carried out? No doubt you could cheapen the first construction by reducing the gauge; but you would not make a more profitable line.
312. It is pointed out that the smallness of the traffic between the two districts may not warrant the connection of them by rail; but the fact is lost sight of that this proposed line is only a portion of a North Coast railway scheme; I wish to bring out that in connecting the two districts it must not be lost sight of that this line is a part of that scheme, and that if it was merely a matter of connecting the two districts, it could be done at a much less cost? I do not think the reduction of cost would be worth anything.
313. Do you not think the cost of a narrow-gauge line would be much less? I do not think you would save very much.
314. Do you not think you would save in this way: that there are better places than Casino and Lismore and Grafton to connect for trade purposes? You have the same difficulty, the same ridges, the same waterways, to go over.
315. I do not think so; if you study the district you will find that you can get better parts of the Richmond River district to connect with better parts of the Clarence River district than Grafton, with a less number of creeks and rivers to cross than you get on the proposed line from Casino to Grafton? Of course, the Committee would be able to get information as to that; but I am informed that you would not.
316. From your reports you would not like to say to the contrary? From the information I have got outside the reports, I should say that the difficulties would be very much greater.
317. Do you not remember about some proposal being made for the construction of a railway from Lismore to Maclean, *via* Coraki, on the Richmond River? Yes.
318. If that line were carried out—well, I admit it would not answer the purpose of being part of a North Coast railway—from the district standpoint, would it not be more cheaply constructed than a railway from Lismore to Grafton? I have not data with me to judge.
319. You would have no creeks to cross, and you would only cross the Richmond River in one place, and go over, comparatively speaking, level country, and fairly good country the whole way? I should like to see a section and to see what I have to get before I give an estimate.
- 320.

320. With regard to that part of the line between Lismore and Murwillumbah, that project was put before the Committee as an expensive line;—are you aware of the engineering difficulties between Murwillumbah and Lismore? My officers laid out the line under my supervision.
321. It is very difficult country? It is very difficult.
322. Not very hard grades, but hard country? We did the very best, I believe that could be done. I do not believe anybody could do better.
323. It was a very expensive route? Yes; there were a lot of tunnels on the line.
324. Has the traffic on the line been equal to the estimate made by the Commissioners, or has it exceeded that estimate? I would like to refer to the Commissioners' report before I answered the question. I know that the traffic receipts have increased during the last few years. I think, as a rule, the Commissioners have been very careful in their estimates, and the lapse of a few years has shown that their traffic estimates have been exceeded.
325. Can you state, now, the price of the sleepers for the Lismore-Tweed line? Yes. There were four contracts let on that line. One consisted of Leicester Creek and Wilson's Creek bridges; Nos. 2, 3, and 4 were contracts for the construction of that line apart from those bridges. On No. 2 contract the prices for sleepers were 3s. 4d. and 3s. 6d. for ironbark. On No. 4 contract, that is, at the Murwillumbah end, the sleepers cost 3s. and 2s. 10d. Assuming that the ease of getting sleepers was about the same on both lines, I think you will see that my estimate is about right. I do not think that on an average you would get them for less than 3s. 3d.
326. If you make it generally known that the Railway Commissioners will accept sawn ironbark sleepers on the same conditions as hewn sleepers they will get them at a much less rate? I shall be very glad to try it.
327. You could even stipulate that only straight-grained timber should be sawn, so as to be a safeguard to them;—but the saw-mill proprietors understand that the Commissioners will not accept sawn timber at all? This is my specification—a specification which I had at this time, and the present one does not materially vary from it—"The sleepers shall be of iron-bark or approved hardwood, sawn or hewn from large trees." The contractor has every opportunity to supply sawn timber if he likes; but I do not think a half per cent. of the sleepers supplied have been sawn—only in fact where red gum from the rivers of the interior has been offered—and that timber you cannot split.
328. I have had inquiries from saw-mill proprietors, and made inquiry of the Railway Commissioners, as to whether sawn timber would be taken for railway sleepers, and they said, "No, it must be hewn;" so that the sawmill owners are under the impression that they cannot saw the timber? I should be very glad to take them, and I am quite sure that the Commissioners will not refuse to take over the line.

H. Deane.
23 Feb., 1900.

William Colquhoun, Acting Secretary to the Railway Commissioners, sworn, and examined:—

329. *Chairman.*] You are the Acting Secretary to the Railway Commissioners in the absence of Mr. McLachlan, who is absent on leave? Yes.
330. Have you brought a statement showing the expenditure and the earnings on the Lismore-Murwillumbah line since it was opened? Yes. It reads as follows:—

W.
Colquhoun.
23 Feb., 1900.

EXPENDITURE AND EARNINGS—Lismore to Murwillumbah.

Year ending 31st December.	Length.	Capital Cost.	Interest on Capital	Working Expenses.	Earnings.	Loss after providing for Working Expenses and Interest.
	m. chs.	£	£	£	£	£
1894*	63 57	842,735	11,040	2,630	1,975	11,695
1895	63 57	916,034	32,172	5,765	5,919	32,018

* 1st section, Lismore to Mullumbimbah 58 57 opened 15th May, 1894.
2nd section, Mullumbimbah to Murwillumbah 25 opened 24th December, 1894.

63 7

331. Did the Railway Commissioners make an estimate of the traffic which they expected to get on this line? According to the printed report on the proposed railway from Grafton to the Tweed, the usual estimate of working expenses and traffic was not furnished.
332. Will you be good enough to read from the report the passage to which you refer? It is contained in the evidence which Mr. Barling, the late Under Secretary, read before the Committee on the 12th November, 1899, as follows:—

We have not given the usual statement of estimated working expenses and traffic, as the figures cannot be laid down with any degree of certainty. We, therefore, ask to be relieved from giving this information, as we feel the figures would be to a very great extent speculative, and the subject is one requiring to be dealt with on broad principles of State.

TUESDAY, 19 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.		JOHN CHRISTIAN WATSON, Esq.
The Hon. ANDREW GARRAN, LL.D.		ROBERT HENRY LEVLEN, Esq.
JOHN McFARLANE, Esq.		

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Hugh McLauchlan, Secretary to the Railway Commissioners, sworn, and examined:—

H.
McLauchlan.
19 June, 1900.

333. *Mr. McFarlane.*] The estimated cost of this proposed railway is £501,000? Yes.
334. Is that for a recent survey? We had the information from Mr. Deane recently. I could not say when he made the survey on which he founded the estimate.
335. If this estimate and survey were made some nine or ten years ago, do you think there would be a material difference in the estimate of a survey that might be brought up to date? I could not say. I should think not; but that would be purely a matter for Mr. Deane.
336. Has it not been the experience that the old surveys and estimates have been considerably reduced by up-to-date surveys and estimates? Yes, there has been that tendency; but I am not sure whether raising the minimum wage would not rather increase them again.
337. What about the cost of material? Material, too, has gone up. I should hardly think that you would find a reduction, wages and material having gone up.
338. Is it your opinion that there would be no material difference between the cost as estimated then and as estimated now? I am not in a position to express an opinion on that point; that is a matter for the engineers to deal with.
339. Do you think that the route selected for the proposed railway is the best route available? That is a matter which the Commissioners would not like to go into. They take the general direction of the line, leaving the Public Works Department to select the detailed route. The Commissioners take the two points and the general business in between.
340. Have you any estimate to furnish in connection with the traffic that there is likely to be in the event of this railway being constructed? The Commissioners estimate the interest and working expenses to amount to £21,429—that is, providing for a tri-weekly service—and the returns from the traffic would only amount to £4,844.
341. Showing a considerable loss? Showing a very heavy loss.
342. Can you give us any information as to how that estimate of the traffic has been arrived at? The estimate was arrived at from a report submitted by the Chief Traffic Manager. I can only give the information which he has supplied to us.
343. Do the Commissioners view the proposal to construct this line favourably? No, very unfavourably.
344. Can you give us the reasons for that? The principal reasons are that the line would result in an absolute loss to the country, and there is no prospect of development ahead to warrant them in recommending it, and, as a matter of fact, though I know the Grafton people are anxious to have it, at Casino the people are not anxious to have this railway. Therefore, it is not a line that is to meet a general public want, and it would be an unremunerative work.
345. Is it not considered by the Commissioners as part of the North Coast line? The North Coast line is so far ahead that the Commissioners would not recommend the construction of it at present. The North Coast line will have to start from its southern boundary, say, at Maitland; but the Public Works Committee has reported against even the first step being taken, and the Railway Commissioners think it would be unwise even to construct the section as part of a national line.
346. Is not that one of the principal arguments for constructing the proposed line between Lismore and the Tweed, that in the future it will be part of the North Coast line? That was one of the arguments that was raised; the country between Lismore and the Tweed is largely settled, and is also some of the best country in New South Wales. This line, as the Commissioners say, is not capable of producing any large development—it will go through comparatively poor country. If the Commissioners recommended the other line there were certain conditions under which they recommended it.
347. Nearly the whole of that line between Lismore and the Tweed passes through private property, does it not? A great deal of it; but there were some extensive reserves, I understand, in the vicinity which were Crown lands. The Commissioners pointed that out in their original report, I think, in the year 1889.
348. Could you give us the extent of those reserves? The Commissioners, in their report dated 3rd May, 1889, on the Grafton to Tweed line, say:—

Along the route of the railway, and within 10 miles on either side, there are Crown lands to the extent of 622,000 acres, at present valued at £761,000, and undoubtedly if the line is made those lands if sold judiciously would realise to the State quite if not more than double this amount.

That was one reason they had for recommending the construction of the line, that the cost would be really defrayed out of the enhanced value of Crown lands.

349. What result has followed the estimate of the area of Crown lands, and the price that it would realise? That I am not in a position to say. We were not credited with any of the enhanced value.
350. Could you give us the result of the construction of the Lismore to the Tweed railway with regard to traffic generally? The line is 63½ miles in length. The cost has been £921,000. The traffic on the line last year was equal to £11,400; expenses and interest came to £40,674, leaving a loss of £29,273. That was for the year ending 31st December, 1899.
351. Comparing that year with previous years, how does it stand;—does it show an increase in gains and decrease in losses? Compared with the previous year there is a slight increase in the loss, and to some extent that was due, I think, to people going in more largely for dairy-farming in that district, as against sugar-cane and maize growing. One thousand acres under crop would give a great deal more traffic than 1,000 acres producing only grass and butter.

352. I understand that the railway is used to a large extent for the conveyance of sugar-cane to different mills? Yes; and a great deal of dairying is going on in the district.
353. Have the Commissioners formed an opinion as to the likelihood of that railway in the near future being a paying line? It looks as if it would be a long time before it is a paying line.
354. It has been rather an expensive line to construct? It has.
355. As compared with the proposed line from Grafton to Casino, is there any difference in the cost of that line? Although the distances are nearly the same, there is yet £400,000 difference in the estimate of the cost of construction.
356. That country is less difficult for railway construction? The country is easier for railway construction, as there are not the same number of waterways and the same cuttings to be made.
357. Do you not think it would materially help to make the Lismore to the Tweed line a paying one if we made this extension further north? To the Queensland Border.
358. No, further southward? No; you would add to the working expenses, considered as a whole, and there is no interchange of business there which would warrant the construction of a railway.
359. Is it not probable that the Tweed will be connected with the Queensland railway system in the near future? That is a matter, of course, for the Government to determine. We notice that there is a proposal at the present time with that in view.
360. In the event of that being carried out there will only be a short mileage to connect the two systems;—would it not be advisable to connect the northern rivers with the Queensland system, in view of federation being close at hand, and the abolition of the Border duties, so that our farmers would have a market in Queensland? I do not think that that would happen. I do not believe there would be sufficient business to pay for this railway.
361. Would it materially assist? No; there would not be anything like sufficient business. Suppose you had a railway from Brisbane to Grafton, the people at Grafton would still deal with Sydney. The freights by sea to Sydney would be lower than by railway from Grafton to Brisbane, and Sydney is a larger centre.
362. I am speaking with regard to merchandise? If you take the products of the Clarence River you will find that Queensland is producing them even better than the Clarence does to-day.
363. The Queensland market often draws largely on the Sydney market for maize;—in view of that, would it not be cheaper for the growers in the Clarence district to send their produce direct to Queensland instead of sending it to Sydney to be afterwards taken to Queensland? I should not think that there would be a great deal of the Clarence River maize sent to Brisbane.
364. It has been so? Not to any very great extent, I should think. That would not be business that would pay a railway; it is low-freight goods.
365. Does that apply to agricultural produce generally? Yes.
366. Could you give us the nature of the report which has been furnished to the Railway Commissioners with regard to the class of land that there is between Grafton and Casino? The Commissioners themselves went over it, and they consider that the land is inferior. As a matter of fact, I should say that that is indicated by the large areas which have not yet been taken up.

H.
McLachlan.
19 June, 1900.

WEDNESDAY, 20 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and further examined:—

367. *Mr. McFarlane.*] You stated yesterday that the Commissioners do not look upon the proposed railway from Grafton to Casino as likely to form a part of the North Coast railway? I think I stated that they see no necessity for the line to be made. As a matter of fact, for the coast line you would want to have the first step; but that first step, the proposed line from Manildra to Taree, has been reported against by the Works Committee. The feeling of the Commissioners is that at present there is no necessity for a North Coast railway.
368. In view of that fact, would not a light line of railway do to connect Grafton with Casino? You can hardly have a light line of railway in difficult country, such as that in which it is proposed to make this line. Light lines of railway are made through flat country. The engineers might be able to cheapen the line.
369. Could you give us any idea of the difference in the cost of a line such as that now proposed and a light line? Light lines of railway are made through flat country at a cost of about £2,000 a mile. This line is estimated to cost about £7,000 a mile. It is an engineering question.
370. Is it difficult country through which this line is proposed to be made? Yes. You cannot make cheap light lines in the Coast district as you can in the interior, where the country is practically a dead level.
371. What is the difference? The country in the Coast district is very undulating, and there are many watercourses to be crossed. The line from Jerilderie to Berrigan and that from Narrabri to Moree, for instance, are railways made in flat country.
372. Would the grades be difficult on the line between Grafton and Casino? They would be much more difficult than on the line from Narrabri to Moree. Of course, I am not competent to speak on the subject from an engineering point of view.
373. Can you tell us what section has been pointed out as the most expensive section of the proposed railway? No; that is a matter that we know nothing about. We take the estimate of the Engineer-in-Chief, and adopt that without question.

H.
McLachlan.
20 June, 1900.

H.
McLachlan.
20 June, 1900.

374. I notice that, as regards the proposed Railway from Grafton to Glen Innes, a very material reduction has been made in the estimate given as compared with the estimate of some years ago? Yes, I noticed that. Years ago the cost was put down at over £1,000,000.

375. Now it is under £500,000, is it not? That is a matter for the engineers.

376. You stated yesterday that the Commissioners went over the line from Grafton to Casino;—did they explore the country to any extent, or did they merely follow the road? They followed the route as far as possible, and made inquiries intermediately as to the character of the country.

377. Could you give us any information as to how the estimated increased traffic, owing to the construction of the line, was arrived at? No. We had a report on the subject from the Chief Traffic Manager, and I would prefer that he should answer you himself. Yesterday we were speaking about the maize traffic. I find that the production of maize in Queensland last year was 2,250,000 bushels. The quantity imported into Queensland from New South Wales was 239,000 bushels in addition to that. But, even assuming that the Clarence district produces one-sixth of the total maize crop of the Colony, and that one-third of that maize that was imported into Queensland went from the Clarence district, and that it all went over the proposed line, it would only mean about £500 worth of traffic. That would not have a great bearing on the revenue of the line, though we are giving credit almost for the maximum.

378. You said yesterday that the Richmond people were not favourable to the construction of this line? The people at Casino are not.

379. Can you explain why that is so? The Casino people do not see any great necessity for the railway from what we can gather. I think that if the people at one end are not in favour of the line, it does not seem that there is any great necessity for it.

380. Would that arise from the fact that there is a contention between the Clarence River people and the Richmond River people in regard to connection with the table-land? I believe that, to some extent, does govern the question; but it shows that there is no unanimous desire for the railway, even on the part of the people in the district; they do not ask for it.

381. Is the report of the Commissioners concerning the character of the country between Grafton and Casino favourable to the extent that population is likely to settle between the two towns? No, they do not think that any great development will follow, even if the railway is made.

382. How do they class the country? They class the country as partly good for pastoral occupation and partly for dairying purposes. But dairy produce does not give a great deal of business to a railway. 100 acres under grass would not give much more than a ton of traffic in a year; but the same area under crop would give a very much bigger return, probably thirty times that amount.

383. Would it not cause a considerable increase in the passenger traffic, and also in merchandise, supplies being brought from Sydney? It would, to some extent, but the governing factor would be the butter industry, and 100 acres of dairy land would not give more than a ton of butter per annum.

384. Has any estimate been made of the area of country which the proposed line would serve? I think the Traffic Manager has the figures worked out.

385. *Mr. Watson.*] According to the evidence of some local people, and of the District Surveyor, it would seem that the greater portion of the country through which the proposed line would run would be suitable for dairying? Part of it would be, no doubt.

386. In the event of settlement taking place to the extent which the District Surveyor considers possible—one family to every 500 or 600 acres—do you think that from such a population as that you would get enough traffic to justify the construction of the line? The Commissioners think not. The country cannot be so very good, because at present we learn from the reports that there are hardly 100 people between Grafton and Casino, and the country is not extensively used for cattle. If it were going to be good for dairying there would be natural grasses there at the present time. I recollect that a previous Committee reported that some of the runs on the Upper Clarence had been abandoned.

387. It would seem that where the land has been improved by ringbarking and clearing, very fair grass is the result? The land in some parts—about Myall and Stony Creeks, and similar places—may be suitable for closer settlement, but certainly there is not enough of it to warrant the large expenditure that would be involved in the making and working of a railway.

388. Assuming that it was found possible to construct, what would practically be a tramway, at a very much lower cost, with the object of serving the dairying interest, could you say what expenditure per mile the Commissioners would think justifiable, in view of the large extent of Crown land there? At the present time, according to all the figures that we have, there is no likelihood of the line paying working expenses, so any capital expenditure you might have would be dead loss to the country.

389. You could not say what is the basis on which the traffic has been calculated? We have reports on the subject, but I prefer that the Chief Traffic Manager should give you the information.

390. *Dr. Garran.*] I gather from what you said yesterday that your first experiment in making railways in dairying country on the Richmond River has not been profitable? No; it covered working expenses, but the interest on the large capital expended has not been met.

391. Is it improving year by year? As far as the railway is concerned, we have not had much improvement. If we compare the year 1898 with 1899, we got better results in 1898. That may be due to the production of sugar-cane and maize going out and the settlers being occupied with dairy farming.

392. As railway people in search of income, you would rather see the Richmond farmers occupied in producing sugar than in dairying? Yes.

393. It brings in more produce? It gives the railway more business.

394. The dairy produce is compressed into a small space? Yes; and, of course, settlement is not nearly as close as it would be if the farms were under cultivation, which would involve the employment of labour.

395. Supposing that, under federation, the competition in sugar production became so severe in Queensland that sugar went out of cultivation on the Richmond, you would lose the sugar-cane business? Yes; and value of the railway traffic would still further diminish.

396. Then you do not think there is much hope of any rapid improvement in the returns if the line is made? No.

397. Do you know whether the produce they bring down is shipped at the Tweed River or at Lismore? I could not say.

398. Of course, Lismore is an immensely better port? Yes.

399. You are sure of getting your stuff away from there? Yes.

H.
McLachlan.

20 June, 1900.

400. You are not so sure of getting it away from the Tweed? No; and a better class of boats run to the Richmond.
401. Do you know where the Brunswick stuff goes to? I think it goes from the Tweed. There is a good deal of butter dealt with at Byron Bay.
402. That line at present has a mixed traffic in cane and dairy produce;—you have no dairying railway? Not pure and simple; the Illawarra line is to a large extent a dairying line.
403. Yes, but you have several towns on that line? Yes; it is also a tourist line, and there is the mineral interest in the Illawarra district, which makes a big difference.
404. This line is put before us as a dairying line;—there will be a little timber and maize to be carried, and a few other things, but we are to look to dairying for the principal traffic? Yes.
405. Well, taking 15 miles at each side of the line, and allowing 500 acres for each family, we should not settle such a large area as to give a considerable passenger traffic? No; it would not give a great deal of railway business.
406. And it will be some years before the land is taken up? I should think so.
407. Naturally the better land of the Richmond River would be occupied first? Yes.
408. Then, as people cannot get first-class land, they will fall back on second-class land? Yes.]
409. The general rule in regard to settlement has been that it is of supreme importance to get good land if you can? Yes; the rush in that district has been for the best land.
410. The man who takes up bad land has a hard time? Yes.
411. The man who settled on good land can pull through, even in bad seasons? I think so.
412. There are good patches on the line, but as a whole it is only second-class land? That is the opinion of the Commissioners.
413. Even now it is not a cattle-fattening country? No; the country is not at present altogether taken up for pastoral purposes.
414. A good deal of the fertility of the Richmond district is due to the dykes of basalt in that country? The Richmond River land is rich volcanic soil.
415. There is no volcanic soil of any extent between Grafton and Casino? Not to my knowledge.
416. Do you see any chance of developing any trade besides a dairy trade there? There may be a limited traffic in timber, but the Commissioners do not expect that it will reach large proportions.
417. The line is advocated on two grounds—first to connect the two rivers, and, secondly, as a section of the North Coast railway? Yes.
418. Take the connection of the two rivers, is this the best way to do it? That is a matter which the Commissioners have not looked at.
419. If we look at it as a section of the North Coast railway, is it wise to begin at the Northern end instead of at the Southern end? In the opinion of the Commissioners, there is no necessity at present, whatever there may be in the future, for a North Coast railway, and that opinion has been endorsed by a previous Public Works Committee.
420. Suppose it was decided in a few years time to make a railway from Glen Innes to Grafton, or from the Mother-of-Ducks down through the Don Dorrigo country,—would the making of that line give a stimulus to produce for this line? It might to some extent; but I should not think it would be sufficient to warrant the construction of the railway.
421. If we had this line, then we should have railway communication from Sydney to both the Clarence and the Richmond Rivers? But that would be of no use when you have communication by sea. Nobody would send goods by railway from Sydney to the Clarence River. We could not possibly compete.
422. Though it may be very important to reconsider the question when that railway is made, it may be better to defer it until then? The thing is absolutely premature.
423. It is a drawback to you having the Lismore to the Tweed section detached from the railway system? Yes; you have to maintain an independent staff, and to keep separate rolling stock.
424. And there is no through traffic of any kind, but only purely local traffic? It is all local business—nothing else.
425. That line may be better when it gets connected with your general system? It is such a distance away from the railway point of view. It might be that the conditions in regard to the distribution of rolling stock and management would be better, but that is a very small percentage of the cost of a railway.
426. This Richmond district is one of the finest in the country? Yes.
427. And it has the best rainfall? Yes.
428. Is it not discouraging that a railway through such country as that cannot pay? Yes; it is a guide which should indicate that the line now proposed is not likely to pay.
429. We have railways in other parts of the country which have not the qualities of this line, and yet they are doing better;—what is there specially in this that makes it less favourable? It is simply because it drains no back country. It is point-to-point traffic. Take a line that does pay—that from Narrabri to Moree; that drains the traffic of thousands of miles. In this case you simply do a local business.
430. Will not this line drain a territory 15 miles on either side of the line? It may do that; but it is very limited.
431. Has the land within reach of the line been all taken up? One of the Chief Traffic Manager's officers, in a report which he wrote six months ago on the subject, says:
- The country to be served would scarcely be sought after until the present large areas of excellent land on the Upper Richmond have been brought into profitable use. On the Upper Richmond alone there are about 180,000 acres of highly-improved freehold land on both sides of the river in the hands of six stations, and in this area there are but ten selectors, out of which number only four have any land on the river frontage. Then around Lismore, and within the influence of the existing line, chiefly at Bangalow, there is also a large tract of excellent country idle, and 9 miles of the best land between Lismore and Casino is in one holding. In the event of the large area being subdivided, it is a matter for consideration as to whether the Crown land (unimproved) between Grafton and Casino would be disposed of as readily as is represented would be the case.
432. Then up to the present time that railway has not succeeded in breaking up the large estates? No.
433. Nor in causing them to be worked on the halves system? No.
434. Then there is really a very large area of first-class land which awaits cultivation, the produce of which would come on to the railway? Yes; convenient to the existing line.
435. That traffic will benefit the line? Yes; still we have great leeway to make up.

McLachlan.
20 June, 1900.

436. Still, not half the land that could feed that line is at present used? No; the present traffic is only equal to £11,000 a year on the existing line.
437. These dairying settlers do not travel often? No. Of course, travelling is always regulated by facilities and location. People living close to town will travel much more frequently than people in the country distant from a centre.
438. Different classes of settlement yield different classes of traffic? Yes; miners travel more than farmers do on railways.
439. Then, even assuming that all the available lands, the produce of which could be sent to this railway between Lismore and the Tweed, were occupied productively, you still do not think that the line would pay? Not unless there were close settlement; but I do not see any prospect of its being occupied closely enough to make the line pay.
440. Then, if that will not pay, what chance would a line between Grafton and Casino have? There is no prospect whatever of it paying.
441. *Mr. Watson.*] Of course the line from Lismore to the Tweed was constructed through land held by private individuals? There was a large area of Government land in the vicinity of the railway. There are some big Government reserves.
442. *Dr. Garran.*] Had the private land which was bought there to be paid for very extravagantly? I could not say from memory.
443. *Mr. Watson.*] On the line under consideration there is nearly a third of 1,000,000 acres of Crown land within 10 miles of the route? Yes.
444. *Dr. Garran.*] The surveyor values the average of this land between Grafton and Casino at 15s. an acre, and he says that if a railway were made it would be worth 10s. an acre more? Yes.
445. If the Commissioners could get that 10s. an acre, would that lighten their burden? Even if they did, the loss is so great that it would not be sufficient.
446. *Mr. Shepherd.*] Would the opening of this line in any way affect the line from Lismore to Murwillumbah? It might throw a little more business on to that line. Mr. McFarlane thinks that a certain quantity of maize would go from Grafton to Brisbane, and, if so, it would pass over the Lismore to Murwillumbah section; still I do not think there would be a great deal of business.
447. I see that there has been a very heavy loss on that line? Yes.
448. There has been an increase in the working expenses every year;—can you account for that? I do not think that the increase in the working expenses has been anything out of reason. The line is an expensive one to maintain. It is in soft country, which is subject to a heavy rainfall. The bridges require painting, and it is country that would necessitate a good deal of attention. Vegetation is very rank, the soil being rich, and the line requires a lot of clearing. That has been the causes of the extra expenditure.
449. I see that during the six years that the line has been working the expenditure has been increasing; the expenditure for 1894 was £2,620, but in 1899 it rose to £3,380? Some of those figures refer to the line before it was opened throughout.
450. I am taking the return which was furnished here in February? They do not deal with like circumstances.
451. They do not show the real facts of the case? No.
452. I suppose you have never been over the route of this proposed line? I know the rivers very well, but I have not been over the country.
453. I suppose the country is very rough, as the estimated cost of the line is £7,559 a mile? Yes; the cost of construction is comparatively heavy, because that country is undulating, and it is broken by watercourses.
454. In country like that it is impossible to make a cheap railway? Quite.
455. *Chairman.*] This line would not obtain any traffic from one terminal point to the other? We think not. Sydney is the big market for both rivers, and the freights from both places are practically the same.
456. And are not their conditions pretty well the same as regards fertility and production? Very much the same.
457. It is not like a line going from one country with one sort of climate and productions, and one going from a district with a different climate and different products? No.
458. Even taking the estimate of those witnesses who are in favour of the construction of the line, namely, that something like 640 acres per family would be sufficient, you could only settle within 15 miles of the proposed line 2,000 families; and if the whole river were settled, would that 2,000 families, under the conditions that would prevail there, produce enough traffic to lessen the difference between the annual cost and the annual revenue? Of course it would help the line a little; but the traffic would certainly not be sufficient to make it pay. You have one of the best examples in the Illawarra district. There you have a considerable population, but only a local business. The railway does not drain a big area of country, and on that line we lose many thousands of pounds a year; yet that district is far better developed, it has greater production, and a larger population than this line will have for many years to come.
459. Have you ever made any calculation as to the cost per family of railway facilities, with a view of finding some average at which a line would pay? No; because the circumstances differ in every case. There is the distance produce has to be sent to reach the terminal point, and the distance between your principal centres. You could not go on any hard-and-fast-rule.
460. Is there any great area to the south of Grafton that would be drained by the line? The river would act as a barrier to the south. Below Grafton the river has excellent ports.
461. So that each end the railway is practically shut out from draining any large area of country? Yes; that is really one of its limitations in regard to its being a payable line.
462. Do you think we should be justified in taking the experience of the Lismore to the Tweed line as a guide to what would happen in this case? It would be a guide; and you have this further consideration—that it passes through better country, with a larger population.
463. *Mr. McFarlane.*] I understand it has been decided to extend the railway south from Lismore to Casino? That is not a matter that the Commissioners are aware of. It would have to come before Parliament.

464. It has been practically recommended? It has not been finally decided upon as far as we know.

465. How would the country compare between Lismore and Casino with that between Grafton and Casino? We are advised that the country between Lismore and Casino is a far better class of country, carrying a larger population and more capable of development, and that it would give a good deal of traffic. A great deal of dairying is going on in that district.

H. McLachlan.
20 June, 1900.

466. Have you any idea as to what would be the cost per mile? I believe the estimated cost of the line from Casino to Lismore was £123,000 for 18 miles.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

467. *Chairman.*] Have you a statement of the probable traffic on this proposed line of railway? Yes; I will read it:—

J. Harper.
20 June, 1900.

PROPOSED RAILWAY, GRAFTON TO LISMORE, 80 MILES.

I beg to report having visited Grafton, Casino, and Lismore for the purpose of estimating the probable traffic to be carried by this proposed railway, which has been the subject of inquiry on three different occasions, the first section, viz., Lismore to Casino (18 miles) having been recommended by the Public Works Committee for construction as far back as September, 1892.

As you are aware, the country to be served by this project between Grafton to Casino is much inferior to that around Casino and between there and Lismore, yet it must be admitted that there is a good area of land suitable for dairying but only a small area for growing maize, &c., at intervals along the route. No increase in the settlement has, however, taken place between Grafton and Casino since this line was last reported upon in December, 1897, and the existing intermediate population does not exceed 100. Dairying on a very limited scale has been carried on by a few old settlers at Myrtle Creek (40 miles north of Grafton, and 20 miles south of Casino) during the last two years, and this is the only new feature of development worth recording between Grafton and Casino, 62 miles. This section of the line is a complete blank so far as intermediate traffic is concerned, and, as there is no exchange of products between the Richmond and Clarence Rivers, there can be no through goods or stock traffic from Casino (on the Richmond) to Grafton (on the Clarence) or *vice-versa*. Under these circumstances it is impossible to estimate with any degree of accuracy what the earnings of the proposed line would be for the first 62 miles—i.e., from Grafton to Casino—especially as the country to be served would scarcely be sought after until the present large areas of excellent land on the Upper Richmond and around Lismore have been brought into profitable use. On the Upper Richmond alone there are about 180,000 acres of highly improved freehold land on both sides of the river in the hands of six stations, and in this area there are but ten selectors, out of which number only four have any land on the river frontage. Then, around Lismore, and within the influence of the existing line, chiefly at Bangalow, there is also a large tract of excellent country idle, and 9 miles of the best land between Lismore and Casino is in one holding. In the event of these large areas being subdivided, it is a matter for consideration as to whether the Crown land (unimproved), between Grafton and Casino would be disposed of as readily as is represented would be the case with railway communication.

As regards the section Casino to Lismore, it may be stated that the line would practically only serve Casino township and the country to the north, there being little or no intermediate settlement to benefit. The present method of obtaining traffic for Casino and the Upper Richmond district is by ocean-going steamer to Coraki (21 miles from Casino), and thence by a drogher to a point within 3½ miles of the township, necessitating a road cartage costing 7s. 6d. per ton. Four years ago the road cartage did not exceed 1½ mile, for which a charge of 6s. per ton was made, but the distance has since been increased by 2 miles owing to the river silting up. Perishable traffic from Casino is conveyed to Lismore by road, 19 miles.

The charge for landing goods from Sydney at the point of delivery for Casino is the same as to Lismore; therefore, for estimating purposes, it has to be borne in mind that the present high rate of road carriage for 3½ miles will, in competition with a railway, be reduced to such an extent as to make it profitable to continue to receive inwards traffic of the 1st, 2nd, and 3rd classes, *via* Coraki, in preference to rail from Lismore to Casino, notwithstanding the representations which have been made to the contrary by the Casino people, who look upon the present means of transit as uncertain and very unsatisfactory. The same number of handlings would be involved by either route, and a fair comparison of the cost would be as under:—

	1st class. s. d.	2nd class. s. d.	3rd class. s. d.
Lismore to Casino, by rail	7 7	8 11	11 4
Cost of handling traffic at both ends	2 6	2 6	2 6
Total cost <i>via</i> rail	10 1	11 5	13 10
Present road rate, 3½ miles	7 6	7 6	7 6
Probable road rate	5 0	5 0	5 0

There is, however, a want of proper communication between the storckeeper and the point where the traffic is now landed (which difficulty might probably be overcome by the introduction of telephones), and necessarily some inconvenience is caused in not knowing when to expect the boats in order to properly arrange for the cartage of the goods to destination. It is also represented that in consequence of the erratic arrivals of the ocean boats an accumulation of supplies is landed on one day, involving the employment of extra carts to bring the traffic to the stores on the same day as it is discharged from the drogher,—the accommodation at the landing-wharf being inadequate to permit of storage. It was also argued that with a railway at Casino, there would be no necessity to continue the dredging work now being carried on by the Government to keep the river navigable for the droghers from Coraki, and that it would be less expensive for the Steamship Company to land the Casino traffic at Lismore, instead of by drogher from Coraki. The fact, however, remains that settlers along the river would still have to be served, but fewer boats would of course be required. As to the expense of employing the droghers, it might be considered advisable to sound the Steamship Company's people in Sydney on the subject, as this has some bearing on the question.

It was further pointed out that the teams from Drake and Tenterfield obtain delivery of their goods at Lismore, in preference to the Casino wharf, although the latter is 15 miles nearer. The chief cause of this is the steep grade down the river-bank to the wharf—it being unsuitable for large teams, but quite safe for carts.

Estimate for traffic from Casino to Lismore, 18 miles.

Having fully considered the matter, I am of opinion that the following estimate is a fair one for the above section. The figures on the left show the extent of existing traffic as near as it is possible to estimate, and the figures on the right the estimate allowed for the line.

Existing Traffic.	Tons	Tons.	Estimate allowed for Line.
General goods	3,000	1,000 @ 4s. 1,000 @ 9s.	£200 450
Dairy produce	200	400 @ 3s. 6d.	70
Maize, &c.	2,000	2,000 @ 2s.	200
Timber	5,000	2,000 @ 2s. 6d.	250
Figs (trucks)	75	150 @ 15s.	113
Tons.....	10,200	6,400	
Trucks.....	75	150	£1,253
Goods, stock, &c.			£1,283
Passengers			450
Other coaching			50
Mails			216
			£1,999

J. Harper.
20 June, 1900.

It will be observed that I have allowed for double the existing traffic in dairy produce and pigs, whilst as regards the other lines of traffic I have made a liberal allowance, considering the nature of the competition. Agricultural produce for export will eventually be largely superseded by dairying, and a large quantity of the maize, hay, &c., now grown is for cows, pigs, &c., both for summer and winter use. In respect to timber, it is doubtful whether we would carry two-fifths of the present traffic, because of the cheap and easy means of transit by water to Coraki, as many as 150 large logs having been rafted down the river at one time by the owner of the material, and the appliances for lifting the logs from the water to the ocean-going boats, at Coraki, are said to be satisfactory. The rate from Coraki to Sydney is the same as from Lismore.

It is estimated that sixty teams are drawing timber from 7 to 50 miles to Casino, the bulk being obtained about 21 miles out.

Passenger traffic. There is, approximately, 4,500 people in Casino and district, and I estimate that about two-thirds will make one trip per year each at 3s.

Section, Casino to Grafton 62 miles.

I am at a loss to find a basis for preparing an estimate for this section, but assuming we doubled the Lismore-Casino estimate of £1,783 for goods and coaching (not mails) the total for the above section would be £3,566 for goods and coaching, which, if anything, is excessive. Although the through distance from Lismore to Grafton is 80 miles, we could not rely upon carrying any goods or stock traffic a further distance than 40 miles, midway, because the facilities for dealing with the traffic are the same at Lismore as at Grafton, and both ports would be used; hence my suggesting that the estimate for the section, Lismore to Casino (18 miles), be doubled to provide for traffic on the adjoining section to Grafton being carried about an average distance of 40 miles. On this basis, the two estimates would be as follows:—

	Miles.	Goods.	Passengers, &c.	Mails.	Total.
Lismore to Casino	18	£1,283	£500	£216	£1,999
Casino to Grafton	62	2,566	1,000	744	4,301
		£3,849	£1,500	£960	£6,309

I have, however, further increased the Casino-Grafton estimate by about 10 per cent.

Recent Developments.

The dairying industry has assumed large proportions on the Tweed and Richmond Rivers (maize and sugar-cane receded), and from information supplied me by the police I find that the production of butter increased from 1,500 tons in 1897-98 to 2,500 tons in 1898-99. This quantity is valued at £203,000, and it is estimated that for the year ending July next the value will be at least £250,000, which, under ordinary circumstances, would represent the value of 25,000 bales of wool.

In that portion of the Casino district which would be served by the proposed line, dairying only fairly started about two years ago, and 200 tons of butter are now produced yearly. In the first place a large quantity of the cream has to be carted a distance of 20 miles from Kyogle to the butter factory at Casino, which at contract price costs 20s. per ton, and the butter has to be taken by road to Lismore, 19 miles, for freezing purposes and export. This costs a further 17s. 6d. per ton. Allowing 2 lb. of cream to make 1 lb. of butter, the total cost of road transit from creamery in Casino district to Lismore (39 miles), would be £2 17s. 6d. per ton for butter as against a market value of £80 per ton average. A fast coach service is employed, and the cream and butter arrive in good condition. In that portion of the Lismore district not served by the proposed line the most distant road-cartage for cream is 15 miles before reaching the butter factory established at Lismore, whilst, as already stated, in the Casino district 39 miles have to be traversed to reach the export point, Lismore. There are 1,326 registered dairies, forty-seven creameries, and eight butter factories on the Tweed and the Richmond.

Probable Development.

It is estimated that a family of five persons would produce about 2½ tons of butter per annum from 200 acres of land. This will serve to indicate what extra traffic would result from increased dairying business. Off the same area of land we would get at least 70 tons of agricultural produce for transit by rail. The absence of rail communication between Casino and Lismore does not retard progress so far as dairying is concerned, and I feel satisfied that there will be a large development in this industry without a railway. The present rates and method of transit are by no means prohibitory to the production of butter, and the Casino district, although not served by the existing Lismore-Tweed line, has indirectly benefited by its construction inasmuch as it developed the dairying business in the Tweed and Lismore districts, and as a consequence sufficient business resulted to induce companies to open up factories at Casino and elsewhere for the treatment of cream.

468. You look upon this line as one which it can only be hoped will become reasonably successful, if it ever can be that, by reason of greatly increased settlement along the route? Yes.

469. There is nothing in the present character of the settlement to justify such a large expenditure? No.

470. Do you think it would be reasonable to hope that continuous close settlement along the line would make the railway pay? I do not think that most of that country is capable of close settlement; it is rather second-rate dairying country. Compared with the land on some of the more northerly rivers, it is only third or fourth-rate country.

471. You do not expect to get any other than dairying traffic? No, not much else; there would be some timber, but a great deal of the timber along the line would not be carried to Grafton or Lismore; it would go down the river.

472. The first 20 miles of the railway from Grafton, on account of its proximity to the river, would be practically unproductive? Yes, as regards traffic.

473. Is Grafton the centre of a circle from which any large amount of traffic might be expected to the railway south or west of the town? I cannot conceive of it going north of what, after all, represents their principal market. I cannot conceive that any traffic would go from Grafton along that line to Casino or Lismore.

474. Do you think the producers in that district would either send their produce to Grafton or down the river to Sydney, or some other market? Yes.

475. There is no likelihood of the people sending their products from Grafton to Casino? No.

476. Do the same conditions hold in the case of Casino as in that of the other terminus? No. Ten or 15 tons of butter a week are sent from Casino to Grafton. No doubt there is a difficulty in connection with the south arm of the river at Casino. I do not know whether that can be overcome. Casino has important trade relations with Lismore.

477. They are not likely to establish one with Grafton? No; at all events they said definitely enough when I was there that they would not, and I cannot conceive that they would, that is to say that they would send their produce 62 miles instead of 18 miles to the port of shipment.

478. It is an important fact that the two terminal points are in districts from which no traffic can be drawn? I do not know of any traffic that they could interchange between the two points. There may be some passenger traffic that I have indicated in the estimate, but it would be of a precarious character.

479. Dr. Garran.] This proposed line joins two river ports? Yes.

480. Casino at one end and Grafton the other? Yes.

481. Casino is such an inferior port to Lismore that Lismore will be the port? Yes, a great deal of the traffic will always go to Lismore.

482. It would be absurd to make this line, and not to make the Casino to Lismore section? Decidedly.
483. If we consider this as made, we must consider the other as made too? Yes, the Casino to Lismore extension.
484. Practically we may wipe out Casino as a port, and the ports would be Grafton and Lismore? Yes.
485. And the distance between them would be, what? Eighty miles.
486. Then we have to consider the traffic on this 80 miles that would pay? Yes. I have endeavoured to give an estimate, but I have also pointed out the difficulty of giving an estimate where no traffic exists to-day. You can probably give an estimate of the traffic between Casino and the district towards Lismore. It is a settled district with a population of 4,500; but the other district has only a population of about 100.
487. Is the freight from Lismore to Sydney as low as that from Grafton to Sydney? I do not think there is any difference.
488. Then we might take midway, that is 40 miles as the dividing point of the trade? Yes.
489. So that everything to the south of that 40 miles intersection would go to Grafton, and everything to the north would go to Lismore? Yes.
490. So you would not have more than 40 miles freightage? No.
491. There would be an average of 20 miles for each section of the line? Yes. Between Casino and Lismore, I think, it would carry the traffic incidental to the district, and produce larger settlement and larger development there.
492. Is the good land on the Richmond sufficiently taken up to induce dairymen to go on the land north of Grafton? I consider that is so. There is a very large proportion of freehold land that has not been taken up which is far better than any between Grafton and Casino.
493. It is admitted that the Richmond district is as fine a dairying district as any in the Colony? Yes.
494. People will not give that the go-by to go to land south of it? No.
495. It appears that the principal difficulty in the way of getting the land there is that it is so largely held by speculative holders? I would not say by speculative holders. They are carrying stock on their land—some of them very good stock.
496. Does it pay as well to carry stock as to carry on dairying? I should think not.
497. Have you any notion what the land is worth to the other for carrying stock? No; circumstances vary very much there.
498. If it be worth more to use the land for dairying purposes, will not self-interest lead them to do it? Manifestly it will.
499. Then the return from the railway in years to come ought to be better than they are now? That is where the land is better, in the immediate vicinity of Casino; but there is very little land of the same quality as that between Casino and Grafton.
500. The Lismore-Murwillumbah line that you are working now is a line connecting two river points? Yes.
501. Do you find about half-way that the traffic is divided, some going south and some going north? The bulk of the traffic comes to Lismore. Beyond Byron Bay there has not been very much development as far as dairying is concerned.
502. Then your principal trade lies between Byron Bay and Lismore? Yes.
503. That line is only about 30 miles in length? It is about 30 miles from Byron Bay to Lismore. The railway is about 60 miles in length.
504. Are the roads good there? It all depends on the condition of the season. At a time like this they would not be good.
505. Then people 15 miles from Byron Bay could not send their butter in in wet weather? No.
506. How far does the dairying trade go from Byron Bay inland? About 20 miles.
507. Did it go that distance before the railway was made? Before the railway was made there were no factories there; the industry was of a most primitive character.
508. It is quite a new business? Yes.
509. Then you are not able to say exactly how far the railway has led to its development? I should say unhesitatingly that it is entirely due to the railway.
510. Though we are losing so much money on that railway, it has stimulated the occupation of the district? Yes.
511. That is the only consolation we have? Yes.
512. Do you think the same effect would follow as regards this proposed railway between Casino and Grafton? No.
513. Because of the inferiority of the land on this line? Yes.
514. If a line from Lismore to the Tweed running through the very best land and the best watered district in the Colony loses £29,000 a year, what will happen as regards a line between Casino and Grafton through worse territory? It must inevitably mean greater loss. It is practically the same distance, and will be practically the same cost per mile.
515. You do not see any ray of hope for this line? I do not.
516. Is a line wanted between Richmond and the Clarence to connect the two rivers? I do not think so; I cannot see where it would come in, or what interest would be served. The Casino people say they do not want it. The Grafton people want it, but for what purpose I cannot imagine. There is no doubt that some land would probably be thrown open in the neighbourhood, but it is an open question whether a sufficient quantity would be benefited by it, and sufficient revenue obtained to warrant its construction.
517. Looked at as a section of the North Coast railway, is it better to begin at the north end or the south end? I should unhesitatingly say that it would be better to commence at the other end by a connection with the Northern line at Maitland or thereabouts.
518. To go from Maitland to the Manning first? Yes; assuming that it was desirable to make a railway at all.
519. You cannot find anything encouraging to say about this line? No; I cannot.
520. You are not prejudiced against it? Absolutely not.
521. You look at it from the point of view of a traffic manager? Yes.
522. *Mr. Watson.* We have had it in evidence from local residents, and from the District Surveyor that there was a considerable area of Crown land to the extent of between 300,000 and 400,000 acres within reasonable distance of this projected line? It would be useful to have a map showing its location.

J. Harper.
20 June, 1900.

523. Mr. Ebsworth, the District Surveyor, produced a map showing that that area of Crown lands existed within what he thought would be the influence of the railway? Yes, we discussed that, and I showed him the improbability of a large portion of it being influenced by the railway.

524. At any rate, it is pretty safe to say that there is a very large area of Crown land? Yes; a very great deal of it is not much good.

525. It is asserted that about 600 acres would be sufficient to maintain a family. Assuming that for 15 miles on each side of the line the land was settled to that extent—say, for 50 miles of the 64 miles of railway—that would mean about 1,500 families settled there;—should we be likely to get sufficient traffic from that number of families to justify the making of the line? Certainly not.

526. In the evidence of Mr. Varley, who is president of the Dairymen's Association at Grafton, there are estimates given showing the amount of traffic that he anticipates from the settlement of less than 500 families, and his total estimate works out at nearly £16,000 a year? Is he going to get that out of butter? Assuming that 500 families each produced a ton of butter per annum, that would give 500 tons.

527. He speaks of cream going to the factories? That would make the traffic less.

528. Is there not more bulk in cream than in butter? I do not know how many tons of butter they expect to produce. I notice that that gentleman's estimate exceeds very largely all that we are earning in the 63 miles of settled country between Murwillumbah and Lismore, with a population of between 20,000 and 30,000. That is a complete answer at once.

529. There is one item which seems a very large one—that is the estimate that there will be 9,470 adult fares, giving a total revenue of £6,000? I will give an idea of what the total earnings have been on the Lismore to the Tweed line. On the Lismore line we carried last year 28,178 passengers, and the total earnings from passenger traffic amounted to £5,420. That includes the whole of that district, which is immeasurably richer than the one in which the proposed line is to be made, and carries a population of between 20,000 and 30,000, as against 100 on the other line. The returns from goods and stock traffic amount to £5,978, giving a total revenue on that line of £11,398. Mr. Varley tells us that we are going to make £4,000 or £5,000 more on this line than we are making on the Lismore line. That answers itself.

530. What traffic, leaving dairy produce out of the question, do you think it would be fair to anticipate in the way of goods from Grafton or from Lismore; supplies for the people settled on the river—1,000 families? It would depend on where they were settled.

531. Take an average of 20 miles? Say 5,000 people. I should say that under favourable circumstances we might get a revenue of between £2,000 and £3,000 a year.

532. Have you any data on which you can form a rough opinion as to the traffic which the dairy trades would give you under similar circumstances? Nothing beyond the valuable evidence that we have of the traffic on an existing line over a similar distance, in infinitely better and more thickly populated country.

533. You have two ports in that district—one at Byron Bay? All that is shipped from there is infinitesimal.

534. They have a very important factory there, have they not? Butter runs into very little in the way of freight. The average freight is about 5s. a ton.

535. So you have to rely on what you can make out of carrying supplies and from fares? Yes. The fares on the Lismore to the Tweed line represent more than the goods traffic. Generally speaking, it is the other way, the goods traffic being the greater earning power; but in that district, owing to most of the traffic being low-class produce, such as logs, cream and butter, there are very small earnings from what is fairly big work, and that includes sugar-cane too—8,000 or 9,000 tons of sugar-cane.

536. Would that be carried at a very low rate? The average rate is about 2s. a ton.

537. What basis have you taken for your estimate—the existing population or the prospective increase? I have more than doubled the estimate for Casino traffic, as there was no other means of getting at it.

538. What basis have you taken for your working expenses—a daily service? No; a tri-weekly service.

539. Assuming that this line was constructed, with a view of giving increased value to and settling the Crown lands in the vicinity, do you think that, with the settlement of 1,000 families, you would be able to earn more than working expenses? No. First of all, you would want to catch the families.

540. Assuming that they were there? No, that would not pay working expenses.

541. So that even a reduction of the capital cost would not be sufficient to compensate if it were possible to make the line much cheaper? No. The actual working expenses on the Lismore to the Tweed line during 1899 were £7,369.

542. Is that a daily service? A daily, and in some cases a tri-weekly service.

543. Has there been any large increase of population along the line, as well as at each end? Yes; in the Richmond River district.

544. That population has been settled for the most part upon land which was previously held by large owners? No; a great deal of it is original selections which, until the line came along, were virgin forests.

545. I am thinking of the additional population—was that upon Government land, or upon private land? I think most of that land had been taken up by selectors in 640-acre blocks before the line was made.

546. So that the increase has been in privately-owned land? No; I think most of the land has been acquired from those who originally took it up.

547. The increase of settlement has not been by means of the selection of Government land, but by acquiring it from private hands? Yes; there has been some private land taken up.

548. Was there much Crown land available after the line was constructed? I do not think there was.

549. You expressed the opinion that the people would be more likely to be attracted by a chance of leasing or buying the richer lands held privately on the Upper Richmond? Yes.

550. Than by the chance to take up second-class land between Grafton and Casino? Yes.

551. Have you any idea what they pay usually as rental for those richer lands? No, I could not say; I think there are only ten selectors on them.

552. There is a great deal of land in the district which is rented;—we were told locally that the rent paid for privately-owned land for dairy purposes ran from 5s. to 7s. 6d. an acre;—do you think people would prefer to pay that rent for land on the Upper Richmond to paying, say, 7½d. an acre, which is 2½ per cent. on the 25 per cent. valuation of the district surveyor? I think they would take up the best-improved land. The disposition would be to go for the better class of land.

553. There is a very big difference in the rent? Yes; and a big difference in the land.

J. Harper.

20 June, 1900.

554. Have you been along the route of the proposed railway? Yes.
555. Did you notice any of that second-class land after it had been cleared? Yes; it was specially pointed out to me.
556. There seems to be a vast improvement there as compared with the virgin forest? Yes, there is in all land when it is cleared; but I do not know much about the quality of the herbage.
557. It would appear that land up there with a good rainfall and a warm climate would not require to be intrinsically so good as other land to feed stock on? No.
558. Did I understand you to say that you did not think much of the timber traffic which might be expected on the line? I think that a great proportion of it would find its way either down to the Richmond or into the river. Some of the timber from the north would come to the line; but it is questionable how far it would pay them to have it carried by rail.
559. Local evidence went to show that the greater part of the timber would be tapped by the railway where it crosses the Richmond Range? The greater part of the timber is north of that point.
560. It would come to the railway about there? I do not think so.
561. Where would you say it would come to the railway? I question whether it would pay to carry it at all from that direction.
562. We were told that the line, where it crossed the Richmond Range, would be 10 or 12 miles from the good timber;—do you think that that would be too far? No; but I am thinking of a large volume of timber draining the whole of the Richmond Range. It is no use talking of a supply that would give out in three or four years.
563. The range, after it is crossed by the line, curves to the northward, and runs parallel to the line some little distance? Yes.
564. What makes you think that the timber, say, south of midway between Casino and Grafton would go to Lawrence rather than to Grafton for shipment? I mean timber south of the line, not north of the line.
565. The local forester states that the timber land is mainly unsuitable for farming? Yes.
566. He estimates that if the timber were cut within a reasonable distance of the line, it would yield £80,000 in royalties, in addition to the railway revenue? Well, we want to go to the experience of the more northern rivers, where they have more timber.
567. What has been the experience there? It is all included in the tonnage I have given you.
568. Does that Lismore to the Tweed railway tap good timber land? Yes; there is magnificent timber down there.
569. What sort? Pine, tallow-wood, and iron-bark.
570. And the railway does not seem to attract it? The railway attracts it, but there is not much value in it.
571. *Mr. Shepherd.*] You have been over the route of this line? Yes.
572. Do you think the country is of such a nature that the railway would be likely to cause a large population to settle for the purpose of cultivation? No; certainly not for the purposes of cultivation. It might by-and-bye, when the people are crowded out of the better dairying districts, become a good dairying district.
573. What proportion of that country do you think would be suitable for agriculture? I should imagine a very small proportion—only land on the creeks; that is, for such high-class agriculture as you would expect in that district.
574. Is it good grazing country? Yes.
575. As grazing country alone it would not be likely to support a railway? No.
576. And timber, as a rule, is not sufficient to support a railway? No; it is a constantly disappearing quantity.
577. What is the nature of that country? It is ridgy forest country.
578. Is it pretty rough all the way along the line, or is a large portion of it comparatively level? There is not much of it level till you get within 3 miles of the Richmond.
579. The ridgy country is not considered fit for cultivation? No, it would be very poor agricultural land.
580. Have you any idea what area of land on that line would be likely to support a family? I should think that it would be land that would carry a cow to 4 or 5 acres.
581. I think you are opposed altogether to the construction of this line? My feeling is this: That it is a line which is not of pressing urgency, not nearly so pressing as a lot of other lines which are required for the development of the country. The people of that district have got their waterways on either side of them at reasonable distances, and there are excellent roads communicating with the waterways. There is very little prospective traffic for a railway.
582. *Mr. McFarlane.*] Does not the estimated cost of this railway from Grafton to Casino appear rather high—over £7,000 a mile? I do not know the details of that; it is Mr. Deane's estimate.
583. The estimate of the proposed line from Casino to Lismore is about the same? Yes.
584. Can you tell whether there were two separate estimates? No. I think, in the first place, the estimate was prepared of a line projected from Lismore through to the Tweed as part of one whole; but I fancy that Mr. Deane has revised it recently.
585. You have in your hand a map showing the disposition of the timber on the proposed line? Yes.
586. Could you give the Committee an idea of how the traffic would be affected on this line? I am under the impression that to the north of the 29th parallel the timber would go to the sea. The greater proportion of the timber south of the line would fall into the Richmond and the Clarence, and would not be attracted to the railway. On the western side of the line, south of the 29th parallel, the timber would probably be attracted to the line.

THURSDAY, 21 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVYEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

C. W. Darley.
21 June, 1900.

587. *Mr. Watson.*] In connection with this proposed railway from Grafton to Casino, it is thought advisable to get some information from you as to the present state of the Clarence River from a navigation standpoint, and also as to the works which you are carrying out in connection with the river;— could you give the Committee a short statement on the subject? The improvements at the entrance to the Clarence River, as originally proposed by Sir John Coode, were estimated to cost £615,182. Parliament has approved of a certain portion of the scheme being carried out involving an expenditure of £254,300. What is known as the middle training-wall has been completed, and so far has been very satisfactory. We have deep water all along the wall.

588. Has the construction of that middle training-wall meant the abandonment of an earlier scheme, which was partly carried out by Mr. Moriarty, for a training-wall further south? Mr. Moriarty's scheme is not under consideration. It is Sir John Coode's scheme that we are carrying out.

589. Mr. Moriarty's first idea was anterior to that? Yes; that was based on only a small sum of money being expended there. It was not thought that the Government would enter on costly works. The training-wall has, so far, been such a success that it has got rid entirely of the inner crossing, and we have permanent deep water inside the entrance now, and the bar has certainly kept better and more uniformly good than it used to do. I think the direct scour on the bar has been benefited. The portion of the scheme that was authorised was the removal of the north reef; but it was pointed out at the time the matter was under consideration that that might be impossible, and it was found impossible to remove that reef until we could get still water under the shelter of a southern breakwater. So the work of removing the reef, which has been authorised by Parliament, has not been entered on, and cannot be entered upon yet.

590. Not until you get the southern breakwater? We must have the shelter of the southern breakwater.

591. *Dr. Garran.*] How much of it? We require nearly the whole of it.

592. *Mr. Watson.*] You have a certain portion of the southern breakwater already done, have you not? Yes.

593. What would remain to be constructed before you would get sufficient shelter to enable you to take away the middle reef? I think that by the time we got half the length we could do it. We require to construct 1,200 feet.

594. Is that in addition to what is now constructed? Yes. It has only just been started. Very little has been done since Sir John Coode reported on the scheme. We have simply been tipping stone there to replace some washed away.

595. Could you give a rough idea of the cost of completing sufficient of the southern breakwater to give the desired shelter? The southern breakwater is estimated to cost £146,459 altogether.

596. So that an expenditure of about £70,000 would be necessary to complete half of it? Yes, an expenditure of £60,000 or £70,000 to give sufficient shelter to get at the reef.

597. Do you think the removal of the middle reef would, apart from its allowing sufficient water for vessels, assist the general scour on the bar? I think it would. At present it scatters the current, sending it north and south. But if we could get the southern half removed we should improve the passage between the reef and the end of the training-wall, and concentrate a larger scour straight out eastward.

598. Can you say what is the depth that you can fairly rely upon as the result of the work you have been so far engaged in on the bar, and then inwards for some distance? Of course the bar varies much with the wind. At present there is about 16 feet of water on the bar. That is in what is known as the southern channel. It is a good channel, but it is a crooked one. The eastern channel is the best—that is the straighter channel. It shoaled up after long-continued north-east winds. Last year we did a little dredging on it, and it kept deeper for some time. If the westerly winds set in again I expect the current will move back to the eastern channel. The southern channel turns round the breakwater and goes down the coast. It is a good channel, but not a nice one for strangers. The regular traders know it. If we had the breakwater it would tend to concentrate the current and keep it towards the eastern channel, and shut up the southern channel.

599. Would the construction of the breakwater ensure a good depth, beyond the probability of alteration, by the prevailing winds? The bar is one that will vary with the wind. There is no doubt that if the northern breakwater had been constructed also it would tend to make the bar more permanent. The southern breakwater would do all that is necessary to maintain a good entrance to the river.

600. Do you know whether the sand on the bar is of great depth? Yes, there is a great depth of sand there.

601. So if you can get sufficient scour there is no doubt of its being able to remove the sand from the bar? It would if we could get one good flood. We have had no flood since the inside works were carried out. A flood would open it for a long time. It has not had a good wash out since the works were constructed.

602. You said the construction of that southern wall had had a good effect on the channel? Yes, a very good effect.

603. And what was formerly known as the inner crossing has now disappeared? Yes, it has quite gone. The inner crossing was an opening down from the eastern end of Freoburn Island towards Yamba.

604. The crossing that one time blocked up the channel has disappeared? Yes, It is quite gone. Once C. W. Darley. you get over the bar it is all deep water up into the entrance. Where the deepest water is now was dry land with timber growing on it at the time when Mr. Moriarty dealt with the matter. 21 June, 1900.

605. Have the inner works been fairly completed now? What is known as the Goodwood Island training-wall has been completed, and the next work authorised is known as the Iluka training-wall. That training-wall was designed by Sir John Coode to follow round the foreshore from the southern portion of the North Spit. I have been watching the action of the current in the bay for some years past, and I find that we cannot draw the current out of that bay. The Goodwood Island training-wall is not sufficient. The current still turns into the bay, and then goes southward along the North Spit, and strikes the south training-wall nearly at right angles, causing an eddy there and deep water. There is about 55 feet of water where the currents meet. I came to the conclusion that as long as that continued the entrance would never be very satisfactory. The current always tends, in passing down from Iluka, to fall out towards the training-wall, making the channel between the point of the Spit and the south training-wall very narrow indeed. It is not more than 250 feet wide at present. I got out a scheme which the Minister authorised for a training-wall to cut out the bight altogether, going in a curve from Iluka inside Goodwood Island training-wall, and turning round nearly parallel with the south training-wall to meet the inner north training-wall. We are now engaged in the construction of that work, and I think it will have a beneficial effect.

606. These currents from the North Arm have to follow the old training-wall along the foreshore of Iluka or get through before that? It will work round in front of that wall; it starts from the western corner of the Iluka shore.

607. Was a wall round the Iluka foreshore constructed? No, no money was spent there; but we are moving it out into the bay. Instead of a concave curve we are making a convex curve.

608. Do you anticipate that in the further concentration of the current by means of the training-wall you will be able to keep the scour sufficiently strong to have a fair depth on your bar? It will tend to widen the channel at the North Spit, to keep a better channel along the training-wall, and concentrate a better scour on the bar.

609. Do you think the depth you are now able to maintain on the bar will be sufficient, without the breakwater to ensure navigation for steamers of reasonable size? We cannot maintain a permanent channel under present conditions. Since we have carried on the work of the south training-wall, there has been no actual block to navigation. There has always been a south or an east channel, though at times not very good. We have a dredge now specially fitted for bar work; last year we sent it up there, and in a few days she took enough off the top of the bar to again draw the current on to it, and it has gone on deepening. We can keep the navigation sufficiently good there for the present trade without outside expenditure. If they want to bring bigger steamers that can not be done without more works being carried out, but the present steamers have not been obstructed.

610. It would seem from what you say as to the character of the bottom of the bay outside, that there would always be some danger of its shoaling up? The name of the bay in the old days was "Shoal Bay." I think the name was given to the place by Captain Cook. The shoals prevented the Clarence River from being found for many years after this country was occupied. People did not like going in there. There is a vast amount of sand there which will always keep on the move, and the bar must fluctuate.

611. But with the dredge that you have now it would seem to be a comparatively easy matter to get a sufficient depth of water for steamers now trading there? We keep a special dredge for bar work. Whenever we hear of any bar being in a bad state that dredge is immediately ordered away to the place. The day that we got information that this bar was shoaled up the dredge was sent there, and in a few days she did so much work that she greatly improved the bar, and it went on improving afterwards.

612. Assuming it was a moot point whether it was worth while extending both breakwaters in order to get an increased depth of water, would you still think it necessary to spend this extra £70,000 on the southern breakwater to assist in the removal of that middle reef? I think it would be desirable. There is another reason that may be given, and that is, that for the inner work we want chiefly small stone, but for the breakwater we want only large stone. At present we are working the quarry, and we have to break the stone small for the training-wall. If we have to complete the inside work and then make the breakwater, we shall have to waste an enormous quantity of small stone that we cannot put into the breakwater. If it is to be done at all it would be better to face it before we have done all the inside work. The country would save a large sum of money by having it done now, instead of postponing it until the inside work is finished.

613. What do you estimate the cost of the removal of that inner reef would be? It is estimated to cost £28,500.

614. That would be, roughly, to remove that reef and to put a sheltering breakwater to the extent necessary would cost another £100,000? Yes.

615. Going up towards Grafton, can you tell us if there are any obstructions, and what is the nature of them? There is a shoal near Elizabeth Island carrying from 10 to 12 feet of water. We dredge it occasionally, but after a fresh it shoals up again. I think there would be no difficulty in deepening it to 15 feet if necessary. The bottom is only sand and shingle.

616. Does that extend to any great length along the course of the channel? No; it is a short shoal. Then, at the Elbow, near Lawrence, there is a short patch with 12 feet of water. At that place the river has a very sharp bend, and to enable large vessels to go up it would be necessary to carry out the construction of a training-wall and do some dredging to straighten the river at that place.

617. Would that be a half-tide wall, so as not to interfere with the floods? The river is too wide there, and I would carry the wall up to high-water mark. Immediately below Lawrence there is a very narrow place, and there there is 60 feet of water, because the river is too narrow. The next shoal is at the Ulmarra Crossing—it is rather a long one. We deepened that to 14 feet a few years ago, and since it was deepened it is keeping very good.

618. Could you give any estimate of what it would be necessary to spend to equalise the depth? We do that out of revenue votes. It is really part of the maintenance of the river.

619. The training-wall would not come into that? I have not prepared an estimate of that.

620. It would not amount to a very great deal? It would not.

621. Then, from what you say, it seems that even with the work so far completed, the navigation can be fairly relied upon for steamers of the size of those at present used? Yes; there would be no difficulty in opening the navigation up to Grafton with a depth of 15 feet. 622.

- C. W. Darley. 622. You think that can be fairly relied upon now? Not now, but there would be no difficulty in obtaining that depth.
- 21 June, 1900. 623. Taking the present condition of the river, what could you guarantee for vessels without a further vote from Parliament? Vessels drawing 12 feet of water can navigate the river easily enough.
624. If this line is constructed it is possible that another length from Casino to Lismore will be constructed, as there is a probability of a certain amount of traffic going towards the Richmond at Lismore;—what is the present condition of the navigation of that river? The Richmond bar is now very fair, and it is maintaining its depth. We can always count on having 13 feet of water on the Richmond bar at present. The inner crossing of the Richmond bar is not yet established; it is in a transition stage. The middle training-wall is being constructed there, and I think it will have a very beneficial effect. We are moving the channel now from its southern course to a more direct northern course towards the bar. I think in a very short time that will be a good channel. It is improving every day.
625. As the result of the construction of that middle training wall? Yes.
626. Is that in addition to the plans of Sir John Coode? Yes. We had the same trouble at the Clarence. I fancy the mistake in both cases was in having the entrance so wide inside. The current made down to the south shore, then ran up along the southern breakwater, and crossed and struck the northern breakwater at right angles. There was no direct run to the bar. Experience shows that we must direct the current for as great a distance inside the harbour as possible on to the bar, without any turning. That training-wall is having the effect of directing and strengthening the current. There is a patch of hard sand in front of Ballina which we are removing. More current is passing through the north channel every day, and when we get a little more of that sand removed, we can bring the whole current into the north channel and shut up the other altogether.
627. Does that mean that some of the expenditure previously incurred under Sir John Coode's scheme will be wasted? No, because we are only carrying this wall up to high-water, so that the floods can cross it. Sir John Coode's work will prevent any big flood from bursting out behind our works, they will give free vent to the floods, and when a portion of the southern breakwater is carried 12 feet over high-water, that will prevent any break-out where the river has broken out before. But for that it might break out south of the entrance.
628. It will prevent the flood-water from breaking out south of the southern breakwater? Yes. If it broke through there the channel might be changed and taken away from the present entrance altogether. If the southern wall had been made originally to its full height, the other works would not have been necessary. But taking everything into consideration it is best as it is.
629. It affords a greater escape in case of flood? Yes, a greater relief for big floods, and we concentrate the whole of the normal current of the river in the north channel.
630. Will the removal of that indurated sand crossing near Ballina be expensive? One channel has been cut through, and we are widening it. The work is not expensive, the sand being easily dredged. We have a dredge ready to go up there with special cutting gear, which will dredge and pump the sand away without any blasting.
631. Could you say what has been spent at this entrance, taking the breakwater and two training-walls? The total expenditure has been £260,244.
632. What will be necessary in addition to what has been done for the completion of the two breakwaters? We have £96,000 still available of the amount authorised. There are certain sums which have been spent, which must be re-credited to the vote. The original estimate will complete the work. We spent money on the North Creek canal, but that expenditure was forced upon us. It is really not included in the original estimate, though it was absolutely necessary to do the work.
633. Will that £90,000 be sufficient to complete both breakwaters? I think it will nearly finish both breakwaters. If we take the other 10 per cent., which we are entitled to under the Act, the other £30,000 will complete the whole work.
634. At present you are proceeding with the southern breakwater? Yes; I am pushing on with the southern breakwater, employing double shifts, which are working day and night.
635. Then do you intend to take up the work on the northern side when you have completed the southern breakwater? In a few month's time we shall go on with the northern breakwater. We wanted to get the southern breakwater more advanced before doing so.
636. Vessels going out of the Richmond River have to steer pretty well a north-easterly course from the bar to avoid the shoaling outside? The current, after running down the north breakwater, turns north-easterly, but I think that as we concentrate the current more into the north channel, it will tend to straighten out.
637. I understand that further up the river you have some works in progress, and that you are asking for votes to enable you to remove the obstructions? There are several shoals up the river that want improving, apart from places where there is rock extending into the river, which I recommended should be removed to improve the river generally. I may mention the chief obstructions. The first is at the upper end of Pimlico Island, where there is about 10 feet of water, which wants deepening a little. It is silt which can easily be removed. Then there are the Blackwall Flats immediately above Wardell. There are about 8 feet 6 inches on the Blackwall Flats at low-water. That wants deepening. It is rather a long shoal, about 1,000 feet in length.
638. That is indurated sand? Yes, a hard sand. Part of it, I believe, is soft; but there are bands of indurated sand in it. The next obstruction is at Goat Island, there is about 10 feet of water there which requires deepening, it is silt, and could easily be removed. The floods broke out a little above there twice, and, I think, that caused the Goat Island shoal. Then there is another shoal about a mile below Woodburn with 10 feet of water on it. Then about a mile below the Elbow there is another, Swan Reach, with from 9 to 10 feet on it, and which should be deepened. That also consists of soft material. There is a shoal a little above the Elbow, also consisting of silt with 9 or 10 feet of water on it. The ruling depth from Coraki to Lismore is about 10 feet.
639. The removal of the obstruction below Coraki to a greater depth than 10 feet would only permit of navigation to that point, or do you anticipate the deepening of the river further up? We could deepen the river all the way.
640. Could you say what you will require outside your ordinary annual expenditure in the way of special votes to remove those obstructions in the river, apart altogether from the works at the entrance? I think

think that to put the navigation of the Richmond River in good order it would require an expenditure of £50,000 or £60,000 on the inner river. There are many places where we could remove rocks which are diverting the current. At present there are rocks at Woodburn. They are rocks overlying soft material, and it would not be difficult to remove them. If Parliament voted the money we should get some special plant for the work, such as we have at Newcastle for breaking up the rocks, and doing the work on a larger scale than we can at present.

641. Have you the figures of the total amount spent and authorised on the Clarence and Richmond Rivers for the purposes of comparison? Yes. The total expenditure authorised on the Richmond is £356,350. The actual expenditure has been £260,244.

642. That is independent of your estimate of another £50,000 or £60,000 that would be necessary to complete the work? That amount was for entrance works only. There has only been very small amounts spent in improving the river. There have been no special votes for the river at all.

643. What amount has been authorised and spent on the Clarence River? The expenditure authorised on the Clarence is only £251,300.

644. Has that all been spent? No, we have only expended £144,000.

645. That is independent of what was originally spent by Mr. Moriarty? Quite independent of it.

646. I think you said that for the partial extension of the southern breakwater, and the removal of the middle reef, you would require another £100,000? Yes.

647. That would bring the expenditure on the Clarence up to about the amount authorised for the Richmond River? Yes.

648. *Mr. McParlane*] The estimated cost of constructing the south training-wall on the Clarence River is £77,700? Yes; we have completed it within that amount. It did not cost within £30,000 of the amount of the estimate.

649. What was the actual cost? It was something like £30,000 under the amount you have mentioned.

650. It did not cost within £30,000 of the estimate? No. The works so far constructed have cost about £37,400 less than the original estimate. The greater part of that saving was on the south training-wall.

651. Do you think there would be a corresponding reduction in the expenditure on the breakwater? No. I think we can do the work for the amount estimated, but I do not think there can be a corresponding reduction. It so happens that the channel kept straight out all the time that we were doing the work. But had the sand filled in again, as it did in the old days, then we might have had a very large expenditure. Fortunately, some years before a big flood had straightened out the channel, and we were able to extend the wall without having to fight the current, and the work was cheapened in that way.

652. You remember where the trouble used to arise at the crossing? Yes.

653. The south training-wall practically cuts the crossing through? Yes; it is really north where the trouble always was.

654. What depth of water was there usually on that crossing before the training-wall was constructed? Nine or 10 feet. It has shoaled up to 6 feet.

655. What depth of water is there along the training-wall? From 18 to 24 feet.

656. So you look upon the construction of this training-wall as a success? Yes.

657. How far does the influence of that scour caused by the training-wall extend seaward? I think it extends pretty well to the bar.

658. How far would that be? About 3,000 feet out.

659. It has an influence out that distance? It has; but the strong north-east winds would overcome that influence and cause the sand to train round. As soon as the winds cease the channel straightens out.

660. How far is the shallowest part of the bar from the end of the training-wall? About 3,000 feet out.

661. That will be immediately beyond where you say the training-wall goes? Yes; it begins to deepen very quickly there.

662. Outward? Yes.

663. Once you cross the bar it deepens quickly? Yes.

664. Do you not think if the southern breakwater was carried out 1,000 or 1,200 feet further it would send the scour considerably over where the bar is now? Of course it would.

665. Would not that leave continuous deep water right out to sea? It would certainly improve the depth of the water.

666. I understand, from the captains of boats, that it is only a ridge where the bar is, and that the water is very deep outside? Yes; it deepens very quickly outside.

667. If the scour removed that ridge, it would leave deep water, would it not? It would certainly increase the depth.

668. Do you think there would be any danger of any shoaling beyond that again? I do not think so. But I should always expect, after a long continuance of north-east winds, to see the sand from the north shore going across the bar; but it will be only a temporary inconvenience.

669. Have you any data showing what depth of water there was on the bar after the heavy flood you have spoken of? I have a record, but not with me.

670. Could you give us any idea? I could not say how long it kept up.

671. I understand that Sir John Coode's idea, when he prepared the plans, was to carry out the breakwaters first;—was that so? Yes, he suggested that.

672. And to have the ridge removed? Yes.

673. And if necessary to make a training-wall? Yes.

674. Is there any particular reason why that proposal was departed from? I cannot say.

675. Do you think that was a wise departure? I do not think it was a mistake. I think it was best to see what the effect would be before a large expenditure was entered upon.

676. I understand that the idea was that in carrying out the breakwater, that portion of the training-wall could be carried out at the same time, so that the small stone could be used for the training-wall, and the larger stone for the outer works? Sir John Coode did not say so. He simply proposed the construction of the south breakwater first. He did not give that as a reason. There is no doubt in my mind that we have adopted a wise course in constructing the south training-wall. It has been contended that we might not have done it for the amount estimated, and that it would have caused a great deal of inconvenience to the shipping, and perhaps have temporarily blocked shipping if the channel had gone southward of the wall. We should have been fighting against the current all the time whilst the wall was being constructed.

But

C. W. Darley.
21 June, 1900.

- C. W. Darley. But it so happened that Sir John Coode came after the big flood that swept out the channel. As I explained to the Committee, Mr. Moriarty never could have proposed such a scheme as that, for one thing no large sum was ever voted in those days for such works, and he never could have counted on the north channel sweeping out. He had to try as well as he could to form the best possible channel where Nature had put it. He had to follow round the old channel. Before Sir John Coode's arrival, the large flood came, and cut off the North Spit, and he said, "Now we must fix a channel where it is by a new training-wall." If we had waited, and had not constructed the wall until we made the breakwater, the channel might have come south again. Had it done so, and forced the channel down to the south again, we might have found very serious difficulty in constructing the south training-wall, and we might have had to block navigation until we forced the current into the northern channel again. It so happened, however, that the channel kept to its new course as long as we were constructing the wall.
677. How long has the present channel along the training-wall been opened up? About thirteen years.
678. Do you think there is no danger of it shifting? It cannot shift now for the wall.
679. What class of stone would be required for constructing the outer breakwater? Large blocks.
680. About what weight? I should like to get them from 15 to 18 tons in weight.
681. Do you think there would be a considerable waste in quarrying stone of that kind? It can only be advantageously quarried when you have work to do with the small stone. We cannot put small stone in with the large.
682. If the whole of the training-walls were completed before starting the breakwaters, would it mean a material increase in the cost of the breakwaters if it was found necessary eventually to carry them out? It would.
683. Is there plenty of valuable stone in the new quarry? Yes.
684. Can that be obtained cheaper than stone from the old quarry? The old quarry is worked out completely. We can get stone much cheaper from the new quarry.
685. Does it give satisfaction as to quality? I think it will do just as well as the stone out of the old quarry.
686. How were the harbour works at the Richmond River commenced in the first instance—by carrying out training-walls or commencing the breakwater? We commenced with the north breakwater first. Sir John Coode recommended that the southern breakwater should be made first, but I took a different view. Sir John Coode, for some reason, laid great stress on the matter of the southern breakwater. I examined into the question, however, and recommended that the northern breakwater should be made first, and in support of my views I wrote home to Sir John Coode, and he entirely agreed with me, because certain changes had taken place after he visited the Colony which rendered that course necessary. The channel had worked far north into the bay, and was passing inside the Beacon Rock; so it was imperative that it should be moved out to that position as quickly as possible. It was a position causing navigation to be attended with the greatest possible difficulty and danger. We commenced with the northern breakwater, and pushed that out, closing the channel between Pilot Point and Beacon Rock, and then we continued with the northern breakwater, and then went on with the southern breakwater.
687. What is the length of each? I could not give the exact figures.*
688. Is the work of extending them discontinued at present? The southern breakwater is being extended; but not the northern breakwater.
689. Is the northern breakwater complete? No; the northern breakwater was well in advance of the southern, and I saw that it was necessary to go on with the southern, so I made a recommendation to the Minister, and we arranged to stop the construction of the northern breakwater temporarily, and we set double shifts to work on the south side. We use the electric light, and employ the men day and night.
690. Has any good result followed the construction of the northern breakwater? Yes; it straightened out the entrance.
691. The object in carrying out the southern breakwater is that it will still further improve it? Yes.
692. How far have the training-walls been extended on each side of the channel? There is only one training-wall on the Richmond, and that is the middle training-wall.
693. Comparing the entrances of the two rivers before any improvements took place in the shape of breakwaters or training-walls, which river carried the greatest depth of water? The Clarence.
694. With reference to the shoal on the bar, can you give some estimate of the distance of it from the entrance to the river;—which of the bars was the farthest out to the sea from the actual entrance? The Clarence. The Richmond bar was a varying quantity—sometimes it was northwards, and sometimes it was about a mile south. The Clarence bar is further out from what we may call the centre of the entrance than the Richmond bar.
695. If the works were carried out in a similar way on the Richmond to what they are on the Clarence by the construction of training-walls only, and not the carrying out of the breakwater, what would the effect be? The two cases are so different that you cannot compare them.
696. You think that training-walls would not have a good effect? Extensive training-walls were necessary on the Clarence to fix the channel on the inside.
697. If the two breakwaters were carried out, would not that have the effect of creating a channel on the Clarence sufficient to deepen the bar? Yes.
698. I mean independently of the training-wall? Then I say no, because the trouble on the Clarence was always inside. If we had not gone on with the whole of that training-wall, the channel would have gone back round by Yamba.
699. With regard to the navigation of the Richmond River bar up towards Lismore, would it cost any very large amount to make the river navigable for steamers drawing 14 or 15 feet of water, assuming that it would be so improved as to admit steamers drawing 15 feet of water;—would it cost a large amount to dredge the river to enable steamers to go to Lismore? It would not cost a very large amount to deepen the river for navigation. Two or three dredges working there for a couple of years would nearly do it. That is merely to open the navigation; but I want to see something more—I want to see the river improved to carry off the floods.
700. Has the erosion of the banks something to do with the silting up? Not in the lower river.
701. Have they not had very heavy washaways? Not so much on the Richmond as on the Clarence.
702. Have you any remedy for that? On the Clarence, of course, the remedy would be stone facings, which will have to be used sooner or later.

703.

* NOTE (on revision):—The northern breakwater is now completed for a distance of 2,938 feet, and the southern breakwater is completed for a distance of 7,012 feet from starting-point.

703. Would that be cheaper than dredging? You would want to do that and dredge too. On some portions of the Clarence it will have to be done very soon. It would do away with the necessity for constant dredging. C. W. Darley.
21 June, 1900.

704. With regard to the southern breakwater at Clarence Heads, you said that, in your opinion, if you carried out the southern breakwater it would afford protection to enable you to remove the reefs;—is that so? That is one of the objects of it. We cannot remove the reef until the breakwater is there.

705. Sir John Coode makes a strong point of the removal of the reef? Yes.

706. Do you think the reef could be removed by carrying out the southern breakwater only? Yes; I think the southern breakwater will give us the shelter which is necessary.

707. You think the southern breakwater would create such a scour as would deepen the water further out? It would direct the scour; it would keep it from wandering away to the south, and keep it on in a straight course to the eastward.

708. *Chairman.*] There has been, at the entrance of each of these rivers, an amount of money either spent or authorised amounting to a little over £300,000? Yes.

709. That, of course, was designed mainly for the purpose of allowing the settlers in each of the two districts served by the river to get their produce to market and get their supplies up by the river? Yes.

710. Do you think, taking a rough view of public expenditure over the Colony, the amount spent on each of those places is commensurate with their importance? I do. I think it is justified.

711. When this total amount of £350,000 in each case is spent, what will practically be the effect on the river, as far as navigation is concerned;—what depth will vessels be able to draw on either of these rivers? That money has only been expended on the entrances. More dredging will be necessary in the rivers, and when these works are completed I think vessels will be able to navigate the Richmond drawing 15 feet of water.

712. Could a steamer of 1,000 tons burden go up the river? No.

713. It would be a fair-sized coastal steamer that would draw 14 or 15 feet? Yes.

714. Do you think the settlers on the river would then have easy and uninterrupted means of getting their goods away and of obtaining their supplies? Yes; with those improvements, coupled with the dredging of the river. There might be a good deal of dredging done; there would be no difficulty in dredging to a depth of 15 feet in the Clarence.

715. We are engaged in considering the expediency of constructing a line of railway from Grafton to Casino; judging from the map and the evidence, the bulk of the settlers in each case are concentrated along the river, whereas the district where the proposed line goes is very sparsely populated;—do you think that those people, with the expenditure of that sum of money on each of the rivers, and a little more for dredging, would be fairly well provided with means of communication? If the rivers are opened up they will be very well supplied with means of communication. They want to get their produce to Sydney—not from one river to the other.

716. Even if the connecting link Mr. Watson indicated from Casino to Lismore were constructed, and the proposed line were made from Grafton to Casino, do you think then there would be any large inter-river traffic, or traffic from one river to the other? I do not think so. There might be a traffic from Casino to Lismore; that is good country, and there is good navigation at the river to Lismore, which would give an outlet for traffic; but as for the line between Casino and Grafton, I cannot say much about it.

717. *Dr. Garran.*] In an inquiry as to the works at the mouth of the Clarence about ten years ago, the evidence given was that then the difficulty of entering the Clarence was the sharp turn that had to be made after passing between the two reefs to avoid the sand-spit in front? Yes; to get round to Yamba.

718. I gather from you that since you made the inner training-wall you got the flood down between those two reefs? Between the training-wall and the reef.

719. Your channel is a different one from what there was then? Yes.

720. So that steamers in going in now do not turn sharp to the left, but go straight on? Yes.

721. So that the whole design of the work has been modified? No; the design is being carried out.

722. The Committee was told that the object was to blast away a great deal of the southern reef to avoid that sharp turn to the left? No; because the southern training-wall in the case of the Clarence was part of the design, it was to widen the channel instead of scattering the current.

723. To ease off that sharp turn? No; it was to concentrate the current in one channel.

724. Was the design of this inner training-wall to get rid of that channel near Yamba? Yes.

725. And to get a straight run? Yes.

726. Was that Sir John Coode's idea? Yes; to shut up the channel at Yamba.

727. Steamers do not go near Yamba? No.

728. So that the entrance to the river now is pretty straight? Yes.

729. All you want is to widen the channel and keep it open? Yes.

730. And to widen that channel you must blast away the north reef? A portion of it—not all.

731. Is the removal of that reef the most urgent thing that is now wanted at Clarence Heads? It is decidedly wanted. I do not say it is the most urgent thing.

732. What is there that is more urgent? Well, perhaps we might say that it is the most urgent of works not yet undertaken. The most urgent work now is the work we are doing—the new Iluka wall.

733. How much do you say it will cost to remove this north reef altogether? About £23,500.

734. Can you do that better in winter, when the westerly winds are blowing, than in summer? At present we could not do it at all, in either winter or summer.

735. The view that you put before us now is that you want to remove that north reef, but that you cannot do it until you have quiet water, and that there will not be quiet water until the southern breakwater has been extended? Yes.

736. So the southern breakwater must precede the removal of that reef? Yes.

737. And it is necessary to remove the current? Yes.

738. That is how the matter stands at present? Yes.

739. The northern breakwater you do not consider to be so immediately urgent? I do not.

740. Does the water cling to the inner training-wall as it comes down now? At present it is divided. A portion follows the Iluka shore, and a portion goes along the training-wall; then the portion that comes along the Iluka shore meets the north bank on the western side of the north point, and running along it takes an easterly course, and reaches the current along the wall at almost right angles, causing a great eddy;

- C. W. Darley. eddy; it then flows along the wall to the entrance. It is with the view of getting rid of that cross action that I recommended the Minister to move the Huka wall out into the bay.
- 21 June, 1900. 741. Does that central training-wall rest on the sand, or has it gone down to the rock? It is on sand.
742. Does the working of the water round it undermine it? No; it has kept slipping down to the bottom, and we make it up from time to time.
743. It is working its way through the sand towards the solid bottom? It runs down and checks the scour. At the bottom of the wall on the river side the stones have gone right down to the bottom, and the water is deep on one side, being about 50 feet.
744. You have to keep on topping it up? We had to keep topping it up when constructing it; but it is remaining steady now.
745. From what you see now, you have no doubt that the works you are recommending will be effective? No.
746. You have got the channel under control? Yes.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie. 747. *Chairman.*] Do you produce a map showing the character of the various holdings along the proposed railway? Yes; within 20 miles of each side of the proposed line.
- 21 June, 1900. 748. And within 20 miles around Grafton as a centre at one end? Yes.
749. Will you give the details? In the area just described there are 624,500 acres of alienated land; 515,200 acres of reserves; 742,500 acres of Crown lands—that is, exclusive of the reserves. The area of Crown lands held under occupation license is 545,700 acres; the area of untenanted land is 106,800 acres. The alienated land is shown on the map by blue tint, the reserves by green tint, and the Crown lands by brown tint.
750. Could you indicate what is the character of the reserves comprised within that area? There are a great many reserves. The large green patches on the map represent in every case forest reserves. There are other reserves for a variety of purposes.
751. I notice that there is a string of reserves practically following the route of the line;—are they forest reserves? Not all of them.
752. *Mr. Watson.*] Part of them are railway reserves, are they not? Yes.
753. Have you any details as to the rents of the Crown lands held under lease? The occupation licenses, which embrace pretty well the whole of that brown tint, range from three-fortieths of a penny to 1½d. per acre.
754. *Chairman.*] Coming to the Grafton end of the line, the bulk of the alienated area seems to have followed very closely along the course of the river? Yes, it has.
755. Is it the same at the Casino end? Yes. The alienations follow the river at the Casino end.
756. *Mr. Watson.*] That land under occupation license, tinted brown on the map, has been open for selection since 1884, I presume;—when did the leases run out in the Eastern Division? I think it was in 1890. At any rate, they have all expired long ago.
757. Since the lands comprised in the original leases were not selected, it has been held under occupation license? The greater part of it.
758. And has been open for selection? Yes; the area tinted brown on the map is practically all open for selection.
759. The presumption is, then, that either the terms have not been sufficiently good to encourage settlement on that area, or the land is not sufficiently good? Yes; or both.
760. Do you know whether there has been any large area formerly included in the leaseholds for which occupation licenses have not been obtained? Practically, the larger part is held on occupation license. As against upwards of 500,000 acres of land under occupation lease, there are 200,000 acres not so held.
761. *Chairman.*] If you shut the Grafton end off in the same manner as you do the Casino end, it is practically admitted that the line will draw very little traffic south of Grafton;—suppose you cut it off at the Grafton end, would the proportion of alienated land then be larger or smaller than the area you put before the Committee? The larger part of the alienated land would be shut out. The Grafton end would include considerably more alienated land in proportion than the other.

THURSDAY, 28 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	}	JOHN CHRISTIAN WATSON, Esq.
The Hon. ANDREW GARRAN, LL.D.		ROBERT HENRY LEVIEN, Esq.
		JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

William Henry Hall, Sub-editor of Statistical Year Books, Government Statistician's Department, sworn, and examined:—

- W. H. Hall. 762. *Chairman.*] Will you furnish the Committee with statistics, showing the area under cultivation within the area likely to be affected by the proposed railway from Grafton to Casino? Yes, as far as it is possible to get them.
- 28 June, 1900. 763. Is there any difficulty in this instance? There is a paucity of information. The estimated population within the area likely to be affected by the proposed railway is 6,700. The estimated population of the municipality of Casino—2,050—is included in this number.
764. *Dr. Garran.*] Do the figures include the population of Grafton? No.
765. What area does the return, which you are about to put in, show in the cultivation include? It includes north of Grafton and away to the range.
766. How near to Grafton? Ten or 12 miles out.

767. *Mr. Watson.*] Do you take in Lawrence? No; I do not take in any part which is likely to be affected by the sea carriage. W. H. Hall.
 768. *Dr. Garran.*] How far on each side of the proposed line do you go? Twenty miles from the coast side, and extending to the range on the other side. I put in the following return:— 28 June, 1900.

RETURN showing the Area under cultivation within the Area likely to be affected by the proposed Railway from Grafton to Casino.

District.	Year.	Cultivation.														Live Stock.					Dairy Produce.			
		Wheat.		Maize.		Other Grains.	Hay.	Green Food.	Area under—						Cattle.					Butter made.	Cheese made.

	1898	116	97	3,058	10	5
	1899	108	94	2,520	7
	1900	108	90	3,600	3	8

769. *Chairman.*] Can you tell us the total area under cultivation for the last year, leaving out the Casino end, and the total amount of butter manufactured, leaving out the Casino end, and compare it with the total including Casino? 219 acres, excluding Casino. In Casino there would be a small portion south of the river, but, so far as I could gather in my research, the only settlement along the line is about Myall and Myrtle Creeks, and very little there. Whenever there has been cultivation, it has not been on more than from 5 to 10 acres on any selection.

770. What are the figures with regard to butter, excluding the Casino end? 404 lb.

771. And what are the figures including Casino? 478,154 lb.

772. Taking a general view of the settlement along the line, including Casino, has the progress of the district been fairly rapid? It seems to me that the character of the district has changed. If you examine the figures you will notice that the producers have, apparently, given up the growth of cane to go in for dairying. The yield of cane has dropped from 17,703 tons in 1897 to 3,629 tons in 1900, so that apparently they are giving up one industry for another.

773. What is the population of Grafton? It is stated in the following return:—

PROPOSED RAILWAY FROM GRAFTON TO CASINO.
ESTIMATE of Population.

Locality.	Estimated Population.
Municipality of Grafton	5,020
Within the Population Area of Grafton on the north side of the Clarence River, exclusive of the Municipality of Grafton	500
Within that portion of the 10-mile radius around Grafton proclaimed under the Orders in Council of 9th March, 1847, and 8th February, 1855, on the north side of the Clarence River, and inclusive of the Municipality of Grafton	6,000

774. *Mr. Watson.*] Is there any population between the boundary of the municipality, going northward, and the 10-mile radius which you speak of? I think you will find, in the majority of country towns, that the municipality extends out from 5 to 10 miles.

775. *Chairman.*] From how far south are your figures drawn? Twenty miles.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

776. *Mr. Watson.*] Since you were last examined on this question, the Sectional Committee has inspected the route, and taken local evidence, and it appeared to that Committee that there was no likelihood, for a considerable time, at any rate, of other than very light traffic resulting from the construction of the line; it has occurred to some members of the Committee that it might be possible to look at this particular piece of railway from a different standpoint from that of a line to be connected with the general railway system of the Colony, and that it might be possible to get a light line, pure and simple—more in the nature of a tramway—sufficient to carry the small anticipated traffic which would result—can you offer any opinion as to the possibilities in that direction? I would point out that, if we did that, whatever might be decided upon, the line would have to be built so as to carry the rolling stock now running over the Lismore to the Tweed line. The two lines would, no doubt, be connected. The Secretary for Public Works has already given notice of a resolution to introduce the question of the Casino to Lismore construction. The Government would never leave a small gap. It might be a system detached from the main system of the Colony, but it would form one system between Grafton and the Tweed. The same rolling stock would have to run throughout. I should not recommend any lightening of the permanent way. The adoption of lighter rails would seriously hinder the use of the rolling stock at present running on the Lismore to the Tweed section. After all the saving would not be such a very great one. I believe it makes a difference of about £130 per mile if you knock off 10 lb. per yard in the weight of the rails. The difference in cost between 40 and 60-lb. rails would

H. Deane.
28 June, 1900.

H. Deane.
28 June, 1900.

would thus be about £260 per mile. When I was last before the Committee, I was asked to consider the question of cheap construction. I have gone into that matter. At the same time I would strongly recommend that no cheapening be carried out; but a certain amount of cheapening could certainly be effected by steepening the railway grade—making it in that respect more like a tramway, and also in sharpening the curves. At the request of the Committee I have revised the estimate, assuming that the ruling grade should be 1 in 25, and the sharp curves 6 chains radius, and I have tried also what could be done in the way of cheapening by other means, such as cutting out a portion of the ballast, reducing the station accommodation and cutting off a portion of the allowance for contingencies. I find that by so doing the cost per mile would be brought down from £7,803, at which it now stands, to £4,800—that is, a reduction of £3,000 per mile. I have in my estimate considerably reduced the earthworks by putting in steeper grades and sharper curves. The culverts and timber bridges are slightly reduced. The ballasting I have cut down considerably. No doubt a line could be made and worked with less ballast than is shown, although I do not consider it an economical arrangement—it would mean more maintenance; and I think the price of sleepers perhaps could be cut down. The station works could be designed so as to meet first requirements, leaving the future to provide for the rest. I have also cut down the large item of £70,000 for Grafton station and works to £6,000. As I have stated, I have also cut off a certain amount of the contingencies. I have assumed that, with proper care, such a large amount for contingencies would not be necessary. I have, therefore, reduced the contingency item by £10,000. All these savings amount together to about £3,000 per mile. I do not, however, recommend them. The only saving which, in my opinion, would be really justifiable would be the reduction of the large item in connection with Grafton station, which I think I agreed to in my former evidence. I might say that, with regard to making a steeper ruling grade and sharper curves, if those grades and curves were adopted, then at some future time, when the traffic increases, they would have to be altered. The grades, of course, could be cut down later on, so as to bring them in conformity with the ruling grade beyond; and the line would have to be altered in location so as to suit the larger radius. In a line of this character, through a district of this kind—that is to say, looking at it as a coast district and a country which is largely subject to floods—there are certain items of expenditure which it is almost impossible to reduce very much. For instance, there are the culverts and timber bridges, the larger bridge at Casino, and the level crossings and fencing. You must, in a cattle country, have strong, substantial fences. You cannot put a cheap wire fence there, and you must provide level crossings, and in some cases road diversions. Mr. Stuart, of my Department, has recently been over the line. I was asked by the Colonial Secretary, Mr. See, to let some one go over it. I told Mr. See I did not think it at all necessary, and that not much good would result from it. Still I wished the line to have every chance, and the residents to be perfectly satisfied. Therefore, I arranged for Mr. Stuart to go, having first submitted the matter to Mr. O'Sullivan, the Secretary for Public Works, who approved, and this is Mr. Stuart's report:—

GRAFTON TO CASINO.

Memorandum to the Engineer-in-Chief, Railway Construction.

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,

Sir,

Sydney, 27 June, 1900.

In accordance with the accompanying instructions, namely, to see what arrangements could be made to obtain land for railway purposes in the event of this line passing, I proceeded to Grafton, and interviewed Mr. G. H. Varley, Chairman of the Chamber of Commerce, Mr. Munroe, auctioneer and land agent, the District Surveyor, and one or two other leading men interested in the welfare of the district, and in forwarding the construction of the above proposed railway. After going into the matter we came to the conclusion that, as far as the resumption of the properties within the municipal area of the city was concerned, the best plan would be to supply Mr. Varley with a map showing the areas required, and to leave the matter in his hands, namely, to get the people whose properties are affected to sell their land at a reasonable figure, or to accept the Government valuation. I also informed him that all land outside the municipal area would probably have to be given free of cost.

Leaving Grafton, I went over the route of the proposed line, with a further view of seeing if anything could be done towards reducing the cost of construction; but with the exception of the small deviations at 4 and 16 miles respectively, suggested by Mr. Burge, and another at 21 miles (this latter owing to the ruling grade having been altered since Mr. Burge's inspection from 1 in 50 to 1 in 60) nothing material could be effected except by greatly increased curvature or steepening the grades; neither of which I should recommend, seeing that this line will ultimately be portion of the North Coast system.

When at Casino I examined portion of a deviation suggested by Mr. Pyers, the Member for The Richmond, which he considered would considerably shorten the line. This deviation would leave the present survey between Myall and Myrtle Creeks, and, steering approximately straight, would cross the main Grafton-Casino road near where the Ellangowan road joins it, thence skirting round the foot of the low ridges on which the main road runs, and keeping to the left of this road it would cross the Richmond River, and gradually bearing round, join the adopted survey at the western end of the proposed station-ground. This deviation would go through better land, and shorten the line by 3 or 4 miles; but against this you have an increased area of flooded country, probably more earthworks in crossing the range between Myrtle and Sandy Creeks, and the hills on the southern side of Deep Creek, and it would not suit the new junction of the Tenterfield line quite so well. This deviation, although not too promising, might be further looked into when the line comes to be permanently staked.

CHAS. McD. STUART.

That last proposal of deviation is a straightening of the line very much as shown on the map by the blue line, except that it comes a little further to the west, so as to join in on the western side of Casino. I think evidence was given to the effect that any straightening of the line there would be rather more costly than the line laid out.

777. Mr. Stuart, having recently gone over the line, is of the same opinion as previous surveyors who have gone over it, namely, that it cannot be materially cheapened without increasing the grades and curves? Yes.

778. The savings which you say are possible amount to about £192,000? Yes.

779. Can you say what would be the speed at which the line could be worked with a grade of 1 in 25, and using the class of engine now used on the Lismore to Tweed line? I suppose the engines would go safely round the 6-chain curve, but I am sure the Locomotive Engineer would not like to have them put to that test on account of wear and tear. I imagine they would have to proceed pretty slowly. I should not like to see anything faster than 15 miles an hour attempted when going round those curves. The bad curves, of course, would be confined only to a portion of the route. There would still be a considerable run of straight line without excessive curvature.

780. I believe the worst curves would be where the Richmond Range is crossed? Yes.

781. Following the spurs which run up to the divide? That would be the worst place. Then there is a place further on—nearer Myrtle Creek.

782.

782. If there were any doubt about being able to use the engines now in use on the Lismore to the Tweed line with this altered Grafton to Casino line, would your objection still hold good about the using of lighter rails. If the shortening of the curves precludes the use of the engines now in use on the Lismore to the Tweed line, would not it be just as well to take the whole matter in hand and say, "We will adopt new engines, and have lighter rails for the Grafton to Casino line"? Even then I would not recommend that, because, sooner or later, as traffic increases, that line would have to be put on the same footing as the other, and then the 40 lb. rails would not suit. You would have to renew the road by putting down 60-lb. or 70-lb. rails, and you would have a lot of material on hand which you could not use for any other purpose, because we do not use 40-lb. rails anywhere else, and we are not likely to do so.
783. What would be the life of a 40-lb. rail with traffic such as you would get on a line of this description, using it three or four times a week? The traffic would be so small that steel rails would last from twenty to thirty years.
784. So that if there were any probability of the traffic increasing to any great extent before that period expired, it would not be wise to put down 40-lb. rails if other things were equal? I do not think it would. It would be a great pity to make a saving in that way.
785. You say that, in going round the curve, it would not be advisable to exceed a speed of from 10 to 15 miles an hour? Yes.
786. Could the class of engine now in use on the Lismore to the Tweed line take a train up a grade of 1 in 25 at that speed? In using steeper grades you would, of course, have to reduce your loads. It is assumed, of course, that the traffic would be very small. Only on the assumption that the train loads would be very light would it be really advisable to put in such steep grades, or anything like that—working it, in fact, like a tramway. I could find out for the Committee how much those engines would take up a grade of 1 in 25.
787. Say at a speed of from 20 to 25 miles? I will obtain the information and send it in.*
788. Would 40-lb. rails carry the trucks now in use on the Lismore to the Tweed line if they were loaded? Yes, I should think so.
789. Is there any great objection, from the point of view of railway working, and keeping in view the probability of only light traffic, to the use of such an engine as is now working on the Camden tramway? For this particular section.
790. Yes, in conjunction with the Lismore to the Tweed line? I should think there would not be for that particular section; but I am sure the Commissioners would not approve of using one class of engine on one part of the line, and another class of engine on another part.
791. But if you have two different classes of traffic to deal with, surely it would be permissible to arrange your hauling power and other details in conformity with the difference? That is a traffic question, which I have not gone into carefully. Perhaps some of the traffic officers would give better evidence than I.
792. Do you think you have included all the items in which it is possible to make any reduction consistent with safety? Yes; I have included all the items where one can make any material reduction. I have not made any reduction in the cost of the bridges or timber openings. I do not consider that desirable, because, before those bridges are worn out or decayed, the line would have to be put on the same footing as the other. It would have to be made to carry the same rolling-stock.
793. I do not suppose, in any case, the building of a bridge to carry slightly lighter rolling-stock would be very much cheaper than the ordinary bridge you construct? No, not in proportion.
794. The large bridges—I include Myrtle Creek—come to £25,000; culverts and timber bridges crossing all creeks, £80,000; so that there is a total of £105,000 for bridges and culverts, and of course covering that 7 miles of flooded country? You cannot build a light bridge and then strengthen it conveniently. You would have to pull it down and build up a stronger one, so that there would be a great waste of money when the character of the traffic came to be altered, and you had to use the heavier rolling-stock.
795. Assume a difference of 30 tons in an engine, would the reduction in the case of a bridge, built to carry a 30-ton engine, be proportionate to the cost of one built to carry a 60-ton engine, or would it be greater in proportion? The main girders would be, approximately, in proportion, always allowing that there would be a certain amount of expense in each case, which is common to the two, and could not be reduced. Then the platform of the bridge would not be reduced in proportion. The piers and the abutments would be probably very much the same.
796. Then there would not be a great difference between the two classes of bridge? No, not at all in proportion to the load to be carried.
797. Assuming that the line were constructed, as suggested, with grades of 1 in 25, and curves of 6 chains radius, would it then, say ten or twenty years afterwards, be very expensive to make the line up to the standard at which it is now proposed? Of course, it would mean a considerable alteration in the location, and there would be a cutting down of the grades. It might be done, perhaps, by altering the location altogether without cutting down. In some few places, probably, it would be cheaper to cut down the grades where curves are not involved, than to alter the location. I think the additional expenditure would, probably, be a good deal more than the difference of first cost.
798. In the meantime you would be saving the interest on the reduction? Yes.
799. Assuming that a lighter line were sufficient to carry whatever traffic there would be, do you think the saving in interest for ten years would make good the extra expenditure which would be necessitated by not constructing it in the first instance according to the original design? I suppose it would be a question of additional earthworks only. Anything else which is saved could simply be supplemented; but the earthworks would mean an alteration. A great deal of the work in the way of banking and cutting would be absolutely thrown away; so it would, perhaps, in some of the smaller culverts. You might be in a position to save, in the first instance, about £70,000 in earthworks and small culverts. The other savings really do not affect the load to be carried, but these do.
800. The other savings above the £70,000 are in respect of the station buildings and matters of that kind? Yes, and ballast and all the rest of it.
801. What you would save, then, would be the interest on the capital cost of £70,000? Yes. That at 3 per cent. would be £2,100 per annum, or £21,000 in ten years. It would be difficult to say, at the present moment, whether it would not cost later on £90,000 instead of £70,000. Of course there might be

* NOTE (on revision):—The gross loads that would be drawn by A class engine (6-wheel coupled) might be taken at 100 tons, and the C class (4-wheel coupled and bogie) 70 tons.

H. Deane.
28 June, 1900.

H. Deane.
28 June, 1900.

be a greater difference; it might cost more than £90,000—that is more than £70,000, plus the interest for ten years; but it is difficult to say. I am afraid I could not give a reliable opinion upon it.

802. *Dr. Garran*] As a general rule, in railway construction, does it cost more to make a cheap line first, and convert it into a good line afterwards than it does to make a good line first? It depends on what you want to add afterwards. If, as is suggested, you altered the location later on. I think it would be better to have the right location at first; but if it is merely strengthening the ballast, or cutting down grades, it is better, perhaps, to make the cheaper line first, and improve it afterwards.

803. Supposing, in this instance, we make a cheap line, and in ten years find it necessary to convert it into a good line, would it cost as much to convert it into a good line, as the saving which would be effected by constructing it as a cheap line? My difficulty is to know how much of the line would have to be renewed and altered in location, and built afresh. The comparison would depend upon how much of the old work would be absolutely thrown away, and how much would have to be new.

804. Would not the working expenses be very much increased on the cheap line over the dear line, taking into consideration the slowness with which the trains would have to be run, and the smaller haulage power of the engines? No; I do not think the working expenses would be increased, if you had small loads and only one train to carry them. Of course, if you had to multiply the number of trains, because you could not carry sufficient in one train, it would be a different thing; but if you only had small loads to carry, and could do all that was required with small trains, I do not think the working expenses would be greater with the cheaper line. I do not think the permanent-way expenses would be greater. Some portions of the permanent-way expenses—the maintenance of the line—would be dearer, and others cheaper. You would have shallower cuttings, and maintenance would be cheaper on that account. On the other hand, some of the work, being light ballast, would not be so substantial, and it might on that account be dearer. I think the two things would about balance.

805. Considering that there is a good rainfall in this district, would it be safe to make a light ballasted line? I should not recommend it.

806. I suppose there is a great difference between a dry and a moist climate in that respect? Yes. We could not do without ballast altogether, as we do on some of the western lines; I do not think the full amount of ballast is too much for a line of this character. At the same time, there is no doubt it could be worked with just enough ballast to do the packing up of the sleepers, when they show a tendency to subside.

807. Do you think that, under those circumstances, it would stand one of the heavy easterly gales which break on that coast? It would stand it right enough, but I think maintenance would be more costly, on account of the smaller amount of ballast.

808. I believe the line you have in the Richmond district at present is a thoroughly good one? Yes; it is well ballasted with blue metal.

809. There is no cheapness about that? No.

810. You have nothing there to guide you? No.

811. *Mr. Watson*] That line cost about £18,000 per mile? That was largely due to the heavy nature of the cuttings, the tunnels, and the bridges.

812. *Dr. Garran*] But it is a thoroughly good line? Yes, it is a very good line—a first-class line.

813. You have no cheap line at all on the coast? No; they are all first-class lines.

814. *Chairman*] The reductions you outline, leaving out the station at Grafton, amount to about £2,000 per mile? Yes.

815. At 3 per cent, that means £60 per mile in the annual savings;—could you make any comparison between that saving and the increased cost per mile for maintenance, and the increased cost, if any, per mile, in carriage—that is the working expenses? I think the working expenses would amount to about the same on both lines.

816. Would stiffer grades mean larger consumption of coal? Yes; but if you only have to carry small loads, I do not know that that would come into consideration very much.

817. Would not the decreased speed also mean higher cost of working, or would the amount be negligible? I think it would be negligible.

818. Would the increased cost for maintenance be a large item as against the £60 per mile in the annual saving? I do not think so. With regard to the maintenance of way, I may state that in consequence of the cuttings being less deep there would be less cost. As a rule, shallow cuttings are easier to maintain than deep cuttings. On the other hand, in consequence of the small amount of ballast there would be more maintenance. I think they would just about balance. It is very difficult to estimate the difference.

819. At any rate you do not recommend that the changes which have been suggested should be made? No.

820. Do you care to offer an opinion as to the advisability of constructing the line at all, apart altogether from the engineering question? It does not seem to me that there is much call for the line. A good deal of the first part of the line would be close to the water. A large portion of it would be more or less parallel with the river. When you get out a distance of from 15 to 20 miles you are within a few miles of Lawrence. The further end would be pretty well served by the Casino line.

821. And the intermediate part of the line does not go through country which is thickly populated? No. The country at the northern end of the line seems to be the best. There is more settlement on Myall Creek, and on some of the other creeks than there is at the Grafton end except on the river flats.

822. *Mr. McFarlane*] I suppose the proposed line could not be used as a North Coast line until the whole of the line is completed from Morpeth? No.

823. I understand the Railway Commissioners are opposed to the construction of a North Coast line? They opposed the construction of the first section of it—from Maitland to the Manning—which is the only portion which has been submitted up to the present.

824. I suppose we could not have a North Coast line without that? No.

825. The Public Works Committee, I believe, would not recommend its construction? That is so.

826. In view of that fact, I suppose, it is probable that it will be a good many years before there can be a North Coast line? Yes.

827. So that the proposed line would be merely a connection between Grafton and Casino for many years to come? Yes. I do not think the fact that it would have to form a part of the North Coast line would be a sound reason for making a very substantial line, because the solidification of the line might, very

very well, be left to the future. When the North Coast line became an actual fact would be time enough to consider the improvement of the line.

828. Even if the first section of the North Coast line were sanctioned, would it not take a very considerable time to construct the whole length of it as far as Grafton? Yes. I think the first section would be about 100 miles—that is from Maitland to the Manning; and, roughly speaking, it would be about 200 miles from the Manning to the Clarence.

829. Has there been any exploration of any country connecting the Richmond with any other point than Casino and the Clarence, with view of getting a cheaper line? Yes. I think the country has been explored; but it is always considered that any line further to the east would be more expensive on account of the amount of water which would be met with.

830. Should the item for constructing a bridge over the Richmond River, at Casino, be charged to a line between Grafton and Casino? I think so.

831. A good portion of Casino is on the same side of the river as Grafton? Not very much. There is a good road bridge across the river there.

832. So far as connecting Grafton and Casino is concerned, a railway bridge would not be necessary,—it would only be necessary when connecting the Grafton-Casino line with some other railway from Lismore? Yes, but still it would be involved.

833. In view of that, is it fair to charge it all to Grafton and Casino? I think so, because it would become a necessity to connect it.

834. Should not some of it be chargeable to the Lismore-Casino line, as well as to the proposed line? No; unless, of course, Grafton is the point to be aimed at. If you want to get to Grafton from Lismore, perhaps the bridge ought to be charged as much to that section as to any other; but if the traffic is to be the other way about—northward—I think it is a fair thing to charge the bridge to the Grafton-Casino section. That is, however, a question of opinion. One thing, which it is necessary to point out to the Committee, is this: Members of the Committee have noticed the fact that out of the £3,000 of saving per mile, £1,000 is due to the reduction of the Grafton station and works there, leaving £2,000 due to the cheapening of the line per mile. I would point out that out of that £2,000 something over £1,000 only is due to the grades and curves, and a little under £1,000 to the lessening of works which can be supplemented afterwards. That is to say, that you spoil the line really by effecting a saving of something over £1,000 per mile. You can save a lot of expense without hurting the line at all, by simply reducing the accommodation, and afterwards supplementing it when traffic increases, and the requirements are greater. All you do by this saving is to spoil the line, with grades of 1 in 25 and curves of 6 chains radius, and you only effect a saving of £1,100 per mile. It does not appear at all desirable to cheapen in that way.

835. *Chairman.*] Do you know why such a pretentious station is set out at Grafton? Sooner or later the item would have to be drawn upon. It includes a lot of wharfs, offices, repairing shops, and a lot of work which, when the system becomes a large one, would be required, but at the present time it is not actually necessary.

836. *Mr. Shepherd.*] I understand you to say that the working expenses on a cheap line are about the same as those on one of our ordinary lines? I did not make any general statement of that character. I think the working expenses in this case would, probably, be about the same; but where there is a lot of traffic the working expenses on a cheap line would be very much greater than they would be on an expensive line.

837. I suppose that the same number of men would be employed in either case? I do not know that they would. In this particular case I suppose they would; but I did not make that as a general statement, applicable to all cases.

838. Would not the consumption of coal per hour be about the same? Yes; with the same load carried, you would have to get over the same summits; the same amount of work would really be done.

839. Supposing you had to travel 100 miles; a train, travelling at 20 miles an hour, would cover that distance in five hours, whereas a train travelling 10 miles an hour would cover it in ten hours;—that would mean ten hours as against five hours' consumption, and it would also mean ten hours' wages as against five hours? There would be less fuel consumed with the slower rate of speed.

840. *Dr. Garran.*] You would have to pay more wages if you kept the engine-drivers and guards twice as long? Yes; if you kept them overtime; but if the traffic were small, you might not have to do that.

841. Would the consumption of coal be increased by the stiffness of the gradients? Yes, over those gradients; but you would get the corresponding runs down, and would effect a saving in that way. I do not think there would be much difference if you went at a correspondingly lower speed. Of course, if you tried to get the same speed out, you would spend a good deal more in proportion on the steeper grades.

THURSDAY, 5 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

JOHN CHRISTIAN WATSON, Esq.

The Hon. SOLOMON HERBERT HYAM.

ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

Thomas Herbert Wilshire, Conditional Purchase Inspector, and Forester, Grafton, sworn, and examined:—

842. *Mr. Watson.*] Do you know the route along which the proposed line is to be constructed? Yes.

843. Can you furnish any particulars regarding the occurrence of timber along the route? Yes. I have a report, which I will read:—

1. One of the finest and densest hardwood forests on the north coast of New South Wales exists along the Richmond Range, in the county of Richmond. The timber referred to covers an average width of 2 miles on both sides of the summit line of the range.

H. Deane.

28 June, 1900.

T. H. Wilshire.

5 July, 1900.

T. H.
Wilshire.
5 July, 1900.

2. The Richmond Range runs nearly parallel to the proposed railway from Mongogarie Creek, in the parish of Busby, to Mount Marsh, in the parish of Marsh, county of Richmond, being 13 miles from the surveyed line of railway at the former, and 12 miles at Mount Marsh, and the distance varies up to 15 miles from the line. From Mount Marsh the range turns easterly and crosses the surveyed route; thence it continues easterly. For about 8 miles east of the proposed railway timber would be drawn to the line; but any further east along the Richmond Range it would be taken direct by teams to the North Arm of the Clarence River. It is anticipated that the railway would carry timber cut on the Richmond Range over a length of 60 miles of that range, by 4 miles wide, comprising 200 square miles.

3. The hardwood timbers within this limit are spotted-gum, ironbark, blackbutt, tallow-wood, red mahogany, grey-gum, stringybark, and bloodwood. The following soft woods also exist in patches within the same area along the range:—Pine, beech, teak, black bean, silky oak, and a little cedar, all of which are of marketable sizes.

4. At the present time this forest for 30 miles between Mongogarie Creek and Mount Marsh is nearly virgin. Ironbark piles 60 feet long, and squared girders 16 inches by 14 inches and over 40 feet long, have been recently taken out of the part just referred to, for special orders; but its distance by road to shipment on the Clarence and Richmond Rivers—from 30 to 40 miles at present—precludes a general trade. The railway, however, if constructed, would open this extensive, valuable forest, it being from 12 to 15 miles only from the surveyed line.

5. The general rates for cutting and carriage of timber to the Clarence and Richmond Rivers from the counties of Clarence and Richmond, are, for—

Girders—12d. to 13d. per cubic foot, of which the carriage is reckoned at 6d. to 7d., the total payment being distributed between the cutter and drawer. A load by bullock trolley contains from 120 to 150 cubic feet.

Logs for sawing—The prevailing rates for cutting and carriage of logs for the saw-mills from the above areas are 2s. 6d. to 3s. per 100 superficial feet.

Piles—For cutting and drawing piles to navigable water from the areas referred to, 6d. to 10d. per lineal foot is paid, of which up to 2s. 6d. per pile goes for cutting it. The lengths of the piles vary from the about 30 feet to 55 feet, and the 10d. rate prevails for the largest sizes.

6. The estimated quantity of marketable timber at present within the area of 50 miles by 4 miles along the Richmond Range is three trees of 800 superficial feet to each acre, which, at the ruling rate of royalty, would yield in revenue to the State 4s. per tree, or £76,800. This forest area along the Richmond Range will be permanently retained for the preservation and growth of timber. A low estimate of its continual production, after the present marketable timber is removed, would be one tree of 800 superficial feet per acre per annum, giving an annual royalty, if demand on the area to its full capacity were made, of £25,600.

7. Independent of this permanent forest area, there are 139,463 acres of temporary forest reserves adjacent to, and up to 15 miles from, the proposed railway, in which large quantities of ironbark and spotted-gum are the prevailing timbers, which will afford marketable supplies for some years.

8. Ironbark is also growing scattered over the unreserved and vacant Crown lands along the general route of the line. These lands are at present only returning small rentals as occupation licenses. Sufficient sleepers to build the line can be obtained growing within the limits of the railway reserve along the original trial survey line.

844. Which of the areas along the route would be available for drawing traffic to the railway? The bulk of the traffic in the shape of timber would be drawn from the western side of the railway line.

845. At what point on the proposed line would you first get timber for traffic purposes? Going from Grafton you would get it first about Myall Creek and Camira.

846. That is from 28 to 30 miles? Yes.

847. For how far along the line, going towards Casino, would you continue to get timber traffic? To within about 16 miles of Casino. Of course, I am speaking now of good timber.

848. Along miles of the line there would be a probable timber traffic? From 20 to 25 miles.

849. What timbers are included in the area which would be likely to give traffic to the line? Ironbark, blackbutt, teak, pine, a little cedar, tallow-wood, and mahogany.

850. Do you think there would be any traffic in spotted-gum? Yes; I think the spotted-gum is one of our best timbers. It is splendid timber on the range. It is thoroughly sound, and of great length.

851. *Mr. Hyam.*] My experience is that the northern spotted-gum is poorer than the southern spotted-gum? They use a lot in the sawmills up there.

852. *Mr. Watson.*] What do they principally use it for? For buildings. One of the sawmills turned out about 1,000,000 feet of spotted-gum which was grown in different parts of the Grafton district. I think the bulk of it came from the south side of the Clarence.

853. Would the line tap a considerable area of pine? Not a great area.

854. In what direction would the timber go when put on the line? Towards Grafton. There would be a great probability of direct shipment there.

855. Would it pay the timber-growers to drag the timber from the range, a distance of 12 or 14 miles, and load it on the trucks for Grafton? I think so.

856. Is there any possibility of their leaving the railway on one side and taking the timber to Lawrence? No; if they did that they would do it now, but it does not pay. It has never paid to draw mill-timber to Lawrence.

857. Unless a railway is constructed somewhere in that direction, the timber on the main range is likely to remain untouched? I think so, unless a mill is erected somewhere on the road.

858. You seem to think that the range will yield a good deal in the way of royalty? I am certain it will.

859. Is your estimate made up on the basis of the old royalties charge? No; on the proposed new royalties.

860. There seems to be a little objection to them coming into force? It looks like it. We used to charge 9d. per 100 feet on the reserves and 6d. for other hardwoods. Sixpence is a moderate royalty, but it is passed on. The saw-mill proprietor does not pay.

861. What class of timber is most in demand for export to outside markets? Ironbark. Very little other timber goes out of the Clarence River.

862. The demand for other timber is local? Yes.

863. Is a considerable quantity of ironbark shipped from there now? Yes; the trade is active just now, and has been for the last two years.

864. What is paid for road carriage at the present time? For girders, 1s. to 1s. 1d. per cubic foot—that is, for hewn timber.

865. Is that irrespective of distance? They are drawing 50-foot lengths to Lawrence, a distance of 32 miles.

866. Is the bulk of the timber obtained in the district, and which is sent to Lawrence, drawn that distance? No; the bulk of the timber is drawn from 15 to 20 miles.

867. And do they get an equivalent to that price? Yes. For hewn timber the charge for drawing and cutting is 11d. to 1s. 1d. per cubic foot. The cutter and drawer generally divide between them.

868. Have you a knowledge of the land through which the proposed railway will pass? Yes; up to Myrtle Creek.

T. H.
Wilshire.
5 July, 1900.

869. What is your opinion of the land from Grafton to Myrtle Creek? It is only second-class, and not too good second-class.
870. Assuming that the railway were constructed, what area would be necessary to support a family? 640 acres, at the very least.
871. To what would it be possible to devote the land? Chiefly to dairying. The agricultural land is very limited. It only fringes on the creeks.
- 872-3. Do you think that the land is such that, with improvement in the way of ringbarking and the planting of artificial grasses, 640 acres would maintain a family? Yes. With artificial grasses, dairying ought to do very well on 640 acres.
874. Has it been shown that artificial grasses will thrive up there? Yes. Some of the selectors at Myall Creek are growing paspalum. It is growing luxuriantly.
875. Have any of them tried it on the higher or more ridgy lands? I do not think so. I have, however, seen it growing at Smith's Creek on very raw sand.
876. Does it thrive? Yes; it appears to be a hardy grass.
877. From what you have seen of the land beyond Myrtle Creek, would you say it is as good as, or worse than, that from Grafton to Myrtle Creek? It does not vary very much until you get into Casino. I have made a rough estimate, and I think that 1,500,000 superficial feet of timber ought to be removed per year by rail.
878. How long do you think it would take to exhaust the forests? In view of the young growth, I do not think it would be possible to exhaust them if we had careful supervision and proper working. Of course the indiscriminate cutting which has been taking place should not be continued.
879. Do they put the beech and similar woods to any useful purpose, locally? It is used for building purposes; but there is not great demand for it, locally.
880. Is there any export demand for it? No; it is very limited.
881. *Chairman.*] Is it because the soft woods are not valuable enough to allow heavy road-carriage to be paid that there has been no outside market for them? I think there is no demand for them. Of course there is a great demand for pine.
882. *Mr. Shepherd.*] Do you think the country from Grafton to Casino is, as a whole, fit for either agriculture or grazing? At present it is chiefly used for grazing.
883. What is its carrying capacity for sheep? Sheep would not do there. It requires 20 acres for a beast. Of course it could be much improved by ringbarking and the planting of grasses, so as to bring it down to 6 or 7 acres to a beast.
884. Do you think the country would be likely to be taken up for closer settlement in the event of the railway being constructed? I think so.
885. Do you think a considerable portion of the country would be suitable for mixed farming? I think so—that is, for straw crops. There is not much of it suitable for the growth of maize.
886. I suppose the timber-carriage would be scarcely sufficient of itself to support a railway? I scarcely think it would.
887. At what distance from the line would it pay to cut the timber? Any amount can be obtained within 15 or 16 miles.
888. The country generally is of a hilly character? It is undulating and level.
889. Are the roads fairly good? The roads are tiptop, and there is plenty of grass.
890. Then 20 miles would not be an excessive distance to draw for ordinary farm work? No.
891. Is much cultivation being carried on? It is very limited, except on Myall and Myrtle Creeks.
892. Is the silky oak growing plentifully? No; but there is a fair amount of it.
893. To what size does it attain? The growth will not be more than from 3 feet to 4 feet 6 inches.
894. Is it a suitable timber for casks? Yes.
895. *Mr. McParlane.*] What is the annual output of timber from the Clarence for export? I cannot say exactly, but I should think that it is about 2,000,000 feet of iron-bark, exclusive of piles.
896. Is that for piles and girders? Yes.
897. Where is it principally sent to? New Zealand.
898. Do any of the Northern rivers ship direct to New Zealand or foreign ports? I do not think so.
899. Do you think the whole of the ironbark timber on the reserves, or on the range, would be cut for export by way of the Clarence? I think so. I do not think a stick of it would go to Casino. It could be shipped direct from Grafton or Lawrence.
900. Is the export trade likely to increase? I think so. There is another mill in commission now for the export trade.
901. Do some of the saw-mills use tramways for conveying timbers to the mills? Yes. One of the mill-owners has 12 or 13 miles of tramway running.
902. Is that method cheaper than carrying by team? It has the advantage that they can work it in almost any weather.
903. If the proposed railway were constructed, do you think the timber that is now carried considerable distances would be carried by train instead of by team? I think it would, from the western side of the proposed railway.
904. You have stated that the country between Grafton and Casino is second-class country;—do you mean second-class grazing or agricultural country? It is second-class grazing country.
905. Do you know the land on the Camira homestead? Yes.
906. How would you class that land? With the exception of the agricultural portion of it, I would not call it first-class land.
907. It has been stated in evidence that some portions there have been placed under cultivation with good results? That would be beyond the creek only. The fringes along the creek are fairly good, but the forest country is only second-class.
908. What class of country is it when cleared for grazing purposes? Cattle do very well upon it.
909. Is it suitable for dairying? Yes; with improved conditions, such as good grasses.
910. Is the grass sour? It is rank, and I suppose it is sour too. The country wants well eating out. In the paddock country, of course, a good number of cattle are fattened.
911. How long have you occupied the position of Inspector of Conditional Purchases in the Clarence district? Fourteen years.
912. What district were you in previously? The Hunter River district.

T. H.
Wilshire,
July, 1900.

913. Do you think the whole of the Crown lands along the proposed route, within a reasonable distance of the route, will be taken up in the event of the line being constructed? I think a very large area of it will be taken up. I have not the slightest doubt that eventually the whole of it will be taken up.
914. *Mr. Hyam.*] Have you both varieties of spotted gum—red and white—in the district? Yes.
915. Which class of spotted gum predominates? The white.
916. That, of course, is the best timber? Yes.
917. Is there a large export trade in spotted gum? No; not an export trade.
918. Is there likely to be an export trade in it? I do not see why it should not be exported.
919. Is there not some objection to it for wood-blocking? Yes; I do not think it stands well in the ground.
920. Is it used for bridges? Not as a general rule; but it ought to do well for decking. It is a splendid timber.
921. Is the country through which the railway will pass heavily timbered? Yes.
922. Would it be difficult and expensive to clear? You could ringbark it for about 1s. an acre. The ruling rates there vary from 6d. to 1s. per acre. We consider that the land should be heavily timbered if we pay 1s. an acre.
923. Do you think artificial grasses will grow well in the district? I am quite certain that *paspalum* will grow well. I have seen it tried on much inferior land—on almost raw sand.
924. It will grow in sandy country if there is any moisture, but a good deal of the country through which the proposed line will pass consists of heavy, raw, clayey soil? There is a lot of it which is very sandy.

TUESDAY, 10 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grafton to Casino.

The Honorable John See, M.P., Colonial Secretary, sworn, and examined:—

Hon.
J. See, M.P.
10 July, 1900.

925. *Chairman.*] Would you prefer to make a statement of your views, first, on this question? Perhaps it may assist the Committee to some extent if I give a brief *resume* of the development which has taken place on the Clarence, the Richmond, and the Tweed, since 1871. Of course the Clarence was occupied for some years before 1871; but it will hardly be necessary to go back to that period. In 1871, the Clarence, the Richmond, and the Tweed, in fact, the whole of the Northern district from the border to the Clarence, was called the Clarence electorate. I have had some figures taken out for the convenience of the Committee to show the development of these districts during the period I have mentioned, and for the purposes of comparison I have had the figures taken out in decades. In 1871, the Clarence River district, the Richmond River district (which is now divided into three electorates, namely, Ballina, Lismore, and the Richmond), and the Tweed River district, which is now a separate electorate, formed one electorate. At the present time this country comprises six electorates, namely, Grafton, the Clarence, the Tweed, the Richmond, Ballina, and Lismore. The total population of the whole of these districts in 1871 was 13,760; in 1881, it was 23,762; in 1891, it was 40,394; and in 1900 it is 48,500; so that the increase in the population has been most phenomenal. I will now state the number of holdings exceeding 1 acre, and the area included therein. In 1871, the number of holdings was 1,528, with an area of 162,809 acres; in 1881, the number of holdings was 2,219, with an area of 562,533 acres; in 1891 the number of holdings was 4,064, with an area of 1,188,513 acres; and in 1900, the number of holdings is 5,054, with an area of 1,208,542 acres. The total area cultivated was 27,934 acres in 1871, 38,324 acres in 1881, 69,012 acres in 1891, and 81,543 acres in 1900. Maize was the principal product in the early years of the settlements. In 1871, the area under maize was 24,635 acres, yielding 1,044,632 bushels. In 1881, the area under maize had gone down, because in the interim sugar-growing had been introduced. In that year the area under maize was 22,523 acres, yielding 1,022,890 bushels; in 1891, the area under maize was 41,321 acres, yielding 1,486,977 bushels. So that between 1881 and 1891 the acreage under maize was nearly doubled. Of course the outlying districts had become more populated and occupied as the result, and the agricultural development took place. In 1900, the area under maize is 49,402 acres, yielding 1,611,822 bushels. Now, I come to the area under sugar-cane. In 1871 there was comparatively little land under cultivation for sugar-cane, and the statistics in reference to that yield are not available. In 1881, in the whole of these districts, the area under cultivation for sugar-cane was 11,990 acres, yielding 119,300 tons of cane. In 1891, the area under cultivation was 22,045 acres, yielding 183,455 tons of cane. In 1900, the area under cultivation is 22,479 acres, yielding 169,949 tons of cane. I may add that when dairying became popular, and it was proved that it was a paying product, some portion of the land which had hitherto been devoted to growing cane was used for the purpose of dairying. That is accounted for to a very large extent by the fact that a large quantity of the back land, or what is called forest land, had not formerly been used. It was not utilised to the extent it is now being utilised before the advent of the dairying industry. When the dairying industry developed and was proved to be a payable one, some of the land hitherto used for cane-growing was incorporated with the forest land in connection with dairying. That accounts for the little diminution there has been in the yield of sugar-cane. Then, of course, the seasons would also affect the yield to some extent; and there were other causes. I do not want to say anything about the tariff conditions, but one of the reasons for the diminution was the proposal to abolish the duty on sugar, and, as the Committee, of course, know, it was reduced from £5 to £3 a ton. I will now give the figures in regard to live stock. In the whole of these districts there were 14,136 horses in 1871; 18,534 horses in 1881; 32,297 horses in 1891; and 33,646 horses in 1900. Of cattle, in 1871, there were 172,327 head. What are

Hon.
J. See, M.P.
10 July, 1900.

are called the dairying districts of the northern portion of the Colony—away from the river banks—particularly the Richmond and the Clarence, and some portions of the Tweed, were primarily used for squatting purposes, and it has always been, perhaps, one of the most famous districts in the Colony for the breeding of cattle. Therefore, the number of cattle in the districts, as the Committee will observe, is very considerable. In 1871, the number of cattle was 172,327 head; in 1881 it had increased to 217,552 head; in 1891 to 219,708 head; and in 1900 to 288,516 head. There are a few sheep in these districts, but not many. The sheep have diminished in number. In 1871 the sheep numbered 26,630; and in 1900, only 5,054. Swine have increased from 7,333 in 1871 to 34,302 in 1900. Perhaps the most phenomenal development in production has been in connection with dairying. In 1871 there was very little dairying. The difficulties in getting produce to market were very much greater in regard to carriage by sea. At that time they did not get the advantage of cold storage. The butter, if sent, would reach the market in a very bad condition. Not only in connection with the Clarence and the Northern districts, but in connection with the whole world, the matter of cold storage has largely contributed to the enormous development which has taken place. There was very little butter made in 1881; but in 1891, 1,218,580 lb. were made, and in 1900, 7,720,884 lb. made, so that the development in the decade has been more than six times as much as it was at the beginning. In the production of ham and bacon there has been a very large increase. Latterly there has been, perhaps, as great a development and improvement in the manufacture of bacon as there has been in connection with dairying; but the dairy business has brought, side by side with it, this development of the production of swine, and the enormous production of bacon. These figures come from the Statistician, and, therefore, are absolutely correct. In 1891, the ham and bacon cured in the district weighed 145,558 lb., and in 1900 the bacon and ham cured weighed 1,583,782 lb. I had these figures prepared to show the Committee the enormous development which has taken place there during those years, more particularly during the last ten years, in regard to what we call the dairying industry. I have very much pleasure, Sir, in handing in these figures to be appended to my evidence [*Vide Appendix*], in view of the fact that I wish to emphasise particularly the importance of these districts as to their past, their present, and their future probabilities. I shall be very glad to answer now any questions which may be put to me.

926. *Dr. Garran.*] You have given us a very interesting account of the very rapid development of these northern rivers during the last ten years;—I suppose there has been no parallel to it in any other district of the Colony? I do not know of any.

927. I gather that it has been principally due, first, to the growth of sugar-cane, and, secondly, to the dairying industry, which has been made possible by the better steam transit and the cold storage? Primarily, and to the advantage of the railway between Murwillumbah and the Tweed.

928. Sugar-cane was grown considerably on the Clarence before it was attempted on the Richmond? I really cannot say that. Of course, the Clarence is an older settled district than the Richmond.

929. And there was more development on the Clarence before there was ever a mill erected on the Richmond? I think the first sugar-growing was attempted on the coast or on the Macleay.

930. It is correct that there was a great deal more sugar grown on the Clarence than on the Richmond? I think they attempted to grow sugar on the coast, down the rivers, till they found that they could not grow it to advantage on account of the frosts. In 1871 the Richmond was comparatively unoccupied, except by timber-getters. Therefore, any development which has taken place has happened since that year.

931. The navigation of the Clarence was better than the navigation of any of the northern rivers at that time? Very much better.

932. And the flats on the Clarence was where, principally, the sugar-cane was grown? Yes.

933. It does not grow on the rising ground? It does not grow well on the forest lands. It grows well on alluvial lands.

934. In the Richmond, you have a country out of flood-reach, which is also good sugar-growing country, because it is trap-rock country? It is very good.

935. So that the character of the two rivers differs very much in that respect? Not in the rivers themselves. The alluvial land on the bank of the Richmond is almost on all-fours with the alluvial land on the bank of the Clarence.

936. I mean that you can grow on higher and drier land on the Richmond than you can on the Clarence? Yes; but it is scarcely river land—it is adjacent to the Richmond. It is alluvial in a sense, but it is not formed by deposits.

937. It is the detritus of volcanic rock which makes it so rich? Yes.

938. Are the original growers on the Clarence—the men who took up land in the first instance, and brought that land under cultivation—are they mostly the growers there now? A great number of them are. Of course, a great number of them have disappeared altogether from the scene; a great many of them are dead.

939. Are the growers now a tenant class or freeholders? Mostly freeholders.

940. There are more tenants, I suppose, than freeholders? I suppose so.

941. The great bulk of land on the Clarence was taken up by free selectors? Originally; and a good many of the farms have changed hands by the ordinary processes which have come about.

942. So far as dairying is concerned, I presume the development has been greater on the Tweed, the Brunswick, and the Richmond, than on the Clarence? Yes; it has. In 1891 the production of butter on the Richmond was 1,025,934 lb.; on the Clarence it was only 52,636 lb.; and at Grafton it was only 140,010 lb. At that time there were only three electorates. But in 1900 Lismore produced 2,866,760 lb.; the Richmond, 546,540 lb.; the Tweed, 2,594,720 lb.; and at Grafton it had gone up from 140,010 lb. in 1891 to 1,157,623 lb. in 1900. And the Clarence, which in 1891 produced only 52,636 lb., had gone up to 537,671 lb. in 1900. So that the ratio of increase would be almost the same for the decade.

943. Of late years has not the dairying industry developed much more rapidly on the Richmond than on the Clarence? I do not think so from the figures I have given. There was a great area of land on the Clarence—what we call forest land—which was not used except for the ordinary purpose of breeding cattle. With the advent of the Fresh Food and Ice Company, who put up a very large factory—perhaps one of the very best in the Colony—the farmers got an opportunity of using their waste lands, and the result of that action has been this enormous increase in the Clarence and Grafton electorates, which are practically the same district, for they are only divided by an imaginary line. The production of butter has grown from 1,218,580 lb. in 1891 to 7,720,884 lb. in 1900. The industry is only in its infancy yet.

Hon.
J. See, M.P.
10 July, 1900.

944. You owe that result to the enterprise of a private company? We owe that to the fact that facilities were afforded to farmers who had cattle to put their milk to the use which the factory enabled them to do.

945. It was the enterprise of a private company which gave the stimulus to the district? Quite so. Of course, dairying would be possible on the rich river flats even more than on forest land.

946. Has it superseded the sugar-cane much now? Not very much. I pointed out the total decrease in acreage under sugar-cane. According to this return the maximum area under crop was in 1891, when it was 22,045 acres, which includes the whole of the rivers. In 1891 the area under sugar-cane in the Richmond was 13,549 acres, in the Clarence, 8,171 acres, and in Grafton, 325 acres. These three electorates were split up afterwards into the Lismore, the Richmond, the Tweed, Ballina, Grafton, and the Clarence electorates. But the total area under sugar-cane in the whole of the rivers was 22,479 acres in 1900, as against 22,045 acres in 1891; so that there has been an increase of about 450 acres, notwithstanding the advent of dairying and other causes.

947. Do you know of any riverside farmers on the Clarence who are experimenting in both industries—dairying and cane-growing—at the same time? Some of them are.

948. Do you happen to know which they find the more profitable? It depends entirely on the character of the land. A man who has rich alluvial land—

949. I am speaking of the alluvial banks? There is no doubt that they can make more money from growing sugar-cane on alluvial land than they can make from dairy-farming; but, in connection with the alluvial flats, there is a considerable area of forest land which they can utilise for dairy cattle, and they can work the two things combined. There are a great many persons who formerly did nothing but take up land and try experimental crops—did a little odd farming, timber-getting, and miscellaneous work. They now devote themselves almost exclusively to dairying, notwithstanding that many of them have to take their milk for a considerable distance, and they do not get very good prices.

950. Taking the alluvial land only, is there a tendency on the part of farmers to give up cane-growing in favour of dairying? No.

951. The old crop pays the better on that rich land? Yes.

952. In the Richmond River district, where some men have been growing sugar-cane before dairying became fashionable, is there any tendency to give up growing sugar-cane on that land? Not on the alluvial land; but in what they call the big scrub there is—in the neighbourhood of Byron Bay. Moreover, a great number of these smaller factories or creameries have been started; in fact, a great many of the farmers themselves have their own separators. A separator enables the farmers to convert their milk into cream, and the bulk is reduced, and they can reach the factory very much better than they could under the old conditions; and the roads are made also.

953. Can a man who has his own separator afford to live further off from a factory than a man who has to send his men into the factory? Undoubtedly.

954. That is one great advantage? Unquestionably. I will give one case in point. I do not know the number of acres which the man holds; I know he is a very enterprising man; I do not know a better type of farmer. He lives at a place called Stockyard Creek, and his case is a notable one. In spite of his industry, he could not make his land pay, although it was fairly good land. He was a considerable distance away from a factory at which his milk could be treated, so he obtained a separator for himself. At that time he was considerably in debt, but now I think he is almost out of debt, and he is in a very prosperous condition so far as his prospects are concerned. He is not only treating his own milk, but he is treating the milk of a number of his neighbours.

955. How far is he from the factory? Ten miles. If he had to take his milk 10 miles it would not have paid him, but he can take his cream that distance. One cart can take the cream from the milk of a great many cows, whereas one cart cannot take the milk of many cows.

956. What is the proportion of the diminution in the bulk? I could not tell you, but it is very considerable; and then the skim milk, after it is denuded of butter properties, is used for the feeding of pigs.

957. I gather from your answer that, so far as new farms are concerned—I mean new ground being taken up and brought into cultivation—the tendency is to go into dairying rather than sugar-cane growing? There is not very much land on the Clarence—that is, what we should call alluvial land—within reach of the river.

958. I am speaking of the alluvial land on the Richmond? And even on the Richmond, too. There is not so much of that land which is suitable for growing sugar-cane, except in the big scrub, and they find it pays them better there to use the land for dairying.

959. How far from a mill can you grow sugar-cane—that is, with land carriage and no water carriage? It would not pay to grow sugar-cane very far away from the railway or the shipping port. If they had to cart their cane 4 or 5 miles it would hardly pay them. On the Tweed railway itself the price for drawing the cane with the sugar is not very high. Still it is high when you consider that they have to pay for the carriage of the bulk, not the manufactured article. If they have to pay 3s. a ton for the carriage of their cane, and it takes 10 tons of cane to make a ton of sugar, that would be 30s. If they had a ton of manufactured sugar they could get it taken for 4s. or 5s.

960. It is very important to get the cane taken to the mill as soon as it is cut? Yes, because there is a weepage.

961. So that there is a natural limit from the mill in which you can grow cane for land transit? Yes.

962. Unless you have cheap railways to run along into the back country? Certainly.

963. There is not the same difficulty in regard to the cream? No; but there is some difficulty.

964. There is more temptation, if you are going to take up new farms, to go in for dairying than to go in for cane-growing? Undoubtedly.

965. The future of the big scrub on the Richmond looks more towards dairying than cane-growing, at present? Yes; but then you know dairying in the big scrub, and dairying in what we call the forest country, are two very different things. To make the scrub land available for dairying, you have to spend a good many pounds per acre. I suppose you may reasonably estimate that it would cost you £5 or £6 an acre to clear the scrub, whereas in ordinary forest land a little ringbarking here and there, and fencing, would be all that was required.

966. Is the herbage on the forest land as succulent and good as it is on the Richmond? I do not think it is, per acre.

967. It would not carry so many cows per acre, or yield so much milk? No; but they can keep a great many more cows. Hon.
J. See, M.P.
968. Now, taking these rivers, the produce of the Tweed is mostly sea-borne to Sydney, I suppose? A good deal of the heavy stuff is. A 10 July, 1900.
969. There is no other way to get it to Sydney? They could get it to Lismore and Byron Bay.
970. By going outside the Heads and going into the other river? A good deal of the dairy produce which is produced on the Tweed finds its way to Byron Bay, where they have a very large co-operative factory; and then it is shipped. The cream is taken by train to Byron Bay, and is brought on to Sydney by steamer.
971. Suppose the Grafton and Casino railway were made, would that in any way affect the quantity of shipping at Byron Bay? Not a bit.
972. What goes there now would go there then? I think so.
973. Would the produce of the Brunswick be in any way affected by making a railway from Grafton to Casino? I do not think so.
974. It would still take the same road to market? I think so.
975. Do you think the produce of the Richmond would still find its outlet at the Richmond Heads, or would it go to Grafton? I think it would still go by the river.
976. We must not look upon this line from Grafton to Casino as a line which is likely to rob other ports of their trade, but as a line to develop its own trade? Yes; it will largely add to the interchange of trade between the two great districts.
977. Does the man who makes butter want to change with another man who makes butter? There is a great deal of other trading. There are the passenger trade, the cattle trade, and the timber trade, and a number of other trades which grow up by reason of better communication being provided. A man who buys cattle on the Richmond or the Clarence, and wishes to convey them promptly to their destination, instead of driving them 60 or 100 miles, would put them in a railway truck, and get them delivered at their destination in a few hours, thereby effecting an enormous saving in their condition.
978. Is Grafton a good market for cattle? It is a very good market, because the population of Grafton and the Clarence combined is 20,500.
979. But the Clarence is a very good cattle-growing district itself? It does not pay them to kill cattle which are useful for dairying, and therefore they go to the Richmond very often for cattle.
980. They are not all cows;—there are some bullocks, as well as cows? They have an enormous meat-preserving establishment at Ramornie, which buys a great many of the surplus cattle on the Richmond. If, instead of driving these cattle, as they do now, from the different outlying stations, they could put their cattle into a railway-truck at night, and take them to their destination in the morning, the cattle would save enormously in condition. At the present time there is enormous waste in condition. I have had a good deal of experience with cattle. I used to buy a very large number of cattle for the purpose of freight. We used to reckon that from the time we bought a bullock on the station it would take us, at the earliest, a week to get it to market, and a bullock which weighed 900 lb. on the station would be reduced to 800 lb., besides deteriorating in other respects.
981. Does it not depend partly on the feed on the road? It is not always available; and if there is plenty of feed it belongs to other people very often.
982. How far is Ramornie from Grafton? It is 9 miles above Grafton. It is on the junction of the Orara Creek and the Clarence; but there is abundance of good land between Grafton and Ramornie.
983. Is it navigable to there for steamers? Yes.
984. Do they get many cattle from the Richmond district? An enormous number in the season. Of course it depends entirely on the price. When cattle are high, as they have been during this season, consequent on droughts elsewhere, there has been a big demand. Queensland has suffered, perhaps, more than we have from drought; therefore, the cattle supply has been diminished. I reckon they kill from 15,000 to 20,000 head of cattle every year, and in some years they kill more than that number.
985. Do you think that many of the Richmond cattle would take the trucks at Casino? I am sure they would, because this railway would go right through the cattle country.
986. Through it or to it? It would go through a great deal of the cattle country.
987. Do you mean to say that the land on either side of this proposed line is occupied for fattening cattle? Some of it, adjacent to the head of the river, round Casino and that way.
988. At the end of the line? Suppose it is 5 or 6 miles from the proposed railway to Kyogle, Dyrabba, and other stations; it would not take them very long to get to the depôt where cattle are shipped. They would have abundance of food, and the cattle could be put on the trucks and sent along.
989. It does not pay to put cattle in a truck for a short journey, because the knocking about they get in putting them in is very considerable? At times it does. A 100-mile run would take a lot out of cattle. Moreover, there is the question of despatch to be considered. If they could draft their cattle from the station by rail, and supply the requirements exactly as they arise every day, it would save a lot of wear and tear on the cattle which are usually brought over 400 or 500 in a drove, put in a paddock, where they wait to be killed.
990. You look on the cattle trade as a material element in the earnings of this line? I do. In the settlements which are taken place on the Richmond, and the various parts of the district, including the Clarence and Grafton, the interchange in the breeds of cattle is great. A farmer, for instance, who wants to stock a farm goes to another part of the country. If he wants cattle he goes to the Clarence or some other place. He knows the place where he can get them on the best terms, and get them delivered in the best condition. There must of necessity, be an enormous development of the trade, consequent on the two districts being connected, notwithstanding that they produce to a very large extent similar products.
991. This line has been put before us in a double aspect, partly as a section on the North Coast line, and partly as a local line;—have you any idea in which capacity it is of the more importance? I think they are both important.
992. You do not think one more important than the other? No; I think they are almost inseparable. From my experience in the northern districts, I do not think there is any question whatever but that there must be a North Coast line made sooner or later, and the sooner it is made the better, because I think the North Coast districts are capable of carrying a larger population than any other portion of the Colony, from

Hon.
J. See, M.P.
10 July, 1900.

from the agricultural and industrial point of view. Of course, I omit Newcastle and Sydney, which are not parallel. I do not think there is any other place in the Colony to be compared with the North Coast districts, not even the South—and I have been a good deal over the South—as regards the area of good land available and the magnificent character of the rainfall, to say nothing of its timber and its minerals. 993. But would the timber and the minerals be an interchangeable trade, or a trade mostly for Sydney? It would be an intermediate trade. For instance, take the timber industry between any of these ports—between the Clarence and the Richmond—it would not pay to haul the timber by team. If they could put it on a truck and bring it alongside the vessel, which is prepared to take it away to Sydney or elsewhere, the handling would be very much less. At present it has to be hauled over bad roads, and timber lorries make bad roads, because their loads are much heavier. The less handling you have for any kind of article the cheaper you can put it on board, and the cheaper you can sell it to a person desiring to buy.

994. Is there not a good deal of timber left in the Clarence River district still? Yes.

995. Enough for its own support? There should be more than that.

996. You will not want to import timber to the Richmond for many years to come? I do not think so. I know that within a comparatively short distance from Grafton—within 40 or 50 miles, and in what they call the Don Dorrigo country—there is, perhaps, the finest pine forest in Australia.

997. That would not want to be sent north to the Richmond? Some of it might. They are very rapidly denuding the Richmond of some of its best timber. It is a pity that it is going on, although it is necessary for it to be done for the clearing of the land. In some cases there has been a larger destruction in property and in value, in the shape of timber to make the land available for farming purposes, than the farms are worth when cleared.

998. Is not the timber worth as much as the crops? Yes; but it does not suit a man who wants to grow cattle or cane to have a pine forest. He has either to let the forest remain and wait, or to cut down the trees—which would be worth a great deal of money if kept—and make his land available for grazing or farming.

999. According to the evidence put before us, there has been very little purchase of land, and settlement, on this line, between Grafton and Casino, because of the want of transit? That is right. It is of no use taking up land if you cannot get your produce to market.

1000. Is it your opinion that if the line were made, the whole of the land would, in a few years, be taken up for dairying? I suppose the whole of it would be taken up; they would have to take the good and the bad, and therefore the bad would go with the good.

1001. From a traffic point of view, would a line running through a dairying district, and settling the country for, say, 15 miles on either side, give a profitable return? No; and I do not think any line in the Colony would. I think if you take the line between Wagga Wagga and Narrandera, or between Goulburn and any other point on the main line, the local trade of itself would not pay the interest on the cost of construction of the line.

1002. Not even what it drew to itself? No. I do not think that the line for the purpose of Sydney proper—the suburban line—would pay the interest on the outlay.

1003. Now the Moree line has paid with what it has carried and drawn to itself, rather being an exception to most of our lines? I think that in the construction of railways we should look at the local aspect of the line. The local aspect, no doubt, is a big factor as a reason why a line should pay, because it enables the people to take up land which otherwise they would not take up. If we wish to induce people to go into the bush and settle, we must give them facilities to get their produce to market.

1004. *Mr. Levien.*] It is the trade out beyond Moree which makes the Moree line pay? Of course it is. The trade beyond Moree is a great deal more in bulk than the trade between Moree and Narrabri.

1005. *Dr. Garran.*] It is not the trade alongside the line so much as what it concentrates at the ends? Yes.

1006. Looking at dairying produce, cream is a very portable commodity, and the quantity you get off a large dairying district does not give very much revenue to the railway? Not the actual product itself; but then side by side with that product you get an increase of population, and you get other industries growing up. You want the wheelwright, the shoemaker, the blacksmith, and the thousand and one things which mean settlement.

1007. Even then, we are told that this land would have to be put into 500-acre blocks? Perhaps so.

1008. You would only have one family to every 500 acres, so that you would not get a very dense population? Let me put this point to the Committee: Anyone who knows the Richmond River district—notwithstanding the fact that the railway does not give anything like a revenue to pay the interest on the cost of construction—anybody who knows that district, would not hesitate to say that the construction of the railway between Murwillumbah and Lismore was a good thing for that district and the Colony, because the figures I have given here prove that but for something of that sort being done, this enormous production of butter would not have taken place, because they could not get it to market. The advantage of being able to sell the Crown lands, and giving people facilities to settle on the land, has been consequent upon the railway being made, and although the direct loss on the railway has been very considerable, we must take into consideration the indirect advantages, which are very numerous, and which have resulted from its construction.

1009. Apart altogether from your own interest in the district, do you think the gain to the nation is more than the £29,000 a year loss on the line? I have no doubt whatever but that it is. I have not an acre of land which will be benefited, and, so far as I know, it would not put one shilling in my pocket; therefore, I am not speaking from any personal standpoint. I have no doubt, whatever the railway may cost, the indirect advantages would largely overbalance the loss which would be sustained, from the interest point of view, by its construction.

1010. Putting it in the money point of view which you, as an ex-Treasurer would appreciate, do you think that indirectly the State gets £29,000? Yes; because in the first place the State can sell the Crown lands which otherwise it could not sell. I am quite sure that the land would bring a very much better price, and largely cover the cost of the line.

1011. If we allow the land to be taken up by free selectors we should not get a better price? You give people a better opportunity to settle on the land. Under present conditions if a man took up land, he could not live on it.

Hon.
J. See, M.P.
10 July, 1900.

1012. Was the land on the Lismore-Murwillumbah line in private ownership before it was made? It might have been just adjacent to the line. There has been an enormous quantity of land taken up since the railway was made, and there is an enormous area yet to be taken up. If they had little spurs running out from that line into the dense bush, it would give an enormous stimulus to settlement over and above that which they have at present.

1013. As a practical man, you think the loss to the Treasury is practically made good in invisible and indirect ways? I think, immeasurably so.

1014. We have had it stated in official evidence that a family of five persons would produce $2\frac{1}{2}$ tons of butter off 200 acres of land, and that from the same area there might be got 70 tons of agricultural produce for transit by railway;—do you see what a very small quantity of tonnage there is between the railway? It would be a great deal more sensible to consider the value of the $2\frac{1}{2}$ tons of butter.

1015. It would if you paid freight by value? In one case, you can produce an article of value, by reason of doing something, which would not have been produced if the State had not done that thing. The $2\frac{1}{2}$ tons of butter at £100 per ton would be worth £250; but the 70 tons of agricultural produce, especially if potatoes, might not be worth more than £2 a ton.

1016. I am looking at it from the revenue point of view;—if we had an *ad valorem* freight charge on all our produce that would tell very strongly? On the other hand, you have to consider that if the stuff is produced it means money, and the man who gets the money spends it by making improvements, which means labour, and a variety of other things. It is an advantage to the community to have this increased spending power. It goes to swell this enormous production of butter, which means so many million pounds of weight, as well as a million pounds of money.

1017. I merely ask you whether we should gain indirectly by making a railway through this very productive country? I have no doubt whatever but that we should.

1018. Even though we make a heavy loss on the revenue side? I have no doubt whatever. Taking it as a local line, and, consequently, as a portion of the North Coast line, which must inevitably come, I do not think there could be any doubt whatever about it.

1019. There is another point to consider—the Railway Commissioners are always trying to make a profit, and when they do make a clear profit they give the country the benefit of cheaper rates. The more we load them with unprofitable lines the more impossible we make it for them to reduce the rates? Then you may take this argument: Suppose the Commissioners could dominate the construction of railways, there are a great many lines made which would not have been made at all, and the settlement which has followed from their construction has been of great advantage to the country generally, and the end of it has been that, although they do not perceive the advantage which the railways derive, yet there is a very considerable advantage, we will say, to the trunk line by reason of the construction of lines which do not directly pay—for instance, the Mudgee line, and many other lines which I have before me here. Looking at it simply from a business point of view, if it were your money or mine, probably, we should not do it, but the State undertakes to construct these railways, and, as the State owns the Crown lands, the more quickly you can dispose of those lands, not for the sake of the money which they bring, but for the sake of the settlement which they induce, the larger the volume of trade we encourage on our railways. That is exactly how the Americans look at this question. They used to make the railways first, and the population used to follow the lines. We have turned it round the other way. We want the population to settle on the land first, but they cannot live on the land unless you give them facilities in the shape of railways, and because we cannot see to-day that a line is going to pay we almost shut our eyes against the probable development that will take place. This return unmistakably proves, I think, what I have said. If this enormous development has taken place during the last thirty years we can reasonably infer that there is going to be a very much larger development during the next thirty years.

1020. The question is simply one of financial obligations on the State—how far we can afford to go in losing money which is not directly recouped? Taking it from the selfish point of view it means that the more railways you have the better it is for the people, and then it means certainly an advantage to the city as well as the country. If there were a reasonable prospect of a railway line paying I have never yet once given my vote against its construction, no matter to what part of the country it was to go.

1021. I am speaking of cases where there is a reasonable prospect of its non-paying for a very long term of years;—how long do you think it will be before the Lismore line pays? It goes through auriferous country, and there might be a gold-field discovered.

1022. But taking the country as it is? There is a probability of the line paying. There is the timber industry. Those forests of timber in the intervening country, and in parts of the district, are almost beyond reckoning.

1023. Do you think the Lismore line by itself would pay for twenty years to come? No.

1024. Not directly? I do not think any bit of line will pay. I think the more you add on to that line the better it will pay.

1025. The more money you will lose directly? Well, it is only taking it out of one pocket and putting it in another.

1026. The difficulty is to trace it into the State treasury from the other sources? Our settlers are producing an enormous quantity of goods which are required for our consumption, and but for that production we should have to import them. If we did import them we should have to pay, but if we produce them we pay the settlers for producing.

1027. In the case of the butter which we make, we are sending it away? Some of it.

1028. Most of it? We are getting money for it, and that helps to pay the English creditor the interest on the capital.

1029. You think it pays the nation to make a non-paying railway, where it would not pay a private company to do so? I do. If an enterprising individual had a product of the same character as the State has, then his shrewdness would cause him to take up some ground, because he would anticipate that a man would come along and make a railway. There are a lot of things in business that men sell which do not pay, but which they are obliged to keep.

1030. The Americans have made a great many lines by land endowments; they got the land as a free grant or at a very small price, and they sold it with the railway increment added to it? They do not value the land a bit till it is put to use.

1031. They did sell it to the settlers at a very much bigger price than they had to pay for it? Yes; they got the ground, and there the settlement follows the construction of the line.

1032.

Hon.
J. See, M.P.
10 July, 1900.

1032. We do the other thing, and what we want we buy back for five times what it was sold for? There is a good deal of this land which has not been sold.

1033. Most of the line from Murwillumbah to Lismore went through private property? A good deal of it did. That was more or less speculative. The land was so rich that people took it up in anticipation of something happening, and it did happen.

1034. *Mr. Watson.*] The railway happened? It was inevitable that it should happen. I have here a map which particularly describes the different electorates I have been speaking of.

1035. *Mr. McFarlane.*] Do you look on this proposed line as a section of the North Coast line? Yes.

1036. What is your opinion as to the North Coast line being eventually a paying line? I think it will be sure to pay. I think it will open up better country than any country yet opened up by a railway.

1037. Have you a knowledge of the character of the country between the different coastal rivers—say, between the Hunter and the Tweed? Yes; I have been all along the coast, from Point Danger to Cape Howe, and I have a good knowledge of the character of the country at the head of the navigation of the different rivers, and between there and the table-lands.

1038. Is it a class of country which will be settled upon in the event of a railway being constructed? I have no doubt whatever about it. I might give one instance. I look upon the Don Dorrigo country as quite equal to the big scrub, and in some respects it is better, because it is better adapted for the growth of roots—potatoes and turnips—and grain and barley, and things of that sort. I do not think there is any part of the world where the land is richer than it is in the Don Dorrigo scrub.

1039. Would the extension of a line south from Grafton touch this country? Yes; it would go very adjacent to it. It would make it possible for them to reach a profitable market with their different products.

1040. Which would be their nearest port in the event of that North Coast line being made? It depends upon which direction it went. If it went in the direction of Don Dorrigo, or from there inland from the coast, Grafton would be.

1041. Is there any available port south? There are two places which they call harbours—namely, Woolgoolga—where there is a jetty, which, I think, I was instrumental in getting—and Coff's Harbour; but they are only open places. Coff's Harbour is sheltered by an island in some weathers, and in others it is not. They are natural inlets, but not harbours in the sense in which we understand harbours—they are something like Byron Bay.

1042. Which is looked upon as the best port between the Hunter and the Queensland border? The Clarence, I should think.

1043. How do freights from the Clarence to Sydney compare generally with the freights from other coastal rivers? They are low at the Clarence, because the depth of water is greater. Of late years the Richmond has been improved very considerably. The harbour improvements which are going on have considerably helped the navigation. I may say the same of all the northern rivers where harbour improvements are going on. Perhaps there is the same ratio of improvement as on the Clarence, but still the Clarence really carries the greatest depth of water.

1044. Are freights cheaper at present on the Clarence than on the Richmond? Yes.

1045. In the event of a railway being constructed from Grafton to Casino, seeing that the freights are low between the Clarence and Sydney, would not that induce traffic from the Richmond River too? I think the tendency would be that it would go to Grafton. By far the larger portion of the trade which would be created, or the produce which would be raised between the two rivers, would go to Grafton.

1046. There have been some conflicting statements made in regard to the possible carriage of traffic between Grafton and Casino;—in your opinion, would the railway induce a greater amount of traffic than there is at present? There is no doubt whatever about it. Wherever railways are made, there is a considerable amount of traffic which springs up, and people do not seem to know where it comes from. There is a considerable amount of traffic between the Clarence and the Richmond even now.

1047. How does it go? Most of it goes from Woodburn to Chatsworth. Some of it goes direct to Casino and Grafton; other portions go from Lawrence.

1048. Would that traffic go by rail if the proposed line were made? I should think so. If a man could get from Grafton to Casino or Lismore in two or three hours, where it now takes him twenty-four hours to go by coach, I think it goes without saying that he would go by rail.

1049. What is your opinion of the character of the Crown lands between Grafton and Casino? I should describe them as good grazing lands, with some portions adapted for agriculture. It is a great deal better class of grazing land than the land which we ordinarily understand as grazing land in many parts of the country.

1050. Given railway facilities, do you think it would increase the value of the Crown lands between the two places? I am sure it would. At any rate, people would take up the land, and live on it, whereas now they will not touch it, because they cannot live upon it.

1051. What has been the common practice in regard to railway reserves;—are they usually thrown open for free selection, or are they sold by auction? I do not know.

1052. There are a number of railway reserves along the route of the proposed line? I do not know what the custom is in that case.

1053. But a railway reserve really means that the land is reserved in anticipation of a line coming that way, and if it went by that way the land would be made available for selection, I should think? It would depend largely on administration, I suppose. The Government would have the power to dedicate these reserves for any purpose it thought proper.

1054. *Mr. Watson.*] These reserves have been kept back from selection with a view to railway construction? With a view to preserving the land.

1055. *Mr. McFarlane.*] What I want to know is, what is usually done by the Crown with these reserves, after the line is constructed? I should think they would be thrown open for selection. There is an area, of about 500,000 acres of land on this route, unalienated.

1056. You made some mention of the meat trade between the Richmond and the Clarence;—do you know where the local butchers mostly get their fat cattle? The great bulk of the cattle consumed on the Clarence comes from the Richmond.

1057. I am speaking of the cattle consumed, apart from the meat-preserving works? Yes. I do not know what the percentage is, but I know that the butchers of Grafton go and buy their cattle from Kyogle, Dyrabba, and other stations about the Richmond.

1058. When you were purchasing cattle, where did you mostly get fat stock? At what we call the head of the Richmond.

1059. How would you get them to market—by the Richmond, or by driving them to the Clarence? They have to drive them to the Clarence now; but, if they had a railway, I should think they would use the line. They bring the stock over in mobs of fifty or 100.

1060. *Mr. Levien.*] So far as that railway goes, it seems to be against your personal interests;—you are largely interested in the shipping trade, and this railway would be against your interests, would it not? I do not think so. I do not look upon the proposal in that way. I think the enormous increase in production would rather, if anything, benefit me.

1061. It is in your favour the way you are giving your evidence;—I regard your evidence as absolutely fair in every way, because I thought this line was somewhat against your own personal interests in the shipping trade? In giving evidence on a proposal of this sort it is really a national matter with me, and not a personal matter. I have always advocated the construction of, not only this line, but a line to connect with the table-land, and whatever might be the result of its construction to me personally, it would not enter into my thoughts to prevent it or hinder it from being done if I believed that it ought to be done.

1062. *Mr. McFarlane.*] Have you a good knowledge of the timber trade in the Clarence district? Yes.

1063. Is it on the increase? Very considerably. I may say that there is an enormous company projected now for the purpose of exporting timber. They propose to deal with a great deal of this timber—pine and other stuff—for export, more upon the lines which America adopts in regard to the timber trade. They propose to have the very best powerful machinery for handling great logs, and bringing them to the coast in the cheapest possible manner, and cutting them up with the best facilities.

1064. Is the port sufficiently good to enable shipping to take timber to other colonies? Yes; there is a constant trade going on with sailing vessels to New Zealand. A good deal, if not most, of the timber which has been used in constructing the various harbour works in New Zealand has, I think, gone from the Clarence. There are two or three vessels of 400 and 500 tons trading backwards and forwards now.

1065. Do they meet with any delay at the bar? Only that delay which would cause them not to get into Sydney or Newcastle when it is very rough.

1066. In bad weather? No; they have a tug-boat. In a heavy easterly sea they could not get in any more than they could get into Sydney. I do not think the steamers are bar-bound on the Clarence more than twice a year. They go over the bar. I have been over the bar when I did not like it, but the captain said that there was no danger, and he knew better than I did whether there was.

1067. Do you think that that trade would be likely to increase in the event of the line being constructed? It must enormously increase.

1068. Have you any knowledge of any large forest reserves on the proposed line, containing ironbark? Yes; there are hundreds of millions of feet of timber between the border of Queensland and right down along the North Coast to Port Stephens. I do not think it is possible to estimate the value of these forests—whether they are what we call scrub forests or the ordinary forests. I have been bewildered sometimes in going along the North Coast line from the Manning to Port Macquarie, and thence right on to the Clarence, to see the magnificent timber that is there. And if you get further back, in what we call the spurs of the mountains, where the creeks take their rise, and go to make these rivers, there are pine and cedar trees in abundance, and some of the finest trees in the world. This pine forest I spoke of a little time ago is astounding—nobody could believe it, if he did not see it—as regards the enormous number of trees that it contains. In taking out these trees, there is no doubt that they could preserve the forest by letting the young trees grow. They do it in other countries, but we have been rather getting rid of our forests for the purpose of carrying on farming operations, and in a great many cases we have been destroying a very much more valuable asset than we have created. Down about Woolgoolga, for instance, and all the way up to Orara, the country is capable of carrying an enormous population, if they only had the means of getting their stuff to market. They have to depend now on the ordinary bullock teams; but the roads are very bad, because the country is rotten. The better the country, the more rotten it is for traffic. In wet weather they cannot get across the country at all, unless the roads are made; and making roads means spending a lot of money.

1069. *Chairman.*] And they do not last long when they are made? No; because they have to carry big loads of timber or produce, to pay. As soon as roads are made, if very bad weather come, they are dug up. It cannot be helped, but still there it is. It looks like making a road to be destroyed almost immediately by the heavy traffic.

1070. *Mr. McFarlane.*] Mr. Deane, the Engineer-in-Chief for Railways, has made an estimate of the cost of a light line between Grafton and Casino;—do you think a light line would suit the requirements until such time as the North Coast line was built? If they could work it on the grades, certainly.

1071. It could be constructed at a much less cost? Any railway would be better than none at all. A light line, if it could be made, would serve the purpose for the time being; but, ultimately, it would be converted into a more substantial line if it were proved, as I feel sure it would be, that the trade would warrant its being done. Wherever it may come from or to, there must be a connection between the coast and the table-land. That enormous tract of country between Queensland and Newcastle, that no railway touches at all, and which would not interfere with any railway which at present exists, must be considered. There is one-eighth of the whole Colony not touched by railway construction in any shape or form.

1072. *Mr. Shepherd.*] Are you well acquainted with the country between Grafton and Casino? I have been over about a third of it. I have been to Casino, and I know that end well; and I have been a considerable distance along the road from Grafton to Casino; but I have never been upon the route there. I know from those who have been on the route, and from my knowledge of that part which I have seen, that it is good country generally.

1073. Is it not a fact that it is not, by any means, an agricultural country between the two points? It depends on the kind of agriculture. For maize-growing, generally, no, although it would grow good maize; but I am told by those who have taken up bits of land here and there that it grows the succulent grasses splendidly.

1074. Grafton and Casino are already well served, are they not, by water communication with Sydney? Fairly well.

Hon.
J. See, M.P.
10 July, 1900.

Hon.
J. Sec, M.P.
10 July, 1900.

1075. So that this line would really have to support itself by the trade between the two points, say, from 20 miles on either side? The intermediate country, of course, would be opened out.

1076. Do you think the country is of such a nature that it would be capable of supporting the railway? Yes; that and the trade which would follow as the result of making the railway would, I think; but, as I said before, I do not think any railway in the country would pay between any particular town and town—that is, from the carriage of the intermediate trade. I do not think, for instance, that the trade between Quirindi and Singleton would pay of itself. It is the trade which the line brings from beyond, and also the accumulation of the intermediate trade, which pays.
